Notice and Warning

Patent or Trademark Rights—The inclusion in this National Formulary of any drug in respect to which patent or trademark rights may exist shall not be deemed, and is not intended as, a grant of, or authority to exercise, any right or privilege protected by such patent or trademark. All such rights and privileges are vested in the patent or trademark owner, and no other person may exercise the same without express permission, authority, or license secured from such patent or trademark owner.

Compliance with Federal Statutes—The fact that an article appears in this National Formulary does not exempt it from compliance with requirements of Acts of Congress or with regulations issued by agencies of the United States Government under authority of these Acts. Revisions of the Federal requirements which affect the National Formulary standards will be made the subject of NF Interim Revision Announcements or Supplements as promptly as practicable.

Use of NF Text—The National Formulary text is fully copyrighted. Authors and others wishing to use portions of the text must obtain permission to do so, through the Director of the National Formulary (see page xxxiii).

Endorsement Disclaimed—Inclusion of any drug in this National Formulary is not to be construed as endorsement of any individual drug product or specific brand of such drug.

AUTHORITY

The Committee on Specifications shall consist of fifty (50) members, broadly representative of the pharmaceutical, chemical, and biological sciences. The Committee on Specifications shall function in an advisory capacity, in developing standards, specifications, test procedures, and assays, as may be required for articles recommended for admission to the National Formulary. (From Chapter XIV, Article VIII of the By-Laws of the American Pharmaceutical Association, as amended through 1969.)

PREFACE

Man has recognized the basic need for drug standards and specifications virtually since he first began to employ substances with purported medicinal properties in his attempt to alleviate illness and suffering. Most of the drugs which were available from prehistoric times until the dawn of the sulfa-antibiotic age were at best crude nostrums. Few of these articles did the patient any good, and he was probably fortunate if they did him no harm.

The state of drug standardization has followed a rather parallel course in its development and history. While efforts had been made to achieve means whereby medicinals could be examined and assessed as to their identity, purity, and potency, most of these efforts resulted in methods equally as crude and unreliable as the nostrums themselves.

However, almost coincident with the birth of the chemotherapeutic age, the science of analytical chemistry began to advance with enormous strides. Fortunately, pharmaceutical scientists recognized the potential application of these new and remarkable approaches to the analysis of drug substances and drug formulations. With ingenuity which rivals that seen in any field of science or technology, pharmaceutical scientists—particularly during the past ten years—have utilized the recent developments in analytical methodology in the testing of pharmaceuticals. The net result permits inspection of infinitely smaller samples, enormously greater selectivity, and drastically improved precision and accuracy.

The fundamental purpose of the National Formulary is to provide standards and specifications which can be used to evaluate the quality of pharmaceuticals so that the physician can prescribe drugs with assurance, the pharmacist can dispense drugs with reliability, and the patient can consume drugs with confidence.

Exhibiting a singleness of purpose, the entire efforts of the National Formulary Board—as well as the NF Committees, panels, individual advisors, and staff—during these past five years have been directed at providing just such standards and specifications for the benefit of the professions of medicine and pharmacy, and particularly in the interest of the general public. In pursuing this course, the many recent developments in drug analysis and related methodology have been freely drawn upon and widely utilized. While it will be left for history to determine the full impact which this new compendium will have on the future course of drug standardization, nevertheless, one prediction can be made with confidence: the new National Formulary provides a combination of the most advanced and authoritative means heretofore available for assessing drug quality. Never before has the pharmaceutical analyst, from a regulatory standpoint, been in the posture of being able to determine and ascertain so much regarding the identity, strength, quality, and purity of many of the drugs with which he is concerned.

Organization and Codification

The end product of any program or activity is generally greatly influenced and affected by the depth of planning and degree of organization which has been utilized in developing and executing that program or activity.

The content of the National Formulary has gradually evolved over the past 78 years from a simple drug recipe book to a highly sophisticated compendium of complex scientific information. During this same period, the distribution and use of the NF—earlier limited to a relatively small group of pharmacists—has grown so that it now reaches a large number of national and international users including members of all the health professions, as well as the pharmaceutical industry, pharmaceutical education, law enforcement agencies, and many others. It has come to be formally recognized as an official compendium of drug standards and specifications under terms of the federal as well as the state drug laws.

It is only natural that the mechanism whereby this compendium is revised and published has also become much more complex and intricate as these various aspects of growth, expansion, and maturity have taken place. Regrettably, before 1965 the formal codification of the present organization of the NF structure had not been accomplished. The full responsibilities of the various bodies within the organizational framework had not been officially stipulated nor defined. This was the case in spite of the fact that the need for such codification had been recognized for many years and was the primary point brought out in the 1959 Remington Address by the retiring NF Director, Justin L. Powers. He suggested that consideration be given to expanding the APhA By-Laws to describe the National Formulary operation in greater detail.

The need for this public clarification of the authority and responsibilities of the organizational units within the NF, as well as the overall function and purpose of the NF itself, now appeared to be even more urgent than ever before.

As a consequence, immediately after publication of NF XII in early 1965, efforts were initiated for a thorough reorganization of the entire committee and staff structures, the delineation of responsibilities, and in general, a formalization of the complete NF revision and publication process to render it highly methodical and systematic. This effort culminated in early 1967 with the adoption of revisions in the APhA Constitution to recognize the NF program as the first objective of the Association's existence, and the addition of an entire new APhA By-Laws chapter pertaining exclusively to the NF codification (the pertinent portions of the Constitution and By-Laws are reprinted beginning on page xlv). One particularly notable feature of the codification is the provision for an appeals route. This is just one facet of the codification which is designed to provide the National Formulary with a greatly enhanced legal foundation in the event of any challenge either to its basic authority, or its method of arriving at the specifications adopted, or the specific standards thereby derived.

The terminology used to designate various constituent NF groups was also changed in 1967, with probably the most significant change being the redefining of the group formerly identified as the Committee on National Formulary to the present National Formulary Board. This present term more clearly reflects the full responsibilities and broad functions of this body. It also facilitates the establishment of a more clearly related organizational framework of constituent committees (Admissions Committee and Specifications Committee), as well as advisory panels.

Furthermore, in an effort to present in a systematic and concise form the stepwise procedures entailed in the NF revision and publication program, highly detailed flow diagrams were prepared to provide this information in graphic stepwise fashion. The flow diagrams cover all the major phases of the NF program and are available for public reference.

Statement of General Principles

A critically important consideration during the early stages of each NF five-year revision period is the development of the statement of *General Principles* to be followed in the compilation of the new edition of the compendium. This statement summarizes the general policies adopted by the National Formulary Board and constitutes the guidelines utilized in subsequently planning and implementing the program for the revision and preparation of the NF. Many innovations of policy and procedure were initiated by the NF Board at the beginning of the revision period just concluded, with a view toward having the National Formulary fully meet current needs of drug standardization. Therefore, the statement of *General Principles* has required extensive change and expansion in order to reflect accurately the policies which have been formulated to guide all those persons having some responsibility in the mammoth task of preparing NF XIII. Following adoption by the NF Board, and after approval by the APhA Board of Trustees, the revised statement was made public and widely publicized through announcements in the pharmaceutical press. The statement, as adopted, appears beginning on page 1 of this volume.

Admissions Policy

A fundamental consideration which was carefully reviewed in depth by the National Formulary Board was the admissions policy to be employed for NF XIII. The NF Board unanimously and emphatically reaffirmed the policy adopted in 1961 and initially employed for NF XII—namely, that therapeutic value would serve as the sole criterion in considering articles to be admitted to the NF for medicinal purposes.

The Board also defined its policy with regard to the admission of drug combinations—namely, that NF monographs for combination dosage forms will be limited to those combinations for which there is a therapeutic advantage to the patient as contrasted with administration of the separate individual therapeutically-active ingredients.

On the other hand, a broader policy was adopted and followed relative to the admission of pharmaceutical aids or adjuncts by not limiting such admissions to those ingredients specified in NF monograph formulas (recipes). Pharmaceutical aids are utilized as excipients in preparing dosage forms but are generally without therapeutic value in themselves. Providing NF monographs for a broader group of such articles will serve to give greater assurance of quality and purity suitable for pharmaceutical purposes.

After careful consideration of the various factors and ramifications involved, the NF Board decided not to admit to NF XIII drugs which are used solely for veterinary purposes. As a consequence, all articles admitted to NF XIII are on the basis of their usefulness in human medicine or as adjuncts relating to human medicine.

Articles Admitted

Based upon the recommendations of the NF Committee on Admissions and its Subcommittee on Dosage Forms, over one thousand articles were provisionally admitted to NF XIII. Of these, suitable monographs were prepared for 992 articles which were accorded final admission to the new edition. A record-shattering 411 (or 41 percent) of these articles are being newly admitted to the National Formulary. At the same time, 221 drugs which had been in the previous NF are no longer accorded NF recognition.

In May 1967 the initial list of provisionally admitted drugs was released from the NF office simultaneously with the release of a similar list from the USP office. Because of the much greater interest in this information as a result of Medicare legislation and other reimbursement programs, a conscientious effort was made to coordinate the release of such information from the respective NF and USP offices, and to provide this information as early in the respective revision programs as possible.

The unusual character of the newly admitted articles also warrants comment. These newly recognized drugs fall into a broad range of therapeutic classes including various oral contraceptive agents (as well as the first such combination dosage forms to be officially recognized), the first prophylactic antiviral agent, cardiac drugs, diagnostic aids, hypoglycemics, tranquilizers, a broad array of potent steroids, and the first aerosol propellants (as well as the first aerosol dosage forms).

Pharmacological Category Statements

Beginning with NF X, published in 1955, brief statements have been appended to National Formulary monographs to indicate the principal pharmacologic or therapeutic property of the respective articles. While the terms used were generally accurate in themselves, there had been many inconsistencies and discrepancies when the terms used were compared for similar or related drugs.

The need for a uniform and systematic set of category statements has been recognized for some time. With the NF now placing emphasis on therapeutic value in considering drugs for admission, greater use is made of the category statements, such as in preparing lists of NF drugs grouped by pharmacologic properties. Another feature which has added considerably to the importance of the category statements is their use in connection with drug coding or with information documentation and retrieval systems. The information which is fed into a computer is often entered under the heading of the drug classification. Inconsistent classifications would lead to serious limitations or errors in such systems.

Consequently, a uniform set of NF category statements has been developed and approved by the NF Admissions Committee. The complete listing appears beginning on page lxvii.

Dose Statements

The reorganization of the pharmacological category statements to present this information in a more systematic fashion is one major change in NF XIII which is of interest to the practicing pharmacist or physician. As another example of this nature, the information provided in the individual monographs with respect to dosage has been substantially expanded. In many cases a *usual dose range* is now included in addition to the *usual dose* statement.

The dosage information given in the official compendia is regarded with a considerable degree of authority, despite the limitations spelled out in the NF General Principles (see page 3), and in the General Notices (see page 12). In light of this, it should be reemphasized that such dose information applies to normal adults, unless stated to the contrary.

Indeed, the NF Board studied the possibility of providing additional information for special segments of the population, but came to the following conclusions with respect to these special groups:

> *Infants and Children*—Generally, no doses are provided for infants and children because of the differences in their response to drugs which may result from many factors unique in the process of growth and development. An infant's or child's dose requires adjustment to his needs based upon a number of factors, including growth in size, maturity of organs and their functions, and in particular the maturity of processes related to drug metabolism.
>
> *Pregnancy*—The Usual Dose statements provided in the NF do not apply to pregnant women. During pregnancy there are certain drugs which should not be used, and —for those drugs which are used— the doses must be carefully individualized since drugs, depending on their dose, may have temporary or permanent effects on the growing fetus.
>
> *Aged Individuals*—Doses must be individualized in the aged because impaired ability to metabolize or excrete drugs, or other pathology, may cause abnormal responses to drugs.

Drug Quality

For many decades the medical and pharmaceutical professions had confidently relied upon the quality of the drugs which they respectively prescribed and dispensed. They had come to look to the official compendia as the cornerstones upon which such drug quality was firmly based. But history will record the latter half of this past decade as the period during which man everywhere began to ask questions and raise doubts about the most traditional and accepted facets of his environment and the systems which man himself had established. If religion, social behavior, and civil authority could be subjected to such fundamental reassessment, it is no wonder that searching questions and similar doubts arose concerning drug quality.

Regrettably, in this total picture the professions were simultaneously buffeted by other forces not the least of which included economics and political considerations.

Placing all this within a context where the scientific aspects were already somewhat dim and clouded, it is no wonder that the confidence of the practitioner in his reliance on the traditional pillars of the official compendia was noticeably shaken.

During this period, National Formulary officials attempted to provide both clarification and direction in the hotly debated area of drug quality:

> *Clarification*, by distinguishing between the establishment or existence of standards and the actual compliance with those standards; by distinguishing between the testing and data needed prior to marketing a new drug or drug product as contrasted to the testing and standards appropriate for subsequent batches of a drug product already marketed; by distinguishing between the ideal requirement that every batch of every drug be clinically tested in human subjects, and the pragmatic necessity of using specific physical, chemical, and biological tests carefully selected through scientific study and deduction.
>
> *Direction*, by organizing panels and fostering the study of factors bearing on drug quality, and subsequently—through the legislative framework inherent in the compendia—by establishing new tests, new specifications, and new standards, all designed as steps forward in the constant and continuing quest for drug quality.

The official compendia are not perfect instruments, and no claim has been made that they are. However, the fact remains that compendial standards constitute the best, if not the only, scientific yardsticks by which an objective measure or assessment can be made of the quality of a particular drug product.

Bio-availability

The official compendia have long set the pace in developing standards and establishing specifications for the identity, purity, and strength of drugs. Relatively recently, however, an awareness has developed that other properties can play a significant role from the standpoint of satisfactory quality of a particular drug product. These properties can affect what has come to be referred to as the "physiological availability," or the "biological availability," or the "bio-availability" of the drug product—in essence, the extent to which the active ingredient in a drug product can be taken up by the body in a form which is physiologically active.

In other words, even if the drug is of the highest purity, is it in a suitable physical state which lends itself to proper utilization in a biological system on the basis of its physical properties or conditions? Such factors might pertain to the polymorphic form of a crystal or to the particle size of any drug substance in the solid state. Such factors might also relate, in the case of dosage forms, to the buffer capacity and pH adjustment of an injectable or ophthalmic fluid, or the propensity to dissolve in the case of a tablet or capsule intended for oral administration.

Our full recognition of these problems—like that of the entire scientific community—is relatively recent. It follows, therefore, that our ability to resolve these problems has been limited by the scientific knowledge available, coupled with the simple fact that time is required to translate new knowledge into meaningful standards. However, the National Formulary has responded to these challenges with vigor and has recognized the inherent urgency of developing appropriate solutions.

As an important initial step, a USP-NF Joint Panel on Physiological Availability was appointed. The panel included individuals with wide experience in this area as well as a wide diversity of affiliations and viewpoints. The joint panel began its work by considering types of tests which might be valuable and useful as an indication of the physiological availability of a particular drug product. The panel then considered methodology for conducting such tests as well as the drug dosage forms to be given highest priority in the application of such a test. The findings and observations of this joint panel have been freely drawn upon by the NF Board in deciding the direction which is being taken relative to adoption of the new dissolution test for tablets and capsules and the manner in which this test is being specified in individual monographs.

The NF Board felt that, where indicated, it would be even more valuable to establish appropriate specifications both for the active ingredients, and the final dosage form, to serve as an index of drug quality from the standpoint of expected biological availability. In this manner, the problem would be subjected to a two-pronged attack.

Clinically, it has been demonstrated that crystal form can have a marked influence on the absorption profile of certain chemical substances which can occur as polymorphic forms in the solid state. A special NF panel was established and the new X-ray diffraction specification eventually resulted from the activities of this group.

As indicated above, the fact that the physical form of a drug or the physical characteristics of the dosage form in which it is administered can play a highly significant role in determining the biological suitability of that drug has only recently become recognized. Present-day pharmaceutical research is being concentrated on uncovering the relative importance of these factors and how they influence the performance which might be anticipated from the drug when it is administered. This research is actively in progress in many industrial, academic, government, and private laboratories. As quickly as information and conclusions become available, appropriate standards and specifications are being established by the official compendia in an effort to provide a means of assessing and ensuring drug quality from these standpoints. The X-ray diffraction specification and the new dissolution test for tablets and capsules constitute just two dramatic examples of the strides which have been made through the efforts of the NF Board to provide objective means of assessing drug quality with respect to drug form and formulation, as these attributes might influence the biological performance of the article.

Tests and Assays

The National Formulary, by law, establishes standards and specifications for the articles included therein. Almost of equal importance, however, are the procedures utilized in determining compliance. This fact became very evident to Congress and the federal agencies during the early part of this century. The 1906 Food and Drugs Act only required that articles comply with NF specifications but did not specify how compliance might be determined.

Unscrupulous operators seized upon this latitude to utilize faulty, imprecise, and crude methods which often gave results indicating whatever these operators set out to demonstrate. Congress closed this loop-hole in the 1938 Federal Food, Drug, and Cosmetic Act by stipulating that compliance must be demonstrated using the procedure given in the official compendium. This action served to add considerable importance to the test methods and procedures—as distinguished from the specifications and tolerances—adopted by the compendia.

A very significant indication of the progress made in utilizing the most advanced knowledge and sophisticated analytical techniques as applied to drug standards is evident from the new NF General Tests chapters. These new General Tests are extremely diverse in their nature as well as in their intended purpose. The diversity is evident from the following partial list of new chapters: Selenium Limit Test; Salmonella Test; Dissolution Test; Steroid Chromatographic Purity; Rubber Closures; Coulometry; Phase Solubility Analysis; and X-ray Diffraction. About 15 new chapters are being added to the General Tests section and all the chapters being carried over from NF XII have undergone revision, which in some cases was quite extensive. For example, the chapter on Spectrophotometry has been expanded to include atomic absorption spectrophotometry as well as fluorometry and nephelometry.

The establishment of methodology, as described in the preceding paragraph, now permits the application of such specifications or requirements within individual NF monographs where such a requirement is considered to be desirable or necessary. As an illustration, the new Salmonella Test now enables the NF Board to specify in pertinent monographs of drugs derived from animal sources that such articles be free from Salmonella. The chapter on X-ray Diffraction provides a technique enabling the NF Board to specify in those monographs where polymorphism or crystal form may be a potential problem that the article must conform to a specified X-ray diffraction pattern for it to be regarded as complying with the NF specifications. Consequently, appropriate requirements have been entered in the pertinent individual monographs to utilize as far as possible and practical the new General Tests procedures.

It was anticipated that a completely new General Tests chapter would be provided in NF XIII for Sterility Tests. While much effort was expended on this project by a panel under the direction of the USP, progress in this area did not proceed to the point where the NF Board felt that the proposed new procedures could be adopted with full confidence for inclusion in NF XIII. As a consequence, although a drastically revised version did appear in NF XIII galley proof, the version from NF XII was reinstated by way of page proof and now appears in this compendium.

Hopefully, the remaining questions about the proposed new Sterility Tests chapter can be resolved at an early date and the resulting new version will then be adopted by way of a Supplement to NF XIII. If this materializes, it is assumed that the membrane filtration technique will be a part of the new chapter. Moreover, adoption of the membrane filtration technique will enable the NF Board to specify a sterility requirement in the individual monographs for ophthalmic ointments as the Board had originally intended.

Aerosols

A new dosage form will be officially recognized for the first time in NF XIII through inclusion of several monographs for aerosol preparations. Heretofore, no aerosol had been recognized in the official compendia. This development has been made possible by the establishment of criteria concerning what basic requirements aerosol products should be required to meet. Depending upon individual cases, these might include leak testing, labeling requirements, total content of the container, quantity of drug delivered by a metered-dose valve, and so on. Furthermore, among the new monographs being admitted to NF XIII are several which provide standards and specifications for the principal propellants most commonly used for aerosol purposes.

Content Uniformity

A new type of test specification was applied for the first time in six NF XII tablet monographs. This specification is referred to as the "content uniformity" test, and it was adopted after long study on the basis of evidence indicating the need for such a requirement to demonstrate acceptable homogeneity of prepared tablets.

The National Formulary Board extended this specification to all NF XIII tablet monographs where (a) the active ingredient is present in relatively low quantities—usually 50 mg. or less of any strength available; and (b) test procedures and similar considerations indicate that it is feasible to apply the specification. Furthermore, this same concept has been extended in NF XIII as a test specification to other dosage forms where such a requirement is considered to be desirable and shown to be practical. These other dosage forms include capsules and sterile solids. As a consequence, this specification is widely employed in NF XIII monographs; the net effect is to provide greatly increased assurance of homogeneity from the standpoint of uniformity within a single lot.

Timed-Release Preparations Test

A test procedure, as well as the pertinent apparatus for conducting the test, for the *in vitro* examination of timed-release tablets and capsules was officially adopted by inclusion in the Second Supplement to NF XII. This new procedure—which is now formally incorporated in the NF XIII General Tests section—provides a useful means of establishing suitable test criteria to assure product uniformity of most timed-release preparations. The procedure is provided for its value as a routine control test method, and in order to foster uniformity and inter-laboratory consistency in conducting such testing.

A noteworthy feature of this action is that it represents some departure from usual compendia practice in that no specific product specifications are presently being established. Instead, adoption of this test procedure serves to provide general guidelines and direction in the development of acceptable procedures of drug testing and pharmaceutical analysis. This reflects an awareness on the part of the NF Board of its broadened responsibility in helping to assure appropriate drug standards in light of modern manufacturing and analytical techniques.

Automated Analysis

A growing awareness has developed that drug quality control testing by manufacturers, and drug quality enforcement testing by government agencies, must be increased even further to provide better assurance of a safe and effective drug supply. This view also is shared by the NF Board, and is reflected in many of the new tests and specifications. A particular case in point is the content uniformity test, since this specification is directed at determining uniformity *within* a given batch or lot, rather than simply uniformity *between* lots.

However, one major complaint has been raised concerning the greatly increased analytical load caused by the new test. Even though in certain instances a more simplified test procedure can be utilized in place of the regular monograph Assay, nevertheless the requirement that at least ten and as many as 30 separate individual replicates be performed is obviously burdensome and constitutes a greatly increased demand on facilities and personnel for the parties involved—whether in the laboratory of the manufacturer or in some enforcement agency such as the Food and Drug Administration.

As an unrelated but nonetheless parallel development, an entirely new dimension has been added to pharmaceutical analysis within the last five years. We have witnessed the successful application of the technology of automation to drug analysis.

Automated analytical equipment presents a means of saving both time and personnel, and ultimately equipment and costs. Unfortunately, the application of automated analysis to official compendium procedures is not without some difficulties.

The first problem encountered is the prohibition—under Section 501(b) of the Federal Food, Drug and Cosmetic Act—against the use of an analytical method different from that appearing in the NF.

The second problem is that of prohibition against alternative methods. This policy recognizes that the NF test and assay procedures must be the common ground between plaintiff and defendant—between enforcement agency and manufacturer. If compliance or lack of compliance could be shown by different methods, this would either place an undue burden of proof on the government or place the manufacturer in double jeopardy.

The third problem pertains to the obligation that NF procedures be general in nature, indicating that it would not be reasonable to require that everyone perform a particular procedure, such as the content uniformity test, using automated equipment.

In the face of these considerations, the NF Board gave the matter deep study with the hope of formulating a policy and interpretation which would at the same time fulfill pragmatic and practical aspects while still satisfying the legal obligations and responsibilities of the NF as an enforcement device.

The Board concluded that: (a) the NF only intends to state what shall be done and is silent on who or what shall perform the actions; (b) the NF only intends to recommend equipment which would be suitable (see initial paragraph under *Apparatus*, page 8); and (c) the NF does require that—in order to demonstrate compliance, or lack of compliance—the exact chain of chemical and physical steps must be conducted. This says that the integrity of the official procedure must be maintained in that a different analytical procedure cannot be used nor can significant steps be eliminated. There is no flexibility in this latter area.

To clarify beyond any doubt the Board's position in this regard, the General Notices have now been revised accordingly (see initial paragraph under *Procedures*, page 9).

Significance and Function

The National Formulary serves pharmacists and pharmaceutical manufacturers by providing standards for the procurement of drugs used in dispensing, prescription compounding, and manufacturing, and by supplying formulas and working directions for the preparation of some dosage forms. It provides standards for use by state and federal food and drug law officials in their enforcement programs, thus simplifying legal procedures.

The activities and functions of the National Formulary also constitute an important service to the medical profession and to the public. The first three editions of the National Formulary served mainly as a convenience to practicing pharmacists by providing uniform names, uniform formulas, and working directions for the small-scale manufacture of pharmaceutical preparations frequently prescribed by physicians.

Under the present criterion of *therapeutic value*, as described under the heading of *Admissions Policy*, the National Formulary has also assumed added importance as a therapeutic guide for pharmacists and physicians. Taken together, those articles which now appear in the concurrent editions of the National Formulary and the United States Pharmacopeia constitute the drugs of the greatest established merit and the most generally accepted usefulness.

Until 1906, when it was designated as one of the two official compendia by the terms of the Federal Food and Drugs Act, the function and significance of the National Formulary remained unchanged. The provisions inherent in the 1906 law and the Federal Food, Drug, and Cosmetic Act of 1938 and its amendments—particularly those enacted in 1962—have subsequently increased the obligation of those responsible for the revision of the National Formulary, and in turn, have added greatly to its significance.

The position of the National Formulary as a book of legal standards for drugs is made clear by the references to it in the 1938 Federal Food, Drug, and Cosmetic Act. Section 501(b) of this statute requires that drugs purporting to be those listed in the National Formulary must conform to the standards of strength, quality, and purity prescribed therein. All determinations of these standards must be made in accordance with the methods prescribed in the text. Variations from these standards are permitted only when certain labeling requirements of the Act indicating the nature of the deviation are met.

The same section of the Act authorizes the U.S. Secretary of Health, Education, and Welfare to prescribe tests where none have been provided or where those described are believed to be inadequate. Before the Secretary can take such action, however, he must first call to the attention of those responsible for the revision of the National Formulary the need for additional or more adequate tests. He may then proceed only after a reasonable period of time has elapsed, and if the National Formulary Board has failed to provide adequate tests or methods of assay. Thus, while considerable recognition of NF standards is shown in the Act, adequate checks and safeguards against omissions and arbitrary or scientifically unsound specifications are also provided.

Nomenclature

The last edition of the National Formulary was published at a time when drug nomenclature was an extremely controversial and troublesome topic. By "nomenclature" is meant simply the selection and agreement on suitable nonproprietary drug names, without any consideration here of trademark or brand names.

Indeed, the *Preface* to NF XII stated that "in recent years, probably no other single subject pertaining to drugs has received more attention from Congress, enforcement agencies, purchasing departments, hospitals, manufacturers, physicians, pharmacists, and the general public...." That *Preface* then went on to devote more space to this topic than any other subject discussed.

As amended in late 1962, the Federal Food, Drug, and Cosmetic Act contains certain provisions regarding drug names. The law refers to "established names" for drugs and defines such names to include the names given for dugs in the official compendia. Among the provisions embodied in the law are statements concerning "unduly complex names" and "simple and useful names." Authorization also is extended to the Secretary of HEW to review the NF drug names and to modify those names under certain specified conditions.

Early during this past revision period, the NF conducted a full-scale review to determine which NF drug names might possibly be regarded as being unduly complex, and to study what might be done of its own volition in the way of suitably modifying those names. Assistance in this project was provided by the USAN Council staff. Such reviews are highly complex and involved. Furthermore, when a decision is ultimately reached to make a name change, the process of transition is, at least temporarily, a traumatic one for all those affected by it. Consequently, such decisions are not arrived at lightly and often involve extended deliberation.

After extensive deliberation and consideration, the NF Board completed its review of NF monograph titles from the standpoint of their "usefulness and simplicity." On this basis, a number of monograph titles have been changed in going to NF XIII. The changes involved include two antibiotics, which present peculiar legal problems because of the distinctive requirements regarding certification of antibiotics embodied in the federal law. Through extensive negotiations, a mutually agreed upon procedure was developed with the FDA to achieve these name changes in an orderly manner and with a minimum of disruption and possible confusion. One of the contemplated name changes was the subject of an appeal to the APhA Board of Trustees, as provided for under the By-Laws. The appeal was rejected and the action proposed by the NF Board was upheld.

The APhA, through the participation of the National Formulary, continues to cosponsor the USAN Council—an activity in which it has formally participated since January 1964. The other two sponsors are the American Medical Association and the United States Pharmacopeia. For some time a mechanism had been sought to enable the FDA to participate in the USAN Council activities without violating the independent nature of the USAN Council and without compromising the FDA responsibilities under the law.

The need for such an arrangement became especially apparent in 1966 when the FDA published a proposal to adopt a certain non-USAN name, when a USAN name considered more desirable had been in use for a number of years. After considerable effort—especially on the part of the National Formulary—the FDA was dissuaded from its intended action and withdrew the proposal.

Subsequently, in June 1967, the USAN Council was reorganized on the basis of certain agreements concluded with the FDA. This reorganization serves to strengthen the USAN Council and to add additional stature to its decisions. The FDA took specific note of this in a statement which was published in the Federal Register on March 20, 1968, concerning general policy in regard to established names for drugs and regarding the processing of New Drug Applications. Later, the NF Director was appointed as one of three special consultants to the FDA Commissioner in the area of drug nomenclature. This appointment has served to maintain improved liaison and communication between the NF and the FDA in this important area.

While not strictly related to nomenclature, a comment would be in order here concerning chemical names and formulae. Current NF policy is delineated in the statement of *General Principles* (see page 1). It also should be mentioned that the chemical names and graphic structures portray the compounds only to the extent that their structures are actually known and have been fully verified. However, paticularly in the case of certain steroids, recent information from research laboratories indicates that various articles, previously regarded as being single isomers, are in fact composites consisting principally of the form represented, along with lesser proportions of other isomers. In viewing the chemical names and graphic structures, this possibility should be kept in mind; it simply reemphasizes the often stated admonition that one must always evaluate the total monograph and never appraise only a single feature or selected portion taken out of the full monograph context.

Drug Standards Laboratory

The official compendia have need for some direct laboratory assistance despite the very considerable time and talent contributed by the various Board members and other individual participants, as well as government, academic, and industry laboratories.

As noted in the *History* (see page xlii), the Drug Standards Laboratory was reorganized under the APhA Foundation in 1962. By the close of the NF XII revision period, the Laboratory was making a significant contribution to the NF program. Nevertheless, it remained quite apparent that the needs of the compendia required that much more be provided in the way of such assistance and service.

Consequently, by early 1968 the sponsoring organizations of the Laboratory (the American Medical Association, the APhA, and the USP) thoroughly reevaluated its function and role. A major extension of the Laboratory program and staff was embarked upon as a result of this reevaluation. The extension in program and expansion of staff has taken place during the past two years with the result that the Laboratory made a major contribution to the NF revision program by providing extensive laboratory assistance. The Laboratory now serves a most vital role as an integral part of the facilities which are drawn upon and utilized in the NF program.

HEW Task Force

During the past five years, government interest in expanding its drug programs to additional segments of the American public has stimulated some rather extensive—if not comprehensive—reviews and studies of related factors pertaining to drugs. Probably the most extensive of these studies, and the one which covered the broadest array of drug related topics, was the study made by the Task Force on Prescription Drugs of the U.S. Department of Health, Education, and Welfare.

National Formulary officials supplied technical advice and scientific consultation to the HEW Task Force in a number of subject areas, including: (a) pharmaceutical nomenclature; (b) drug coding and classification; (c) therapeutic classification; and (d) drug quality and quality standards.

Reference Standards

As noted in the historical commentary regarding NF XII (see page xli), the use of and need for reference substances for comparative testing purposes has literally mushroomed. This has been due primarily to the general use of instrumentation in compendial procedures. However, the program of supplying reference substances has also expanded due to other factors all of which reflect an awareness on the part of the NF Board that—even aside from their use in connection with procedures embodied in the compendium—this program in itself constitutes a very significant facet in the establishment of specifications when viewed in broad perspective.

Approximately 250 NF Reference Standards are now called for in tests and assays described in NF XIII. Of these, only about 70 had been previously needed, and therefore supplied by the National Formulary office.

Some of the new Reference Standards pertain to drugs previously recognized in the NF and which have been readmitted to NF XIII. Formerly, it was the NF policy to permit comparative tests to be conducted using a sample of the drug conforming to the pertinent NF monograph of the drug entity. As a result, a sizable number of NF dosage form monographs specified use of the drug substance rather than the corresponding NF Reference Standard. The NF Board concluded that it would be preferable to make available for distribution NF Reference Standards in each such case.

As a service to the pharmaceutical and scientific communities, a broadened program has been developed to supply, on order, other standardized substances which appear to be needed for pharmaceutical analysis or related purposes, even though these standardized substances are not required for tests or assays in the NF. To date this extended program includes: (a) standards for several articles formerly recognized in the NF; (b) standards for nearly a dozen antibiotics which are now subject to FDA certification; (c) five standards required by the Food Chemicals Codex and distributed under an agreement with the National Academy of Sciences; and (d) a standard for papain resulting from a direct request from the Pharmaceutical Manufacturers Association for establishment of such a standard.

The NF Board also established a new general policy, which has been implemented in NF XIII, that wherever there are NF Reference Standards available, the NF monograph for the corresponding drug substance will routinely include tests of infrared and ultraviolet spectra, unless there is a specific reason for making an exception. This serves to utilize the Reference Standards more fully in meaningful tests of an article's identity, purity, and quality.

Finally, in keeping with the growth and expansion of the Reference Standards program, a systematic protocol has been established and approved by the NF Board regarding the development, testing review, and approval of all new and all replacement NF Reference Standards. This protocol has been followed in developing all the new Reference Standards for NF XIII.

General Information

As an adjunct to its principal role of establishing drug standards and specifications, the National Formulary also serves in various auxiliary capacities. Being a convenient source of reference information to pharmacists, physicians, and others, constitutes one of these functions. The majority of the features which had been incorporated as matters of information in NF XII have been continued in the current edition. In most cases this required considerable revision of the material in order to update it in light of recent developments. For example, the General Information chapter on the International Pharmacopoeia required complete revision since not only are the comparisons made with NF XIII drugs (rather than NF XII drugs), but the Second Edition of the I.Ph. was issued in 1967, necessitating the revamping of all the comparative entries.

A major new chapter has been added to the General Information section. This is a Table of approximate solubility data, tabulating all such data which could be compiled in the NF office from various sources of information. While every effort was put forth to make the data in the table as accurate as possible, some discrepancies were noted in those values which appear in the literature or were obtained from other sources. This would indicate that—depending upon the source of information utilized—certain differences might be observed in comparing any literature value to what appears in the new Table. Of possibly greater disappointment, however, was inability on the part of the NF staff to obtain quantitative data from any available source concerning many of the NF articles, or at most, only very limited information pertaining to many others.

Several chapters which had appeared in the NF XII section have been deleted. Most missed will probably be the Synopsis of Federal Regulations for Narcotic Drugs; this chapter was dropped because all legislative signs pointed toward Congress enacting a new "omnibus" narcotic and dangerous drug law which would have rendered the NF chapter obsolete and inaccurate; while prompt passage of such a bill had been anticipated, no such new law had been passed at the time of this writing. The Optical Crystallographic Characteristics chapter also has been dropped due to inability to provide pertinent data for the many new drugs admitted to NF XIII in time for inclusion in the volume; it is hoped that this information can be compiled for inclusion of the chapter in an early Supplement. The listing of recipes for Podiatry Preparations was dropped in line with the therapeutic value criterion adopted for the entire National Formulary; it was concluded that the interests of podiatry—like general medicine, medical specialties, and dentistry—are best served by ensuring that drugs of importance in the practice of podiatry are included in the regular monographs section, and that the customary requisites of safety and demonstrated effectiveness be required as with all other medicinal articles.

While containing certain material which constitutes specifications and standards, the chapter on Pharmaceutical Preparations, which appears in the General Tests section, is largely informational in nature. The discussions of many of these dosage forms have undergone extensive revision, and several additional dosage forms are now covered for the first time as the result of new commentaries which have been introduced.

NF Style Book

The nature of the National Formulary as a legally recognized compendium of drug standards necessitates that particular care and attention be devoted to the uniformity of terminology and the clarity of expression employed in preparing the NF text. Since over 500 individuals actively participate to some degree in the revision program, it is necessary to ensure wide availability of the matters of style and interpretation of terminology which are utilized in the NF.

A style book, jointly published by the NF and the USP, previously provided such information to those serving the official compendia. However, the substantial editorial differences between the two books which later developed made it highly desirable to provide separate style publications. On this basis, a style book devoted exclusively to the requirements of the National Formulary was prepared and made available during the summer of 1966 for general use by those working on the revision leading to NF XIII.

This 52-page booklet spells out the specific details of format and editorial style to be followed in drafting text for inclusion in the National Formulary. Devoted solely to the requirements of this compendium, it proved to be exceedingly useful as the revision period progressed. The NF is a type of legal document, by virtue of its recognition in federal and state laws. Like most laws, the text of the NF is subject to interpretation by those whom it regulates as well as by the courts. Consequently, the text of the National Formulary must be clear, uniform, and unequivocal at all times, in spite of the fact that numerous individuals participate in the compilation of each new edition. Hence, the necessity of a detailed style manual is obvious.

Copies of this Style Book were distributed extensively to facilitate the appropriate wording of material drafted for inclusion in NF XIII by members of the NF Board, committees, and panels, as well as by various other participants who collaborated in the NF program. A supplement (1968) to the Style Book also was prepared and distributed in order to update the Style Book in light of changes in NF policy which were recently adopted by the NF Board.

Revision Processes

The revision processes relating to the preparation of NF XII had been materially expanded. These processes were further broadened during the past revision period in an effort to place the entire National Formulary program on the most democratic footing and authoritative foundation which it was possible to create within the prevailing bounds of personnel, time, and funds available.

Distribution of galley proof was increased to almost 300 interested persons. Moreover, page proof was circulated to over 200 proofreaders for comment, criticism, and correction.

Initiating an entirely new practice, beginning in 1966, an open discussion period has been held during the APhA Annual Meeting each year. This informal event is intended to provide appropriate opportunity for any interested person to discuss the NF Director's annual report, as well as any other aspect of the NF program, with the NF officers or Board members who are present.

A formal open conference on NF XIII page proof was held on August 14, 1969, in order to provide a final opportunity and public hearing for the registering of comments and recommendations in connection with the proposed content of the new National Formulary.

Format and Style

Although the two-column format used in NF XI and NF XII has been very well received, it had the minor disadvantage of subjugating the monograph titles and graphic material. In an effort to retain the desirable features of the two-column format and yet overcome this disadvantage, the format for NF XIII in the monographs section has been modified to present the titles and preliminary information—graphic structure, systematic chemical name, molecular formula, and molecular weight—in single-column form; that is, full-page width. Moreover, the monograph definition is the single most important part of any monograph and it is presented in indented fashion, and centered, to set it off from the rest of the monograph.

Previous efforts to distinguish between drug entities and dosage forms by use of different type designations presented repeated difficulties and unavoidable inconsistencies. As a consequence, no such effort at distinction is made in NF XIII.

Because it is standard practice in the National Formulary to list all monographs alphabetically according to the first noun or noun form in the title, there has been little need for cross references. However, it was recognized that combination dosage forms may be listed according to the different component ingredients, and that in the case of organic salts of cations, either the cation or organic anion might be given first. Hence, in these cases, italicized side headings have been introduced in the monographs section to cross-index pertinent page numbers.

Interim Revision

The need for continuously refining specifications and updating standards has become increasingly urgent. This development has been a natural consequence of the introduction of many new drugs and the accelerated growth of our knowledge concerning the pharmaceutical sciences.

In order to keep the National Formulary abreast of these developments and to maintain its standards as current as practicable, the NF Board from time to time issues Interim Revision Announcements and Supplements.

Interim Revision Announcements to

this edition of the National Formulary may be issued in the form of releases to the pharmaceutical press. Such Announcements are designed to publicize promptly minor corrections and other revisions of limited scope. Reprints of Interim Revision Announcements will be made available only upon request accompanied by an addressed and stamped envelope.

Supplements to NF XIII, covering a wider scope than can be included adequately in Interim Revision Announcements, will also be issued when necessary. Interim Revision Announcements published prior to the issuance of a Supplement will be incorporated in the Supplement.

Supplements, when issued, will be published and their availability publicized as described in the preceding paragraph. Copies will be mailed automatically, without cost, to every owner of a National Formulary XIII who takes the precaution to fill in and mail the "order form" postal card which is included inside the back cover of each book.

It is anticipated that Supplements to NF XIII will be issued with even greater frequency than for past editions of the NF, in an effort to place the NF revision program on a more continuous basis.

Indication of Patent Status

National Formulary drugs covered by patents—or for which patents are pending—are indicated by footnotes in the monographs concerned. This designation, as far as it was possible to determine, applies to patents in effect at the time of publication of NF XIII.

Copyright Use

The partial reproduction of the text of the National Formulary by periodicals, textbooks, and works of reference, for the purpose of comment, such as cannot be used as a substitute for the National Formulary, will be permitted, provided the form of reproduction is first approved by the American Pharmaceutical Association. The reproduction of substantial portions of the text of the National Formulary in such a way as to permit such reproduction being used in lieu of the National Formulary is prohibited, except after approval of the form and under agreement for compensation to be determined in each case by the Committee on Publications and approved by the Board of Trustees of the American Pharmaceutical Association. Applications for use of copyright should be made to the Director of the National Formulary.

Coupon

A coupon will be found on the back of the title page, bearing the number of the copy and the following words: "National Formulary, Thirteenth Edition, Official Copy. Copyright, 1970, by the American Pharmaceutical Association." This coupon serves to identify an official copy of the National Formulary and should not be removed.

Recognition and Appreciation

The sheer magnitude and breadth of the program of activities necessary to develop a comprehensive new compendium of sophisticated methodology and complex standards requires the direct assistance and cooperation of literally hundreds of persons who serve on the NF Board, committees, and panels; as NF proofreaders; and as individuals simply interested in helping a cause they consider to be important. Only the NF Director is fully aware of, or can fully appreciate, the great personal efforts and sacrifice all these participants make on a voluntary basis, without compensation, and generally with the most meager personal recognition.

Even though a sincere effort has been made to list the names of all participants in various rosters and listings which appear in the preliminary pages of this new edition, and even though a few comments might be made here concerning the particular contributions of certain individuals or groups, mere words utterly fail to convey either the magnitude or the significance of the assistance they have provided. We can only hope that they glean personal satisfaction from the knowledge that through these efforts they have materially advanced the public health and welfare.

The reader is initially referred to page v on which appears the names of the National Formulary Board members. As provided in the By-Laws, the NF Board is charged with the primary responsibility for the revision and preparation of this compendium. Consequently, the greatest credit for each new edition must go to the pertinent Board. However, in our opinion, the current NF Board—both collectively and individually—did such an outstanding job of performing the task assigned to it that we cannot help but feel that their degree of participation and effort expended must be truly unique in the annals of volunteer service. It is also our conviction that the net result of the Board's effort—namely, the National Formulary, Thirteenth Edition—in itself reflects the success of this effort better than any verbal tribute or accolade.

The vast scope of the National Formulary requires a very considerable degree of specialized assistance in various diverse areas. The knowledge and talents of many persons have been freely drawn upon to satisfy this need. The two principal NF committees—the Committee on Admissions and the Committee on Specifications—provide the greatest source of such talent. These Committees, or panels drawn from them, have provided considerable assistance by conducting reviews and evaluations or performing other tasks in various specific areas.

Moreover, when a certain project has posed more than the usual problems, it has been the general practice to constitute a special advisory panel to study the matter in depth, and hopefully then to recommend a solution to it. Just one such example is the Advisory Panel on Chemical Names and Formulas which, under the able chairmanship of Dr. Clarence T. Van Meter, had responsibility for reviewing all the graphic structures, molecular formulas, and systematic chemical names, and then for revising them in accord with the latest reference sources recognized as most authoritative by the National Formulary. The rosters of most of these special advisory panels are provided immediately following the lists of the two NF committees.

There are many other instances where persons have provided the National Formulary program with help and assistance on an individual basis without being formally involved as members of the Board, committees, or panels. Insofar as has been possible, the names of these persons are listed as other participants, beginning on page xv. This National Formulary has benefited from valuable advice and cooperation from many collaborators, who voluntarily contributed of themselves, and who furnished information and recommendations which were considered in preparing the NF text.

The value and benefit of all this expert knowledge and assistance would have been largely dissipated or lost were it not for a loyal, efficient, dedicated, and diligent staff. As in the case of any great army in the field, effectiveness of operation and ultimate accomplishment is entirely dependent upon the availability and performance of supportive forces. In essence, the NF staff serves a similar function. Moreover, the NF office is the focal point for the many activities which are underway relating to the NF program in various laboratories throughout the United States and even abroad. Furthermore, the staff in the NF office coordinates and channels the operation of all the various NF boards, committees, and panels.

The Director of the National Formulary has had the benefit of this dedicated and loyal staff, the members of which compensated for their limited number by extending themselves on many occasions far beyond the call of normal duty.

Mr. Durward F. Dodgen, as Assistant Director of the NF for most of the revision period, was the immediate associate of the Director and he played a major role in seeing that the many phases of the program proceeded satisfactorily. The Director frequently called upon Mr. Dodgen to handle various matters on his behalf and in the name of the National Formulary. Because of his constant capable assistance, the Director wishes especially to single him out for the highest recognition and deepest appreciation.

As Mr. Dodgen's predecessor, Dr. Samuel W. Goldstein was very instrumental in helping the Director to get this past revision period off to a fine start. He also helped substantially in orienting his successor which maintained a smooth operation within the NF office. Dr. Goldstein's long association with the National Formulary has been extremely useful and beneficial; his unfailing devotion to all his various responsibilities has been a source of inspiration to all who know him.

Mrs. Rhea L. Talley coordinated many of the technical activities which took place behind the scenes, but were essential to the total NF operation. For example, few knew of her work in coordinating the reference standards program, in compiling background information for the Committee on Admissions, and in organizing all material for the printer.

Miss Linda LaFontaine joined the staff late in the revision period, but even in the relatively brief time prior to publication of NF XIII, she contributed significantly to its successful completion.

Mrs. Maria E. Cassidy, Miss Vivienne T. Chin, Mrs. Robbie E. Gupta, Mrs. Patricia A. Lefler, Mrs. Marie E. Lindsay, Mrs. Patricia A. Morrison, Mrs. Roberta B. Weissman, and the late Mrs. Clare H. Gee all contributed materially in processing correspondence and performing various secretarial duties relative to the NF revision and publication program.

The support provided by the APhA Board of Trustees, and in particular Dr. William S. Apple, the APhA Executive Director, to the NF Board and to the NF Director, was extremely gratifying. While the Board of Trustees and its Publications Committee have continually shown constructive interest in the National Formulary, the NF Director wishes to take especial note of the fact that at no time during his tenure has there ever been the slightest suggestion of interference with the NF operation, or even question of actions taken by the NF Board. This implies a degree of confidence on the part of the Board of Trustees and the APhA Executive Director which is appreciated and provides a source of deep satisfaction.

In setting specifications and standards which will be enforced by government agencies—in particular the FDA—and which must be complied with by the pharmaceutical industry, the NF of necessity has frequent contacts with personnel in those government agencies and in industry.

We are deeply pleased that, particularly during a time when similar relationships have been subject to stresses and strains for other than scientific reasons, the NF has maintained the most cordial relationships with the scientific and professional communities within both government and industry.

Personnel at the FDA have been of immeasurable assistance. The names of many FDA staff members will be found among the panels and other participants in the front pages of this volume; however, we would be remiss if we did not single out Dr. Daniel Banes, Mr. Jonas Carol, and Mr. James B. Kottemann for special mention due to their particularly great involvement with the NF program.

Many organizations within the pharmaceutical industry provide technical help and assistance to the National Formulary. None, however, exceeds nor equals the contributions made by the Quality Control Section of the Pharmaceutical Manufacturers Association in helping in the development of suitable and meaningful standards for drugs. Many of the official general procedures are the fruit of collaborative efforts which were initiated within this group. A debt of gratitude is hereby acknowledged; we also take this opportunity to note with pleasure the cordial relationship which the NF Director has enjoyed with the present and past officers of the Quality Control Section.

As noted earlier in this *Preface*, the Drug Standards Laboratory has played a most significant role in the successful completion of the NF revision program. The dynamic activity of the Laboratory is a direct reflection of the inspiration of

Mr. William J. Mader, Director of the Laboratory. His considerable assistance, as well as that of past and present Drug Standards Laboratory staff members, is gratefully noted.

The long existent, cordial relationships with the American Medical Association, and in particular its Department of Drugs and the USAN Council office—as well as the American Dental Association, and in particular its Council on Dental Therapeutics—have continued during this recent revision period. These relationships serve to emphasize the deep, if often unconscious, involvement of the other health professions in the matter of providing quality standards for drugs.

The NF and USP are often thought of as companion volumes, and in the manner in which they complement each other, they are indeed that. Their mutual aims and ultimate similarity of purpose naturally serve to bring them together, as well as to necessitate frequent contact and a close working relationship between their respective staffs. The cooperation provided by the USP staff in this connection—and particularly that of Dr. Lloyd C. Miller, USP Director of Revision—is gratefully acknowledged.

The Mack Printing Company has been selected to print all the recent editions of the National Formulary, and this firm again was chosen to print NF XIII. The efforts put forth by the staff at Mack Printing Company in various phases of the processing and production have been most commendable. The burden of coordinating the entire project resided with Mr. Charles B. Cowling, and through him we acknowledge the assistance of all his associates at Mack Printing Company.

Finally, the Director wishes to take particular note of the appointment of Dr. John V. Bergen to the NF staff as Associate Director of the National Formulary. This appointment is of special significance since Dr. Bergen is scheduled to assume the position of Director, effective January 1, 1970. At that time he will also succeed the incumbent as Chairman of the NF Board. The major contribution he has made during the completion of the NF XIII program, as well as his clear insight into the ramifications and complexities of the NF program, have clearly demonstrated that in the coming years the National Formulary will continue to go forward under his inspired leadership.

The completion of this compendium, therefore, also signals the termination of this writer's immediate involvement with the National Formulary and its program of establishing standards of quality for drugs intended for the prevention or cure of disease or the mitigation of suffering. We take this opportunity to thank all of those who responded to our call for assistance in this crusade, and we hope that in the years to come history will judge with favor the results of our efforts.

September 1969

Washington, DC 20037

HISTORY
# of the National Formulary*

Formularies and pharmacopeias from very early times have had an important and significant influence upon the establishment and observance of drug standards. The early standards for drugs, however, were not all comparable to those of today. That could not be expected. Standards for drugs of any period are always limited by the stage of development of the collateral sciences upon which they depend. The development of new standards for established drugs, and the discovery of new drugs, have closely paralleled the advancements in science. On the other hand, the search for a better knowledge of drugs has frequently contributed to the advance of science in general, and to pharmacy, chemistry, and pharmacology in particular.

Early pharmacopeias and formularies could do little more than provide uniformity of titles for botanical drugs and the few available medicinal chemicals, methods for preparation of the latter, and uniformity of formulas for dosage forms of these drugs.

The events leading to the publication of the first edition of the National Formulary and its progress since its appearance in 1888 illustrate a phase in the evolution of drug standards. When the American Pharmaceutical Association was organized in 1852, the only authoritative and generally recognized book of drug standards available was the third revision of the United States Pharmacopeia. It had been started in 1820 by physicians to serve as "a therapeutic guide to the medical profession." As such, its scope, then as now, was restricted to drugs selected by representatives of the medical profession, and believed by them to possess the greatest therapeutic merit. This selectivity has always prevented inclusion by the United States Pharmacopeia of a large number of drugs which enjoy a substantial degree of acceptance by physicians and are judged to have significant therapeutic value. This pharmacopeial selectivity is largely responsible for the origin and development of the National Formulary, and is one of the main reasons there are these two official drug compendia in the United States today.

The idea of a National Formulary for use in the United States is nearly as old as the American Pharmaceutical Association. This association of pharmacists organized in 1852 included among its original objectives the following:

"(a) To improve and regulate the drug market by preventing the importation of inferior, adulterated or deteriorated drugs and by detecting and exposing home adulterations. (b) To improve the science and art of pharmacy by diffusing scientific knowledge among pharmacists and druggists, fostering pharmaceutical literature, developing talent, stimulating discovery and invention, encouraging home production and manufacture in the several departments of the drug business. (c) To uphold standards of authority in the education, theory, and practice of pharmacy. (d) To create and maintain a standard of professional honesty equal to the amount of our professional knowledge with a view to the highest good and greatest protection to the public."

One means of partially activating these objectives was to promote the standardization of names and formulas for extensively used dosage forms of drugs not described in the US Pharmacopeia. It is therefore not surprising to find that as early as 1856 an American Pharmaceutical Association committee was appointed to develop plans for the compilation of standards for dosage forms not included in the United States Pharmacopeia of that period. During several ensuing years such a committee was continued, but plans for a formulary entirely acceptable to the Association were not presented. In the meantime, a book on elixirs by John Uri Lloyd, and the New York and Brooklyn Formulary for local use were published in 1883. Pharmaceutical interest in these books stimulated the Association to intensify its efforts to produce a formulary, and in 1888 the first edition of the National Formulary was published under the title "National Formulary of Unofficial Preparations."

---

* For a more detailed history of early editions of the National Formulary see NF VII pages xiv to xxvii.

The designation "Unofficial Preparations" in the title was used because the Pharmacopeia had earlier adopted the term "official" as applying to the drugs for which it provided standards. The title of the publication was changed to "National Formulary" when, by the terms of the Federal Food and Drugs Law of 1906, both the United States Pharmacopeia and the National Formulary were designated as official compendia.

The First Three Editions of the National Formulary

The first edition of the National Formulary was a book of formulas for widely used dosage forms of that period such as elixirs, emulsions, fluidextracts, tinctures, solutions, syrups, and many others. At the time of its publication, there were no federal or state food and drug laws requiring adherence to National Formulary standards of nomenclature and composition of dosage forms. Despite the lack of legal compulsion, the National Formulary—like the United States Pharmacopeia—did much to promote uniformity in many drugs and preparations distributed under distinctive names. When the Federal Food and Drugs Act was passed in 1906, the National Formulary was well established, and it was natural that its standards should be recognized by the terms of that Act as those with which drugs described therein must comply. New editions representing minor revisions were published in 1896 and in 1906.

The Fourth and Fifth Editions of the National Formulary

A fourth edition, the first after the passage of the 1906 Federal Food and Drugs Law, was published in 1916. This edition marked a turning point in the scope of the National Formulary, and established a pattern for its future policies which has resulted in its development into a book of modern standards for drugs.

In the 1916 edition, standards of identity, strength, quality, and purity, in addition to distinctive titles and formulas, were introduced into many of the monographs. In that edition, specifications for basic drugs as well as dosage forms were included on a much larger scale than previously. Official formulas for a limited number of parenteral solutions under the class title "Ampuls" were published for the first time in the National Formulary. The fifth edition, published in 1926, did not differ materially from the preceding edition.

The Sixth and Seventh Editions of the National Formulary

In 1929, the Council of the American Pharmaceutical Association elected a new Committee on National Formulary. Under the capable direction of the Chairman of this Committee, Professor E. N. Gathercoal, a program was inaugurated and carried out which resulted in more far-reaching changes and greater progress in the technique of revising the National Formulary than in any previous period. A series of prescription surveys, published by the American Pharmaceutical Association in book form under the title, "The Prescription Ingredient Survey," was used as a basis for determining admissions to the sixth edition of the National Formulary, published in 1936. An unusually large number of obsolete drugs were discontinued, and numerous additional chemical, biological, and proximate assays were developed and introduced. One of the outstanding features of the sixth edition was the inclusion of monographs on a large number of ampuls and tablets with adequate standards of identity, strength, quality and purity, thus recognizing modern trends in dosage forms which previously had been neglected by the official compendia. The members of the Combined Contact Committee of the American Drug Manufacturers Association and the American Pharmaceutical Manufacturers' Association made outstanding contributions in the development of standards for ampuls and tablets.

By the time of the appearance of the sixth edition, it was evident that a new Federal Food, Drug, and Cosmetic Act, replacing the 1906 law, would be enacted. Plans in connection with the legislation indicated that a greatly strengthened and more comprehensive Act would place greater significance and importance upon official drug standards than obtained under the 1906 law. Accordingly, the Committee on National Formulary immediately began a study of the specifications in the new edition which were not entirely satisfactory.

Prior to 1936, the work incidental to the establishment of National Formulary standards was done voluntarily and gratuitously by the members of the Committee. The problems which evolved in connection with the sixth edition were so extensive that it was necessary to inaugurate a new and more efficient procedure whereby inadequate standards could be investigated and corrected more promptly than had been possible previously. Provision was made by the American Pharmaceutical Association in 1936 for the establishment of a well-equipped laboratory to serve as a clearing house for the research necessary in the establishment of adequate drug standards. This laboratory was installed in the Headquarters Building of the Association in 1938.

Other changes in policy relating to the National Formulary, adopted or inaugurated by the Council of the American Pharmaceutical Association after the publication of the sixth edition, included provision for the issuance of interim revision supplements, provision for issuance of the National Formulary at five-year instead of ten-year intervals, and a change in the organization of the Committee.

By means of Interim Revision Announcements, necessary corrections in the sixth edition monographs were issued as promptly as possible. The *Bulletin of the National Formulary Committee*, issued as a periodical upon a subscription basis, was used for the dissemination of all information concerning the National Formulary.

The decision to issue revisions of the National Formulary at five-year instead of ten-year intervals was necessary because of the rapid advancements and changes in the types of drugs employed. When the principle of more frequent revisions was adopted, the revision program was placed on a continuous basis, and activated by the provision for an Executive Committee of ten members with a chairman to serve as a full time employee of the American Pharmaceutical Association. The reorganization of the Committee on National Formulary also provided for designation of the chairman as *Director of Revision*. This small Executive Committee with power to act has made it possible to issue Interim Revision Announcements promptly, and has promoted the smooth functioning of a continuous program.

A Committee was elected under the new design of organization in 1939. When this Committee began to function early in 1940, it found that plans for the seventh edition had been well advanced by the previous Committee. The seventh edition, published in 1942, was for the most part an extension of the sixth edition, but with many new specifications added, and unsatisfactory standards corrected. The seventh edition also included a much enlarged and thoroughly revised section on materials and preparations for use in the clinical laboratory. In the process of revision, several sixth edition National Formulary monographs were transferred to the United States Pharmacopeia, and the majority of the USP XI monographs not admitted to USP XII were incorporated in the seventh edition of the National Formulary in order to provide for the continuance of official standards. In connection with the seventh edition it was necessary to issue five supplements. Their issuance provided mainly for replacements of drugs and pharmaceutical necessities employed in National Formulary preparations which became unavailable during World War II.

The Eighth and Ninth Editions of the National Formulary

Immediately after the publication of the seventh edition in May, 1942, work was started on its revision. Surveys of limited scope were conducted to aid the Committee in reaching decisions on deletions and new admissions for the eighth edition. When final decisions on these questions were made during the early part of 1944, it became apparent that again the National Formulary was to undergo a more extensive revision than at any time in the past. It was decided to discontinue official standards for a number of drugs, mostly of botanical origin, which had become obsolete. Monographs on several drugs were also discontinued because of their admission to USP XIII. Approval of the admission of approximately 100 new drugs was given by the Committee. The staff of the American Pharmaceutical Association Laboratory, assisting the members of the Committee and other collaborators, then developed tentative specifications which were published in the *Bulletin of the National Formulary Committee*. Since all specifications were based upon the results of extensive laboratory investigation, few adverse criticisms were received, this again illustrating the advantage of available laboratory facilities for any drug standardization project. In addition to admitting previously unofficial drugs, the Committee also voted to continue official recognition of a large number of pharmacopeial drugs not admitted to USP XIII.

The eighth edition of the National Formulary, the second published under the plan adopted in 1938 for more frequent revisions, was published in November, 1946. The provisions of the new standards became effective April 1, 1947, thus giving pharmacists time to familiarize themselves with the new edition, and pharmaceutical manufacturers an opportunity to make necessary changes in labels before compliance with the standards was compulsory.

Admissions of drugs to the eighth edition were based upon extent of use and therapeutic value. In addition to extensive changes in content of the National Formulary, numerous editorial changes were made, including the transposition of Latin and English titles, and the use of metric weights and measures was emphasized.

The ninth edition of the National Formulary was published in July, 1950, and became official November 1, of the same year. This edition included specifications for 717 drugs and dosage forms of which 155 had not been in the previous editions.

Essentially the same procedures as those employed in the revision of NF VIII were followed. Admissions to this edition were based, in part, on extent of use as determined by surveys designed to furnish the background information required, but therapeutic value was considered to a greater extent than in previous editions.

One Supplement to NF IX was issued in 1950, and one Interim Revision Announcement was published in 1952 for the correction of errors and the revision of a limited number of specifications.

The Tenth and Eleventh Editions of the National Formulary

The tenth edition of the National Formulary was published in August, 1955, and became official on December 15 of the same year. Two Interim Revision Announcements were issued, one of which became effective December 15, 1955, and the other on October 1, 1956.

During the revision of the ninth edition of the National Formulary, leading to the publication of the tenth, substantial changes in the content of the text were made. Of the 717 monographs in NF IX, 242 were not admitted to NF X. Titles and standards for 259 drugs, for which official standards would not otherwise have been provided were added to NF X during the revision period. In the process of revision, many individual specifications for strength, quality, purity, and identity were revised and materially improved.

In 1951 the *Bulletin of the National Formulary Committee* was re-titled *Drug Standards* and many of the new specifications were published therein for review and comment.

Several new features were added to NF X. Among these were specifications for the disintegration time of coated, buccal, and sublingual tablets; weight variation standards for the content of dry-filled capsules; and for solubility of hypodermic tablets. Through the efforts of a joint USP and NF Panel on Sterility Requirements, the general chapters on injections and sterility tests were revised and a new chapter on general sterilization procedures was prepared. A new section on general information was added to NF X. This section included specifications for prescription balances, weights and measuring devices; formulas for clinical laboratory reagents; a selected list of drugs and formulas for preparations used by chiropodists; basic information relating to dyes for use in coloring pharmaceutical preparations; a table comparing the names and standards of strength of drugs covered in the International Pharmacopoeia with those appearing in NF X; and a description of general sterilization procedures.

The section on clinical laboratory reagents and the table of optical crystallographic characteristics of NF medicinal chemicals underwent considerable revision and were transferred to the general information section.

The eleventh edition of the National Formulary—the last of five editions issued under the direction of Dr. J. L. Powers—was published in July, 1960, and became official October 1, 1960. Subsequently, four interim revision announcements were issued which became effective January 1, 1961; May 1, 1962; February 1, 1963; and May 1, 1963. As in the case of the preceding volume, NF XI was marked by a large number of new admissions, 285, which together with the 531 monographs admitted from NF X provided a total of 816 monographs. At the same time, 208 of the articles in the previous edition were no longer accorded NF recognition.

NF XI presented a marked change in typography and style, with use of a two-column format for the first time. In addition, the tests and assays reflected somewhat greater use of the new analytical techniques which were beginning to gain widespread acceptance for both quality control and enforcement purposes. This required a substantial increase in the number of reference standards, from ten in NF X to forty-two in NF XI.

The Twelfth Edition of the National Formulary

Probably the most distinguishing feature of the twelfth edition—particularly from an historical standpoint—was adoption of a sweeping new criterion for determining admission of drugs to the National Formulary. As heralded in the preface to that edition, the philosophy of *extent of use*, which had been the traditional criterion for recognition of articles in the NF, was struck down and eliminated. In its place, the concept of *therapeutic value* was established as the sole basis for inclusion of a drug in the compendium. This action served to elevate the importance of the compendium as a guide to rational medical practice, and raised the stature of the NF within the medically-related community. Not only did this action anticipate the action of Congress in the 1962 Drug Amendments, whereby effectiveness was introduced as a new requirement for the marketing of drugs, but presumably was influential in subsequently moving Congress to include the NF in the Medicare amendments to the Social Security law.

The great impact of instrumentation in pharmaceutical analysis for the first time was reflected in the individual NF monographs. Ultraviolet spectrophotometry had been employed to some extent in the eleventh edition, but it was in NF XII that instrumentation was fully accepted and embraced as a general approach to the establishment of drug standards and specifications.

However, with the general adoption of instrumentation, the need for suitable samples of reference substances to be used for comparative testing purposes also mushroomed. From a mere handful—ten in the case of NF X—the number of NF Reference Standards rose to almost one hundred. While still ancillary to the compendium itself, supplying this number of reference substances required a major expansion of this phase of the overall program to the point where in itself the Reference Standards activity became a significant facet of the total operation of establishing specifications.

The individual monographs, as presented in NF XII, were also affected in other ways as the result of the 1962 Drug Amendments. Previously, synonyms had been in wide use and were included by name in the pertinent monographs. This practice was specifically prohibited by the directive from Congress. Furthermore, batch certification—with the concomitant power for FDA to set specifications—was extended to all antibiotics. Taking this development into account, the NF deleted all standards and specifications from all the antibiotic monographs, in order to avoid any confusion which would result from dual and possibly even conflicting standards. Abbreviated monographs for antibiotics were still included in the NF to indicate their accepted therapeutic value as determined by the Committee on Admissions and to give related information of interest to pharmaceutical and medical practitioners.

Early during the revision period leading to NF XII, the American Medical Association and the United States Pharmacopeia joined with the American Pharmaceutical Association in sponsorship of the analytical laboratory facilities housed in the Association's building and operated under the auspices of the APhA Foundation. Through this mutual support and cooperation, the Drug Standards Laboratory was revitalized and by the close of the revision period was making a significant contribution to the NF program by providing direct, convenient laboratory services.

A thorough overhauling of all graphic formulas and all systematic chemical names was also instituted in NF XII to bring these into accord with the latest approved practices of recognized authoritative groups such as Chemical Abstracts Service and the International Union of Pure and Applied Chemistry (IUPAC). Furthermore, all molecular weights and assay calculation factors were recalculated on the basis of carbon-12 rather than oxygen-16, as previously employed. This change was in line with the 1961 revision of International Atomic Weights which changed the element of reference.

NF XII was published in early January 1965 and became official September 1, 1965. Subsequently, two supplements were issued which became effective on September 1, 1965, and on March 1, 1967, respectively. Issuance of supplements revived a practice which had not been utilized during the several previous revision periods. One interim revision announcement was also issued, which became official April 1, 1968. Continuing the trend of the last two editions, there were many new admissions to NF XII (248) to provide a total of 783 articles in the volume itself—another 19 articles were admitted by way of the supplements. At the same time, 280 monographs in NF XI were not voted admission to the new edition.

During the period covered by the thirteen editions of the National Formulary, many individuals have served as members of the revision bodies. Their names may be found by reference to previous editions of the National Formulary. The names of the Chairmen of the National Formulary Boards (or, as previously referred to, Committees on National Formulary), the years served by each, and the editions published during each corresponding period are tabulated below:

CHAIRMEN	NF EDITIONS	YEARS
Charles Rice	I	1883–1888
C. Lewis Diehl	II, III, IV	1889–1917
Wilbur L. Scoville	V	1919–1929
Edmund N. Gathercoal	VI	1930–1940
Justin L. Powers	VII, VIII, IX, X, XI	1940–1960
Edward G. Feldmann	XII, XIII	1960–1969

NATIONAL FORMULARY CODIFICATION*

Establishment and Organization of the National Formulary

Article I. Definition

The National Formulary, including Supplements and Interim Revision Announcements thereto, shall be a compendium of standards designed to ensure the safety, effectiveness, quality, and purity of drugs. Such standards shall include the titles, definitions, descriptions, and specifications (including test procedures and assays for the determination of the standards so established) appropriately developed and established to ensure adequate and appropriate characteristics of quality, strength, purity, and identity of the articles to which the respective standards apply.

Article II. Functions of the Board of Trustees

Pursuant to the provisions of Article II, A, 1 of the Constitution and Chapter III, Article II of the ASSOCIATION By-Laws, the Board of Trustees shall provide for the compilation and publication of the National Formulary, including Supplements and Interim Revision Announcements thereto. To this end, it shall do the following:

A. Provide for the publication and dissemination of successive editions of the National Formulary and for such Supplements and Interim Revision Announcements thereto as may be promulgated from time to time.

B. Receive and consider for approval the Statement of General Principles and other matters of significant general policy which the National Formulary Board may formulate concerning the program of maintaining and revising the National Formulary.

C. Receive and review periodic reports on the status and progress of the revision and publication program submitted to it by the Director of the National Formulary.

D. Receive and consider for budgetary approval proposed plans and contracts for the printing and distribution of each new edition of the National Formulary.

E. Review and consider for approval proof copies of each proposed revised edition of the National Formulary, or Supplement or Interim Revision Announcement thereto. When publication is authorized, the Board of Trustees shall approve the date on which the new edition of the National Formulary, or Supplement, or Interim Revision Announcement shall take effect and become official.

F. Establish the sale price for the National Formulary and for National Formulary Reference Standards.

G. Consider and approve the payment of any consultant fees or honoraria, when such a recommendation is made in connection with the National Formulary revision program.

H. Review all decisions of the National Formulary Board in accordance with the procedure established in these ASSOCIATION By-Laws.

Article III. The National Formulary Board

The National Formulary, including Supplements and Interim Revision Announcements thereto, shall be compiled under the direction of the National Formulary Board, elected by the Board of Trustees. Such Board shall consist of the Director of the National Formulary, a Secretary, and nine (9) elected members. Each member shall be elected to serve for a period of five (5) years or until a successor, having been duly elected, has assumed the duties of his office. The members elected shall be selected from a panel of experts who are generally recognized as being qualified to evaluate (in their respective fields) the safety, effectiveness, quality, and purity of drugs and to prescribe standards and specifications for drugs and other articles which may be used in connection with drugs. At least one (1) of the members of the Board shall be a physician and the other members shall be qualified in the pharmaceutical and related sciences. In selecting a candidate for election, due regard shall be had for his qualifications to serve as a member of the Board as evidenced by both his professional training and experience and by his professional standing and reputation in the area of the pharmaceutical and related sciences. In carrying out its functions, the Board shall do the following:

---

* These articles of Codification of the National Formulary constitute Chapter XIV of the By-Laws of the American Pharmaceutical Association, as amended through 1969.

A. Meet at the call of the Director of the National Formulary, but in any event at least once a year. The presence of eight (8) members, including the Director and the Secretary, at any meeting of the Board shall constitute a quorum. The Board may take action at such a meeting by affirmative vote by a majority of the members present and voting. Matters pertaining to the Board's business requiring action between meetings may be submitted to the members of the Board by mail ballot accompanied by a suitably designed letter, circular, or bulletin, outlining the issues implicit in the question submitted for a vote.

B. At or near the beginning of each revision period, formulate a Statement of General Principles to be followed in the compilation of the National Formulary which shall serve as the general policy concerning planning and implementing the revision program of the National Formulary and the issuance of new editions, Supplements, and Interim Revision Announcements. Such general principles and policies shall be submitted to the Board of Trustees for approval, and, after approval, shall be made public.

C. Consider and act upon all proposals and recommendations made by the National Formulary committees and advisory panels, or from any other source, for revision of, additions to, and omissions from the National Formulary text.

D. Promulgate such revisions in the present official edition of the National Formulary as is deemed advisable or necessary to ensure a current compendium. In undertaking such revision, each member of the Board shall review and consider revising such portions of the current edition of the National Formulary, and the preparation of proposed new text for the National Formulary, as are assigned to him by the Director of the National Formulary. All revisions shall be consistent with the Statement of General Principles to be followed in the preparation of the next edition of the National Formulary. Upon completion of the assignment of each individual Board member, the entire Board shall review, and consider for approval, the final text of the manuscripts submitted by the individual members.

E. Recommend to the Board of Trustees the date on which the new edition of the National Formulary, or Supplement or Interim Revision Announcement thereto, shall take effect and become official.

F. Establish a Committee on Admissions and a Committee on Specifications, as hereinafter provided.

G. Consider and act upon proposals for admission to the National Formulary of any of those nontherapeutic substances used in the fabrication of dosage forms which are usually referred to as "pharmaceutical necessities" or "pharmaceutic aids."

H. Where deemed necessary, approve the establishment and preparation of authentic samples of various substances required for use as Reference Standards in National Formulary assays, tests, and for related purposes.

I. Through the Director of the National Formulary, recommend to the Board of Trustees the removal, for cause, of any member of the Committee on Admissions or of the Committee on Specifications.

J. Consider and act upon any other matter relating to the safety, effectiveness, quality, and purity of drugs and their safe use, when, in the judgment of the Board, such action is deemed desirable.

K. The National Formulary Board may promulgate such additional rules and regulations, and adopt such procedures, consistent with the Constitution and ASSOCIATION By-Laws, as it deems necessary to ensure the accuracy and adequacy of the National Formulary.

Article IV. Administrative Officers

The administrative officers of the National Formulary shall be a Director of the National Formulary, who shall be a full-time member of the ASSOCIATION staff, and a Secretary. Each shall be elected for a five (5) year term of office by a majority vote of the Board of Trustees and each shall hold office for the elected term and until such time when a successor, having been duly elected, has assumed the duties of his office. In the event of a vacancy in an office by resignation, death, or any incapacity to serve, the Chairman of the Board of Trustees may appoint a successor, *pro tempore*, who shall serve in such office until a successor shall have been elected and shall have assumed office. The Board of Trustees may remove any officer from office for cause.

Article V. Director of the National Formulary

The Director of the National Formulary shall be the chief administrative officer of the National Formulary Board. He shall have executive supervision over all of the activities of the Board, including direction of the activities of all committees, special panels, consultants, and other personnel, which may be established, retained, or employed from time to time to conduct the program and affairs of the National Formulary. He shall be an *ex officio* member, with vote, of the National Formulary Board, act as its Chairman, and preside at all of its meetings. He shall also be an *ex officio* member, without vote, of all committees and panels established in connection with any of the functions of the Board.

In carrying out his duties as the chief administrative officer of the National Formulary Board, the Director of the National Formulary shall, in addition to such functions as are implicit in his office as chief administrative officer, perform the following functions:

A. Establish, when deemed necessary or advisable, specific advisory panels, or engage consultants, to consider general or special subjects relating to the development of specifications for articles admitted to the National Formulary.

B. Coordinate all phases of the revision and publication program. His office shall operate as the administrative center for the various activities in the National Formulary program. He shall assign specific portions of any current National Formulary text to individual members of the National Formulary Board for detailed review and revision, when, in the opinion of such member, a need for revision is indicated.

C. Establish appropriate communications systems with the National Formulary Board, the Committee on Admissions, and the Committee on Specifications to ensure the systematic and orderly operation of these groups in their assigned responsibilities. He shall arrange for the compilation of all approved additions to, omissions from, or revisions in the National Formulary, and shall supervise the preparation of the final manuscript of the National Formulary.

D. Provide for the printing and wide distribution to members of pertinent scientific communities for review and comment of galley proof and page proof of new editions of the National Formulary, and shall arrange for an Open Conference at an appropriate time near the end of each revision period, to provide a forum for public comment on the proposed text of the new edition.

E. Arrange for the printing, distribution, and publicity of each new edition of the National Formulary, or Supplement or Interim Revision Announcement thereto, and present appropriate plans to the Board of Trustees for its consideration and budgetary approval.

F. Whenever a revised edition of the National Formulary, or Supplement or Interim Revision Announcement thereto, has been completed and approved by the National Formulary Board, inform the Board of Trustees and transmit sufficient proof copies of the proposed publication to the Board of Trustees for its review, consideration, and approval for publication as provided in the ASSOCIATION By-Laws.

G. Provide for the standardization, packaging, labeling, and distribution of authentic samples of various substances deemed necessary by the National Formulary Board as Reference Standards in National Formulary assays, tests, and for related purposes.

H. Submit written reports to the Board of Trustees, at least annually, reporting on the progress and affairs of the revision and publication program.

I. Call the meetings of the National Formulary Board, prepare a detailed agenda for each meeting, and preside at all meetings.

J. Nominate candidates for election as members of the Committee on Admissions and of the Committee on Specifications at the beginning of each new revision period. After approval of the candidates by the National Formulary Board, he shall submit the nominations to the Board of Trustees for consideration and election to office. The list of candidates for election to membership on the Committee on Admissions shall include at least twenty (20) nominations and the list for election to membership on the Committee on Specifications at least fifty (50) nominations.

K. Nominate candidates for filling vacancies which may occur on the National Formulary Board, the Committee on Admissions, or the Committee on Specifications, and after approval by the National Formulary Board, submit his list of candidates to the Board of Trustees for consideration and election.

L. Upon what seems to him sufficient cause, recommend to the Board of Trustees removal of any member of the National Formulary Board, the Committee on Admissions, or the Committee on Specifications.

Article VI. Secretary

The Secretary shall keep fair and sufficiently complete summary minutes of meetings of the National Formulary Board, committees, and advisory panels to reflect the proceedings of such meetings accurately; preserve all reports and communications received by the National Formulary Board; and perform such other duties pertaining to the management of the affairs of the National Formulary Board as may be assigned to him by the Director of the National Formulary.

Article VII. Committee on Admissions

The Committee on Admissions of the National Formulary shall consist of the physician member of the National Formulary Board, who shall act as the Chairman of the Committee, and nineteen (19) additional members, sixteen (16) of whom shall be physicians or pharmacologists. The members of the Committee shall be elected by the Board of Trustees from a list of candidates nominated by the Director of the National Formulary and approved by the National Formulary Board. Each member shall be elected to serve for a term of five (5) years. Any member may be removed by the Board of Trustees for cause.

The Committee on Admissions shall perform the following functions:

A. Consider and act upon appropriate matters submitted to it by the Director of the National Formulary for consideration and action. Except as may be otherwise provided in the ASSOCIATION By-Laws, the Committee's action shall be consistent with basic policy established by the National Formulary Board from time to time. All Committee decisions shall be transmitted to the National Formulary Board by the Director of the National Formulary for consideration and action.

B. In considering eligibility of an article for admission to the National Formulary, determine the therapeutic value of the article proposed for admission and select for admission only articles considered by it to possess demonstrated therapeutic value and usefulness. Suitable dosage forms for the administration of such articles may be determined for admission by a special subcommittee of five (5) members, appointed by the Director of the National Formulary, primarily from the membership of the Committee itself. The Committee may, at its discretion, approve for admission specific dosage forms containing rational combinations of official drugs. Approval of an article for recommendation for admission to the National Formulary shall be by an affirmative vote of not less than two-thirds ($^2/_3$) of the ballots cast by the members of the Committee voting, providing that not less than fifteen (15) votes are cast; and provided, further, that approval of a dosage form for recommendation for admission by the subcommittee shall be by an affirmative vote of not less than three (3) members of the subcommittee.

C. Review and consider for approval recommendations for admission of therapeutic substances and dosage forms submitted by duly constituted National Formulary advisory panels of experts in paramedical specialty fields. Approval of an article or dosage form thus recommended shall be an affirmative vote of a simple majority of the ballots cast by the Committee on Admissions, provided not less than fifteen (15) votes are cast.

D. Review and consider for approval the pharmacological category statements and the dose statements proposed for inclusion in the National Formulary monographs for therapeutic articles. When requested by the Director of the National Formulary, members of the Committee on Admissions, either individually or as a panel designated by the Director of the National Formulary, shall recommend, for inclusion in the National Formulary, caution statements and related information of a medical nature pertaining to the effective and safe use of drugs.

Article VIII. Committee on Specifications

The Committee on Specifications shall consist of fifty (50) members, broadly representative of the pharmaceutical, chemical, and biological sciences. The members of the Committee shall be elected by the Board of Trustees from a list of candidates nominated by the Director of the National Formulary and approved by the National Formulary Board. Each member shall be elected to serve for a term of five (5) years. Any member may be removed by the Board of Trustees for cause.

The Committee on Specifications shall function in an advisory capacity, in developing standards, specifications, test procedures, and assays, as may be required, for articles recommended for admission to the National Formulary. Where appropriate, the Director of the National Formulary shall transmit recommendations ensuing from the Committee to the National Formulary Board for its information or approval.

The members of the Committee on Specifications, either individually or as panels designated by the Director of the National Formulary, shall assist in the development of tests, specifications, and other standards for articles which have been approved for admission to the National Formulary.

When requested by the Director of the National Formulary, members of the Committee, either as individuals or as panels designated by the Director of the National Formulary, shall serve in an advisory capacity on any other matter of a specifications nature which may be submitted for consideration by the Director of the National Formulary.

Article IX. General

A. Members of the National Formulary Board, committees, and panels shall adhere to principles enunciated in the National Formulary Board's Statement of Philosophy of Conduct in carrying out their respective assignments.

B. Except where otherwise provided in the ASSOCIATION By-Laws, all actions by the National Formulary Board, its committees and panels, shall be taken by majority vote of the members present at a meeting, provided a quorum is present; or by a majority mail vote, provided the mail votes cast equal in number the quorum required of that body voting at a meeting.

C. Any vacancy on the National Formulary Board, the Committee on Admissions, or the Committee on Specifications, which may occur during the interim period, shall be filled by election by the Board of Trustees of a successor member to fill such vacancy for the unexpired term.

D. 1. Proposals for admission of drugs, and the inclusion of pertinent category and dosage statements in the National Formulary, and proposals for deletion of drugs or the revision of any category and dosage statements in the National Formulary, emanating from the Committee on Admissions, shall be made to the National Formulary Board for consideration and action through the Director of the National Formulary.

2. Suggested standards and specifications, including appropriate tests and assays, for articles which have been qualified for admission to the National Formulary, or suggested revisions of such specifications, tests, and assays for articles appearing in the National Formulary, emanating from members or panels of the Committee on Specifications, or from other appropriate sources, shall be submitted to the National Formulary Board for consideration and action through the Director of the National Formulary.

3. The Director of the National Formulary shall review all proposals made by the Committee on Admissions and all suggested specifications, tests, and assays, as prepared by members or panels of the Committee on Specifications. If, after review, he deems it advisable that any proposal or suggested specification, test, or assay be remanded to the respective committee for further consideration, he may so remand it with his statement as to the reasons for the remand. In case of such remand, the committee shall review the prior recommendation in light of the statement of reasons for the remand, and may then either revise the recommendations or elect to return them to the Director of the National Formulary without revision. In the event of a return without revision, or upon approval of any committee's submittal by the Director of the National Formulary, he shall assign it to a member of the National Formulary Board of his selection for initial review and recommendation. A review of such submittal by such member shall be in accordance with the Statement of General Principles adopted by the National Formulary Board for the preparation of the next edition of the National Formulary. Upon conclusion of his review, the member shall transmit the proposal, with his recommendations, to the Director of the National Formulary for submission to the entire Board.

E. Upon review and consideration of any proposal submitted to it by the Committee on Admissions, the National Formulary Board may approve or disapprove the proposal.

F. Upon review and consideration of suggested standards and specifications, including tests and assays, submitted to it by members or panels of the Committee on Specifications, the National Formulary Board may:

1. Approve the submission;
2. Revise the submission and adopt it as so revised;
3. Remand the submission to the member of the Board having previously reviewed it for further consideration in light of guidelines for revision as established by the Board; such member may then undertake such revision on his own initiative or may remand it to the pertinent panel or members of the Committee on Specifications for revision; or
4. Reject the submission in its entirety.

G. When a decision to admit an article has been acted upon favorably by the National Formulary Board, that article shall be regarded, and announced, as being *provisionally* admitted;

When the monograph for a provisionally admitted article has been prepared in proof form and so publicized through distribution, the article shall be regarded and announced as being *tentatively* admitted; and

When the monograph for a tentatively admitted article has been included in the National Formulary, the article shall be regarded and announced as being *finally* admitted.

Article X. Appeals

The decision of the National Formulary Board with respect to any submittal received by it as provided in the ASSOCIATION By-Laws shall be final unless appealed to the Board of Trustees. Such appeals may be taken by the Director of the National Formulary on his own initiative; and such appeals shall be taken by him on request of any interested party. An appeal shall be perfected by transmitting a copy of the decision appealed from, accompanied by a memorandum summarizing the issue implicit in the appeal, to the Board of Trustees within sixty days of the announcement or publication of the decision. Appeals by interested parties shall be submitted to the Director of the National Formulary for transmittal to the Board of Trustees. The Board of Trustees shall consider and act upon all appeals as promptly as practicable. It may approve the decision by the National Formulary Board or, failing to approve, remand it for further review and consideration by that Board with an accompanying memorandum outlining the reasons for the remand. In the event of approval, the decision appealed from shall become final as of the date of such approval by the Board of Trustees. In the event of remand, the National Formulary Board shall review and take action on any remand by the Board of Trustees. It may then either reaffirm its original decision or revise it in whatever manner is deemed advisable in light of the recommendations made by the Board of Trustees. Either action by the National Formulary Board on such remands shall be final. All final decisions of admission, deletion, or revision shall be put into effect by following normal procedures in revising the National Formulary.

The following is excerpted from the Constitution of the American Pharmaceutical Association; as amended through 1969:

Article II. Objects. This ASSOCIATION shall exist for the following purposes:

A. To aid in improving, promoting, and safeguarding the public health and welfare in every practical manner and by all practical means—

(1) By maintaining a compendium of standards and specifications calculated to promote the safety, efficacy, and purity of drugs, to be known as "The National Formulary." Criteria for establishing such standards and specifications, and the procedures to be followed in qualifying an article for admission to The National Formulary, shall be established by a Board, elected by the Board of Trustees, to be known as the "National Formulary Board"; and

(2) By promoting the safe use of drugs and aiding in the detection and prevention of adulteration and misbranding of drugs and medicines, and by taking such steps, as an ASSOCIATION and in cooperation with other organizations, as will assure the production and distribution of drugs and medicines of the highest quality, in a manner consistent with practices deemed reasonably necessary to ensure their purity and safety.

New Admissions to NF XIII

A

Acetaminophen Elixir
Acetohexamide
Acetohexamide Tablets
Acetophenazine Maleate
Acetophenazine Maleate Tablets
Acetyldigitoxin
Acetyldigitoxin Tablets

Biperiden Hydrochloride Tablets
Biperiden Lactate Injection
Bisacodyl
Bisacodyl Suppositories
Bisacodyl Tablets
Bishydroxycoumarin Capsules
Bismuth, Milk of
Bismuth Subnitrate
Blood Group Specific Substances A and B
Boric Acid
Bromodiphenhydramine Hydrochloride
Bromodiphenhydramine Hydrochloride Capsules

Bromodiphenhydramine Hydrochloride Elixir
Brompheniramine Maleate
Brompheniramine Maleate Elixir
Brompheniramine Maleate Tablets
Butalbital
Butethamine Hydrochloride
Butethamine Hydrochloride and Epinephrine Injection
Butyl Aminobenzoate

C

Caffeine, Citrated
Caffeine, Citrated, Tablets
Calcium Aminosalicylate
Calcium Aminosalicylate Capsules
Calcium Aminosalicylate Tablets
Calcium Benzoylpas
Calcium Benzoylpas Tablets
Calcium Carbonate Tablets
Calcium Cyclamate
Calcium Cyclamate and Calcium Saccharin Solution
Calcium Cyclamate and Calcium Saccharin Tablets
Calcium Ipodate
Calcium Ipodate for Oral Suspension
Calcium Lactate
Calcium Lactate Tablets
Calcium Novobiocin
Calcium Novobiocin Oral Suspension
Calcium Oxytetracycline
Calcium Oxytetracycline Oral Suspension
Calcium Phosphate, Dibasic
Calcium Phosphate, Tribasic
Calcium Saccharin
Calcium Stearate
Calcium Sulfate
Camphor Spirit
Camphorated Parachlorophenol
Candicidin
Candicidin Ointment
Candicidin Suppositories
Caramel
Caraway
Caraway Oil
Carbarsone
Carbarsone Capsules
Carbarsone Tablets
Carbetapentane Citrate
Carbinoxamine Maleate
Carbinoxamine Maleate Elixir
Carbinoxamine Maleate Tablets
Carbol-Fuchsin Solution
Cardamom Seed
Cardamom Tincture, Compound
Carphenazine Maleate
Carphenazine Maleate Tablets
Cascara Tablets
Cascara Sagrada Extract
Cascara Sagrada Fluidextract
Castor Oil, Aromatic
Cellulose, Microcrystalline
Cetyl Alcohol
Cetylpyridinium Chloride
Cetylpyridinium Chloride Solution
Chloral Betaine
Chloral Betaine Tablets
Chloramphenicol for Suspension, Sterile
Chlorcyclizine Hydrochloride
Chlorcyclizine Hydrochloride Tablets
Chlordiazepoxide
Chlordiazepoxide Tablets
Chlormadinone Acetate
Chlormadinone Acetate and Mestranol Tablets
Chlormerodrin
Chlormerodrin Tablets
Chloroform
Chloroprocaine Hydrochloride
Chloroprocaine Hydrochloride Injection
Chlorothen Citrate
Chlorothen Citrate Tablets
Chlorothiazide
Chlorothiazide Tablets
Chlorothiazide Oral Suspension
Chlorotrianisene
Chlorotrianisene Capsules
Chlorpheniramine Maleate Injection
Chlorprothixene
Chlorprothixene Tablets
Chlortetracycline Hydrochloride
Chlortetracycline Hydrochloride Capsules
Chlortetracycline Hydrochloride for Injection
Chlortetracycline Hydrochloride, Ophthalmic
Chymotrypsin
Chymotrypsin, Sterile
Chymotrypsin Injection
Cinnamon
Clidinium Bromide
Clofibrate
Clofibrate Capsules
Cobalamin Concentrate
Cocaine
Cocaine Hydrochloride Tablets
Codeine
Codeine Phosphate, Aspirin, Phenacetin, and Caffeine Tablets
Codeine Sulfate
Codeine Sulfate Tablets
Cod Liver Oil
Cod Liver Oil, Nondestearinated
Colistin Sulfate
Colistin Sulfate for Oral Suspension
Cresol
Cresol Solution, Saponated
Cupric Sulfate
Cyanocobalamin Co 60 Capsules
Cyanocobalamin Co 60 Solution
Cyclopentamine Hydrochloride
Cyclopentamine Hydrochloride Injection
Cyclopentamine Hydrochloride Solution
Cyclothiazide
Cyclothiazide Tablets
Cycrimine Hydrochloride
Cycrimine Hydrochloride Tablets
Cyproheptadine Hydrochloride
Cyproheptadine Hydrochloride Syrup
Cyproheptadine Hydrochloride Tablets

D

Danthron
Danthron Tablets
Dehydrocholic Acid
Dehydrocholic Acid Tablets
Demeclocycline
Demeclocycline for Oral Suspension
Demeclocycline Oral Suspension
Demeclocycline Hydrochloride
Demeclocycline Hydrochloride Capsules
Demeclocycline Hydrochloride Tablets
Denatonium Benzoate
Desipramine Hydrochloride
Desipramine Hydrochloride Capsules
Desipramine Hydrochloride Tablets
Desoxycorticosterone Acetate Pellets
Desoxycorticosterone Pivalate
Desoxycorticosterone Pivalate Suspension, Sterile
Dexamethasone Aerosol
Dexamethasone Elixir
Dexamethasone Sodium Phosphate Cream
Dexamethasone Sodium Phosphate Ophthalmic Ointment
Dexamethasone Sodium Phosphate Ophthalmic Solution
Dexbrompheniramine Maleate
Dexbrompheniramine Maleate Tablets
Dexchlorpheniramine Maleate
Dexchlorpheniramine Maleate Syrup
Dexchlorpheniramine Maleate Tablets
Dextriferron Injection
Dextroamphetamine Phosphate
Dextroamphetamine Phosphate Tablets
Dextromethorphan Hydrobromide
Dextromethorphan Hydrobromide Syrup
Diazepam
Diazepam Injection
Diazepam Tablets
Dibucaine
Dibucaine Cream
Dibucaine Ointment
Dichlorodifluoromethane
Dichlorotetrafluoroethane
Dicyclomine Hydrochloride
Dicyclomine Hydrochloride Capsules
Dicyclomine Hydrochloride Syrup
Dienestrol
Dienestrol Cream
Dienestrol Tablets
Diethylpropion Hydrochloride
Diethylpropion Hydrochloride Tablets
Diethylstilbestrol Dipropionate
Diethylstilbestrol Dipropionate Tablets
Digitalis Capsules
Digitoxin Injection
Dihydroxyaluminum Aminoacetate
Dihydroxyaluminum Aminoacetate Magma
Dihydroxyaluminum Aminoacetate Tablets
Dihydroxyaluminum Sodium Carbonate
Dihydroxyaluminum Sodium Carbonate Tablets
Dimethindene Maleate
Dimethindene Maleate Syrup
Dimethindene Maleate Tablets
Dimethisoquin Hydrochloride
Dimethisoquin Hydrochloride Lotion
Dimethisoquin Hydrochloride Ointment
Dimethisterone
Dimethyl Tubocurarine Iodide
Dimethyl Tubocurarine Iodide Injection
Dioctyl Calcium Sulfosuccinate
Dioctyl Calcium Sulfosuccinate Capsules
Dioctyl Sodium Sulfosuccinate Solution
Dioctyl Sodium Sulfosuccinate Syrup
Diphemanil Methylsulfate
Diphemanil Methylsulfate Injection
Diphemanil Methylsulfate Tablets
Diphenadione
Diphenadione Tablets
Diphenylhydantoin Oral Suspension
Diphenoxylate Hydrochloride
Diphenoxylate Hydrochloride and Atropine Sulfate Solution
Diphenoxylate Hydrochloride and Atropine Sulfate Tablets
Doxapram Hydrochloride
Doxapram Hydrochloride Injection
Dromostanolone Propionate
Dromostanolone Propionate Injection
Dydrogesterone
Dydrogesterone Tablets

E

Ephedrine
Ephedrine Hydrochloride
Ephedrine Sulfate and Phenobarbital Capsules
Ephedrine Sulfate Tablets
Ergotamine Tartrate and Caffeine Suppositories
Ergotamine Tartrate and Caffeine Tablets
Eriodictyon
Eriodictyon Fluidextract
Eriodictyon Syrup, Aromatic
Erythrityl Tetranitrate, Diluted
Erythrityl Tetranitrate Tablets
Erythromycin Estolate
Erythromycin Estolate Capsules
Erythromycin Estolate for Oral Suspension
Erythromycin Estolate Tablets
Erythromycin Ethylsuccinate
Erythromycin Ethylsuccinate Injection
Erythromycin Ethylsuccinate for Oral Suspension
Erythromycin Ethylsuccinate Tablets
Estradiol
Estradiol Pellets
Estradiol Suspension, Sterile
Estradiol Tablets
Estradiol Benzoate
Estradiol Benzoate Injection
Estradiol Cypionate
Estradiol Cypionate Injection
Estradiol Dipropionate

Estradiol Dipropionate Injection
Estrone
Estrone Injection
Ethamivan
Ethamivan Injection
Ethchlorvynol
Ethchlorvynol Capsules
Ethinamate
Ethinamate Tablets
Ethinyl Estradiol and Dimethisterone Tablets
Ethisterone
Ethisterone Tablets
Ethoheptazine Citrate
Ethoheptazine Citrate Tablets
Ethyl Acetate
Ethyl Biscoumacetate
Ethyl Biscoumacetate Tablets
Ethyl Chloride
Ethylcellulose
Ethylene
Ethylmorphine Hydrochloride
Ethyl Vanillin
Eucalyptus Oil

F

Ferrous Gluconate
Ferrous Gluconate Tablets
Ferrous Sulfate Syrup
Fluocinolone Acetonide
Fluorometholone
Fluorometholone Cream
Fluphenazine Enanthate
Fluphenazine Enanthate Injection
Fluphenazine Hydrochloride
Fluphenazine Hydrochloride Injection
Fluphenazine Hydrochloride Tablets
Fluprednisolone
Fluprednisolone Tablets
Flurandrenolide
Flurandrenolide Cream
Flurandrenolide Ointment
Flurothyl
Fluroxene
Fructose
Fructose Injection
Fructose and Sodium Chloride Injection
Fuchsin, Basic
Furazolidone
Furazolidone and Nifuroxime Powder
Furazolidone and Nifuroxime Suppositories

G

Gitalin
Gitalin Tablets
Glutamic Acid Hydrochloride
Glutamic Acid Hydrochloride Capsules
Glutethimide
Glutethimide Tablets
Glycerin Suppositories
Glyceryl Guaiacolate
Glyceryl Guaiacolate Syrup
Glyceryl Monostearate
Glycobiarsol
Glycobiarsol Tablets
Glycopyrrolate
Glycopyrrolate Tablets
Gramicidin
Green Soap
Green Soap Tincture

H

Haloperidol
Haloperidol Solution
Haloperidol Tablets
Hexavitamin Capsules
Hexavitamin Tablets
Hexylcaine Hydrochloride
Hexylcaine Hydrochloride Injection
Hexylcaine Hydrochloride Solution
Hexylresorcinol
Hexylresorcinol Pills
Homatropine Methylbromide
Homatropine Methylbromide Tablets
Hyaluronidase for Injection
Hydralazine Hydrochloride
Hydralazine Hydrochloride Injection
Hydralazine Hydrochloride Tablets
Hydrochloric Acid, Diluted
Hydrocortisone Lotion
Hydroflumethiazide
Hydroflumethiazide Tablets
Hydromorphone Hydrochloride
Hydromorphone Hydrochloride Injection
Hydromorphone Hydrochloride Tablets
Hydroquinone
Hydroquinone Ointment
Hydroxypropyl Methylcellulose
Hydroxyzine Hydrochloride
Hydroxyzine Hydrochloride Injection
Hydroxyzine Hydrochloride Syrup
Hydroxyzine Hydrochloride Tablets
Hydroxyzine Pamoate
Hydroxyzine Pamoate Capsules
Hydroxyzine Pamoate Oral Suspension
Hyoscyamine Hydrobromide
Hyoscyamine Sulfate
Hyoscyamine Sulfate Tablets
Hypophosphorous Acid

I

Ichthammol
Ichthammol Ointment
Indomethacin
Indomethacin Capsules
Iodine Ampuls
Iodine Solution
Iodized Oil
Iodochlorhydroxyquin and Hydrocortisone Cream
Iodochlorhydroxyquin and Hydrocortisone Lotion
Iodochlorhydroxyquin and Hydrocortisone Ointment
Iodochlorhydroxyquin Powder, Compound
Iodochlorhydroxyquin Tablets
Iodoform
Iodopyracet Injection
Iso-alcoholic Elixir

Isobucaine Hydrochloride
Isobucaine Hydrochloride and Epinephrine Injection
Isocarboxazid
Isocarboxazid Tablets
Isoflurophate Ophthalmic Ointment
Isopropamide Iodide
Isopropamide Iodide Tablets
Isopropyl Alcohol
Isopropyl Rubbing Alcohol
Isoproterenol Sulfate Aerosol
Isoxsuprine Hydrochloride
Isoxsuprine Hydrochloride Tablets

J

Juniper Tar

K

Kaolin
Kaolin Mixture with Pectin

L

Lanatoside C
Lanatoside C Tablets
Lavender Oil
Levonordefrin
Levopropoxyphene Napsylate
Levopropoxyphene Napsylate Capsules
Levorphanol Tartrate
Levorphanol Tartrate Injection
Levorphanol Tartrate Tablets

M

Magaldrate
Magaldrate Oral Suspension
Magaldrate Tablets
Magnesium Carbonate
Magnesium Citrate Solution
Magnesium Hydroxide
Magnesium Phosphate
Menadiol Sodium Diphosphate Tablets
Menadione
Menadione Injection
Menadione Tablets
Menadione Sodium Bisulfite
Menadione Sodium Bisulfite Injection
Mepenzolate Bromide
Mepenzolate Bromide Tablets
Meperidine Hydrochloride Syrup
Mephobarbital
Mephobarbital Tablets
Mepivacaine Hydrochloride
Mepivacaine Hydrochloride Injection
Mepivacaine Hydrochloride and Levonordefrin Injection
Meprobamate Oral Suspension
Meprylcaine Hydrochloride
Meprylcaine Hydrochloride and Epinephrine Injection
Mercuric Oxide, Yellow
Mercuric Oxide Ophthalmic Ointment, Yellow
Mestranol Tablets
Metabutethamine Hydrochloride
Metabutethamine Hydrochloride and Epinephrine Injection
Methacholine Bromide
Methacholine Bromide Tablets
Methacholine Chloride
Methacholine Chloride, Sterile
Methacycline Hydrochloride
Methacycline Hydrochloride Capsules
Methacycline Hydrochloride Oral Suspension
Methandrostenolone
Methandrostenolone Tablets
Methantheline Bromide
Methantheline Bromide Tablets
Methapyrilene Hydrochloride
Methapyrilene Hydrochloride Capsules
Methapyrilene Hydrochloride Tablets
Metharbital
Metharbital Tablets
Methdilazine
Methdilazine Tablets
Methdilazine Hydrochloride
Methdilazine Hydrochloride Syrup
Methdilazine Hydrochloride Tablets
Methenamine
Methenamine Tablets
Methenamine and Sodium Biphosphate Tablets
Methionine
Methionine Capsules
Methionine Tablets
Methocarbamol
Methocarbamol Injection
Methocarbamol Tablets
Methotrimeprazine
Methotrimeprazine Injection
Methoxyflurane
Methscopolamine Bromide
Methscopolamine Bromide Injection
Methscopolamine Bromide Tablets
Methsuximide
Methsuximide Capsules
Methyclothiazide
Methyclothiazide Tablets
Methylbenzethonium Chloride
Methylbenzethonium Chloride Powder
Methyl Isobutyl Ketone
Methylprednisolone
Methylprednisolone Tablets
Methylprednisolone Acetate
Methylprednisolone Acetate Suspension, Sterile
Methylprednisolone Sodium Succinate
Methylprednisolone Sodium Succinate for Injection
Methyltestosterone
Methyltestosterone Tablets
Methylthiouracil
Methyprylon
Methyprylon Capsules
Methyprylon Tablets
Methysergide Maleate
Methysergide Maleate Tablets
Mineral Oil Emulsion
Mineral Oil, Light
Monobenzone
Monobenzone Lotion
Monobenzone Ointment
Monoethanolamine
Morphine and Atropine Sulfates Tablets
Myristica Oil

N

Nalidixic Acid
Nalidixic Acid Tablets
Nandrolone Decanoate
Nandrolone Decanoate Injection
Nandrolone Phenpropionate
Nandrolone Phenpropionate Injection
Naphazoline Hydrochloride
Naphazoline Hydrochloride Solution
Neomycin Sulfate and Dexamethasone Sodium Phosphate Cream
Neomycin Sulfate and Hydrocortisone Acetate Lotion
Neomycin Sulfate, Polymyxin B Sulfate, and Gramicidin Ophthalmic Solution
Neomycin Sulfate, Polymyxin B Sulfate, and Zinc Bacitracin Ointment
Niacin
Niacin Injection
Niacin Tablets
Nialamide
Nialamide Tablets
Nifuroxime
Nikethamide
Nikethamide Injection
Nitrofurazone
Nitrofurazone Cream
Nitrofurazone Ointment
Nitrofurazone Solution
Nitromersol
Nitromersol Solution
Nitromersol Tincture
Norethandrolone
Norethandrolone Tablets
Norethindrone Acetate
Norethindrone Acetate Tablets
Norethindrone Tablets
Nortriptyline Hydrochloride
Nortriptyline Hydrochloride Capsules
Noscapine
Nylidrin Hydrochloride
Nylidrin Hydrochloride Injection
Nylidrin Hydrochloride Tablets

O

Octoxynol
Ointment, Yellow
Oleandomycin Phosphate
Oleandomycin Phosphate, Sterile
Oleovitamin A and D
Oleovitamin A and D Capsules
Orange Flower Oil
Orange Flower Water
Orange Peel, Bitter
Orphenadrine Citrate
Oxandrolone
Oxandrolone Tablets
Oxazepam
Oxazepam Capsules
Oxtriphylline
Oxtriphylline Tablets
Oxymetazoline Hydrochloride
Oxymetazoline Hydrochloride Solution
Oxymetholone
Oxymetholone Tablets
Oxymorphone Hydrochloride
Oxymorphone Hydrochloride Injection
Oxymorphone Hydrochloride Tablets
Oxyphenbutazone
Oxyphenbutazone Tablets
Oxyphencyclimine Hydrochloride
Oxyphencyclimine Hydrochloride Tablets
Oxytetracycline Hydrochloride, Ophthalmic
Oxytetracycline Injection

P

Pancreatin
Papaverine Hydrochloride
Papaverine Hydrochloride Injection
Papaverine Hydrochloride Tablets
Parachlorophenol
Paraffin
Paramethasone Acetate
Paramethasone Acetate Tablets
Pargyline Hydrochloride
Pargyline Hydrochloride Tablets
Paromomycin Sulfate
Paromomycin Sulfate Capsules
Pectin
Pentaerythritol Tetranitrate, Diluted
Pentaerythritol Tetranitrate Tablets
Pentazocine
Pentazocine Lactate Injection
Penthienate Bromide
Penthienate Bromide Tablets
Pentylenetetrazol
Pentylenetetrazol Injection
Peppermint Spirit
Peppermint Water
Perphenazine
Perphenazine Injection
Perphenazine Tablets
Persic Oil
Peruvian Balsam
Petrolatum
Phenacaine Hydrochloride
Phenazopyridine Hydrochloride
Phenazopyridine Hydrochloride Tablets
Phenindamine Tartrate
Phenindamine Tartrate Tablets
Phenmetrazine Hydrochloride
Phenmetrazine Hydrochloride Tablets
Phenolphthalein
Phenolphthalein Tablets
Phenprocoumon
Phenprocoumon Tablets
Phensuximide
Phensuximide Capsules
Phensuximide Oral Suspension
Phentolamine Hydrochloride
Phentolamine Hydrochloride Tablets
Phenylethyl Alcohol
Phenylmercuric Acetate
Phenylmercuric Nitrate
Phenylpropanolamine Hydrochloride
Phosphoric Acid
Phosphoric Acid, Diluted
Phthalylsulfacetamide
Phthalylsulfacetamide Tablets
Phthalylsulfathiazole
Phthalylsulfathiazole Tablets

Picrotoxin
Picrotoxin Injection
Piminodine Esylate
Piminodine Esylate Injection
Piminodine Esylate Tablets
Pine Needle Oil
Pine Tar
Pipobroman
Pipobroman Tablets
Plantago Seed
Polycarbophil
Polyethylene Glycol 300
Polyethylene Glycol 1540
Polymyxin B Sulfate Tablets
Polythiazide
Polythiazide Tablets
Posterior Pituitary
Posterior Pituitary Injection
Potash, Sulfurated
Potassic Saline Injection, Lactated
Potassium Acetate
Potassium Citrate
Potassium Gluconate
Potassium Gluconate Elixir
Potassium Gluconate Tablets
Potassium Guaiacolsulfonate
Potassium Iodide Solution
Potassium Phenethicillin
Potassium Phenethicillin for Oral Solution
Potassium Phenethicillin Tablets
Potassium Phosphate, Monobasic
Potassium Sodium Tartrate
Potassium Sorbate
Potassium Warfarin
Potassium Warfarin Tablets
Povidone
Povidone-Iodine
Povidone-Iodine Aerosol
Povidone-Iodine Solution
Pramoxine Hydrochloride
Pramoxine Hydrochloride Cream
Pramoxine Hydrochloride Jelly
Prednisolone Succinate
Prednisolone Sodium Succinate for Injection
Prilocaine Hydrochloride
Prilocaine Hydrochloride Injection
Procaine Hydrochloride and Levonordefrin Injection
Procaine and Phenylephrine Hydrochlorides Injection
Procaine and Propoxycaine Hydrochlorides and Levarterenol Bitartrate Injection
Procaine and Propoxycaine Hydrochlorides and Levonordefrin Injection
Procaine and Tetracaine Hydrochlorides and Levarterenol Bitartrate Injection
Procaine and Tetracaine Hydrochlorides and Levonordefrin Injection
Procaine, Tetracaine, and Phenylephrine Hydrochlorides Injection
Procaine Penicillin G and Sodium Penicillin G for Injection
Prochlorperazine
Prochlorperazine Suppositories
Progesterone
Progesterone Injection
Progesterone Suspension, Sterile
Progesterone Tablets
Promazine Hydrochloride
Promazine Hydrochloride Injection
Promazine Hydrochloride Syrup
Promazine Hydrochloride Tablets
Propiomazine Hydrochloride
Propiomazine Hydrochloride Injection
Propoxycaine Hydrochloride
Propoxycaine Hydrochloride Injection
Propoxyphene Hydrochloride and Aspirin Capsules
Propylhexedrine
Propylhexedrine Inhalant
Pseudoephedrine Hydrochloride
Pseudoephedrine Hydrochloride Syrup
Pseudoephedrine Hydrochloride Tablets
Pumice
Pyrilamine Maleate
Pyrilamine Maleate Tablets
Pyrrobutamine Phosphate
Pyrrobutamine Phosphate Tablets
Pyrrocaine Hydrochloride
Pyrrocaine Hydrochloride and Epinephrine Injection

Q

Quinine Dihydrochloride
Quinine Dihydrochloride Injection

R

Rauwolfia Serpentina
Rauwolfia Serpentina, Powdered
Rauwolfia Serpentina Tablets
Rescinnamine
Rescinnamine Tablets
Resorcinol Monoacetate
Resorcinol Ointment, Compound
Ringer's Solution
Rolitetracycline
Rolitetracycline for Injection
Rose Oil
Rose Water, Stronger
Rose Water Ointment
Rosin

S

Salicylamide
Salicylamide Oral Suspension
Salicylamide Tablets
Salicylanilide
Selenium Sulfide
Selenium Sulfide Detergent Suspension
Senna
Senna Fluidextract
Senna Syrup
Silicon Dioxide, Colloidal
Silver Protein, Mild
Sitosterols
Sitosterols Suspension
Sodium Acetate
Sodium Alginate
Sodium Biphosphate
Sodium Butabarbital
Sodium Butabarbital Capsules
Sodium Butabarbital Elixir
Sodium Butabarbital Tablets

Sodium Carboxymethylcellulose Tablets
Sodium Chloride and Dextrose Tablets
Sodium Chlorothiazide for Injection
Sodium Citrate Solution, Anticoagulant
Sodium Cyclamate
Sodium Cyclamate and Sodium Saccharin Solution
Sodium Cyclamate and Sodium Saccharin Tablets
Sodium Dehydrocholate Injection
Sodium Dextrothyroxine
Sodium Dextrothyroxine Tablets
Sodium Hypochlorite Solution
Sodium Hypochlorite Solution, Diluted
Sodium Ipodate
Sodium Ipodate Capsules
Sodium Methiodal
Sodium Methiodal Injection
Sodium Methohexital for Injection
Sodium Novobiocin
Sodium Novobiocin Capsules
Sodium Novobiocin for Injection
Sodium Penicillin G
Sodium Penicillin G for Injection
Sodium Phosphate
Sodium Phosphate, Dried
Sodium Phosphate, Effervescent
Sodium Phosphate Solution
Sodium Propionate
Sodium Saccharin
Sodium Saccharin Tablets
Sodium Secobarbital and Sodium Amobarbital Capsules
Sodium Stearate
Sodium Thiamylal for Injection
Sodium Vinbarbital Injection
Sorbic Acid
Spearmint
Spearmint Oil
Stannous Fluoride
Stanozolol
Stanozolol Tablets
Starch Glycerite
Sucrose Octaacetate
Sulfacetamide
Sulfacetamide Tablets
Sulfacetamide, Sulfadiazine and Sulfamerazine Oral Suspension
Sulfacetamide, Sulfadiazine and Sulfamerazine Tablets
Sulfadiazine and Sulfamerazine Tablets
Sulfadimethoxine
Sulfadimethoxine Oral Suspension
Sulfadimethoxine Tablets
Sulfaethidole
Sulfamerazine Tablets
Sulfamethizole
Sulfamethizole Oral Suspension
Sulfamethizole Tablets
Sulfamethoxazole
Sulfamethoxazole Oral Suspension
Sulfamethoxazole Tablets
Sulfisoxazole and Phenazopyridine Hydrochloride Tablets
Sulfur, Sublimed
Syrosingopine
Syrosingopine Tablets

T

Tartaric Acid
Terpin Hydrate
Terpin Hydrate Elixir
Terpin Hydrate and Codeine Elixir
Terpin Hydrate and Dextromethorphan Elixir
Testosterone
Testosterone Pellets
Testosterone Suspension, Sterile
Tetanus and Gas Gangrene Antitoxins
Tetracaine
Tetracaine Ophthalmic Ointment
Tetracycline Hydrochloride for Ophthalmic Solution
Tetracycline Hydrochloride Tablets
Tetracycline Phosphate Complex
Tetracycline Phosphate Complex Capsules
Tetrahydrozoline Hydrochloride
Tetrahydrozoline Hydrochloride Ophthalmic Solution
Tetrahydrozoline Hydrochloride Solution
Theophylline, Ephedrine Hydrochloride, and Phenobarbital Tablets
Theophylline Tablets
Theophylline Sodium Acetate
Theophylline Sodium Acetate Tablets
Theophylline Sodium Glycinate
Theophylline Sodium Glycinate Tablets
Thiethylperazine Maleate
Thiethylperazine Maleate Tablets
Thihexinol Methylbromide
Thimerosal
Thimerosal Aerosol
Thimerosal Solution
Thimerosal Tincture
Thioguanine
Thioguanine Tablets
Thiopropazate Hydrochloride
Thiopropazate Hydrochloride Tablets
Thrombin
Tolu Balsam Syrup
Tolu Balsam Tincture
Tranylcypromine Sulfate
Tranylcypromine Sulfate Tablets
Triacetin
Triacetin Aerosol
Triacetin Cream
Triacetin Powder
Triamcinolone Acetonide Aerosol
Triamcinolone Diacetate
Triamcinolone Diacetate Suspension, Sterile
Triamcinolone Diacetate Syrup
Tribromoethanol
Tribromoethanol Solution
Trichlormethiazide
Trichlormethiazide Tablets
Trichloromonofluoromethane
Triclobisonium Chloride
Triclobisonium Chloride Cream
Triclobisonium Chloride Ointment
Tridihexethyl Chloride
Tridihexethyl Chloride Tablets
Triethylenemelamine
Triethylenemelamine Tablets
Trifluoperazine Hydrochloride

Trifluoperazine Hydrochloride Injection
Trifluoperazine Hydrochloride Tablets
Triflupromazine Hydrochloride
Triflupromazine Hydrochloride Tablets
Trimeprazine Tartrate
Trimeprazine Tartrate Syrup
Trimeprazine Tartrate Tablets
Trimethadione Tablets
Trimethidinium Methosulfate
Trimethidinium Methosulfate Tablets
Trimethobenzamide Hydrochloride
Trimethobenzamide Hydrochloride Capsules
Trimethobenzamide Hydrochloride Injection
Trimethobenzamide Hydrochloride and Benzocaine Suppositories
Trioxsalen
Trioxsalen Tablets
Triprolidine Hydrochloride
Triprolidine Hydrochloride Tablets
Troleandomycin
Troleandomycin Capsules
Troleandomycin Oral Suspension
Tromethamine
Tromethamine for Injection
Trypsin Crystallized
Tuaminoheptane Sulfate
Tuaminoheptane Sulfate Solution
Tybamate
Tybamate Capsules
Tyrothricin

U

Undecylenic Acid
Undecylenic Acid Ointment, Compound
Urethan
Urethan Tablets

V

Valethamate Bromide
Valethamate Bromide Injection
Vanilla
Vanilla Tincture
Vinbarbital
Vinbarbital Capsules
Vinyl Ether
Vitamin E

W

Wax, Yellow
White Lotion

X

Xylometazoline Hydrochloride
Xylometazoline Hydrochloride Solution

Y

Yeast, Dried
Yeast, Dried, Tablets

Z

Zinc-Eugenol Cement
Zinc Oxide Paste with Salicylic Acid
Zinc Undecylenate

Classification of NF XIII Articles by Pharmacological Categories*

Abrasive (Dental)
- Pumice

Absorbent (Gastrointestinal)
- Polycarbophil

Acidifier

Acidifier (Gastric)
- Glutamic Acid Hydrochloride
- Hydrochloric Acid, Diluted

Acidifier (Urinary)
- Sodium Biphosphate

Adrenergic
- Pseudoephedrine Hydrochloride
- Tuaminoheptane Sulfate

Adrenergic (Bronchodilator)
- Ephedrine
- Ephedrine Hydrochloride
- Ephedrine Sulfate and Phenobarbital [Capsules]
- Ephedrine Sulfate [Tablets]
- Isoproterenol Sulfate [Aerosol]

Adrenergic (Ophthalmic)

Adrenergic (Vasoconstrictor)
- Cyclopentamine Hydrochloride
- Levonordefrin
- Naphazoline Hydrochloride
- Oxymetazoline Hydrochloride
- Phenylpropanolamine Hydrochloride
- Propylhexedrine
- Tetrahydrozoline Hydrochloride
- Xylometazoline Hydrochloride

Adrenergic (Vasopressor)

Adsorbent
- Kaolin
- Kaolin Mixture with Pectin

Alkalizer
- Potassium Acetate
- Potassium Citrate
- Tromethamine

Alkalizer (Urinary)
- Sodium Acetate

Analgesic
- Acetaminophen
- Aluminum Aspirin
- Antipyrine
- Aspirin [Capsules]
- Aspirin, Phenacetin and Caffeine [Tablets]
- Ethoheptazine Citrate
- Methotrimeprazine
- Pentazocine
- Pentazocine Lactate [Injection]
- Propoxyphene Hydrochloride and Aspirin [Capsules]
- Salicylamide

Analgesic (Dental)

Analgesic (Narcotic)
- Alphaprodine Hydrochloride
- Anileridine
- Anileridine Hydrochloride
- Codeine
- Codeine Phosphate, Aspirin, Phenacetin, and Caffeine [Tablets]
- Codeine Sulfate
- Hydromorphone Hydrochloride
- Levorphanol Tartrate
- Meperidine Hydrochloride [Syrup]
- Morphine and Atropine Sulfate [Tablets]
- Oxymorphone Hydrochloride
- Piminodine Esylate

Analgesic (Urinary Tract)
- Phenazopyridine Hydrochloride
- Sulfisoxazole and Phenazopyridine Hydrochloride [Tablets]

Androgen
- Methandrostenolone
- Methyltestosterone
- Nandrolone Decanoate
- Nandrolone Phenpropionate
- Norethandrolone
- Oxandrolone
- Oxymetholone
- Stanozolol
- Testosterone

Anesthetic, General (Inhalation)
- Ethylene
- Fluroxene
- Methoxyflurane
- Vinyl Ether

Anesthetic, General (Systemic)
- Sodium Methohexital [for Injection]
- Sodium Thiamylal [for Injection]
- Tribromoethanol

Anesthetic, Local
- Antipyrine and Benzocaine [Solution]
- Benzocaine
- Butyl Aminobenzoate
- Chloroprocaine Hydrochloride
- Dibucaine
- Dimethisoquin Hydrochloride
- Ethyl Chloride
- Hexylcaine Hydrochloride

---

* This list of category statements has been developed in order to provide a comprehensive classification system. Article titles are listed only under the category statements describing the therapeutic or pharmaceutic basis for recognition of articles finally admitted to NF XIII. Although some category statements do not include any of the articles finally admitted to NF XIII, they have been retained in this listing as a matter of information.

- Isobucaine Hydrochloride
- Isobucaine Hydrochloride and Epinephrine [Injection]
- Mepivacaine Hydrochloride
- Mepivacaine Hydrochloride and Levonordefrin [Injection]
- Meprylcaine Hydrochloride
- Meprylcaine Hydrochloride and Epinephrine [Injection]
- Pramoxine Hydrochloride
- Prilocaine Hydrochloride
- Propoxycaine Hydrochloride
- Tetracaine

Anesthetic, Local (Dental)

- Butethamine Hydrochloride
- Butethamine Hydrochloride and Epinephrine [Injection]
- Metabutethamine Hydrochloride
- Metabutethamine Hydrochloride and Epinephrine [Injection]
- Procaine Hydrochloride and Levonordefrin [Injection]
- Procaine and Phenylephrine Hydrochlorides [Injection]
- Procaine and Propoxycaine Hydrochlorides and Levarterenol Bitartrate [Injection]
- Procaine and Propoxycaine Hydrochlorides and Levonordefrin [Injection]
- Procaine and Tetracaine Hydrochlorides and Levarterenol Bitartrate [Injection]
- Procaine and Tetracaine Hydrochlorides and Levonordefrin [Injection]
- Procaine, Tetracaine and Phenylephrine Hydrochlorides [Injection]
- Pyrrocaine Hydrochloride
- Pyrrocaine Hydrochloride and Epinephrine [Injection]

Anesthetic, Local (Narcotic)

- Cocaine

Anesthetic, Local (Ophthalmic)

- Phenacaine Hydrochloride

Anorexic

- Benzphetamine Hydrochloride
- Diethylpropion Hydrochloride
- Phenmetrazine Hydrochloride

Antacid

- Aluminum Phosphate [Gel]
- Bismuth, Milk of
- Bismuth Subnitrate
- Calcium Carbonate [Tablets]
- Dihydroxyaluminum Aminoacetate
- Dihydroxyaluminum Sodium Carbonate
- Magaldrate
- Magnesium Carbonate
- Magnesium Hydroxide
- Magnesium Phosphate

Anthelmintic

Anthelmintic (Filariae)

Anthelmintic (Intestinal Roundworms and Trematodes)

- Hexylresorcinol

Anthelmintic (Schistosomes)

Antiadrenergic

- Phentolamine Hydrochloride

Antiadrenergic—Central Stimulant (Specific Analgesic for Migraine)

- Ergotamine Tartrate and Caffeine [Suppositories and Tablets]

Antiadrenergic (Migraine Prophylactic)

- Methysergide Maleate

Antiamebic

- Carbarsone
- Glycobiarsol
- Iodochlorhydroxyquin [Tablets]
- Paromomycin Sulfate

Antiandrogen

Antiarthritic

- Oxyphenbutazone

Antibacterial

- Acetyl Sulfisoxazole
- Calcium Novobiocin
- Calcium Oxytetracycline
- Chloramphenicol [for Suspension, Sterile]
- Chlortetracycline Hydrochloride
- Demeclocycline
- Demeclocycline Hydrochloride
- Erythromycin Estolate
- Erythromycin Ethylsuccinate
- Gramicidin
- Methacycline Hydrochloride
- Nalidixic Acid
- Neomycin Sulfate and Hydrocortisone Acetate [Lotion]
- Oleandomycin Phosphate
- Oxytetracycline Hydrochloride [Ophthalmic]
- Oxytetracycline [Injection]
- Potassium Phenethicillin
- Procaine Penicillin G and Sodium Penicillin G [for Injection]
- Rolitetracycline
- Sodium Novobiocin
- Sodium Penicillin G
- Sulfacetamide
- Sulfacetamide, Sulfadiazine, and Sulfamerazine [Oral Suspension and Tablets]
- Sulfadiazine and Sulfamerazine [Tablets]
- Sulfadimethoxine
- Sulfaethidole
- Sulfamerazine [Tablets]
- Sulfamethizole
- Sulfamethoxazole
- Sulfisoxazole and Phenazopyridine Hydrochloride [Tablets]
- Tetracycline Hydrochloride [for Ophthalmic Solution]
- Tetracycline Hydrochloride [Tablets]
- Tetracycline Phosphate Complex
- Troleandomycin
- Tyrothricin

Antibacterial (Intestinal)
- Colistin Sulfate
- Phthalylsulfacetamide
- Phthalylsulfathiazole
- Polymyxin B Sulfate [Tablets]

Antibacterial (Leprostatic)

Antibacterial (Tuberculostatic)
- Calcium Aminosalicylate
- Calcium Benzoylpas

Antibacterial (Urinary)
- Methenamine
- Methenamine and Sodium Biphosphate [Tablets]

Anticholesteremic
- Clofibrate
- Sitosterols
- Sodium Dextrothyroxine

Anticholinergic
- Alverine Citrate
- Atropine
- Belladonna [Extract]
- Belladonna Leaf [Fluidextract]
- Biperiden
- Biperiden Hydrochloride
- Biperiden Lactate [Injection]
- Clidinium Bromide
- Cycrimine Hydrochloride
- Dicyclomine Hydrochloride
- Diphemanil Methylsulfate
- Glycopyrrolate
- Homatropine Methylbromide
- Hyoscyamine Hydrobromide
- Hyoscyamine Sulfate
- Isopropamide Iodide
- Mepenzolate Bromide
- Methantheline Bromide
- Methscopolamine Bromide
- Morphine and Atropine Sulfates [Tablets]
- Oxyphencyclimine Hydrochloride
- Penthienate Bromide
- Thihexinol Methylbromide
- Tridihexethyl Chloride
- Valethamate Bromide

Anticholinergic (Ophthalmic)

Anticholinesterase (Curare Principles Antidote)

Anticoagulant
- Anisindione
- Bishydroxycoumarin [Capsules]
- Diphenadione
- Ethyl Biscoumacetate
- Phenprocoumon
- Potassium Warfarin

Anticoagulant for Plasma and for Blood for Fractionation
- Sodium Citrate [Solution, Anticoagulant]

Anticonvulsant
- Diphenylhydantoin [Oral Suspension]
- Mephobarbital
- Metharbital
- Methsuximide
- Phensuximide
- Trimethadione [Tablets]

Antidepressant
- Desipramine Hydrochloride
- Isocarboxazid
- Nialamide
- Nortriptyline Hydrochloride
- Tranylcypromine Sulfate

Antidiarrheal (Narcotic)
- Diphenoxylate Hydrochloride
- Diphenoxylate Hydrochloride and Atropine Sulfate [Solution and Tablets]

Antidiuretic

Antidote (Heparin)

Antidote (Narcotic Analgesics)

Antidote (Phosphorus)
- Cupric Sulfate

Antieczematic, Local
- Anthralin
- Juniper Tar
- Pine Tar

Antiemetic
- Prochlorperazine
- Thiethylperazine Maleate
- Trimethobenzamide Hydrochloride
- Trimethobenzamide Hydrochloride and Benzocaine [Suppositories]

Antiflatulent

Antifungal

Antifungal, Local
- Candicidin
- Carbol-Fuchsin Solution
- Resorcinol Ointment, Compound
- Salicylanilide
- Sodium Propionate
- Triacetin
- Undecylenic Acid
- Zinc Undecylenate

Antihistaminic
- Antazoline Phosphate
- Bromodiphenhydramine Hydrochloride
- Brompheniramine Maleate
- Carbinoxamine Maleate
- Chlorcyclizine Hydrochloride
- Chlorothen Citrate
- Chlorpheniramine Maleate [Injection]
- Cyproheptadine Hydrochloride
- Dexbrompheniramine Maleate
- Dexchlorpheniramine Maleate
- Dimethindene Maleate
- Methapyrilene Hydrochloride
- Phenindamine Tartrate
- Pyrilamine Maleate
- Pyrrobutamine Phosphate
- Triprolidine Hydrochloride

Antihypertensive
- Bendroflumethiazide
- Benzthiazide
- Chlorothiazide

Cyclothiazide
Hydralazine Hydrochloride
Hydroflumethiazide
Methyclothiazide
Pargyline Hydrochloride
Polythiazide
Rauwolfia Serpentina
Rescinnamine
Sodium Chlorothiazide [for Injection]
Syrosingopine
Trichlormethiazide
Trimethidinium Methosulfate

Anti-infective, Local

General Principles Followed in the Preparation of the National Formulary

The following general principles have been adopted by the National Formulary Board and approved by the Board of Trustees of the American Pharmaceutical Association.

1. Purpose

The basic purpose of the National Formulary shall be the establishment and promulgation of official standards of identity, strength, quality, and purity for drugs admitted thereto.

2. Admissions

The admission of articles to the National Formulary shall be based upon their therapeutic value when intended for use as medicinal agents in man. Other articles may be admitted as pharmaceutic aids or adjuncts which are utilized in pharmaceutical procedures or in the formulation of dosage forms.

Drug combinations may be admitted to the National Formulary if they are therapeutically advantageous and offer a distinct benefit over separate administration of the individual ingredients.

No article shall be admitted to the National Formulary under the proprietary or trademark name, or if the composition is secret. The fact that an article is subject to patent protection shall not constitute any basis for excluding it from admission to the National Formulary (see patent notice, page ii).

A separate monograph shall be provided for each individual substance required as a stated ingredient in a monograph for an NF article, unless such substance is recognized in the concurrent USP.

3. Format

Standards shall be set forth in the form of distinct monographs for the individual drug entities and dosage forms which are approved for admission to the NF. Each monograph generally will include a title, definition, description, and other pertinent specifications. Such specifications may consist of test procedures, limit tests, and assays.

4. Nomenclature

The title of each drug monograph in the National Formulary shall be in English. Only a single monograph title shall be given for each drug; no synonyms or subordinate titles shall be provided. However, in the case of drugs of a definite chemical composition, the systematic chemical name may also be given in the monograph.

The titles of monographs shall be, as far as possible, convenient for prescribing and dispensing and in harmony with general usage.

Short titles wherever needed shall be coined for articles with cumbersome names. Such titles of drugs admitted to the NF shall be in general accord with the names selected by the United States Adopted Names (USAN) Council for those articles. Furthermore, NF monograph titles shall usually be identical to the International Nonproprietary Names (INN) of the World Health Organization (WHO), since it is general USAN Council policy to strive for uniformity between names selected by the Council and those selected by the WHO.

The chemical names of organic compounds shall correspond to the systematic chemical names as employed by *Chemical Abstracts* for index purposes. The structural formulas provided in the monographs for cyclic organic compounds shall be constructed such that the ring systems are portrayed in *Chemical Abstracts* and/or International Union of Pure and Applied Chemistry (IUPAC) orientation.

Botanical and zoological names shall conform to the rules of the International Botanical Congress and the International Zoological Congress, respectively.

5. Compounded Preparations

A specific formula with manufacturing directions may be included in a monograph where it is possible or desirable to compound the preparation on a small scale or without extensive manufacturing equipment.

6. Official Definitions

A statement, known as the official definition, shall be given where possible in each monograph to define the NF article.

Official definitions relating to synthetic organic chemicals or to inorganic chemicals shall include a statement of the composition based upon the established minimum or minimum and maximum percentage of the chemical as determined by an official *Assay* unless other criteria are equally suitable for such determination.

The official definition for drugs of vegetable origin shall indicate, as far as possible, the part or parts of the plant constituting the drug and the botanical name or names of the plant or plants yielding the drug. The official definition for drugs of animal origin shall indicate, as far as possible, the part or parts of the animal from which the drug is derived and the zoological name or names of the animal or animals yielding the drug. The established minimum and maximum percentages of active constituents shall also be stated in definitions for drugs of vegetable or animal origin for which suitable quantitative methods of assay are provided.

In the absence of an *Assay*, or reference to an official *Assay*, or other means of quantitative determination in lieu of an *Assay*, pertaining to an article of known structure, the official definition shall, as a minimum, consist of the chemical name, the molecular formula, and the structural formula of that article, and no tolerance statement of minimum or minimum and maximum percentage shall be given in such cases. National Formulary policy, however, shall be to include a suitable *Assay* in each monograph wherever it is feasible to do so.

Percent concentrations in definitions shall be indicated as (w/v), (v/v), and so forth, in all cases; except where no indication is given, the percent is weight to weight.

Statements regarding permissive ingredients may be included in the definition only where needed for a specific purpose, or where the nature of the article would normally prohibit the addition of other ingredients.

7. Standards for Identity, Strength, Quality, and Purity

In order to ensure drugs of high medicinal and pharmaceutical value, suitable standards of identity, strength, quality, and purity shall be provided in the monographs on drugs in the National Formulary. The specified tolerances and limits shall be based upon such quality characteristics as might be expected to distinguish a product produced from suitable raw materials under recognized conditions and procedures of good manufacturing practice.

In describing the procedures to be followed, reference may be made in any monograph to any official general or specific tests, assays, or processes.

Assay procedures should be directed at measuring the therapeutically active portion of the molecule in monographs for articles such as salts, esters, amides, complexes, or chelates.

Only one method or procedure shall be specified in connection with each individual test prescribed for the determination of the identity, strength, quality, or purity of an NF article; no alternate procedure may be included in such tests.

In spectrophotometric procedures, the use of reference substances shall be specified, and absorptivity values shall be avoided. For these procedures NF Reference Standards shall be specified wherever feasible.

When an ultraviolet or infrared spectrophotometric method is utilized in the *Assay* in a monograph for a dosage form, suitable preliminary steps shall be provided in the *Assay* procedure to permit the separation and isolation of the ingredient being determined, thereby eliminating possible interference from common absorbing substances, prior to performing the spectrophotometric measurement.

Preference shall be given to the use of different types of *Assay* procedures in the respective monographs for the drug entity and its dosage form. Purity or identity tests generally shall be based upon a different analytical method than that forming the basis of the procedure for the *Assay* in the same monograph.

Statements of the distinctive microscopic structural elements in powdered drugs of vegetable or animal origin may be included in the monographs as a means of determining identity, strength, quality, and purity.

8. Packaging and Storage

A statement prescribing the specific type of container in which the article is to be packaged and the conditions of storage, including any necessary precautions such as avoidance of exposure to light, moisture, and extreme temperature, may be included in the monograph for each National Formulary article.

9. Labeling Requirements

A statement may be included in the monograph for any NF article specifying pertinent information which is either required or prohibited in the labeling for that article.

10. Dosage Forms Available

A brief informative statement indicating the amounts of the therapeutically active ingredient usually available in the particular commercially available dosage form may be provided in each dosage form monograph.

11. Category Statements

A brief statement indicating the primary pharmacologic property or therapeutic use of the pertinent article may be included in the monograph for each National Formulary drug. Such statements shall be selected from a systematic, uniform list developed for this specific purpose. The monograph category statement shall generally indicate the basis for recognition of the drug in the NF.

12. Doses

A usual dose for adults may be stated in the monograph on each drug in the National Formulary generally employed internally for medicinal purposes. A usual dosage range may also be provided. These dosage statements are to be interpreted as the amount or amounts which may be expected to produce the intended therapeutic or other effect in the medical condition for which the drug is recognized in the NF. It is to be understood that the NF does not intend that these doses shall be regarded as obligatory by the physician or other duly licensed practitioner, or as forbidding him either to exceed or reduce the doses stated. A declaration to this effect shall be made in the General Notices of the National Formulary.

In certain instances, where deemed advisable, a usual dose for children may be stated.

There shall be appended to the statement of dose of each compound preparation the approximate amount of each therapeutically active ingredient in the usual dose stated.

Preparations for external use should be so indicated and if dilution of a preparation for such use is desirable, the average extent of such dilution may be stated in the monograph.

13. Antibiotics and Biologics

In order to avoid either duplication or conflict of standards, National Formulary monographs generally shall not include test methods, assays, or specifications for antibiotics or biologics which are subject to batch certification or license by government agencies under provisions of federal law. Monographs, in abbreviated form, may appear in the NF for such articles in order to provide official recognition for them, to establish the pertinent monograph title, to indicate their accepted therapeutic value, and to give related general information of interest to pharmaceutical and medical practitioners.

14. NF Reference Standards

Authentic samples of various substances required for use as Reference

Standards in performing National Formulary assays and tests, and for related purposes, may be established where deemed desirable and made available for distribution on order.

15. Atomic Weights

Atomic weights used in the National Formulary shall be in accordance with the latest available report of the International Commission on Atomic Weights.

16. Weights and Measures

The metric system of weights and measures shall be employed in the National Formulary.

17. Solubilities

General solubility statements shall be provided for information only and shall not constitute standards or tests for purity.

18. Standard Temperature

The standard temperature of 25° C. (Celsius) (77° F.) shall be official in the National Formulary except for alcohol percentage statements or other special cases so designated.

19. Powdered Botanical Drugs

Powdered botanical drugs shall be required to represent the entire plant, unless specifically stated otherwise. When the drug can be powdered without residue, this should be required; in other cases, the amount of allowable residue should be stated.

20. Alcohol in Preparations

The permissible range for the content of C_2H_5OH, in percent (v/v), in each National Formulary preparation, where present in readily determinable quantity, shall be stated in the monograph.

21. General Notices

A general notices section just preceding the individual monographs section shall be provided and shall contain references to such matters as pertain in a general way to the interpretation of the text of the National Formulary.

22. General Tests and Reagents

An appropriate section following the individual monographs section shall be included in the National Formulary and shall set forth methods and standards for general tests, processes, techniques, and apparatus that may be referred to in one or more of the individual monographs. In addition, a section relating to special reagents and their specifications, and to special test and volumetric solutions and directions for their preparation and standardization, shall also be provided.

Where deemed desirable, reference may be made to pertinent portions of similar sections appearing in the concurrent United States Pharmacopeia.

Where the National Formulary Board considers it desirable in the interest of drug purity and quality, appropriate chapters may be included in the General Tests section to standardize certain test methods, apparatus, or other procedures even though such methods, apparatus, or procedures may not be specified in any individual National Formulary monographs.

23. General Information

Various subjects of general information to pharmacists, physicians, and others using the National Formulary may be included in a separate section following the sections on general tests and reagents. Information included in this section shall not constitute official standards of identity, strength, quality, or purity.

24. Supplements

When necessary, *Interim Revision Announcements* to the National Formulary may be published in one of the American Pharmaceutical Association periodicals, and reprints made available, upon request, either free or at a nominal charge.

From time to time *Supplements*, incorporating *Interim Revision Announcements* and other additions and corrections, may be printed separately and distributed to registered holders of the current NF who complete and return the request card provided with each copy of the compendium.

GENERAL NOTICES

applying to the standards, tests, and assays of the National Formulary

---

The General Notices serve a dual purpose: (a) by providing in summary form the basic guidelines for the interpretation and application of the standards, tests, and assays of the National Formulary; and (b) by obviating the need to repeat continually throughout the book those requirements that are pertinent in numerous instances.

Exceptions to the General Notices occasionally are necessary, in which case the wording in the individual monograph or general test chapter specifically states the directions or the intent. To emphasize that such exceptions do exist, the General Notices employ, where indicated, a qualifying expression such as "unless otherwise specified." Thus, it is understood that the specific wording of standards, tests, and assays is binding wherever deviations from the General Notices exist. By the same token, where no language is given specifically to the contrary, the General Notices apply.

TITLE

The full title of this book, including its supplements, is The National Formulary, Thirteenth Edition. This title may be abbreviated to National Formulary XIII, or to NF XIII. Where the term NF is used, without further qualification, during the period in which this National Formulary is official, it refers to NF XIII.

OFFICIAL

The word "official", as used in this National Formulary or with reference hereto, is synonymous with "National Formulary" and with "pharmacopeial." The standards apply equally to articles bearing the official titles or names derived by transposition of the definitive words of an official title, and no other names are permissible. Articles bearing the compendial titles are official whether or not the added designation "NF" is used. Articles listed herein are official and the standards set forth in the monographs apply to them only when the articles are intended or labeled for medicinal use and when bought, sold, or dispensed for this purpose.

ATOMIC WEIGHTS AND CHEMICAL FORMULAS

The atomic weights used in computing molecular weights and the factors in the assays and elsewhere are those recommended in 1967 by the International Commission on Atomic Weights.

Chemical formulas, other than those of the definitions, tests, and assays, are given for purposes of information and calculation.

ABBREVIATIONS

The expressions FDA and NIH refer to the Food and Drug Administration and the National Institutes of Health, respectively, both of which are agencies of the federal Department of Health, Education, and Welfare. The expression USP refers to the current edition of the United States Pharmacopeia, USP XVIII, and its supplements. The term Ph.I. refers to the International Pharmacopoeia published as a recommendation on international standards of strength, quality, and purity for drugs by the World Health Organization.

The expressions AOAC, USASI (formerly ASA), and ASTM refer, respectively, to the Association of Official Analytical Chemists, the USA Standards Institute (formerly American Standards Association), and the American Society for Testing and Materials.

The terms C.S. and T.S. refer to Colorimetric Solution and Test Solution, respectively.

TOLERANCES

Where limits are expressed numerically herein, the upper and lower limits of a range are inclusive so that the range consists of the two values themselves and all intermediate values, but no values outside these limits. With the exception of limits in rubric definitions, which are considered significant to the last digit shown, the values of test limits expressed in percentages are considered significant to the next digit; thus, the expression "not less than 9 percent" in a test denotes not less than 9.0 percent, not 8.9 percent. For all other limits expressed numerically, *i.e.*, those not expressed in percentages, the values are considered significant to the last digit shown.

The minimum purity tolerances specified in the definition for National Formulary articles other than dosage forms are established with a view to the use of the articles as drugs. Such limits do not bar the use of articles which more nearly approach 100 percent purity nor do they constitute a basis for a claim that such articles "exceed" the National Formulary quality. Similarly, a dosage form, the active ingredient(s) of which is purported to approach more nearly 100 percent of the labeled amount(s), does not "exceed" the National Formulary requirements by virtue of its having been prepared to closer tolerances than those specified in the monograph.

The tolerances stated in the definition of preparations and dosage forms allow for assay error, for unavoidable variations in compounding, and for deterioration to an extent considered insignificant under practical conditions. The quantity of each ingredient used in preparing the dosage forms shall be equivalent to not less than 100 percent of that called for in the formula or of the amount declared on the label.

The use of the molecular formula for the active ingredient in defining the required strength of a National Formulary article is intended to designate the 100 percent chemical entity.

PERCENTAGE OF ALCOHOL

All alcohol percentage statements refer to percentage, by volume, of C_2H_5OH at 15.56°.

REAGENT STANDARDS

Standards, tests, and assays are provided to govern the quality of the reagents called for in the National Formulary tests and assays. Listing of these reagents, including indicators and solutions employed as reagents, in no way implies that they have therapeutic merit or utility; furthermore, their status as reagents as distinct from official articles is to be clearly indicated in their labeling.

When a test or assay calls for the use of an NF or USP article—other than an NF or USP Reference Standard—as a material standard of reference, a specimen meeting the specifications of the monograph for that article is to be used.

UNITS OF POTENCY

For those antibiotic, pharmacodynamic, and endocrine preparations as well as most of the enzymes, serums, toxins, vaccines, and related products, for which it is still necessary to express the potency in terms of units by reference to a suitable working standard (usually a USP or NF Reference Standard), the individual monographs refer to USP or NF Units of activity. These units are equivalent to the corresponding international units, where such exist, and to the units of activity established by the Food and Drug Administration in the case of antibiotics, and by the National Institutes of Health in the case of biological products.

The potency and dose of some drugs may be defined in terms of mcg. or mg. of the parent drug (*i.e.*, that portion of the molecule which is responsible for the pharmacologic activity), even though the drug may be used in the form of a salt, ester, or some other chemical combination. The full name of the drug is used in labeling.

INGREDIENTS AND PROCESSES

National Formulary dosage forms are prepared from ingredients that meet the requirements of the respective NF or USP monographs for those individual ingredients for which monographs are provided.

Preparations for which a complete composition is given in this National Formulary, unless specifically exempted herein or in the individual monographs, are to contain only the ingredients named in the formulas. However, there may be deviation from the specified processes or methods of compounding, though not from the ingredients or proportions thereof, provided the finished preparation conforms to the relevant standards laid down herein and to preparations produced by following the specified process.

Where a monograph for a preparation calls for an ingredient in an amount expressed on the dried basis, the ingredient need not be dried prior to use if due allowance is made for the water or other volatile substances present in the quantity taken.

Unless specifically exempted elsewhere in this National Formulary, the identity, strength, quality, and purity of an official article are determined by the definition, description (to the extent that it is applicable, see page 11), physical properties, tests, assays, and other specifications relating to the article, whether incorporated in the monograph itself, in the General Notices, or in the General Tests, Processes, Techniques, and Apparatus section.

Uniformity of Composition

While a demonstration of homogeneity in individual units of a given lot of a National Formulary dosage form may not always be practicable, variations in composition are undesirable and substantial differences in the content of active ingredient between individual capsules, tablets, and other dosage units are to be avoided. (See *Content Uniformity*, page 798.)

Denatured Alcohol

In the manufacture of National Formulary preparations in which alcohol is used only as a solvent and does not remain in the finished product, alcohol especially denatured by the addition of volatile substances, in accordance with federal statutes and regulations of the Internal Revenue Service, may be substituted, but the preparations so made must be identical with those prepared by the processes given in the monographs and must conform to the National Formulary standards set forth.

Added Substances

Unless otherwise specified in the individual monograph, or elsewhere in the General Notices, suitable substances such as bases, carriers, colors, flavors, preservatives, stabilizers, and vehicles may be added to a National Formulary dosage form to enhance its stability, usefulness, or pharmaceutical elegance, or to facilitate its preparation. Such substances may be regarded as suitable only if they are harmless in the amounts used, if they do not exceed a minimum quantity required to provide their intended effect, if their presence does not impair the therapeutic efficacy of the dosage form, and if they do not interfere with the assays and tests prescribed for determining compliance with the National Formulary standards.

Colors—Added substances used solely to impart color may be incorporated in National Formulary articles or preparations, except those intended for parenteral or ophthalmic use. A suitable coloring agent is one that meets the requirements of the Federal Food, Drug, and Cosmetic Act, and that is otherwise appropriate in all respects.

Capsules and Tablets—Capsules and tablets may be manufactured with suitable diluents, colors, lubricants, disintegrants, and adhesives, such as starches, lactose, sucrose, and other innocuous materials. Tablets and the contents of capsules which are intended to be homogeneous are uniform in appearance within a given lot. Substances that are highly adsorbent, *e.g.*, bentonite, are to be avoided in manufacturing tablets of the drugs used in small dosage, such as the cardiac glycosides, alkaloids, and the synthetic estrogens. Tablets may be coated.

Parenteral and Topical Preparations—For the preservation of preparations intended for parenteral administration or topical application, suitable antioxidants and/or antimicrobial preservatives may be added unless interdicted in the monograph. The presence and proportions of added substances, except those for the purpose of adjusting the pH or making the solution isotonic (wherein only the presence and statement of their effect need be stated), are plainly declared on the label of the original container in which the product is sold. The air in the container may be evacuated or be replaced by carbon dioxide, helium, or nitrogen, which fact need not be declared on the label. Surgical sutures may be colored.

Ointments and Suppositories—In official ointments and suppositories, the proportions of the substances constituting the base may be varied to maintain a suitable consistency under different climatic conditions, provided the concentrations of active ingredients are not varied.

TESTS AND ASSAYS

The analytical procedures described in this National Formulary have been designed on the basis that they will be performed by analytical personnel having appropriate training, and that the procedures will be conducted in accord with recognized principles of good analytical practice.

Apparatus

A specification for a definite size or type of container or apparatus in a test or assay is given solely as a recommendation. When volumetric flasks or other exact measuring, weighing, or sorting devices, are specified, this or other equipment of at least equivalent accuracy or calibration must be employed, (for example, see *Volumetric Apparatus*, page 899).

Where an instrument for physical measurement, such as a spectrophotometer, is specified in a test or assay by its distinctive name, another instrument of equivalent or greater sensitivity and accuracy may be used.

Where the use of a centrifuge is specified, the directions are predicated upon the use of apparatus having an effective radius of about 20 cm. (8 inches) and driven at a speed sufficient to clarify the supernatant layer within 15 minutes.

Where tubes or columns are specified, the dimensions refer to internal diameters, unless otherwise specified.

Steam Bath—Where the use of a steam bath is directed, exposure to actively flowing steam or the vapors of vigorously boiling water, or to another form of regulated heat, corresponding in temperature to that of flowing steam, may be used.

Water Bath—Where the use of a water bath is directed without qualification as to temperature, vigorously boiling water is intended.

Foreign Substances

Tests for the presence of foreign substances are provided to limit such substances to amounts that are unobjectionable under conditions in which the medicinal agent is customarily employed.

While one of the primary objects of the National Formulary is to assure the user of official medicinal substances of their identity, strength, quality, and purity, it is manifestly impossible to include in each monograph a test for every impurity or adulterant that might be present. Tests suitable for detecting impurities, the presence of which is inconsistent with good pharmaceutical practice, may be employed in addition to the tests provided.

Procedures

Assay and test procedures are provided for determining compliance with NF standards of purity and strength. Automated procedures employing the same basic chemistry as those procedures given in the monographs are also recognized as being suitable for determining compliance. Compliance also may be shown by use of alternative methods (including automated procedures), chosen for convenience under special circumstances, provided the results thereby obtained are of equivalent accuracy. However, in the event of doubt or dispute, only the result obtained by the procedure given in this National Formulary is authoritative.

In stating the appropriate quantities to be taken for assays, the use of the word "about" indicates a quantity within 10 percent of the specified amount. However, the quantity taken is accurately determined and the assay result is based upon this exact weight or volume. In performing assay or test procedures, not less than the specified number of dosage units should be taken for analysis. Proportionately larger or smaller quantities of sample weights and volumes than those specified may be taken, provided that such measurement is made with at least equivalent accuracy and that any subsequent steps, such as dilutions, are adjusted accordingly to provide concentrations equivalent to those specified and are made in a manner to provide at least equivalent accuracy.

Where it is directed in the assay of Tablets, to "weigh and finely powder not less than" a given number, usually 20, of the Tablets, it is intended that a counted number of tablets shall be weighed, and reduced to a powder. The portion of the powdered tablets taken for assay is representative of the whole Tablets, and, in turn, is weighed accurately.

Assays and tests, in which it is directed that the substance be previously dried, may be performed on the undried substance and the results calculated on the dried basis, provided a *Loss on drying* test is given in the monograph and that the moisture present will not interfere with the assay or test procedure.

Where the use of a pipet is directed for measuring a sample or an aliquot in conducting a test or an assay, the pipet conforms to the standards set forth on page 899, and is to be used in such manner that the error does not exceed the limit stated for a pipet of its size. Where a pipet is specified, a suitable buret, conforming to the standards set forth on page 899, may be used.

The term "exactly," or expressions such as "25.0 ml." or "25.0 mg.," used with respect to volumetric or gravimetric measurements, indicates that the quantity is to be "accurately measured", or "accurately weighed" within the limits stated under *Volumetric Apparatus*, page 899 or under *Weights and Balances*, page 902.

The term "transfer" is used generally to specify a quantitative manipulation.

The term "concomitantly," used in such expressions as "concomitantly determine" or "concomitantly measured," in directions for spectrophotometric assays and tests, is intended to denote that the determinations or measurements are to be performed in immediate succession.

Blank Determination—Where it is directed that "any necessary correction" be made by a blank determination, the determination is to be conducted using the same quantities of the same reagents treated in the same manner as the solution or mixture containing the portion of the substance under assay or test.

Desiccator—The expression "in a desiccator" specifies the use of a tightly closed container of suitable size and design which maintains an atmosphere of low moisture content by means of a suitable desiccant in effective condition, such as anhydrous calcium chloride, magnesium perchlorate, phosphorus pentoxide, or silica gel.

Dilution—Where it is directed that a solution be diluted "quantitatively and stepwise," an accurately measured portion is to be diluted by adding water, or other solvent if specified, in the proportion indicated. The choice of apparatus to be used should take into account the relatively larger errors generally associated with using small-volume volumetric apparatus (see page 899).

Drying to Constant Weight—The specification "dried to constant weight" means that the drying shall be continued until two consecutive weighings do not differ by more than 500 mcg. per g. of substance taken, the second weighing following an additional hour of drying.

Filter—Unless otherwise indicated the expression "filter" means that the solution should be filtered through filter paper.

Identification Tests—The National Formulary tests headed *Identification* are provided as an aid in verifying the identity of substances taken from labeled containers. Such tests, however specific, are not necessarily sufficient to establish proof of identity; but failure of a substance taken from a labeled container to meet the requirements of a prescribed identification test indicates that the substance may be mislabeled. Other tests and specifications in the monograph often contribute to establishing or confirming the identity of the substance under examination.

Ignition to Constant Weight—The specification "ignite to constant weight" means that the ignition shall be continued, at 800 ± 25° unless otherwise indicated, until two consecutive weighings do not differ by more than 500 mcg. per g. of substance taken, the second weighing following an additional 15-minute ignition period.

Indicators—Where the use of a test solution ("T.S.") as an indicator is specified in a test or an assay, 3 drops of the solution shall be added, unless otherwise directed.

Logarithms—Logarithms used in the assays are to the base 10.

Negligible—This term indicates a quantity not exceeding 500 mcg.

Odor—Terms such as "odorless," "practically odorless," "has a faint characteristic odor" or variations thereof in the *Description* apply to examination, after exposure to the air for 15 minutes, of either a freshly opened package of the article, for packages containing not more than 25 g., or, for larger packages, a portion of about 25 g. of the article that has been removed from its package to an open evaporating dish of about 100 ml. capacity. Except in those cases where a specified odor is prohibited, an odor designation is descriptive and is not to be regarded as a standard of quality for a particular lot of an article.

Overnight—The expression "overnight" indicates a time interval of approximately 16 hours.

Pressure Measurements—The term "mm. of mercury" used with respect to measurements of blood pressure, pressure within an apparatus, or atmospheric pressure refers to the use of a suitable manometer or barometer calibrated in terms of the pressure exerted by a column of mercury of the stated height.

Solutions—Unless otherwise specified in the individual monograph, all solutions are prepared with *Purified Water*, USP XVIII.

An expression such as "(1 in 10)" means that 1 part *by volume* of a liquid is to be diluted with, or 1 part *by weight* of a solid is to be dissolved in, sufficient of the diluent or solvent to make the volume of the finished solution 10 parts *by volume*.

Where solutions of a specific concentration are specified in an assay, standardized solutions of other normalities or molarities may be used provided allowance is made for the difference in concentration and the error of measurement is not increased thereby.

Specific Gravity—Unless otherwise stated, the specific gravity basis is 25°/25°, *i.e.*, the ratio of the weight of a substance in air at 25° to the weight of an equal volume of water at the same temperature.

Temperatures—Unless otherwise specified, all temperatures in this National Formulary are expressed in centigrade (Celsius) degrees. All measurements are made at 25° unless otherwise directed.

With respect to sterilization processes involving the use of steam under pressure, the stated temperatures are those at the exhaust line of the autoclave when the steam has completely replaced the air.

Time Limit—In conducting the limit tests for impurities (chloride, iron, etc.), 5 minutes shall be allowed for the reaction to take place unless otherwise specified.

Vacuum—The term "in vacuum" specifies exposure to a pressure of less than 20 mm. of mercury, unless otherwise indicated.

Water—Where water is called for in tests and assays, *Purified Water*, USP XVIII, is to be used. "Carbon dioxide-free water" is purified water that has been boiled vigorously for 5 minutes or more and allowed to cool while protected from absorption of carbon dioxide from the atmosphere.

Water and Loss on Drying—If the water of hydration or adsorbed water of a National Formulary article is determined by the titrimetric method, the test is usually provided under the heading of *Water*. If the determination is made by drying under specified conditions then the test is provided under the heading of *Loss on Drying*. The latter procedure is particularly specified for an article where it is desired to determine all volatile constituents including organic solvents, etc., as well as water.

Description

The *Description* in a monograph is intended to be relatively general in nature. The information embodied therein is usually provided simply to indicate the properties of an article complying with the monograph standards. Statements of chemical and physical attributes that are not definable within reasonably narrow limits—or are not intended to be so defined—are generally included in the *Description* rather than elsewhere in the monograph.

Solubility

The statements concerning solubilities given under the heading *Solubility* in the National Formulary monographs are not standards or tests for purity, but are provided primarily as information for those who use, prepare, and dispense drugs. Only when a special quantitative solubility test is given, and is designated as such, is it a test for purity.

Except as indicated above, the solubility of a National Formulary article in the given solvent is considered to be of minor importance as a means of identification or determination of purity; for these purposes dependence is placed upon the other tests provided in the monographs.

Approximate solubilities of National Formulary substances are indicated by the following descriptive terms:

Descriptive Term	Parts of Solvent Required for 1 Part of Solute
Very soluble	Less than 1
Freely soluble	From 1 to 10
Soluble	From 10 to 30
Sparingly soluble	From 30 to 100
Slightly soluble	From 100 to 1000
Very slightly soluble	From 1000 to 10,000
Practically insoluble, or Insoluble	More than 10,000

Soluble National Formulary articles, when brought into solution, may show slight physical impurities, such as fragments of filter paper, fibers, and dust particles, unless excluded by definite tests or other specifications in the individual monographs.

CATEGORIES AND DOSES

Category

A statement of Category usually is provided in each monograph as useful information. It indicates the therapeutic or pharmaceutic basis for recognition in the National Formulary and generally represents an application of the best known pharmacologic action of the article or of its active ingredient. The Category statement pertains to the administration of the drug systemically unless otherwise specified, or if the nature of the drug is such that it is obviously for nonsystemic use. The statement is not intended to limit in any way the choice or use of the article nor to indicate that it has no other activity or utility.

Usual Dose

The Usual Dose generally given in the monograph is that which may be expected ordinarily to produce in adults, following administration in the manner indicated at such time intervals as may be specified, the diagnostic, therapeutic, prophylactic, or other use for which the article is recognized. Administration is by the oral route unless otherwise specified. The Usual Dose is intended to serve only as a guide to the medical practitioner, who may vary it in the best interests of the patient's welfare and in accordance with the variables which affect the action of the drug.

The statements of dosage in the case of Capsules and Tablets are in terms of the content of active ingredient and seldom represent the total weight of the capsule contents or of the tablets.

In some instances, the dosage may be stated in terms of the pharmacologically active portion of the molecule in order to correlate for the information of the practitioner the weight equivalent to salts, esters, or other chemical forms of the same drug moiety.

Usual Dose Range

The Usual Dose Range is intended primarily to guide the pharmaceutical practitioner with respect to seeking confirmation of prescription orders. The time schedule and route of administration where given for the Usual Dose apply also to the Usual Dose Range, unless otherwise specified.

Dose Equivalents

All doses are expressed in the metric system. "Approximate" equivalents in the apothecary system may be obtained from the "Table of Metric Doses with Approximate Apothecary Equivalents." In labeling dosage forms in both the metric and apothecary systems, the approximate equivalent of the exact quantity is enclosed in parentheses.

When prepared dosage forms such as tablets, capsules, etc., are prescribed in the metric system, the corresponding "approximate" apothecary equivalent may be dispensed, and vice versa.

For converting specific quantities in a prescription order which requires compounding, or in converting a pharmaceutical formula from one system of weights or measures to the other, "exact" equivalents must be used (see *Equivalents of Weights and Measures*, page 965).

Sizes Available

The statement on sizes usually available of a dosage form given in the individual monograph is intended solely as information to medical practitioners, pharmaceutical practitioners, and others concerned with the manner in which dosage forms are commonly supplied. The statement on sizes usually available is not intended to bar the manufacture of the article in strengths differing from those listed, or to preclude its being packaged in different volumes, weights, or counts. Unless otherwise stated, the specifications provided in the monograph apply equally to articles packaged in sizes or strengths other than those listed.

PRESERVATION, PACKAGING, STORAGE, AND LABELING

Containers

The *container* is the device which holds the drug and which is or may be in direct contact with the drug. The *immediate container* is that which is in direct contact with the drug at all times. The *closure* is a part of the container.

Prior to its being filled, the container should be clean and dry. Special precautions and cleaning procedures may be necessary to ensure that extraneous particulate matter is not introduced into the dosage preparation. The container does not interact physically or chemically with the article placed in it so as to alter significantly the strength, quality, purity, safety, or effectiveness of the drug beyond the official requirements.

The National Formulary requirements for the use of specified containers apply to products when dispensed by the pharmacist unless otherwise indicated in the individual monograph.

Light-Resistant Container, page 795—A light-resistant container protects the contents from the effects of light by virtue of the specific properties of the material of which it is composed, including any coating applied to it. If light protection is required, a clear and colorless or a translucent container may be made light-resistant by means of an opaque enclosure in which case the label of the container bears a statement that the opaque covering is needed until the contents have been used.

Well-Closed Container—A well-closed container protects the contents from extraneous solids and from loss of the drug under the ordinary or customary conditions of handling, shipment, storage, and distribution.

Tight Container—A tight container protects the contents from contamination by extraneous liquids, solids or vapors, from loss of the drug, and from efflorescence, deliquescence, or evaporation under the ordinary or customary conditions of handling, shipment, storage, and distribution, and is capable of tight re-closure. Where a tight container is specified, it may be replaced by a hermetic container for a single dose of a drug.

A gas cylinder is a metallic tight container designed to hold a gas under pressure. As a safety measure, for carbon dioxide, cyclopropane, ethylene, helium, nitrous oxide, and oxygen, the Pin-Index Safety System of matched fittings, is recommended for cylinders of Size E or smaller.

Hermetic Container—A hermetic container is impervious to air or any other gas under the ordinary or customary conditions of handling, shipment, storage, and distribution.

Single-Dose Container—A single-dose container is a hermetic container holding a quantity of sterile drug intended for parenteral administration as a single dose, and which when opened cannot be re-sealed with assurance that sterility has been maintained.

Note—A single-dose container should not be confused with a "unit-dose container," which constitutes a single dose for a product which is generally not intended for parenteral administration.

Multiple-Dose Container—A multiple-dose container is a hermetic container that permits withdrawal of successive portions of the contents without changing the strength, quality, or purity of the remaining portion.

Storage Temperature

Specific directions are stated in certain monographs with respect to the temperature at which NF articles should be stored where it is considered that storage at lower or higher temperatures may produce undesirable results. The conditions are defined by these terms:

Cold—Any temperature not exceeding 8° (46° F.). A *refrigerator* is a cold place in which the temperature is maintained thermostatically between 2° and 8° (36° and 46° F.).

Cool—Any temperature between 8° and 15° (46° and 59° F.). An article for which storage in a cool place is indicated may also be stored in a refrigerator unless otherwise specified in the monograph.

Room Temperature—The temperature prevailing in a working area. *Controlled Room Temperature* is maintained thermostatically between 15° and 30° (59° and 86° F.).

Excessive Heat—The expression "excessive heat" designates temperatures above 40° (104° F.).

Protection from Freezing—Where, in addition to the risk of breakage of the original container, freezing subjects a product to loss of strength of potency or to destructive alteration of the dosage form, the container label bears appropriate notice to protect the product from freezing.

Storage in Bulk and Under Nonspecific Conditions

Bulk packages are exempt from the storage requirements when the products are intended for manufacture or for subsequent re-packaging for the dispenser or ultimate distributor. Where no specific storage directions or limitations are provided, it is to be understood that the storage conditions include protection from moisture, freezing, and excessive heat. Such storage areas shall include facilities which are clean and subject to appropriate sanitation and maintenance.

Labeling

Articles in this National Formulary are subject to compliance with such labeling requirements as may be promulgated by federal regulations in addition to the NF requirements set forth for the articles (see notice, page ii).

A shipping container, unless such container is also essentially the immediate container or the outside of the consumer package, is exempt from the labeling requirements of this National Formulary.

Labeling Vitamin-Containing Products—The vitamin content of National Formulary preparations shall be stated on the label in metric units. The amounts of vitamins A and D may be stated also in USP Units. Quantities of vitamin A declared in metric units refer to the equivalent amounts of vitamin A alcohol (retinol).

Amount of Ingredient per Dosage Unit—National Formulary articles in tablet, capsule, or other unit dosage form, shall be labeled to express the quantity of each therapeutically active ingredient contained in each such unit. National Formulary articles not in unit dosage form shall be labeled to express the quantity of each therapeutically active ingredient in 1 ml. or in 1 g., except that oral liquids may, alternatively, be labeled in terms of 5 ml.

Special Tablets—The label of any form of tablet intended for administration other than by swallowing intact bears a prominent indication of the manner in which it is to be used. Where a tablet is enteric-coated, the label so states.

Expiration Date—The monographs for several National Formulary articles, particularly those which are biologic in origin, require that the label bear an expiration date, which is determined conservatively as the date beyond which the article might not have the required potency, provided the article is stored under the prescribed storage conditions.

VEGETABLE AND ANIMAL DRUGS

The requirements for vegetable and animal drugs apply to the articles as they enter commerce; however, batches of such drugs intended solely for the manufacture or isolation of volatile oils, alkaloids, glycosides, or other active principles may depart from such requirements.

Foreign Matter

Vegetable and animal drugs are to be as free as reasonably practicable from microorganisms, insects, and other animal contamination, including animal excreta. Furthermore, they shall be free from pathogenic organisms. They shall show no abnormal discoloration, abnormal odor, sliminess, or other evidence of deterioration.

The amount of foreign inorganic matter in vegetable or animal drugs, estimated as *Acid-insoluble ash*, shall not exceed 2 percent of the weight of the drug, unless otherwise specified in the individual monograph.

Before vegetable drugs are ground or powdered, stones, dust, lumps of soil, and other foreign inorganic matter are removed by mechanical means.

In commerce it is seldom possible to obtain vegetable drugs in a state of absolute purity, and some adherent or admixed, innocuous, foreign matter usually is not detrimental. No poisonous, dangerous, or otherwise noxious foreign substance, however, may be present. Foreign organic matter includes any part of the plant not specified as constituting the drug.

Preservation

Vegetable or animal substances may be protected from insect infestation by means of a suitable fumigant, such as chloroform, carbon tetrachloride, or methyl bromide.

WEIGHTS AND MEASURES

Metric Units

The metric system of weights and measures is used in this National Formulary. The units and the abbreviations commonly employed are as follows:

m. = meter
cm. = centimeter
mm. = millimeter
μ = micron (0.001 mm.)
mμ = millimicron
kg. = kilogram
g. = gram
mg. = milligram
mcg. = microgram[*]
l. = liter
ml. = milliliter[†]
μl. = microliter

Percentage Solutions

Percentage concentrations of solutions are expressed as follows:

Percent Weight in Weight (w/w)—expresses the number of g. of a constituent in 100 g. of solution.

Percent Weight in Volume (w/v)—expresses the number of g. of a constituent in 100 ml. of solution, and is used regardless of whether water or another liquid is the solvent.

Percent Volume in Volume (v/v)—expresses the number of ml. of a constituent in 100 ml. of solution.

The term *percent*, as used in this National Formulary, without qualification means, for mixtures of solids, percent weight in weight; for solutions or suspensions of solids in liquids, percent weight in volume; for solutions of liquids in liquids, percent volume in volume; for mixtures of liquids in solids, percent volume in weight (*e.g.*, ointments); and for solutions of gases in liquids, percent weight in volume. For example, a 1 percent solution is prepared by dissolving 1 g. of a solid or 1 ml. of a liquid in sufficient of the solvent to make 100 ml. of the solution.

In dispensing prescription medications, slight changes in volume owing to variations in room temperatures may be disregarded.

---

[*] The abbreviation "mcg." has come into general use in pharmaceutical literature and labeling. The term "gamma," symbolized by γ, is customarily used for microgram in biochemical literature, while "μg" is generally accepted as the abbreviation in the literature of physics and physical chemistry.

[†] One milliliter (ml.) is used herein as the equivalent of 1 cubic centimeter (cc.).

MONOGRAPHS
on drugs, chemicals, and preparations

Acacia Syrup

Acacia, granular or powdered	**100 g.**
Sodium Benzoate	**1 g.**
Vanilla Tincture	**5 ml.**
Sucrose	**800 g.**
Purified Water, a sufficient quantity,	
To make	**1000 ml.**

Mix the acacia, sodium benzoate, and sucrose; then add 425 ml. of purified water, and mix well. Heat the mixture on a steam bath until solution is completed. When cool, remove the scum, add the vanilla tincture and sufficient purified water to make the product measure 1000 ml., and strain if necessary.

Packaging and storage—Preserve Acacia Syrup in tight containers, and avoid excessive heat.

CATEGORY—Vehicle.

Acetaminophen

4′-Hydroxyacetanilide

$C_8H_9NO_2$ Mol. wt. 151.17

Acetaminophen contains not less than 98.0 percent and not more than 100.5 percent of $C_8H_9NO_2$, calculated on the anhydrous basis.

Description—Acetaminophen occurs as a white, odorless, crystalline powder, possessing a slightly bitter taste.

Solubility—Acetaminophen is soluble in boiling water and in sodium hydroxide T.S. It is freely soluble in alcohol.

Identification—To 10 ml. of a solution of Acetaminophen (1 in 100) add 1 drop of ferric chloride T.S.: a violet-blue color is produced.

Melting range, page 814—Acetaminophen melts between 168° and 172°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Acetaminophen, previously dried over a suitable desiccant, exhibits maxima only at the same wavelengths as that of NF Acetaminophen Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 200,000 solution of Acetaminophen in 0.1 *N* hydrochloric acid in methanol (1 in 100) exhibits maxima and minima at the same wavelengths as that of NF Acetaminophen Reference Standard, similarly measured.

pH, page 824—The pH of a saturated solution of Acetaminophen is between 5.3 and 6.5.

Water, page 900—Determine the water content of Acetaminophen by the titrimetric method; not more than 0.5 percent is found.

Residue on ignition, page 858—Acetaminophen yields not more than 0.1 percent of residue on ignition.

Chloride, page 784—Shake 1 g. of Acetaminophen with 25 ml. of water, filter, and add 1 ml. of diluted nitric acid: the acidified filtrate shows no more chloride than corresponds to 0.2 ml. of 0.02 *N* hydrochloric acid (0.014 percent).

Sulfate, page 784—Shake 1 g. of Acetaminophen with 25 ml. of water, filter, and add 2 ml. of diluted acetic acid followed by 2 ml. of barium chloride T.S.: the mixture shows no more sulfate than corresponds to 0.2 ml. of 0.02 *N* sulfuric acid (0.02 percent).

Sulfide—Place about 2.5 g. of Acetaminophen in a 50-ml. beaker. Add 5 ml. of ethyl alcohol and 1 ml. of diluted hydrochloric acid. Moisten a piece of lead acetate test paper with water and fix to the underside of a watch glass. Cover the beaker with the watch glass so part of the lead acetate paper hangs down near the pouring spout of the beaker. Heat the contents of the beaker just to boiling on a hot plate: no coloration or spotting of the test paper occurs.

Heavy metals, *Method II*, page 806—The heavy metals limit for Acetaminophen is 10 parts per million.

Readily carbonizable substances, page 856—Dissolve 500 mg. of Acetaminophen in 5 ml. of sulfuric acid T.S.: the solution has no more color than Matching Fluid A.

Free *p*-aminophenol—Dissolve 8 mg. of sodium acetate in 50 ml. of water, and prepare a slurry of this solution with 20 g. of silica gel HR containing colloidal silicon dioxide as a binder. From this slurry, prepare a chromatographic plate (see page 789) having a 0.5-mm. layer of the silica gel. To the plate apply 50 μl. of a solution of Acetaminophen in alcohol containing 200 mg. per ml., and 50 μl. of a standard solution of *p*-aminophenol in alcohol containing 50 mg. per ml. Allow the spots to dry, and develop the chromatogram in an unsaturated chamber in a solvent system consisting of methyl ethyl ketone and acetic acid (9:1) until the solvent front has moved at least 15-cm. from the origin. Remove the plate from the developing chamber, and allow the solvent to evaporate. Spray the plate with a 1 in 1000 solution of *p*-dimethylaminocinnamaldehyde in alcohol containing 1 percent hydrochloric acid, and locate the spots by visual inspection after 2 minutes: any red spot produced by the sample, at an R_f value of about 0.25, is no greater in size or intensity than the red spot produced by the standard at the same R_f value, corresponding to not more than 0.25 percent of free *p*-aminophenol.

***p*-Chloroacetanilide**—Transfer 1.0 g. of Acetaminophen to a 15-ml. glass-stoppered centrifuge tube, add 5.0 ml. of ether, shake mechanically for 30 minutes, and centrifuge at 1000 r.p.m. for 15 minutes or until a clean separation is obtained. Apply 100 μl. of the supernatant liquid to a chromatographic plate, prepared as directed under *Free p-aminophenol*, and apply 20 μl. of a standard solution in alcohol containing 10 mcg. of *p*-chloroacetanilide per ml. to the same plate. Allow the spots to dry, and develop the chromatogram in an unsaturated chamber in a solvent system consisting of chloroform-benzene-acetone (65:10:25) until the solvent front has moved at least 12 cm. from the origin. Remove the plate from the developing chamber, and allow the solvent to evaporate. Irradiate the plate under shortwave ultraviolet light at a distance of about 4 cm. above the plate for 10 minutes, and without delay locate the spots by visual inspection under longwave ultraviolet light: any light blue fluorescent spot produced by the sample, at an R_f value of about 0.5–0.6, is no greater in size or intensity than that produced by the standard at the same R_f value, corresponding to not more than 10 parts per million of *p*-chloroacetanilide.

Assay—Transfer to a 250-ml. volumetric flask about 125 mg. of Acetaminophen, accurately weighed, add methanol to volume, and mix. Transfer 5.0 ml. of this solution to a 500-ml. volumetric flask, add 5 ml. of 0.1 *N* hydrochloric acid, and dilute to volume with methanol. Concomitantly determine the absorbance of this solution and of a solution of NF Acetaminophen Reference Standard, in the same medium, at a concentration of about 5 mcg. per ml. in 1-cm. cells, at the maximum at about 249 mμ, with a suitable spectrophotometer, using methanol containing 1 ml. of 0.1 *N* hydrochloric acid per 100 ml. as the blank. Calculate the quantity, in mg., of $C_8H_9NO_2$ in the Acetaminophen taken, by the formula $25C \times (A_U/A_S)$, in which C is the exact concentration of the Reference Standard solution, in mcg. per ml., A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Acetaminophen in tight, light-resistant containers.

CATEGORY—Analgesic.

USUAL DOSE—**650 mg.** every 4 hours.

USUAL DOSE RANGE—**325 mg. to 650 mg.** Not to exceed **2.6 g.** per 24-hour period.

Acetaminophen Elixir

Acetaminophen Elixir contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_8H_9NO_2$.

Identification—The solution prepared for measurement of absorbance in the *Assay* exhibits a maximum at 249 ± 2 mμ.

pH, page 824—The pH of Acetaminophen Elixir is between 3.8 and 6.1.

Assay—

Standard preparation—Transfer about 80 mg. of NF Acetaminophen Reference Standard, accurately weighed, to a 100-ml. volumetric flask, add methanol to volume, and mix. Transfer 10.0 ml. of this solution to a second 100-ml. volumetric flask, dilute to volume with methanol, and mix. Transfer 10.0 ml. of this last solution to a

100-ml. volumetric flask, add 1 ml. of 0.1 *N* hydrochloric acid, dilute to volume with methanol, and mix.

Chromatographic column—Pack a pledget of fine glass wool in the base of a chromatographic tube (25 × 250-mm. tube to which is fused a 5-cm. length of 7-mm. tubing) with the aid of a tamping rod about 45 cm. in length and having a disk with a diameter about 1-mm. less than that of the tube. To 2 g. of purified siliceous earth in a 100-ml. beaker, add 2.0 ml. of a solution containing 1.0 g. of sodium bicarbonate and 4.5 g. of sodium carbonate in each 100 ml., and mix until a fluffy mixture is obtained. Transfer the mixture to the chromatographic tube, and tamp gently to compress the material to a uniform mass.

Assay preparation—Transfer an accurately measured volume of Acetaminophen Elixir, equivalent to about 240 to 250 mg. of acetaminophen, to a 250-ml. volumetric flask, add 2 ml. of sodium hydroxide T.S., dilute to volume with water, and mix. Transfer 2.0 ml. of this solution to a 100-ml. beaker, add 1 drop of hydrochloric acid, swirl to mix, and then add 3.0 g. of purified siliceous earth. Mix thoroughly, and transfer to the chromatographic column. Scrub the beaker with 1 g. of purified siliceous earth mixed with 2 drops of water, transfer the washings to the column, and tamp gently. Place a pledget of fine glass wool on top of the column. Wash the column with 100 ml. of water-saturated chloroform, and discard the eluate. Elute the acetaminophen with 150 ml. of water-saturated ether, collecting the eluate in a 400-ml. beaker. Evaporate the ether to dryness on a steam bath with the aid of a current of air, dissolve the residue in a solvent mixture consisting of 1 ml. of 0.1 *N* hydrochloric acid per 100 ml. of methanol, and quantitatively transfer to a 50-ml. volumetric flask. Rinse the beaker with the solvent mixture, adding the rinsings to the flask, dilute to volume with the solvent mixture, and mix. Transfer 10.0 ml. of this solution to a second 50-ml. volumetric flask, dilute to volume with the solvent mixture, and mix.

Procedure—Concomitantly determine the absorbance of the solutions in 1-cm. cells, at the maximum at about 249 mμ, with a suitable spectrophotometer, using a solvent mixture consisting of 1 ml. of 0.1 *N* hydrochloric acid per 100 ml. of methanol as the blank. Record the absorbance of the *Standard preparation* as A_S and that of the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_8H_9NO_2$ in each ml. of the Elixir taken by the formula $31.25 \times (C/V) \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*, and V is the volume, in ml., of the Elixir taken.

Alcohol content, page 772—Determine the alcohol content by the gas-liquid chromatographic procedure, using acetone as the internal standard: Acetaminophen Elixir contains from 6.5 to 10.5 percent (v/v) of C_2H_5OH.

Packaging and storage—Preserve Acetaminophen Elixir in tight containers and avoid continuous excessive cold.

Elixirs available—Acetaminophen Elixir usually available contains the following amounts of acetaminophen: 100 mg. in 1 ml. and 120 mg. in 5 ml.

CATEGORY and DOSE—See Acetaminophen.

Acetaminophen Tablets

Acetaminophen Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_8H_9NO_2$.

Identification—Triturate an amount of powdered Acetaminophen Tablets, equivalent to about 1 g. of acetaminophen, with 30 ml. of warm alcohol, cool, and filter. Dilute 3 ml. of the filtrate with 10 ml. of water and add 1 drop of ferric chloride T.S.: a violet-blue color is produced.

Disintegration, page 878—The disintegration time limit for Acetaminophen Tablets is 30 minutes.

Weight variation, page 901—Acetaminophen Tablets meet the requirements of the weight variation test for tablets.

Assay—Weigh and finely powder not less than 20 Acetaminophen Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 125 mg. of acetaminophen, to a separator, add 10 ml. of water, and shake well. Completely extract with successive portions of a mixture of chloroform and alcohol (3:1). Filter the extracts through a pledget of cotton into a beaker and wash the filter with several small portions of the mixed solvent. Evaporate the combined filtrate and washings on a steam bath with the aid of a current of air. Transfer the residue, with the aid of methanol, to a 250-ml. volumetric flask, dilute to volume with methanol, and mix. Transfer 5.0 ml. of the solution to a 500-ml. volumetric flask, add 5 ml. of 0.1 *N* hydrochloric acid, dilute to volume with methanol, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Acetaminophen Reference Standard, in the same medium, at a concentration of about 5 mcg. per ml. in 1-cm. cells, at the maximum at about 249 mμ, with a suitable spectrophotometer, using methanol containing 1 ml. of 0.1 *N* hydrochloric acid per 100 ml. as the blank. Calculate the quantity, in mg., of $C_8H_9NO_2$ in the portion of the Tablets taken, by the formula $25C \times (A_U/A_S)$, in which C is the exact concentration of the Reference Standard solution, in mcg. per ml., A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Acetaminophen Tablets in tight, light-resistant containers.

Tablets available—Acetaminophen Tablets usually available contain the following amount of acetaminophen: 325 mg.

CATEGORY and DOSE—See Acetaminophen.

Acetate, Potassium, page 570
Acetate, Sodium, page 635

Diluted Acetic Acid

Diluted Acetic Acid is a solution containing, in each 100 ml., not less than 5.7 g. and not more than 6.3 g. of $C_2H_4O_2$.

Diluted Acetic Acid may be prepared as follows.

Acetic Acid	**158 ml.**
Purified Water, a sufficient quantity,	
To make	**1000 ml.**

Mix the ingredients.

Description—Diluted Acetic Acid is a clear, colorless liquid having a characteristic odor and a sharply acid taste. Its specific gravity is about 1.008.

Solubility—Diluted Acetic Acid is miscible with water, with alcohol, and with glycerin.

Identification—Diluted Acetic Acid responds to the tests for *Acetate,* page 807.

Nonvolatile residue—Evaporate 20 ml. of Diluted Acetic Acid in a tared porcelain dish on a steam bath, and dry at 105° for 1 hour: the weight of the residue does not exceed 1 mg. (50 parts per million).

Chloride—Add 5 drops of silver nitrate T.S. to 10 ml. of a solution of Diluted Acetic Acid (6 in 10): no opalescence is produced.

Sulfate—Add 5 drops of barium chloride T.S. to 10 ml. of a solution of Diluted Acetic Acid (6 in 10): no turbidity is produced.

Heavy metals, page 806—Evaporate 5 ml. of Diluted Acetic Acid to dryness in a porcelain dish on a steam bath. Warm the residue with 2 ml. of diluted acetic acid, and dilute to 25 ml. with water: the heavy metals limit for Diluted Acetic Acid is 10 parts per million.

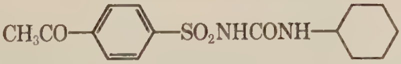
Readily oxidizable substances—To 20 ml. of Diluted Acetic Acid in a glass-stoppered flask, add 0.3 ml. of 0.1 *N* potassium permanganate: the pink color is not changed to brown at once, and the liquid does not become entirely brown or free from a pink tint in less than 30 seconds.

Assay—Transfer 25.0 ml. of Diluted Acetic Acid to a flask, and add 15 ml. of carbon dioxide-free water. Add 3 drops of phenolphthalein T.S., and titrate with 1 *N* sodium hydroxide. Each ml. of 1 *N* sodium hydroxide is equivalent to 60.05 mg. of $C_2H_4O_2$.

Packaging and storage—Preserve Diluted Acetic Acid in tight containers.

CATEGORY—Solvent.

Acetohexamide



1-[(*p*-Acetylphenyl)sulfonyl]-3-cyclohexylurea

$C_{15}H_{20}N_2O_4S$ Mol. wt. 324.40

Acetohexamide contains not less than 97.0 percent and not more than 101.0 percent of $C_{15}H_{20}N_2O_4S$, calculated on the dried basis.

Description—Acetohexamide occurs as a white, crystalline powder. It is practically odorless.

Solubility—Acetohexamide is practically insoluble in water and in ether, and slightly soluble in alcohol and in chloroform. It is soluble in pyridine and in dilute solutions of alkali hydroxides.

Identification—Dissolve about 100 mg. of 2,4-dinitrophenylhydrazine in 1 ml. of sulfuric acid, and cautiously add 5 ml. of alcohol. Cool, filter if necessary to obtain a clear solution, add 5 ml. of a solution of Acetohexamide in hot alcohol (1 in 200), and warm on a steam bath: an orange-yellow precipitate forms.

Melting range, *Class Ia,* page 814—Acetohexamide melts between 184° and 189°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Acetohexamide exhibits maxima only at the same wavelengths as that of NF Acetohexamide Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 100,000 solution of Acetohexamide in 0.01 *N* sodium hydroxide exhibits maxima and minima at the same wavelengths as that of NF Acetohexamide Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance occurring at about 247 mμ, do not differ by more than 3 percent.

X-ray diffraction, page 902—The X-ray diffraction pattern of Acetohexamide conforms to the following pattern:

d	I/I_1
16.05	20
9.60	100
7.89	5
5.90	1
5.35	100
4.98	60

2.08	4
2.04	8
1.96	8
1.72	1
1.62	1

Loss on drying, page 814—Dry Acetohexamide at 105° for 3 hours: it loses not more than 1 percent of its weight.

Selenium—A *Test Preparation* prepared with 100 mg. of Acetohexamide and 100 mg. of magnesium oxide meets the requirements of the *Selenium Limit Test,* page 865 (30 parts per million).

Residue on ignition, page 858—Acetohexamide yields not more than 0.1 percent of residue on ignition.

Heavy metals, *Method II,* page 806—The heavy metals limit for Acetohexamide is 20 parts per million.

Assay—Dissolve about 300 mg. of Acetohexamide, accurately weighed, in 40 ml. of dimethylformamide, add 5 drops of thymol blue T.S., and titrate using a magnetic stirrer with 0.1 *N* sodium methoxide to a blue end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* sodium methoxide is equivalent to 32.44 mg. of $C_{15}H_{20}N_2O_4S$.

Packaging and storage—Preserve Acetohexamide in well-closed containers.

CATEGORY—Hypoglycemic.

USUAL DOSE—**250 mg.** to **1.0 g.** daily.

USUAL DOSE RANGE—**250 mg.** to **1.5 g.** daily.

Acetohexamide Tablets

Acetohexamide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{15}H_{20}N_2O_4S$.

Identification—The solution prepared for measurement of absorbance in the *Assay* exhibits a maximum at 249 ± 2 mμ.

Dissolution, *Method I,* page 802—Not less than 15 percent of the labeled amount of $C_{15}H_{20}N_2O_4S$ in Acetohexamide Tablets dissolves into solution within 20 minutes, not less than 30 percent dissolves within 40 minutes, and not less than 50 percent dissolves within 60 minutes, using a stirring speed of 100 r.p.m. and pH 7.6 standard buffer solution as the *Dissolution Fluid.*

Determine the amount of $C_{15}H_{20}N_2O_4S$ in solution by determining the ultraviolet absorption of aliquots removed from the dissolution solution, at 245 mμ, in 1-cm. cells, with a suitable spectrophotometer, using pH 7.6 standard buffer solution as the blank and utilizing a standard curve, representing absorbance *versus* concentration of NF Acetohexamide Reference Standard.

Weight variation, page 901—Acetohexamide Tablets meet the requirements of the weight variation test for tablets.

Assay—Weigh and finely powder not less than 20 Acetohexamide Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 500 mg. of acetohexamide, to a 100-ml. volumetric flask, add 60 ml. of 0.1 *N* sodium hydroxide, and shake for 30 minutes. Dilute to volume with water, mix, and filter, discarding the first 20-ml. of the filtrate. Transfer 20.0 ml. of the subsequent filtrate to a 125-ml. separator, add 2 ml. of diluted hydrochloric acid, and extract with four 40-ml. portions of chloroform, filtering each portion through chloroform-washed paper into a 200-ml. volumetric flask. Dilute to volume with chloroform, and mix. Transfer 20.0 ml. of this solution to a suitable beaker, and evaporate to dryness on a steam bath. Transfer the residue quantitatively, with the aid of 0.1 *N* sodium hydroxide, into a 100-ml. volumetric flask, add 0.1 *N* sodium hydroxide to volume, and mix. Transfer 10.0 ml. of this solution to a third 100-ml. volumetric flask, dilute to volume with water, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Acetohexamide Reference Standard, in the same medium, at a concentration of about 10 mcg. per ml., in 1-cm. cells, at the maximum at about 249 mμ, with a suitable spectrophotometer, using 0.01 *N* sodium hydroxide as the blank. Calculate the quantity, in mg., of $C_{15}H_{20}N_2O_4S$ in the portion of the Tablets taken by the formula $50C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Acetohexamide Tablets in well-closed containers.

Tablets available—Acetohexamide Tablets usually available contain the following amounts of acetohexamide: 250 and 500 mg.

CATEGORY and DOSE—See Acetohexamide.

Acetone

CH_3COCH_3

2-Propanone

C_3H_6O Mol. wt. 58.08

Acetone contains not less than 99.0 percent of C_3H_6O.

Caution: Acetone is very flammable. Do not use where it may be ignited.

Description—Acetone is a transparent, colorless, mobile, volatile liquid, having a characteristic odor. A solution of Acetone (1 in 2) is neutral to litmus.

Solubility—Acetone is miscible with water, with alcohol, with ether, with chloroform, and with most volatile oils.

Identification—

A: Add 1 ml. of sodium hydroxide T.S. to 1 ml. of a solution of Acetone (1 in 200), warm the mixture, and add a few ml. of iodine T.S.: a yellow precipitate of iodoform appears immediately.

B: Mix 1 ml. of a solution of Acetone (1 in 200) with 5 drops of sodium nitroferricyanide T.S. and 2 ml. of sodium hydroxide T.S., and add a slight excess of acetic acid: a deep red color is produced which develops a bluish purple tint when the mixture is diluted with several volumes of water.

Specific gravity, page 866—The specific gravity of Acetone is not more than 0.789, indicating not less than 99.0 percent of C_3H_6O.

Distilling range, page 782—Acetone distils between 55.5° and 57°.

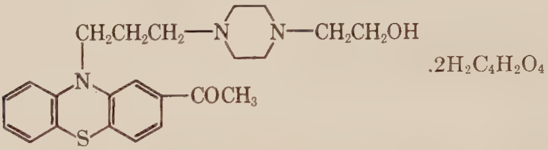
Nonvolatile residue—Evaporate 50 ml. of Acetone in a tared porcelain dish on a steam bath, and dry at 105° for 1 hour: the weight of the residue does not exceed 2 mg. (40 parts per million).

Readily oxidizable substances—Mix 20 ml. of Acetone with 0.1 ml. of 0.1 *N* potassium permanganate in a glass-stoppered bottle: the permanganate color of the mixture does not wholly disappear within 15 minutes.

Packaging and storage—Preserve Acetone in tight containers, remote from fire.

CATEGORY—Solvent.

Acetophenazine Maleate*



10-[3-[4-(2-Hydroxyethyl)-1-piperazinyl]propyl]phenothiazin-2-yl Methyl Ketone Maleate (1:2)

$C_{23}H_{29}N_3O_2S\,.\,2C_4H_4O_4$ Mol. wt. 643.72

Acetophenazine Maleate, dried at 65° for 4 hours, contains not less than 97.0 percent and not more than 103.0 percent of $C_{23}H_{29}N_3O_2S\,.\,2C_4H_4O_4$.

Description—Acetophenazine Maleate occurs as a fine, yellow powder. It melts between 165° and 175° with decomposition.

Solubility—Acetophenazine Maleate is soluble in water. It is slightly soluble in acetone and in alcohol.

Identification—Prepare a solution of Acetophenazine Maleate in methanol containing 1 mg. per ml. On a suitable thin-layer chromatographic plate (see page 791), coated with a 0.25-mm. layer of chromatographic silica gel mixture, spot 10 µl. of this solution and 10 µl. of a methanol solution of NF Acetophenazine Maleate Reference Standard containing 1 mg. per ml. Allow the spots to dry, and develop the chromatogram, using acetone–stronger ammonia water (95:5) as the solvent, until the solvent front has moved about three-fourths of the length of the plate. Allow the solvent to evaporate, and locate the spots using longwave ultraviolet light: the R_f value of the main spot obtained from the sample solution corresponds to that obtained from the Reference Standard solution.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Acetophenazine Maleate, previously dried at 65° for 4 hours, exhibits maxima only at the same wavelengths as that of NF Acetophenazine Maleate Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 30,000 solution of Acetophenazine Maleate in methanol exhibits maxima and minima at the same wavelengths as that of NF Acetophenazine Maleate Reference Standard, similarly measured, and the respective absorptivities, at the point of maximum absorbance occurring at about 243 mµ, do not differ by more than 3 percent.

Loss on drying, page 814—Dry Acetophenazine Maleate at 65° for 4 hours: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Acetophenazine Maleate yields not more than 0.1 percent of residue on ignition.

Assay—Dissolve about 500 mg. of Acetophenazine Maleate, previously dried at 65° for 4 hours and accurately weighed, in 50 ml. of glacial acetic acid, warming slightly to effect solution. Cool to room temperature, add 10 ml. of acetic anhydride, and allow to stand for 5 minutes. Add 1 drop of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a green-yellow end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 32.19 mg. of $C_{23}H_{29}N_3O_2S.2C_4H_4O_4$.

Packaging and storage—Preserve Acetophenazine Maleate in tight containers.

CATEGORY—Tranquilizer (major).

USUAL DOSE—**20 mg.** three times a day.

USUAL DOSE RANGE—**40** to **80 mg.** per day.

---

* Patented. See notice, page ii.

Acetophenazine Maleate Tablets

Acetophenazine Maleate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{23}H_{29}N_3O_2S\,.\,2C_4H_4O_4$.

Identification—Heat a quantity of finely powdered Acetophenazine Maleate Tablets, equivalent to about 20 mg. of acetophenazine maleate, with 20 ml. of methanol on a steam bath for 5 minutes, with occasional swirling. Cool to room temperature, add methanol to restore to original volume, shake vigorously for 2 minutes, and filter. A 10-µl. portion of the filtrate meets the requirements of the *Identification test* under *Acetophenazine Maleate*, page 22.

Disintegration, page 878—The disintegration time limit for Acetophenazine Maleate Tablets is 30 minutes.

Content uniformity, *Method I,* page 799—Acetophenazine Maleate Tablets meet the requirements of the content uniformity test for tablets.

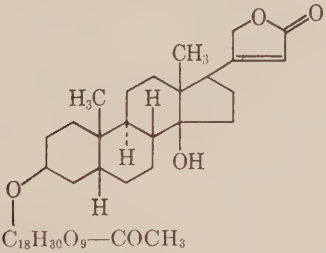
Assay—Weigh and finely powder not less than 20 Acetophenazine Maleate Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 20 mg. of acetophenazine maleate, to a separator, add 50 ml. of sodium chloride solution (1 in 5), and sufficient sodium hydroxide solution (1 in 10) to adjust to pH 11, and allow to cool to room temperature. Extract with four 40-ml. portions of solvent hexane. Extract the combined solvent hexane extracts with three 50-ml. portions of 0.1 *N* hydrochloric acid, combining the acid extracts in a 200-ml. volumetric flask. Dilute to volume with 0.1 *N* hydrochloric acid, and mix. Transfer 10.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with 0.1 *N* hydrochloric acid, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Acetophenazine Maleate Reference Standard, in the same medium, at a concentration of about 10 mcg. per ml., in 1-cm. cells, at the maximum at about 278 mµ, with a suitable spectrophotometer, using 0.1 *N* hydrochloric acid as the blank. Calculate the quantity, in mg., of $C_{23}H_{29}N_3O_2S.2C_4H_4O_4$ in the portion of the Tablets taken by the formula $2C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Acetophenazine Maleate Tablets in tight containers.

Tablets available—Acetophenazine Maleate Tablets usually available contain the following amount of acetophenazine maleate: 20 mg.

CATEGORY and DOSE—See Acetophenazine Maleate.

Acetyldigitoxin*



(acetyltridigitoxose)

α-Digitoxin Monoacetate

$C_{43}H_{66}O_{14}$ Mol. wt. 807.00

Acetyldigitoxin contains not less than 95.0 percent and not more than 100.5 percent of $C_{43}H_{66}O_{14}$, calculated on the dried basis.

Caution: Acetyldigitoxin is extremely poisonous.

Description—Acetyldigitoxin occurs as a white, odorless, microcrystalline powder. It is hygroscopic.

Solubility—Acetyldigitoxin is soluble in methanol and sparingly soluble in chloroform. It is slightly soluble in alcohol and practically insoluble in water.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Acetyldigitoxin exhibits maxima only at the same wavelengths as that of NF Acetyldigitoxin Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 20,000 solution of Acetyldigitoxin in methanol exhibits maxima and minima at the same wavelengths as that of NF Acetyldigitoxin Reference Standard, similarly measured.

Loss on drying, page 814—Dry Acetyldigitoxin at 105° for 4 hours: it loses not more than 10 percent of its weight.

Residue on ignition, page 858—Acetyldigitoxin yields not more than 0.1 percent of residue on ignition.

---

* Patented. See notice, page ii.

Assay—Transfer about 100 mg. of Acetyldigitoxin, accurately weighed, to a 100-ml. volumetric flask, add methanol to volume, and mix. Transfer 5.0 ml. of this solution to a second 100-ml. volumetric flask, dilute to volume with methanol, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Acetyldigitoxin Reference Standard, in the same medium, at a concentration of about 50 mcg. per ml., in 1-cm. cells, at the maximum at about 217 mμ, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg., of $C_{43}H_{66}O_{14}$ in the Acetyldigitoxin taken by the formula $2C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Acetyldigitoxin in tight, light-resistant containers.

CATEGORY—Cardiotonic.

USUAL DOSE—Initial—rapid digitalization, **1.8 mg.** in one dose or several divided doses given within 24 hours; slow digitalization, **2.4 mg.** in divided doses given over a period of 2 to 6 days; maintenance, **150 mcg.** per day.

USUAL DOSE RANGE—Rapid digitalization, **1.6** to **2.2 mg.**; slow digitalization, **1.8** to **3.2 mg.**; maintenance, **100** to **200 mcg.**

Acetyldigitoxin Tablets

Acetyldigitoxin Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{43}H_{66}O_{14}$.

Identification—Shake a quantity of powdered Acetyldigitoxin Tablets, equivalent to about 200 mcg. of acetyldigitoxin, with 10 ml. of a freshly prepared solution of *m*-dinitrobenzene in alcohol (1 in 100), and filter. Add 1 ml. of tetraethylammonium hydroxide solution (1 in 10) to the filtrate, and mix: a reddish violet color slowly forms and then fades.

Disintegration, page 878—The disintegration time limit for Acetyldigitoxin Tablets is 30 minutes.

Content uniformity, *Method I*, page 799—Acetyldigitoxin Tablets meet the requirements of the content uniformity test for tablets.

Assay—

Standard preparation—Weigh accurately about 40 mg. of NF Acetyldigitoxin Reference Standard, previously dried at 105° for 4 hours, and dissolve in sufficient alcohol to make 100.0 ml. Dilute 20.0 ml. of this solution to 100.0 ml. with alcohol, and mix.

Assay preparation—Weigh and finely powder not less than 20 Acetyldigitoxin Tablets. Accurately weigh a portion of the powder, equivalent to about 1 mg. of acetyldigitoxin, and transfer it to a 50-ml. glass-stoppered flask. Add about 30 ml. of chloroform-methanol mixture (2:1), and shake mechanically for 30 minutes. Filter into a 50-ml. volumetric flask, wash the original flask with several portions of the solvent mixture, and filter into the same flask. Dilute to volume with the solvent mixture, and mix. Evaporate 20.0 ml. of this solution to dryness with a rotary vacuum evaporator, using a room temperature water bath, and dissolve the residue in 5.0 ml. of alcohol.

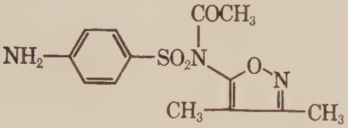
Procedure—To the *Assay preparation*, to 5.0 ml. of the *Standard preparation*, and to 5.0 ml. of alcohol to serve as the blank, add 10.0 ml. of alkaline picrate T.S., and mix by swirling. Allow the solutions to stand, protected from intense light, for 15 minutes, swirling the flasks occasionally. Concomitantly determine the absorbances of the solutions in 1-cm. cells at the maximum at about 485 mμ, with a suitable spectrophotometer, against the reagent blank. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{43}H_{66}O_{14}$ in the portion of Tablets taken by the formula $0.0125C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*.

Packaging and storage—Preserve Acetyldigitoxin Tablets in well-closed containers.

Tablets available—Acetyldigitoxin Tablets usually available contain the following amounts of acetyldigitoxin: 100 and 200 mcg.

CATEGORY and DOSE—See Acetyldigitoxin.

Acetyl Sulfisoxazole*



N-(3,4-Dimethyl-5-isoxazolyl)-*N*-sulfanilylacetamide

$C_{13}H_{15}N_3O_4S$ Mol. wt. 309.35

Acetyl Sulfisoxazole contains not less than 98.0 percent and not more than 100.5 percent of $C_{13}H_{15}N_3O_4S$, calculated on the dried basis.

Description—Acetyl Sulfisoxazole occurs as a white or slightly yellow, crystalline powder.

Solubility—Acetyl Sulfisoxazole is practically insoluble in water. It is slightly soluble in alcohol, and is sparingly soluble in chloroform.

Identification—

A: Dissolve about 10 mg. of Acetyl Sulfisoxazole in 1 ml. of hydrochloric acid, and heat at 100° for 1 minute. Cool the solution, add 10 ml. of water, then add 3 drops of sodium nitrite solution (1 in 100) and 1 ml. of betanaphthol T.S.: an orange precipitate is formed.

B: Place 100 mg. of Acetyl Sulfisoxazole in a test tube, and add 2 ml. of sodium hydroxide solution (1 in 10). Boil for 2 minutes, cool, and carefully add diluted hydrochloric acid dropwise until, first, a precipitate is formed, and then until the precipitate dissolves. Neutralize the solution by adding calcium carbonate in small portions until there is no further evolution of gas. Filter, and add to the filtrate 3 drops of ferric chloride T.S.: a reddish brown color is produced.

Melting range, page 814—Acetyl Sulfisoxazole melts between 192° and 195°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Acetyl Sulfisoxazole, previously dried at 105° for 3 hours, exhibits maxima only at the same wavelengths as that of NF Acetyl Sulfisoxazole Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 100,000 solution of Acetyl Sulfisoxazole in alcohol exhibits maxima and minima at the same wavelengths as that of NF Acetyl Sulfisoxazole Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance, occurring at about 290 mμ, do not differ by more than 3 percent.

Loss on drying, page 814—Dry Acetyl Sulfisoxazole at 105° for 3 hours: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Acetyl Sulfisoxazole yields not more than 0.1 percent of residue on ignition.

Selenium—A *Test Preparation* prepared with 200 mg. of Acetyl Sulfisoxazole meets the requirements of the *Selenium Limit Test*, page 865 (30 parts per million).

Heavy metals, *Method II*, page 806—The heavy metals limit for Acetyl Sulfisoxazole is 20 parts per million.

Assay—Transfer about 1 g. of Acetyl Sulfisoxazole, accurately weighed, to a 250-ml. beaker. Add 15 ml. of glacial acetic acid, swirl to dissolve the sample, then add 2 ml. of sulfuric acid, 25 ml. of hydrochloric acid, and 80 ml. of water. Cool the solution, and titrate immediately with 0.1 *M* sodium nitrite, determining the end-point electrometrically, using calomel and platinum electrodes. Each ml. of 0.1 *M* sodium nitrite is equivalent to 30.94 mg. of $C_{13}H_{15}N_3O_4S$.

Packaging and storage—Preserve Acetyl Sulfisoxazole in tight, light-resistant containers.

CATEGORY—Antibacterial.

USUAL DOSE—Initial, **4.6 g.**, the equivalent of **4 g.** of sulfisoxazole; then **1.15 g.**, the equivalent of **1 g.** of sulfisoxazole, every 4 to 6 hours.

USUAL DOSE RANGE—**1.15 g.** to **2.3 g.** every 4 to 6 hours.

---

* Patented. See notice, page ii.

Acetyl Sulfisoxazole Oral Suspension

Acetyl Sulfisoxazole Oral Suspension contains an amount of acetyl sulfisoxazole equivalent to not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{11}H_{13}N_3O_3S$ (sulfisoxazole).

Identification—Centrifuge a portion of Acetyl Sulfisoxazole Oral Suspension, wash the separated solid by centrifugation with several portions of water, and recrystallize from hot alcohol: the crystals so obtained respond to the *Identification tests*, and meet the requirements for *Ultraviolet absorption* under *Acetyl Sulfisoxazole*, page 25.

pH, page 824—The pH of Acetyl Sulfisoxazole Oral Suspension is between 5.0 and 5.5.

Assay—Transfer an accurately measured volume of Acetyl Sulfisoxazole Oral Suspension, equivalent to about 1 g. of sulfisoxazole, to a 250-ml. beaker. Add 40 ml. of hydrochloric acid, swirl until the sample is dissolved, add 100 ml. of water, and titrate immediately with 0.1 *M* sodium nitrite, determining the end-point electrometrically, using calomel and platinum electrodes. Each ml. of 0.1 *M* sodium nitrite is equivalent to 26.73 mg. of sulfisoxazole ($C_{11}H_{13}N_3O_3S$).

Packaging and storage—Preserve Acetyl Sulfisoxazole Oral Suspension in tight, light-resistant containers.

Suspension available—Acetyl Sulfisoxazole Oral Suspension usually available contains acetyl sulfisoxazole equivalent to the following amount of sulfisoxazole: 500 mg. in 5 ml.

CATEGORY and DOSE—See Acetyl Sulfisoxazole.

Alcohol, Isopropyl, page 382
Alcohol, Isopropyl Rubbing, page 383

Rubbing Alcohol

Rubbing Alcohol and all preparations coming under the classification of Rubbing Alcohols must be manufactured in accordance with the requirements of the Internal Revenue Service, U. S. Treasury Department, using Formula 23-H (8 parts by volume of acetone, 1.5 parts by volume of methyl isobutyl ketone, and 100 parts by volume of ethyl alcohol). It contains not less than 68.5 percent and not more than 71.5 percent by volume of absolute ethyl alcohol, the remainder consisting of water and the denaturants, with or without color additives, and perfume oils. Rubbing Alcohol contains in each 100 ml. not less than 355 mg. of sucrose octaacetate or not less than 1.40 mg. of denatonium benzoate. The preparation may be colored with one or more color additives, listed by the Food and Drug Administration for use in drugs. A suitable stabilizer may also be added. Rubbing Alcohol complies with the requirements of the Internal Revenue Service of the United States Treasury Department.

NOTE: Rubbing Alcohol must be packaged, labeled, and sold in accordance with the regulations issued by the Internal Revenue Service, U. S. Treasury Department.

Description—Rubbing Alcohol is a transparent, colorless, or colored as desired, mobile, and volatile liquid. It has an extremely bitter taste, and in the absence of added odorous constituents, a characteristic odor. It is flammable.

Specific gravity, page 866—The specific gravity of Rubbing Alcohol manufactured with specially denatured alcohol Formula 23-H, is not less than 0.8691 and not more than 0.8771 at 15.56° (the U. S. Government standard temperature for alcohol determination).

Nonvolatile residue—

When the denaturant is sucrose octaacetate—Evaporate 25.0 ml. of Rubbing Alcohol in a tared platinum dish on a steam bath, and dry the residue at 105° for 1 hour: the weight of the residue is not less than 89 mg. Retain the residue for the *Assay for sucrose octaacetate*.

When the denaturant is denatonium benzoate—Evaporate 200.0 ml. of Rubbing Alcohol, quantitatively transferred in convenient portions, in a tared platinum dish on a steam bath, and dry the residue at 105° for 1 hour: the weight of the residue is not less than 2.8 mg. Dissolve the residue in 25 ml. of water, wash with two 15-ml. portions of ether, add 1 ml. of hydrochloric acid, and extract with three 25-ml. portions of ether. The ultraviolet absorption spectrum of the ether solution shows a maximum at about 228 mμ.

Methanol—Dilute 0.5 ml. of Rubbing Alcohol to 1 ml. with water. To 0.5 ml. of the dilution add 1 drop of dilute phosphoric acid (1 in 20), and 1 drop of potassium permanganate solution (1 in 20). Mix, allow to stand 1 minute, and add sodium bisulfite solution (1 in 20), dropwise, until the permanganate color is discharged. If a brown color remains, add 1 drop of the dilute phosphoric acid. To the colorless solution add 5 ml. of freshly prepared chromotropic acid T.S. and heat in a water bath for 10 minutes at 60°: no violet color appears.

Assay for denatonium benzoate—

Buffer solution—Dissolve 9.23 g. of anhydrous dibasic sodium phosphate in 800 ml. of water, adjust to pH 4 with saturated citric acid solution, dilute to 1000.0 ml. with water, and mix.

Standard preparation—Dissolve about 25 mg. of NF Denatonium Benzoate Reference Standard, accurately weighed, in sufficient water to make 500.0 ml., and mix.

Assay preparation—Evaporate 100.0 ml. of Rubbing Alcohol, quantitatively transferred in convenient portions, in a small conical flask on a steam bath. Dissolve the residue in the flask in 25.0 ml. of water.

Procedure—Treat the standard and the sample solutions and the blank similarly and concurrently. Transfer 10.0 ml. each of the *Standard preparation*, of the *Assay preparation*, and of *Buffer solution* to separate 250-ml. separators, and add to each 40 ml. of *Buffer solution*, 10 ml. of a solution of bromophenol blue in chloroform (1 in 1000), and 60 ml. of chloroform. Shake the separators vigorously for 2 minutes, let stand for 15 minutes, then withdraw the chloroform layers through chloroform-washed cotton into 100-ml. volumetric flasks. Repeat the extraction with 20 ml. of chloroform, adding the filtered chloroform extracts to the respective volumetric flasks, dilute to volume with chloroform, and mix. Without delay, concomitantly determine the absorbances of the solutions obtained from the *Assay preparation* (A_U) and from the *Standard preparation* (A_S), respectively, at the maximum at about 410 mμ, with a suitable spectrophotometer, using the blank to set the instrument. Calculate the quantity, in mg., of denatonium benzoate ($C_{28}H_{34}N_2O_3$) in 100 ml. of Rubbing Alcohol by the formula $0.025C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*.

Assay for sucrose octaacetate—Using about 50 ml. of 70 percent alcohol, transfer quantitatively the residue from the test for *Nonvolatile residue* into a 500-ml. conical flask. Neutralize the solution with 0.1 *N* sodium hydroxide, using phenolphthalein T.S. as the indicator. Add 25.0 ml. of 0.1 *N* sodium hydroxide, attach an air condenser to the flask, and reflux on a steam bath for 1 hour. Remove from the steam bath, cool quickly, and titrate the excess alkali with 0.1 *N* sulfuric acid, using phenolphthalein T.S. as the indicator. Perform a blank determination (see *Residual Titrations*, page 883). Each ml. of 0.1 *N* sodium hydroxide is equivalent to 8.483 mg. of sucrose octaacetate ($C_{28}H_{38}O_{19}$).

Packaging and storage—Preserve Rubbing Alcohol in tight containers remote from fire.

CATEGORY—Rubefacient.

Alginate, Sodium, page 636

Almond Oil

Almond Oil is the fixed oil obtained by expression from the kernels of varieties of *Prunus amygdalus* Batsch (Fam. *Rosaceæ*).

Description—Almond Oil is a clear, pale straw-colored or colorless, oily liquid. It is almost odorless, and has a bland taste. It remains clear at −10°, and does not congeal until cooled to nearly −20°.

Solubility—Almond Oil is slightly soluble in alcohol, but is miscible with ether, with chloroform, with benzene, and with solvent hexane.

Specific gravity, page 866—The specific gravity of Almond Oil is not less than 0.910 and not more than 0.915.

Foreign kernel oils—Shake vigorously for 5 minutes 2 ml. of Almond Oil with a mixture of 1 ml. of fuming nitric acid and 1 ml. of water: the mixture is not more than slightly colored.

Cottonseed oil—Mix 5 ml. of Almond Oil in a test tube with 5 ml. of a mixture of equal volumes of amyl alcohol and of a 1 per cent solution of sulfur in carbon disulfide, warm the mixture carefully until the carbon disulfide is expelled, and immerse the test tube to one-third of its length in a boiling, saturated solution of sodium chloride: the mixture develops no reddish color within 2 hours.

Sesame oil—Mix 10 ml. of Almond Oil with 10 ml. of hydrochloric acid, add 0.1 ml. of an alcohol solution of furfural (1 in 50), and shake the mixture vigorously for 15 seconds: no pink to crimson color appears in the acid layer when separate layers form. Should any color appear in the acid layer, add 10 ml. of water, and again shake the mixture vigorously. In the absence of sesame oil the pink color is fugitive.

Mineral oil and foreign fatty oils—Heat on a steam bath 10 ml. of Almond Oil with 15 ml. of a solution of sodium hydroxide (1 in 6) and 30 ml. of alcohol in a flask which has a small, short-stemmed funnel inserted in the neck, and occasionally agitate the mixture until it becomes clear. Transfer the solution to a shallow dish, evaporate the alcohol on a steam bath, and mix the residue with 100 ml. of water: a clear solution results (*absence of mineral oil*). Add an excess of hydrochloric acid to this solution, remove the layer of fatty acids which rises to the surface, wash it with warm water, clarify it by heating on a steam bath, and allow it to cool to 15° without stirring: the fatty acids remain clear for 30 minutes at this temperature (*absence of foreign fatty oils*).

Foreign oils—One volume of the mixed fatty acids obtained in the test for *Mineral oil and foreign fatty oils* when mixed with 1 volume of alcohol, yields a clear solution, which at 15° does not deposit any fatty acid or become turbid upon the further addition of 1 volume of alcohol (*absence of olive, peanut,* or *other fixed oils*).

Free fatty acids, page 804—The free fatty acids in 10 g. of Almond Oil require for neutralization not more than 5 ml. of 0.1 *N* sodium hydroxide.

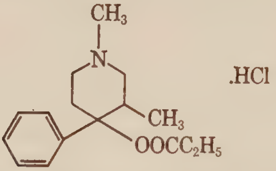
Iodine value, page 804—The iodine value of Almond Oil is not less than 95 and not more than 105.

Saponification value, page 805—The saponification value of Almond Oil is not less than 190 and not more than 200.

Packaging and storage—Preserve Almond Oil in tight containers.

CATEGORY—Emollient; perfume.

Alphaprodine Hydrochloride



(±)-1,3-Dimethyl-4-phenyl-4-piperidinol Propionate Hydrochloride

$C_{16}H_{23}NO_2.HCl$ Mol. wt. 297.83

Alphaprodine Hydrochloride contains not less than 98.0 percent and not more than 100.5 percent of $C_{16}H_{23}NO_2.HCl$, calculated on the dried basis.

Description—Alphaprodine Hydrochloride occurs as a white, crystalline powder. It has a slight odor.

Solubility—Alphaprodine Hydrochloride is freely soluble in water, in alcohol, and in chloroform. It is insoluble in ether.

Identification—

A: Mix about 2 mg. of Alphaprodine Hydrochloride on a spot plate with 1 drop of ammonium thiocyanate T.S. and 1 drop of cupric sulfate solution (1 in 100): a brown turbidity results.

B: Mix about 2 mg. of Alphaprodine Hydrochloride on a spot plate with 1 drop of sulfuric acid-formaldehyde T.S.: an orange-red color develops.

C: A solution of Alphaprodine Hydrochloride in water responds to the tests for *Chloride,* page 808.

Melting range, page 814—Alphaprodine Hydrochloride melts between 218° and 220°.

Loss on drying, page 814—Dry Alphaprodine Hydrochloride at 80° in vacuum over phosphorus pentoxide for 4 hours: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Alphaprodine Hydrochloride yields not more than 0.1 percent of residue on ignition.

Heavy metals, page 806—Dissolve 1 g. of Alphaprodine Hydrochloride in 20 ml. of water, add 2 ml. of diluted acetic acid, and dilute with water to 25 ml.: the heavy metals limit for Alphaprodine Hydrochloride is 20 parts per million.

Assay—Dissolve about 600 mg. of Alphaprodine Hydrochloride, accurately weighed, in a mixture of 50 ml. of glacial acetic acid and 10 ml. of mercuric acetate T.S. Add 1 drop of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a blue end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 29.78 mg. of $C_{16}H_{23}NO_2.HCl$.

Packaging and storage—Preserve Alphaprodine Hydrochloride in well-closed containers.

CATEGORY—Analgesic (narcotic).

USUAL DOSE—Subcutaneous, **20** to **40 mg.** Intravenous, **20 mg.**

USUAL DOSE RANGE—Subcutaneous, **20** to **60 mg.** Intravenous, **20** to **30 mg.**

Alphaprodine Hydrochloride Injection

Alphaprodine Hydrochloride Injection is a sterile solution of alphaprodine hydrochloride in water for injection. It contains not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{16}H_{23}NO_2 . HCl$.

Identification—

A: To 1 ml. of Alphaprodine Hydrochloride Injection add 2 drops of ammonium thiocyanate T.S. and 1 drop of cupric sulfate solution (1 in 100): a brown turbidity results.

B: Evaporate to dryness a few drops of Alphaprodine Hydrochloride Injection in a small porcelain crucible and add 0.5 ml. of sulfuric acid-formaldehyde T.S.: an orange-red color develops.

pH, page 824—The pH of Alphaprodine Hydrochloride Injection is between 4.0 and 6.0.

Other requirements—Alphaprodine Hydrochloride Injection meets the requirements under *Injections,* page 810.

Assay—Transfer to a 125-ml. separator an accurately measured volume of Alphaprodine Hydrochloride Injection, equivalent to about 900 mg. of alphaprodine hydrochloride. Add 5 ml. of sodium hydroxide T.S. and extract the alphaprodine, first with 50 ml. and then with 25 ml. of chloroform, passing the extracts through a filter containing 25 g. of anhydrous sodium sulfate, into a 250-ml. flask. Wash the sodium sulfate with 25 ml. of chloroform, collecting the washings in the 250-ml. flask, add 4 drops of methyl red T.S., and titrate with 0.1 *N* perchloric acid in dioxane to a red end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 29.78 mg. of $C_{16}H_{23}NO_2.HCl$.

Packaging and storage—Preserve Alphaprodine Hydrochloride Injection in single-dose or multiple-dose containers, preferably of Type I glass.

Injections available—Alphaprodine Hydrochloride Injection usually available contains the following amounts of alphaprodine hydrochloride: 40 mg. in 1 ml., 60 mg. in 1 ml., and 600 mg. in 10 ml.

CATEGORY and DOSE—See Alphaprodine Hydrochloride.

Alum

Aluminum Ammonium Sulfate

$AlNH_4(SO_4)_2 . 12H_2O$ Mol. wt. 453.33

Aluminum Potassium Sulfate

$AlK(SO_4)_2 . 12H_2O$ Mol. wt. 474.39

Alum, previously dried at 250° to constant weight, contains not less than 99.0 percent and not more than 100.5 percent of $AlNH_4(SO_4)_2$, or not less than 99.0 percent and not more than 100.5 percent of $AlK(SO_4)_2$.

The label of the container must indicate whether the salt is Ammonium Alum or Potassium Alum.

Description—Alum occurs as large, colorless crystals, crystalline fragments, or as a white powder. Alum is odorless, and has a sweetish, strongly astringent taste. Its solutions are acid to litmus.

Solubility—Alum is freely soluble in water and very soluble in boiling water. Alum is insoluble in alcohol. It is freely but slowly soluble in glycerin.

Identification—

A: Add sodium hydroxide T.S. dropwise to a solution of Ammonium Alum (1 in 20): a precipitate forms which dissolves in an excess of the reagent, and ammonia is evolved.

B: Add sodium hydroxide T.S. dropwise to a solution of Potassium Alum (1 in 20): a precipitate forms which dissolves in an excess of the reagent, but no ammonia is evolved.

C: Hold Potassium Alum in a nonluminous flame: a violet color is imparted to the flame.

D: Add 10 ml. of sodium bitartrate T.S. to 5 ml. of a saturated solution of Potassium Alum: a white, crystalline precipitate forms within 30 minutes.

E: A solution of Alum (1 in 20) responds to the tests for *Aluminum,* page 807, and for *Sulfate,* page 810.

Loss on drying, page 814—Dry Alum at 250° to constant weight, powder the sample, and dry again to constant weight: Ammonium Alum loses not less than 45 percent and not more than 48 percent of its weight, and Potassium Alum loses not less than 43 percent and not more than 46 percent of its weight.

Alkalies and alkaline earths—Completely precipitate the aluminum from a boiling solution of 1 g. of Ammonium Alum in 100 ml. of water by the addition of enough ammonia T.S. to render the solution distinctly alkaline to methyl red T.S., and filter. Evaporate the filtrate to dryness, and ignite: the weight of the residue does not exceed 5 mg. (0.5 percent).

Arsenic—A solution of 1.25 g. of Alum in water meets the requirements of the *Arsenic Test*, page 777 (8 parts per million As).

Heavy metals—Dissolve 1 g. of Alum in sufficient water to make 20 ml., and add 5 ml. of 0.1 *N* hydrochloric acid. Evaporate the sample to dryness in a porcelain evaporating dish. Treat the residue with 20 ml. of water and add 50 mg. of hydroxylamine hydrochloride. Heat the solution on a steam bath for 10 minutes, cool, dilute to 25 ml., and proceed as directed in the *Heavy Metals Test*, page 806, but add 50 mg. of hydroxylamine hydrochloride to the standard lead solution: the heavy metals limit for Alum is 20 parts per million.

Iron—Add 5 drops of potassium ferrocyanide T.S. to 20 ml. of a solution of Alum (1 in 150): no blue color is produced immediately.

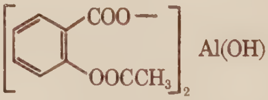
Assay—Weigh accurately about 500 mg. of Alum, previously dried at 250° to constant weight, powder the sample, and dry again to constant weight, moisten with 1 ml. of glacial acetic acid, and add 50 ml. of water and 50.0 ml. of 0.05 *M* disodium ethylenediaminetetraacetate. Warm on a steam bath until solution is complete, and boil gently for 5 minutes. Cool, add 20 ml. of acetic acid-ammonium acetate buffer T.S., 50 ml. of alcohol, and 2 ml. of dithizone T.S., and titrate with 0.05 *M* zinc sulfate to a bright rose-pink color. Perform a blank determination, and make any necessary correction. Each ml. of 0.05 *M* disodium ethylenediaminetetraacetate is equivalent to 11.85 mg. of $AlNH_4(SO_4)_2$ or 12.91 mg. of $AlK(SO_4)_2$.

Packaging and storage—Preserve Alum in well-closed containers.

CATEGORY—Local astringent.

FOR EXTERNAL USE—Topically as a 0.5 to 5 percent solution.

Aluminum Aspirin



Hydroxybis(salicylato)aluminum Diacetate

$C_{18}H_{15}AlO_9$ Mol. wt. 402.30

Aluminum Aspirin contains not less than the equivalent of 80.0 percent of $C_9H_8O_4$ (aspirin), calculated on the anhydrous basis, corresponding to not less than 90.0 percent of $C_{18}H_{15}AlO_9$. Aluminum Aspirin yields not less than 12.0 percent and not more than 17.0 percent of Al_2O_3 (aluminum oxide), calculated on the anhydrous basis.

Description—Aluminum Aspirin occurs as a white to off-white powder or granules. It is odorless, or has only a slight odor.

Solubility—Aluminum Aspirin is insoluble in water and organic solvents. It is soluble, with decomposition, in aqueous solutions of alkali hydroxides and carbonates.

Identification—

A: Dissolve 100 mg. of Aluminum Aspirin in 10 ml. of sodium hydroxide T.S., heating, if necessary, to complete solution. Acidify a portion of the solution with hydrochloric acid, and add 1 or 2 drops of ferric chloride T.S.: a violet-red color is produced.

B: Ignite about 2 g. of Aluminum Aspirin in a suitable crucible, until thoroughly charred, cool, moisten the residue with 1 ml. of sulfuric acid, and cautiously ignite until the carbon is completely consumed, repeating the ignition with additional sulfuric acid, if necessary. Transfer the residue to a platinum crucible, add 1 g. of anhydrous sodium carbonate and ignite for 20 minutes (the mass should be completely molten). Cool, dissolve the mass in diluted hydrochloric acid, and filter: the filtrate responds to the tests for *Aluminum*, page 807.

Water, page 900—Determine the water

content of Aluminum Aspirin by the titrimetric method, stirring the sample for 7 minutes prior to titration and recording the end-point at the end of 10 minutes, accurately timed, from the addition of the sample to the titration flask. Perform a blank determination, following the same time schedule, and make any necessary correction: it contains not more than 8 percent of water.

Heavy metals, *Method II*, page 806—The heavy metals limit for Aluminum Aspirin is 10 parts per million.

Limit of salicylate—Using the absorbance values found at 308 mμ in the *Assay for aspirin* for the *Sample preparation* (A_{U308}) and for the *Standard salicylic acid solution* (A_{S308}), calculate the percent salicylate content (as salicylic acid) by the formula $200 \times (C_S/W) \times (A_{U308}/A_{S308})$, in which C_S is the exact concentration, in mcg. per ml., of USP Salicylic Acid in the *Standard salicylic acid solution*, W is the weight, in mg., of the sample taken, and A_{S308} and A_{U308} are as defined in the *Assay for aspirin*. The salicylate content is not more than 7.5 percent, calculated on the anhydrous basis.

Assay for aluminum oxide—Transfer about 1 g. of Aluminum Aspirin, accurately weighed, to a previously tared and ignited crucible. Ignite the sample at 1000°, preferably in a muffle furnace, to constant weight. The ignited residue obtained is Al_2O_3.

Assay for aspirin—

Sample preparation—Transfer to a 250-ml. separator about 150 mg. of Aluminum Aspirin, accurately weighed, add 40 ml. of sodium fluoride-hydrochloric acid solution (dissolve 500 mg. of sodium fluoride in 100 ml. of 0.1 *N* hydrochloric acid), and shake for 5 minutes. Allow the solution to stand for 10 minutes with frequent shaking. Extract the solution with six 20-ml. portions of chloroform, filtering each portion into a 200-ml. volumetric flask, dilute to volume with chloroform, and mix. Transfer 10.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with chloroform, and mix.

Standard aspirin solution—Dissolve an accurately weighed quantity of USP Aspirin Reference Standard in chloroform, and dilute it, quantitatively and stepwise, to obtain a *Standard aspirin solution* having a concentration of about 50 mcg. per ml.

Standard salicylic acid solution—Dissolve an accurately weighed quantity of salicylic acid in chloroform, and dilute it, quantitatively and stepwise, to obtain a *Standard salicylic acid solution* having a concentration of about 25 mcg. per ml.

Procedure—Concomitantly determine the absorbances of the *Sample preparation* at 278 mμ and at 308 mμ, of the *Standard aspirin solution* at 278 mμ, and of the *Standard salicylic acid solution* at 278 mμ and at 308 mμ, in 1-cm. cells, with a suitable spectrophotometer, using chloroform as the blank. Calculate the quantity, in mg., of $C_9H_8O_4$ (aspirin) in the Aluminum Aspirin taken by the formula, $2C_A \times [A_{U278} - A_{U308}(A_{S278}/A_{S308})]/A_{A278}$, in which C_A is the exact concentration, in mcg. per ml., of USP Aspirin Reference Standard in the *Standard aspirin solution*, and A_U, A_S, and A_A are the absorbances of the *Sample preparation*, *Standard salicylic acid solution*, and *Standard aspirin solution*, respectively, at the wavelengths designated by the subscripts.

Packaging and storage—Preserve Aluminum Aspirin in well-closed containers in a cold place.

Category—Analgesic.

Usual dose—**670 mg.**, equivalent to about **600 mg.** of aspirin, every 4 hours as necessary. Children's dose—**75 mg.** every 4 hours.

Aluminum Aspirin Tablets

Aluminum Aspirin Tablets contain an amount of $C_{18}H_{15}AlO_9$ (aluminum aspirin) equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_9H_8O_4$ (aspirin).

Identification—

A: Digest a portion of powdered Aluminum Aspirin Tablets, equivalent to about 100 mg. of aluminum aspirin, with 10 ml. of sodium hydroxide T.S. with gentle warming, and filter. The filtrate responds to *Identification test A* under *Aluminum Aspirin*, page 30.

B: A portion of powdered Aluminum Aspirin Tablets, equivalent to about 2 g. of aluminum aspirin, responds to *Identification test B* under *Aluminum Aspirin*, page 30.

Disintegration, page 878—The disintegration time limit for Aluminum Aspirin Tablets is 5 minutes.

Weight variation, page 901—Aluminum Aspirin Tablets meet the requirements of the weight variation test for tablets.

Salicylate—Using the absorbance values found at 308 mμ in the *Assay* for the *Sample preparation* (A_{U308}) and the *Standard salicylic acid solution* (A_{S308}), calculate the percent salicylate content (as salicylic acid) of the labeled aspirin content by the formula $(200/T) \times$ (Av. Wt. per Tablet/

Wt. of Sample) $\times C_S \times (A_{U308}/A_{S308})$, in which T is the labeled quantity of aspirin, in mg., in the tablet, C_S is the exact concentration, in mcg. per ml., of salicylic acid in the *Standard salicylic acid solution,* and A_{U308} and A_{S308} are as defined in the *Assay:* the salicylate content is not more than 15.0 percent of the labeled aspirin content.

Assay—Weigh and finely powder not less than 20 Aluminum Aspirin Tablets, and proceed as directed in the *Assay for Aspirin* under *Aluminum Aspirin,* page 30, using an accurately weighed portion of the powder, equivalent to about 150 mg. of aspirin. Calculate the quantity, in mg., of $C_9H_8O_4$ per tablet by the formula $2 \times$ (Av. Wt. per Tablet/Wt. of Sample) $\times C_A \times [A_{U278} - A_{U308} (A_{S278}/A_{S308})]/A_{A278}$, in which C_A is the exact concentration, in mcg. per ml., of USP Aspirin Reference Standard in the *Standard aspirin solution,* and A_U, A_S, and A_A are the absorbances of the *Sample preparation, Standard salicylic acid solution,* and the *Standard aspirin solution,* respectively, at the wavelengths designated by the subscripts.

Packaging and storage—Preserve Aluminum Aspirin Tablets in well-closed containers.

Tablets available—Aluminum Aspirin Tablets usually available contain the equivalent of the following amount of aspirin: 75 mg.

CATEGORY and DOSE—See Aluminum Aspirin.

Aluminum Chloride

$AlCl_3 . 6H_2O$ Mol. wt. 241.43

Aluminum Chloride contains not less than 95.0 percent and not more than 102.0 percent of $AlCl_3$, calculated on the anhydrous basis.

Description—Aluminum Chloride occurs as a white or yellowish white, deliquescent, crystalline powder. It is nearly odorless and has a sweet, very astringent taste. Its solutions are acid to litmus.

Solubility—Aluminum Chloride is very soluble in water and is freely soluble in alcohol. It is soluble in glycerin.

Identification—A solution of Aluminum Chloride (1 in 10) responds to the tests for *Aluminum,* page 807, and for *Chloride,* page 808.

Water, page 900—Determine the water content of Aluminum Chloride by the titrimetric method (*Residual Titration* procedure): not less than 44 percent and not more than 50 percent is found.

Sulfate—The addition of 0.2 ml. of barium chloride T.S. to 10 ml. of a solution of Aluminum Chloride (1 in 100) produces no turbidity in 1 minute.

Alkalies and alkaline earths—To a boiling solution of 1 g. of Aluminum Chloride in 150 ml. of water, add a few drops of methyl red T.S., then add ammonia T.S. until the color of the solution just changes to a distinct yellow. Add hot water to restore the volume to 150 ml., and filter while hot. Evaporate 75 ml. of the filtrate to dryness, and ignite to constant weight: the weight of the residue does not exceed 2.5 mg. (0.5 percent).

Arsenic—A solution of 1.25 g. of Aluminum Chloride in water meets the requirements of the *Arsenic Test,* page 777(8 parts per million As).

Heavy metals, page 806—Dissolve 1 g. of Aluminum Chloride in 1 ml. of diluted acetic acid and sufficient water to make 25 ml.: the heavy metals limit for Aluminum Chloride is 20 parts per million.

Iron—Dissolve 2 g. of Aluminum Chloride in 40 ml. of water, add 2 ml. of hydrochloric acid, dilute to 50 ml., and add 30 to 50 mg. of ammonium persulfate crystals and 5 ml. of ammonium thiocyanate T.S.: any red color in the sample solution does not exceed that in a standard of the same volume containing 20 mcg. of iron and the quantities of reagents used in the test (10 parts per million).

Assay—Transfer to a 250-ml. volumetric flask about 5 g. of Aluminum Chloride, accurately weighed, dissolve in water, dilute to volume with water, and mix. Pipet 10.0 ml. of the solution into a 250-ml. beaker, add 25.0 ml. of 0.05 *M* disodium ethylenediaminetetraacetate, and boil gently for 5 minutes. Cool, and add in the order given and with continuous stirring 20 ml. of acetic acid-ammonium acetate buffer T.S., 50 ml. of alcohol, and 2 ml. of dithizone T.S. Titrate with 0.05 *M* zinc sulfate to a bright rose-pink color. Perform a blank determination, substituting 10 ml. of water for the sample, and make any necessary correction. Each ml. of 0.05 *M* disodium ethylenediaminetetraacetate is equivalent to 6.667 mg. of $AlCl_3$.

Packaging and storage—Preserve Aluminum Chloride in tight containers.

Category—Local astringent.

For external use—Topically as a 10 to 25 percent solution.

Aluminum Phosphate Gel

Aluminum Phosphate Gel is a water suspension containing not less than 4.0 percent and not more than 5.0 percent (w/w) of $AlPO_4$ (aluminum phosphate). It may contain sodium benzoate, benzoic acid, or other suitable agents, in an amount not exceeding 0.5 percent, as a preservative.

Description—Aluminum Phosphate Gel is a white, viscous suspension from which small amounts of water may separate on standing.

Identification—

A: A solution of Aluminum Phosphate Gel in hydrochloric acid responds to the tests for *Aluminum*, page 807.

B: A solution of Aluminum Phosphate Gel in diluted nitric acid responds to the tests for *Phosphate*, page 809.

pH, page 824—The pH of Aluminum Phosphate Gel is between 6.0 and 7.2.

Neutralization rate—Add 30 ml. of 0.1 *N* hydrochloric acid to 6 g. of Aluminum Phosphate Gel, and heat at 37° for 15 minutes: the pH of the mixture is between 2.0 and 2.5.

Acid-consuming capacity—To about 250 mg. of Aluminum Phosphate Gel, accurately weighed, add 30.0 ml. of 0.1 *N* hydrochloric acid, and digest at 37° for 30 minutes. Add 1 drop of thymol blue T.S., and titrate the excess acid with 0.1 *N* sodium hydroxide to pH 2.5. The volume of 0.1 *N* hydrochloric acid consumed is not less than 6 ml. and not more than 11 ml. for each g. of Aluminum Phosphate Gel.

Chloride—Transfer 25 g. of Aluminum Phosphate Gel to a beaker with the aid of about 50 ml. of water, add 5 ml. of nitric acid, mix well, then add, with stirring, 30.0 ml. of 0.1 *N* silver nitrate. Warm on a steam bath for 30 minutes, filter, and wash the precipitate with water acidified with nitric acid. To the filtrate add ferric ammonium sulfate T.S., and titrate the excess silver nitrate with 0.1 *N* ammonium thiocyanate. Each ml. of 0.1 *N* silver nitrate is equivalent to 3.545 mg. of Cl. Not more than 0.16 percent of Cl is found.

Soluble phosphate—Filter 20 g. of Aluminum Phosphate Gel, and wash the residue with 30 ml. of water. Add to the filtrate 2 ml. of nitric acid, heat to 60°, and add 20 ml. of ammonium molybdate T.S. Heat at 50° for 30 minutes, filter, wash the precipitate with dilute nitric acid (1 in 36), and then with potassium nitrate solution (1 in 100) until the last portion of filtrate is not acid to litmus paper. Dissolve the precipitate in 50.0 ml. of 0.1 *N* sodium hydroxide, add phenolphthalein T.S., and titrate the excess alkali with 0.1 *N* hydrochloric acid. Each ml. of 0.1 *N* sodium hydroxide is equivalent to 0.413 mg. of PO_4. The soluble phosphate, calculated as PO_4, does not exceed 0.07 percent.

Sulfate, page 784—Add 10 ml. of diluted hydrochloric acid to 10 g. of Aluminum Phosphate Gel, and heat to boiling. Cool, dilute to 250 ml., and filter, if necessary. A 10-ml. portion of the solution shows no more sulfate than corresponds to 0.2 ml. of 0.02 *N* sulfuric acid (0.05 percent).

Arsenic—Dissolve 16.7 g. of Aluminum Phosphate Gel in just sufficient diluted hydrochloric acid. The solution meets the requirements of the *Arsenic Test,* page 777 (0.6 part per million As).

Heavy metals, page 806—Dissolve 10 g. of Aluminum Phosphate Gel in 2.5 ml. of diluted hydrochloric acid, warming if necessary, and dilute to 25 ml. with water: the heavy metals limit for Aluminum Phosphate Gel is 5 parts per million.

Assay—To about 20 g. of Aluminum Phosphate Gel, accurately weighed in a 100-ml. volumetric flask, add nitric acid to effect solution, dilute with water to volume, and mix thoroughly. Transfer 10.0 ml. of this solution to a 400-ml. beaker, dilute with water to 100 ml., heat to 60°, add an excess of ammonium molybdate T.S., and keep at 50° for 30 minutes. Filter, and wash the precipitate with dilute nitric acid (1 in 36), followed by potassium nitrate solution (1 in 100) until the last portion of filtrate is not acid to litmus paper. Dissolve the precipitate in 50.0 ml. of 0.5 *N* sodium hydroxide, add 3 drops of phenolphthalein T.S., and titrate the excess sodium hydroxide with 0.5 *N* sulfuric acid. Each ml. of 0.5 *N* sodium hydroxide is equivalent to 2.651 mg. of $AlPO_4$.

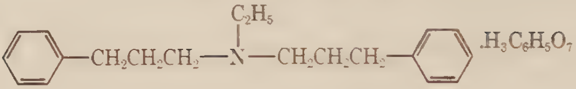
Packaging and storage—Preserve Aluminum Phosphate Gel in tight containers.

Category—Antacid.

Usual dose—**15 ml.** to **30 ml.** every 2 hours.

Usual dose range—**15** to **45 ml.**

Alverine Citrate



N-Ethyl-3,3′-diphenyldipropylamine Citrate (1:1)

$C_{20}H_{27}N . C_6H_8O_7$ Mol. wt. 473.57

Alverine Citrate contains not less than 99.0 percent and not more than 102.0 percent of $C_{20}H_{27}N . C_6H_8O_7$, calculated on the dried basis.

Description—Alverine Citrate occurs as a white to off-white powder having a sweet odor and a slightly bitter taste.

Solubility—Alverine Citrate is slightly soluble in water and in chloroform. It is sparingly soluble in alcohol, and is very slightly soluble in ether.

Identification—Suspend about 500 mg. of Alverine Citrate in 10 ml. of water, add a slight excess of sodium hydroxide T.S. to liberate the base, allow to stand for 5 minutes with occasional swirling, and filter: the filtrate responds to the tests for *Citrate*, page 808.

Melting range, page 814—Alverine Citrate melts between 100° and 102°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Alverine Citrate, previously dried at 80° for 2 hours, exhibits maxima only at the same wavelengths as that of NF Alverine Citrate Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 1500 solution of Alverine Citrate in 0.1 *N* hydrochloric acid exhibits maxima and minima at the same wavelengths as that of NF Alverine Citrate Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance at about 258 mμ, do not differ by more than 2 percent.

pH, page 824—The pH of a solution of Alverine Citrate (1 in 200) is between 3.5 and 4.5.

Loss on drying, page 814—Dry Alverine Citrate at 80° for 2 hours: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Alverine Citrate yields not more than 0.1 percent of residue on ignition.

Assay—Transfer about 360 mg. of Alverine Citrate, accurately weighed, to a separator, add 25 ml. of water and 5 ml. of sodium hydroxide T.S., and extract with four 25-ml. portions of chloroform. Wash the combined chloroform extracts with 10 ml. of water, and filter the chloroform solution through a layer of chloroform-moistened cotton layered over with anhydrous sodium sulfate, collecting the filtrate in a beaker. Wash the aqueous phase with 10 ml. of chloroform and filter as before into the beaker. To the beaker add 3 drops of methanolic methyl red T.S., and titrate with 0.1 *N* perchloric acid in dioxane. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 47.36 mg. of $C_{20}H_{27}N . C_6H_8O_7$.

Packaging and storage—Preserve Alverine Citrate in tight, light-resistant containers.

CATEGORY Anticholinergic.

USUAL DOSE RANGE—**120 mg.** one to three times a day.

Alverine Citrate Tablets

Alverine Citrate Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{20}H_{27}N . C_6H_8O_7$.

Identification—Transfer an amount of powdered Alverine Citrate Tablets, equivalent to about 120 mg. of alverine citrate, to a 200-ml. volumetric flask, add 100 ml. of 0.1 *N* hydrochloric acid, and allow to stand unstoppered until the effervescence ceases. Shake for 30 minutes, dilute to volume with 0.1 *N* hydrochloric acid, mix, and filter, discarding the first 20 ml. of filtrate: the ultraviolet absorption spectrum of the subsequent filtrate exhibits maxima and minima at the same wavelengths as that of a 1 in 1500 solution of NF Alverine Citrate Reference Standard in 0.1 *N* hydrochloric acid.

Disintegration, page 878—The disintegration time limit for Alverine Citrate Tablets is 20 minutes.

Weight variation, page 901—Alverine Citrate Tablets meet the requirements of the weight variation test for tablets.

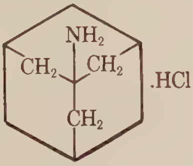
Assay—Weigh and finely powder not less than 20 Alverine Citrate Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 360 mg. of alverine citrate to a separator, and continue as directed in the *Assay* under *Alverine Citrate*, page 34, beginning with "... add 25 ml. of water and 5 ml. of sodium hydroxide T.S. ... "

Packaging and storage—Preserve Alverine Citrate Tablets in tight, light-resistant containers.

Tablets available—Alverine Citrate Tablets usually available contain the following amount of alverine citrate: 120 mg.

CATEGORY and DOSE—See Alverine Citrate.

Amantadine Hydrochloride*



1-Adamantanamine Hydrochloride

$C_{10}H_{17}N.HCl$ Mol. wt. 187.71

Amantadine Hydrochloride contains not less than 98.5 percent and not more than 101.5 percent of $C_{10}H_{17}N.HCl$.

Description—Amantadine Hydrochloride occurs as a white or nearly white, odorless, crystalline powder. It has a bitter taste.

Solubility—Amantadine Hydrochloride is freely soluble in water and is soluble in alcohol and in chloroform.

Identification—Mix 100 mg. of Amantadine Hydrochloride with 1 ml. of pyridine and 0.1 ml. of acetic anhydride, and heat to boiling for about 10 seconds. Pour the hot solution into 10 ml. of 2 *N* hydrochloric acid, and cool to 5°. Collect the precipitate on a sintered-glass filter, wash with water, and dry at 60° in vacuum for 1 hour: the 1-acetamidoadamantane so obtained melts between 147° and 150°, page 814.

Clarity and color of solution—Dissolve 2 g. of Amantadine Hydrochloride in 10 ml. of water: the solution is clear and nearly colorless.

pH, page 824—The pH of a 1 in 5 solution of Amantadine Hydrochloride is between 3.5 and 5.0.

Heavy metals, page 806—Dissolve 1 g. of Amantadine Hydrochloride in 24 ml. of water and add 1 ml. of diluted acetic acid: the heavy metals limit for Amantadine Hydrochloride is 5 parts per million.

Assay—Dissolve about 120 mg. of Amantadine Hydrochloride, accurately weighed, in a mixture of 30 ml. of glacial acetic acid and 10 ml. of mercuric acetate T.S. Add 6 drops of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a blue-green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 18.77 mg. of $C_{10}H_{17}N.HCl$.

Packaging and storage—Preserve Amantadine Hydrochloride in well-closed containers.

CATEGORY—Antiviral (prophylactic).

USUAL DOSE—**200 mg.** per day, given as a single dose or in two divided doses.

---

* Patented. See notice, page ii.

Amantadine Hydrochloride Capsules

Amantadine Hydrochloride Capsules contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{10}H_{17}N.HCl$.

Identification—Place the contents of one Amantadine Hydrochloride Capsule in a test tube, add 2 ml. of pentane, and shake well. Collect the undissolved solid on a sintered-glass filter, wash with two 1-ml. portions of pentane, and dry in the air: the amantadine hydrochloride so obtained responds to the *Identification test* under *Amantadine Hydrochloride*, page 35.

Content uniformity, *Method I*, page 798—Amantadine Hydrochloride Capsules meet the requirements of the content uniformity test for capsules.

Assay—Dissolve 10 Amantadine Hydrochloride Capsules in 20 ml of water by warming on a steam bath, with shaking. Cool, add 20 ml. of 5 *N* sodium hydroxide and 100.0 ml. of benzene, stopper, and shake gently for 15 minutes. Centrifuge to separate the layers, and transfer 10.0 ml. of the supernatant liquid to a conical flask. Add 30 ml. of glacial acetic acid, and titrate with 0.1 *N* perchloric acid in glacial acetic acid, determining the end-point potentiometrically, using suitable electrodes. Each ml. of 0.1 *N* perchloric acid is equivalent to 18.77 mg. of $C_{10}H_{17}N.HCl$.

Packaging and storage—Preserve Amantadine Hydrochloride Capsules in tight containers.

Capsules available—Amantadine Hydrochloride Capsules usually available contain the following amount of amantadine hydrochloride: 100 mg.

CATEGORY and DOSE—See Amantadine Hydrochloride.

Amantadine Hydrochloride Syrup

Amantadine Hydrochloride Syrup contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{10}H_{17}N.HCl$.

Identification—To 10 ml. of Amantadine Hydrochloride Syrup add 5 ml. of 5 *N* sodium hydroxide and 10 ml. of benzene. Shake the mixture gently for 15 minutes, remove the benzene layer, dry it over anhydrous magnesium sulfate, and filter. To the filtrate add 1 ml. of pyridine and 0.1 ml. of acetic anhydride, and evaporate almost to dryness on a steam bath. Dissolve the residue in 5 ml. of 2 *N* hydrochloric acid by boiling, and cool to 5°. Collect the precipitate on a sintered-glass filter, wash with small portions of water, and dry at 60° in vacuum for 1 hour: the 1-acetamidoadamantane so obtained melts between 147° and 150°, page 814.

Assay—Transfer an accurately measured volume of Amantadine Hydrochloride Syrup, equivalent to about 200 mg. of amantadine hydrochloride, to a separator, add 5 ml. of 5 *N* sodium hydroxide and 20.0 ml. of benzene, shake vigorously for 15 minutes, and allow the layers to separate. Transfer 10.0 ml. of the benzene layer to a beaker containing 30 ml. of glacial acetic acid, add 6 drops of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a blue-green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 18.77 mg. of $C_{10}H_{17}N.HCl$ in the benzene aliquot taken.

Packaging and storage—Preserve Amantadine Hydrochloride Syrup in tight containers.

Syrup available—Amantadine Hydrochloride Syrup usually available contains the following amount of amantadine hydrochloride: 50 mg. in 5 ml.

CATEGORY and DOSE—See Amantadine Hydrochloride.

Compound Amaranth Solution

Amaranth Solution	**90 ml.**
Caramel	**100 g.**
Alcohol	**250 ml.**
Purified Water, a sufficient quantity,	
To make	**1000 ml.**

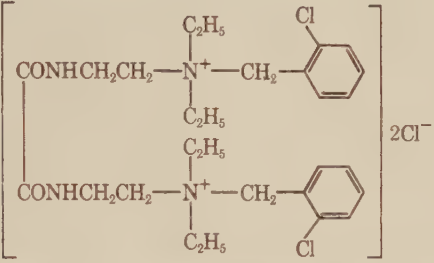
Dissolve the caramel in 500 ml. of purified water, add the amaranth solution, the alcohol, and sufficient purified water to make the product measure 1000 ml., and mix well.

Alcohol content, page 772—Compound Amaranth Solution contains from 22 to 25 percent (v/v) of C_2H_5OH.

Packaging and storage—Preserve Compound Amaranth Solution in tight, light-resistant containers.

CATEGORY—Color.

Ambenonium Chloride*



[Oxalylbis(iminoethylene)]bis[(*o*-chlorobenzyl)diethylammonium] Dichloride

$C_{28}H_{42}Cl_4N_4O_2$ Mol. wt. 608.48

Ambenonium Chloride is anhydrous or may occur as the tetrahydrate. It contains not less than 97.0 percent and not more than 103.0 percent of $C_{28}H_{42}Cl_4N_4O_2$, calculated on the dried basis.

Description—Ambenonium Chloride occurs as a white, odorless powder. It melts at about 200°.

Solubility—Ambenonium Chloride is soluble in water and in alcohol, is slightly soluble in chloroform, and is practically insoluble in ether and in acetone.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Ambenonium Chloride, previously dried to constant weight at 105°, exhibits maxima only at the same wavelengths as that of NF Ambenonium Chloride Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 2500 solution of Ambenonium Chloride in methanol exhibits maxima and minima at the same wavelengths as that of NF Ambenonium Chloride Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance occurring at about 278 mμ, do not differ by more than 3 percent.

Loss on drying, page 814—Dry Ambenonium Chloride to constant weight at 105°: it loses not more than 11.5 percent of its weight.

Residue on ignition, page 858—Ambenonium Chloride yields not more than 0.2 percent of residue on ignition.

Assay—Dissolve about 500 mg. of Ambenonium Chloride, accurately weighed, in a mixture of 80 ml. of glacial acetic acid and 10 ml. of mercuric acetate T.S., add 2 drops of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 30.42 mg. of $C_{28}H_{42}Cl_4N_4O_2$.

Packaging and storage—Preserve Ambenonium Chloride in tight containers.

CATEGORY—Cholinergic.

USUAL DOSE—Initial, **5 mg.,** gradually increased as required up to **5** to **25 mg.** three or four times a day.

USUAL DOSE RANGE—**5 mg.** to **50 mg.**

* Patented. See notice, page ii.

Ambenonium Chloride Tablets

Ambenonium Chloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{28}H_{42}Cl_4N_4O_2$.

Identification—The solution prepared from Ambenonium Chloride Tablets for measurement of absorbance in the *Assay* exhibits a maximum at 278 ± 2 mμ.

Disintegration, page 878—The disintegration time limit for Ambenonium Chloride Tablets is 15 minutes.

Content uniformity, *Method II,* page 799—Ambenonium Chloride Tablets meet the requirements of the content uniformity test for tablets, using the following special procedure: Quantitatively transfer one finely powdered tablet to a 25-ml. volumetric flask, add 12 ml. of chloroform, and reflux on a steam bath for 15 minutes. Cool to room temperature, dilute to volume with chloroform, mix, and filter, discarding the first 5 ml. of filtrate. Dilute a portion of the subsequent filtrate with chloroform, if necessary, to provide a solution containing approximately 400 mcg. of ambenonium chloride per ml. Concomitantly determine the absorbance of this solution and of a solution of NF Ambenonium Chloride Reference Standard, in the same medium at a concentration of about 400 mcg. per ml., in 1-cm. cells, at the maximum at about 278 mμ, with a suitable spectrophotometer, using chloroform as the blank. Calculate the quantity, in mg., of $C_{28}H_{42}Cl_4N_4O_2$ in the Tablet by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity, in mg., of ambenonium chloride in the tablet; D is the exact concentration, in mcg. per ml., of ambenonium chloride in the sample solution, based upon the labeled quantity per tablet and the extent of dilution; C is the exact concentration, in mcg. per ml., of the Reference Standard solution; A_U is the absorbance of the sample solution; and A_S is the absorbance of the Reference Standard solution.

Assay—

Standard preparation—Transfer about 25 mg. of NF Ambenonium Chloride Reference Standard, accurately weighed, to a 100-ml. volumetric flask, add 0.1 N sulfuric acid to volume, and mix.

Chromatographic column—Pack a pledget of fine glass wool in the base of a chromatographic tube (25 × 250-mm. tube to which is fused a 5-cm. length of 7-mm. tubing) with the aid of a tamping rod about 45 cm. in length and having a disk with a diameter about 1 mm. less than that of the tube. To 2 g. of purified siliceous earth in a 100-ml. beaker add 1 ml. of sodium carbonate solution (1 in 20), and mix until a uniform, fluffy mixture is obtained. Transfer to the tube, and tamp gently to compress the mixture to a uniform mass.

Assay preparation—Weigh and finely powder not less than 20 Ambenonium Chloride Tablets. Transfer to a 100-ml. beaker an accurately weighed portion of the powder, equivalent to about 12.5 mg. of ambenonium chloride, add 2 ml. of sodium carbonate solution (1 in 20), and allow to stand for about 10 minutes with occasional swirling. Add 3 g. of purified siliceous earth, mix as directed under *Chromatographic column*, and transfer quantitatively to the column. Scrub the beaker with 1 g. of purified siliceous earth and 3 drops of water, transfer the scrubbings to the column, and tamp gently. Cover the column with a pledget of glass wool. Wash the column with 75 ml. of water-saturated chloroform, followed by 75 ml. of water-saturated ether, and discard the washings. Elute the ambenonium chloride with 75 ml. of a 1 in 500 solution of bis(ethylhexyl)phosphoric acid in water-saturated ether, collecting the eluate in a 125-ml. separator. Extract the eluate with two 20-ml. portions of 0.1 N sulfuric acid, collecting the extracts in a 50-ml. volumetric flask. Dilute to volume with 0.1 N sulfuric acid, and mix.

Procedure—Concomitantly determine the absorbance of the *Standard preparation* and of the *Assay preparation*, in 1-cm. cells, at the maximum at about 271 mμ, with a suitable spectrophotometer, using 0.1 N sulfuric acid as the blank. Record the absorbance of the *Standard preparation* as A_S and that of the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{28}H_{42}Cl_4N_4O_2$ in the portion of Tablets taken by the formula $0.05C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*.

Packaging and storage—Preserve Ambenonium Chloride Tablets in tight containers.

Tablets available—Ambenonium Chloride Tablets usually available contain the following amounts of ambenonium chloride: 10 and 25 mg.

CATEGORY and DOSE—See Ambenonium Chloride.

Aminoacetic Acid

NH_2CH_2COOH

Glycine

$C_2H_5NO_2$ Mol. wt. 75.07

Aminoacetic Acid, dried at 105° for 2 hours, contains not less than 98.5 percent and not more than 101.5 percent of $C_2H_5NO_2$.

Description—Aminoacetic Acid occurs as a white, odorless, crystalline powder, having a sweetish taste. Its solution is acid to litmus.

Solubility—Aminoacetic Acid is freely soluble in water. It is very slightly soluble in alcohol and in ether.

Identification—

A: To 5 ml. of a solution of Aminoacetic Acid (1 in 10) add 5 drops of diluted hydrochloric acid and 5 drops of a solution of sodium nitrite (1 in 2): a vigorous evolution of a colorless gas is produced.

B: Add 1 ml. of ferric chloride T.S. to 2 ml. of a solution of Aminoacetic Acid (1 in 10): a red color is produced which disappears upon the addition of an excess of diluted hydrochloric acid and reappears upon the addition of an excess of stronger ammonia water.

C: To 2 ml. of a solution of Aminoacetic Acid (1 in 10) add 1 drop of liquefied phenol and 5 ml. of sodium hypochlorite T.S.: a blue color is produced.

Loss on drying, page 814—Dry Aminoacetic Acid at 105° for 2 hours: it loses not more than 0.2 percent of its weight.

Residue on ignition, page 858—Aminoacetic Acid yields not more than 0.1 percent of residue on ignition.

Chloride, page 784—A solution of 1 g. of Aminoacetic Acid in water shows no more chloride than corresponds to 0.1 ml. of 0.02 *N* hydrochloric acid (70 parts per million).

Sulfate, page 784—A solution of 3 g. of Aminoacetic Acid in water shows no more sulfate than corresponds to 0.2 ml. of 0.02 *N* sulfuric acid (65 parts per million).

Heavy metals, page 806—Dissolve 1 g. of Aminoacetic Acid in 15 ml. of water, add 4 ml. of diluted acetic acid, and dilute to 25 ml. with water: the heavy metals limit for Aminoacetic Acid is 20 parts per million.

Readily carbonizable substances, page 856—Dissolve 500 mg. of Aminoacetic Acid in 5 ml. of sulfuric acid T.S.: the solution is colorless.

Hydrolyzable substances—Boil 10 ml. of a solution of Aminoacetic Acid (1 in 10) for 1 minute, and set aside for 2 hours: the solution appears as clear and as mobile as 10 ml. of the same solution that has not been boiled.

Assay—Transfer about 150 mg. of Aminoacetic Acid, previously dried at 105° for 2 hours and accurately weighed, to a 250-ml. flask, dissolve it in 50 ml. of glacial acetic acid, add 1 drop of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 7.507 mg. of $C_2H_5NO_2$.

Packaging and storage—Preserve Aminoacetic Acid in well-closed containers.

CATEGORY—Nutrient.

USUAL DOSE—**30 g.** daily, in divided doses.

APPLICATION—Irrigating solution as a 1.5 percent solution.

Aminoacetic Acid Sterile Solution

Aminoacetic Acid Sterile Solution is a sterile solution of aminoacetic acid in water for injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_2H_5NO_2$.

Identification—Aminoacetic Acid Sterile Solution, when adjusted by evaporation or dilution as required to produce a concentration of about 100 mg. per ml. (1 in 10), responds to the *Identification tests* under *Aminoacetic Acid,* page 38.

pH, page 824—The pH of Aminoacetic Acid Sterile Solution is between 4.5 and 6.5.

Pyrogen—Aminoacetic Acid Sterile Solution, diluted if necessary with sodium chloride injection to a concentration of 1.5 percent, meets the requirements of the *Pyrogen Test,* page 851.

Other requirements—Aminoacetic Acid Sterile Solution meets the requirements under *Injections,* page 810, except that the container in which the Solution is packaged may be designed to empty rapidly and may exceed 1000 ml. in capacity.

Assay—Dilute an accurately measured volume of Aminoacetic Acid Sterile Solution, equivalent to about 150 mg. of aminoacetic acid, to 25 ml. with water, and add 10 ml. of formaldehyde T.S., previously adjusted to pH 9.0, and 5 drops of mixed indicator solution (prepared by dissolving 75 mg. of phenolphthalein and 25 mg. of thymol blue in a mixture of equal volumes of alcohol and water to make 100 ml.), and titrate with 0.1 *N* sodium hydroxide until the yellow color disappears and a faint violet color appears. Each ml. of 0.1 *N* sodium hydroxide is equivalent to 7.507 mg. of $C_2H_5NO_2$.

Packaging and storage—Preserve Aminoacetic Acid Sterile Solution in single-dose containers, preferably of Type I or Type II glass.

Solutions available—Aminoacetic Acid Sterile Solution is usually available as a 1.5 percent solution in 1500, 2000, and 3000 ml., and as a 15 percent concentrate in 1000 ml.

CATEGORY and DOSE—See Aminoacetic Acid.

Aminocaproic Acid*

$NH_2CH_2(CH_2)_3CH_2COOH$

6-Aminohexanoic Acid

$C_6H_{13}NO_2$ Mol. wt. 131.18

Aminocaproic Acid contains not less than 98.5 percent and not more than 100.5 percent of $C_6H_{13}NO_2$, calculated on the anhydrous basis.

Description—Aminocaproic Acid occurs as a fine, white crystalline powder. It is odorless or nearly so. Its solutions are neutral to litmus. It melts at about 205°.

Solubility—Aminocaproic Acid is freely soluble in water, in acids, and in alkalies. It is slightly soluble in methanol and in alcohol, and is practically insoluble in chloroform and in ether.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Aminocaproic Acid, previously dried over a suitable desiccant, exhibits maxima only at the same wavelengths as that of NF Aminocaproic Acid Reference Standard, similarly measured.

Water, page 900—Determine the water content of Aminocaproic Acid by the titrimetric method: not more than 0.5 percent is found.

Residue on ignition, page 858—Aminocaproic Acid yields not more than 0.1 percent of residue on ignition.

Heavy metals, *Method II,* page 806—The heavy metals limit for Aminocaproic Acid is 20 parts per million.

Assay—Transfer about 500 mg. of Aminocaproic Acid, accurately weighed, to a beaker, add about 100 ml. of glacial acetic acid, heat gently to effect solution, and cool. Add 10 drops of a 1 in 500 solution of crystal violet in chlorobenzene, and titrate with 0.1 *N* perchloric acid in dioxane to a blue end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 13.12 mg. of $C_6H_{13}NO_2$.

Packaging and storage—Preserve Aminocaproic Acid in tight containers.

CATEGORY—Hemostatic.

USUAL DOSE—Oral and intravenous, Initial, **5 g.** followed by **1** to **1.25 g.** every hour to maintain a plasma level of 13 mg. per 100 ml. No more than 30 g. per 24-hour period is recommended.

---

* Patented. See notice, page ii.

Aminocaproic Acid Injection

Aminocaproic Acid Injection is a sterile solution of aminocaproic acid in water for injection. It contains not less than 95.0 percent and not more than 107.5 percent of the labeled amount of $C_6H_{13}NO_2$.

Identification—Mix 2 ml. of Aminocaproic Acid Injection, added dropwise, with 100 ml. of acetone, rapidly stirring the mixture with a glass rod to induce crystallization. Allow the mixture to stand for 15 minutes, and then filter through a medium-porosity sintered-glass filter. Wash the crystals with 25 ml. of acetone, apply vacuum to withdraw the solvent, then dry at 105° for 30 minutes, and cool. A potassium bromide dispersion prepared from the residue so obtained meets the requirements for *Infrared absorption* under *Aminocaproic Acid,* page 40.

pH, page 824—The pH of Aminocaproic Acid Injection is between 6.0 and 7.6.

Pyrogen—Aminocaproic Acid Injection meets the requirements of the *Pyrogen Test,* page 851, the test dose being 1 ml. per kg.

Other requirements—Aminocaproic Acid Injection meets the requirements under *Injections,* page 810.

Assay—Transfer an accurately measured portion of Aminocaproic Acid Injection, equivalent to 500 mg. of aminocaproic acid, to a beaker, add about 100 ml. of glacial acetic acid, mix, and proceed as directed in the *Assay* under *Aminocaproic Acid,* page 40, beginning with "Add 10 drops of a 1 in 500 solution of crystal violet in chlorobenzene. . . ."

Packaging and storage—Preserve Aminocaproic Acid Injection in single-dose or in multiple-dose containers, preferably of Type I glass.

Injection available—Aminocaproic Acid Injection usually available contains the following amount of aminocaproic acid: 5 g. in 20 ml.

CATEGORY and DOSE—See Aminocaproic Acid.

Aminocaproic Acid Tablets

Aminocaproic Acid Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_6H_{13}NO_2$.

Identification—Triturate two Aminocaproic Acid Tablets with 10 ml. of water, and filter into 100 ml. of acetone. Swirl the mixture, and allow to stand for 15 minutes to complete crystallization. Filter through a medium porosity sintered-glass filter, and wash the crystals with 25 ml. of acetone. Apply vacuum to withdraw the solvent, then dry at 105° for 10 to 15 minutes, and cool: a potassium bromide dispersion prepared from the residue so obtained meets the requirements for *Infrared absorption* under *Aminocaproic Acid*, page 40.

Disintegration, page 878—The disintegration time limit for Aminocaproic Acid Tablets is 30 minutes.

Weight variation, page 901—Aminocaproic Acid Tablets meet the requirements of the weight variation test for tablets.

Assay—Weigh and finely powder not less than 20 Aminocaproic Acid Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 500 mg. of aminocaproic acid, to a beaker, add about 100 ml. of glacial acetic acid, heat gently to effect solution, and cool. Proceed as directed in the *Assay* under *Aminocaproic Acid,* page 40, beginning with "Add 10 drops of a 1 in 500 solution of crystal violet in chlorobenzene. . . ."

Packaging and storage—Preserve Aminocaproic Acid Tablets in tight containers.

Tablets available—Aminocaproic Acid Tablets usually available contain the following amount of aminocaproic acid: 500 mg.

CATEGORY and DOSE—See Aminocaproic Acid.

Aminosalicylate, Calcium, page 113
Aminosalicylate, Calcium, Capsules, page 115
Aminosalicylate, Calcium, Tablets, page 115

Strong Ammonia Solution

Strong Ammonia Solution is a solution of NH_3, containing not less than 27.0 percent and not more than 30.0 percent (w/w) of NH_3. Upon exposure to air it loses ammonia rapidly.

Caution: Use care in handling Strong Ammonia Solution because of the caustic nature of the Solution and the irritating properties of its vapor. Cool the container well before opening, and cover the closure with a cloth or similar material while opening. Do not taste Strong Ammonia Solution, and avoid inhalation of its vapor.

Description—Strong Ammonia Solution is a clear, colorless liquid, having an exceedingly pungent, characteristic odor. Its specific gravity is about 0.90.

Identification—Dense white fumes are produced if a glass rod wet with hydrochloric acid is held near the surface of Strong Ammonia Solution.

Nonvolatile residue—Evaporate a 10-ml. portion of Strong Ammonia Solution in a tared platinum or porcelain dish to dryness, and dry at 105° for 1 hour: not more than 5 mg. of residue remains (0.05 percent).

Heavy metals, page 806—Evaporate 5 ml. of Strong Ammonia Solution on a steam bath to dryness, add to the residue 1 ml. of diluted hydrochloric acid, and evaporate to dryness. Dissolve the residue in 2 ml. of diluted acetic acid, and add water to make 25 ml.: the heavy metals limit for Strong Ammonia Solution is 13 parts per million.

Readily oxidizable substances—To a mixture of 4 ml. of Strong Ammonia Solution and 6 ml. of water, add a slight excess of diluted sulfuric acid and 0.1 ml. of 0.1 *N* potassium permanganate: the pink color does not completely disappear within 10 minutes.

Assay—Transfer quickly a portion of Strong Ammonia Solution to a stoppered thick-walled container (a pressure bottle is suitable) to obtain a column height of about 20 cm., stopper, and cool the container and contents to 10° or lower. Weigh accurately a 125-ml. glass-stoppered conical flask containing 35.0 ml. of 1 *N* sulfuric acid. Insert a graduated 10-ml. measuring pipet into the cooled Strong

Ammonia Solution, allow the liquid to rise in the pipet without vacuum, remove the pipet, wipe off adhering liquid, and discard the first ml. of the Solution permitted to run from the pipet. Hold the pipet just above the surface of the 1 *N* sulfuric acid in the conical flask, and transfer about 2 ml. of the Solution into the flask. Stopper, mix, and reweigh to obtain the weight of the sample. Titrate the excess acid with 1 *N* sodium hydroxide, using 3 drops of methyl red T.S. as the indicator. Perform a blank determination (see *Residual Titrations*, page 883). Each ml. of 1 *N* sulfuric acid is equivalent to 17.03 mg. of NH_3.

Packaging and storage—Preserve Strong Ammonia Solution in tight containers, preferably at a temperature not exceeding 25°.

Category—Solvent; source of ammonia.

Aromatic Ammonia Spirit

Aromatic Ammonia Spirit contains, in each 100 ml., not less than 1.7 g. and not more than 2.1 g. of total NH_3, and ammonium carbonate corresponding to not less than 3.5 g. and not more than 4.5 g. of $(NH_4)_2CO_3$.

Ammonium Carbonate, in translucent pieces	**34 g.**
Strong Ammonia Solution	**36 ml.**
Lemon Oil	**10 ml.**
Lavender Oil	**1 ml.**
Myristica Oil	**1 ml.**
Alcohol	**700 ml.**
Purified Water, a sufficient quantity	
To make	**1000 ml.**

Dissolve the ammonium carbonate in the strong ammonia solution and 195 ml. of purified water by gentle agitation, and allow the solution to stand for 12 hours. Dissolve the oils in the alcohol, contained in a graduated bottle or cylinder, and gradually add the ammonium carbonate solution and enough purified water to make the product measure 1000 ml. Set the mixture aside in a cool place for 24 hours, occasionally agitating it, and then filter, using a covered funnel.

Description—Aromatic Ammonia Spirit is a nearly colorless liquid when recently prepared, but gradually acquires a yellow color on standing. It has the taste of ammonia, has an aromatic and pungent odor, and is affected by light. Its specific gravity is about 0.90.

Assay for total NH_3—Pipet 10.0 ml. of Aromatic Ammonia Spirit into a 250-ml. conical flask containing about 50 ml. of water. Add 30.0 ml. of 0.5 *N* sulfuric acid, and boil until the solution becomes clear. Cool, add 3 drops of methyl red T.S., and titrate the excess acid with 0.5 *N* sodium hydroxide. Perform a blank determination (see *Residual Titrations*, page 883). Each ml. of 0.5 *N* sulfuric acid is equivalent to 8.515 mg. of NH_3.

Assay for ammonium carbonate—Pipet 10.0 ml. of Aromatic Ammonia Spirit into a flask of about 300-ml. capacity. Add about 30 ml. of 0.5 *N* sodium hydroxide, and boil the mixture, replacing the water lost by evaporation, until the vapors no longer turn moistened red litmus paper blue. Cool, dilute with 100 ml. of cold, carbon dioxide-free water, add about 6 drops of phenolphthalein T.S., and then just enough 0.5 *N* sulfuric acid to discharge the color of the phenolphthalein. Then add 3 drops of methyl orange T.S., and titrate with 0.5 *N* sulfuric acid. Perform a blank determination (see *Residual Titrations*, page 883). Each ml. of 0.5 *N* sulfuric acid consumed in the titration with methyl orange T.S. is equivalent to 48.04 mg. of $(NH_4)_2CO_3$.

Alcohol content, page 772—Aromatic Ammonia Spirit contains from 62 to 68 percent (v/v) of C_2H_5OH.

Packaging and storage—Preserve Aromatic Ammonia Spirit in tight, light-resistant containers, preferably at a temperature not exceeding 30°.

Category—Respiratory stimulant.

Application—By inhalation of vapor as required.

Ammonium Carbonate

Ammonium Carbonate consists of ammonium bicarbonate (NH_4HCO_3) and ammonium carbamate (NH_2COONH_4) in varying proportions. It yields not less than 30.0 percent and not more than 34.0 percent of NH_3.

Description—Ammonium Carbonate occurs as a white powder or as hard, white or translucent masses, having a strong odor of ammonia, without empyreuma, and having a sharp, ammoniacal taste. Its solutions are alkaline to litmus. On exposure to air, it loses ammonia and carbon dioxide, becoming opaque, and is finally converted into friable porous lumps or a white powder of ammonium bicarbonate.

Solubility—Ammonium Carbonate is freely soluble in water, but is decomposed by hot water.

Identification—When heated, Ammonium Carbonate is volatilized without charring and the vapor is alkaline to moistened litmus paper. A solution of Ammonium Carbonate (1 in 20) effervesces with acids.

Residue on ignition, page 858—Ammonium Carbonate yields not more than 0.05 percent of residue on ignition.

Chloride, page 784—A 2-g. portion of Ammonium Carbonate shows no more chloride than corresponds to 0.1 ml. of 0.02 *N* hydrochloric acid (35 parts per million).

Sulfate, page 784—A 2-g. portion of Ammonium Carbonate shows no more sulfate than corresponds to 0.1 ml. of 0.02 *N* sulfuric acid (50 parts per million).

Heavy metals, page 806—Reduce Ammonium Carbonate to a coarse powder, and volatilize 2 g. of it on a steam bath. Add to the residue 1 ml. of diluted hydrochloric acid, and evaporate to dryness. Dissolve the residue in 2 ml. of diluted acetic acid, and add water to make 25 ml.: the heavy metals limit for Ammonium Carbonate is 10 parts per million.

Empyreumatic matter—Add a slight excess of nitric acid to a solution containing 1 g. of Ammonium Carbonate, and evaporate on a steam bath to dryness: a colorless, odorless residue is obtained.

Assay—Place in a weighing bottle about 10 ml. of water, tare the bottle and its contents, add about 2 g. of Ammonium Carbonate, and weigh accurately. Transfer the contents of the bottle to a 250-ml. flask, add 50.0 ml. of 1 *N* sulfuric acid, and, when solution has been effected, add 3 drops of methyl orange T.S., and titrate the excess acid with 1 *N* sodium hydroxide. Perform a blank determination (see *Residual Titrations*, page 883). Each ml. of 1 *N* sulfuric acid is equivalent to 17.03 mg. of NH_3.

Packaging and storage—Preserve Ammonium Carbonate in tight, light-resistant containers, preferably at a temperature not exceeding 30°.

CATEGORY—Source of ammonia.

Amobarbital Elixir

Amobarbital Elixir contains, in each 100 ml., not less than 418 mg. and not more than 462 mg. of $C_{11}H_{18}N_2O_3$.

Amobarbital	**4.4**	**g.**
Methenamine	**4.4**	**g.**
Caramel	**11.25**	**ml.**
Propylene Glycol	**310**	**ml.**
Sodium Saccharin	**1**	**g.**
Orange Oil	**0.26**	**ml.**
Lemon Oil	**0.15**	**ml.**
Cinnamon Oil	**0.03**	**ml.**
Caraway Oil	**0.006**	**ml.**
Coriander Oil	**0.0018**	**ml.**
Anise Oil	**0.02**	**ml.**
Alcohol	**300**	**ml.**
Purified Water, a sufficient quantity,		
To make	**1000**	**ml.**

Dissolve the amobarbital, sodium saccharin, and oils in the alcohol. Add the propylene glycol, the methenamine, the caramel, and sufficient purified water to make the product measure 1000 ml. Mix well, allow the product to stand 24 hours, and filter until the elixir is clear.

Identification—The amobarbital obtained in the *Assay*, when recrystallized from hot alcohol and dried at 105° for 30 minutes, melts between 156° and 159°, page 814.

Assay—Transfer 25.0 ml. of Amobarbital Elixir to a separator and make it distinctly alkaline by the addition of sodium hydroxide T.S. Add 20 ml. of solvent hexane, shake the mixture for 5 minutes, allow it to separate, and draw off the water layer into a 125-ml. separator. Wash the solvent hexane portion with 10 ml. of water, add the washing to the water portion, and discard the solvent hexane. Acidify the water portion with hydrochloric acid, render it just alkaline to litmus by adding small portions of sodium bicarbonate, and extract with 5 successive 20-ml. portions of ether. Combine the ether extracts in a separator, wash thoroughly with three 10-ml. portions of water, and in turn wash these water extracts with 10 ml. of ether. Now discard the water portions and add the ether washings to the combined ether extracts in the separator. Filter the combined ether extracts through a dry filter paper into a tared 150-ml. beaker, wash the filter with ether, add the washings to the beaker, and evaporate to dryness on a steam bath. Dry the residue at 105° for 30 minutes. The weight of the amobarbital obtained is that of the $C_{11}H_{18}N_2O_3$ in the portion of the Elixir taken.

Alcohol content, page 772—Amobarbital Elixir contains from 26 to 32 percent (v/v) of C_2H_5OH.

Packaging and storage—Preserve Amobarbital Elixir in tight containers.

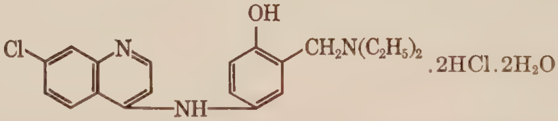
CATEGORY—Sedative.

USUAL DOSE—**5 ml.**

One usual dose contains 22 mg. of Amobarbital.

Amobarbital, Sodium, and Sodium Secobarbital Capsules, page 659

Amodiaquine Hydrochloride



4-[(7-Chloro-4-quinolyl)amino]-α-(diethylamino)-*o*-cresol Dihydrochloride

$C_{20}H_{22}ClN_3O.2HCl.2H_2O$ Mol. wt. 464.82

Amodiaquine Hydrochloride contains not less than 97.0 percent and not more than 103.0 percent of $C_{20}H_{22}ClN_3O.2HCl$, calculated on the anhydrous basis.

Description—Amodiaquine Hydrochloride occurs as a yellow, crystalline powder. It is odorless and has a bitter taste.

Solubility—Amodiaquine Hydrochloride is soluble in water. It is sparingly soluble in alcohol and is very slightly soluble in benzene, in chloroform, and in ether.

Completeness of solution, page 794—A solution of 200 mg. of Amodiaquine Hydrochloride in 10 ml. of water is clear.

Identification—

A: Amodiaquine Hydrochloride meets the requirements under *Identification—Organic Nitrogenous Bases*, page 810.

B: A solution of Amodiaquine Hydrochloride responds to the tests for *Chloride*, page 808.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Amodiaquine Hydrochloride, previously dried over a suitable desiccant, exhibits maxima only at the same wavelengths as that of NF Amodiaquine Hydrochloride Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 100,000 solution of Amodiaquine Hydrochloride in 0.1 *N* hydrochloric acid exhibits maxima and minima at the same wavelengths as that of NF Amodiaquine Hydrochloride Reference Standard, similarly measured.

Water, page 900—Determine the water content of Amodiaquine Hydrochloride by the titrimetric method: not less than 7 percent and not more than 9 percent is found.

Residue on ignition, page 858—Amodiaquine Hydrochloride yields not more than 0.2 percent of residue on ignition.

Assay—Accurately weigh about 300 mg. of undried Amodiaquine Hydrochloride, transfer to a 200-ml. volumetric flask, add 0.1 *N* hydrochloric acid to volume, and mix. Pipet 10.0 ml. of the solution into a 1000-ml. volumetric flask, add 0.1 *N* hydrochloric acid to volume, and mix. Concomitantly determine the absorbance of this solution and of a solution of undried NF Amodiaquine Hydrochloride Reference Standard, in the same medium, at a concentration of about 15 mcg. per ml. in 1-cm. cells, at the maximum at about 342 mμ, with a suitable spectrophotometer, using 0.1 *N* hydrochloric acid as the blank. Calculate the quantity, in mg., of $C_{20}H_{22}ClN_3O.2HCl$ in the portion of Amodiaquine Hydrochloride taken by the formula $20C \times (A_U/A_S)$, in which C is the exact concentration of the Reference Standard solution, in mcg. per ml., calculated on the anhydrous basis, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Amodiaquine Hydrochloride in tight containers.

Category—Antimalarial.

Usual dose—Suppressive, **520 mg.**, the equivalent of **400 mg.** of amodiaquine base, every 2 weeks. Therapeutic, **780 mg.** to **1.3 g.**, the equivalent of **600 mg.** to **1 g.** of amodiaquine base.

Amodiaquine Hydrochloride Tablets

Amodiaquine Hydrochloride Tablets contain an amount of $C_{20}H_{22}ClN_3O.2HCl.2H_2O$ (amodiaquine hydrochloride) equivalent to not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{20}H_{22}ClN_3O$ (amodiaquine base).

Identification—Digest a portion of finely powdered Amodiaquine Hydrochloride Tablets, equivalent to about 200 mg. of amodiaquine hydrochloride, with 50 ml. of water on a steam bath for 15 minutes. Cool, and filter the solution through hardened filter paper: the clear solution so obtained responds to the *Identification tests* under *Amodiaquine Hydrochloride*, page 44.

Ultraviolet absorption, page 866—The solution employed for measurement of absorbance in the *Assay* meets the requirements for *Ultraviolet absorption* under *Amodiaquine Hydrochloride*, page 44.

Disintegration, page 878—The disintegration time limit for Amodiaquine Hydrochloride Tablets is 30 minutes.

Weight variation, page 901—Amodiaquine Hydrochloride Tablets meet the requirements of the weight variation test for tablets.

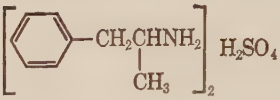
Assay—Weigh and finely powder not less than 20 Amodiaquine Hydrochloride Tablets. Weigh accurately a portion of the powder, equivalent to about 300 mg. of amodiaquine hydrochloride, and transfer to a 250-ml. beaker. Add about 100 ml. of 0.1 *N* hydrochloric acid, and heat on a steam bath for about 15 minutes with occasional stirring. Cool the mixture to room temperature, transfer to a 200-ml. volumetric flask, add 0.1 *N* hydrochloric acid to volume, and mix. Pipet 10.0 ml. of the clear supernatant liquid into a 125-ml. separator. Add about 10 ml. of 0.1 *N* hydrochloric acid, and wash with 20 ml. of chloroform, discarding the washings. Add 4.5 ml. of sodium hydroxide T.S., and extract with four 25-ml. portions of chloroform. Extract the combined chloroform solutions with three 50-ml. portions of 0.1 *N* hydrochloric acid. Combine the acid extracts in a 200-ml. volumetric flask, add 0.1 *N* hydrochloric acid to volume, and mix. Pipet 20.0 ml. of this solution into a 100-ml. volumetric flask, add 0.1 *N* hydrochloric acid to volume, and mix. Concomitantly determine the absorbance of this solution and of a solution of undried NF Amodiaquine Hydrochloride Reference Standard, in the same medium, at a concentration of about 15 mcg. per ml., in 1-cm. cells, at the maximum at about 342 mμ, with a suitable spectrophotometer, using 0.1 *N* hydrochloric acid as the blank. Calculate the quantity, in mg., of $C_{20}H_{22}ClN_3O.2HCl.2H_2O$ in the portion of the tablets taken by the formula $20C \times 1.084 \times (A_U/A_S)$, in which C is the exact concentration of the Reference Standard solution, in mcg. per ml., calculated on the anhydrous basis, A_U is the absorbance of the sample solution, A_S is the absorbance of the Reference Standard solution, and 1.084 is the conversion factor relating the anhydrous salt to the hydrated salt. The quantity determined, multiplied by 0.766 gives the equivalent quantity of $C_{20}H_{22}ClN_3O$.

Packaging and storage—Preserve Amodiaquine Hydrochloride Tablets in tight containers.

Tablets available—Amodiaquine Hydrochloride Tablets usually available contain the equivalent of the following amount of amodiaquine base: 200 mg.

Category and Dose—See Amodiaquine Hydrochloride.

Amphetamine Sulfate



(±)-α-Methylphenethylamine Sulfate (2:1)

$(C_9H_{13}N)_2 . H_2SO_4$ Mol. wt. 368.50

Amphetamine Sulfate, dried at 105° for 2 hours, contains not less than 98.0 percent and not more than 100.5 percent of $(C_9H_{13}N)_2 . H_2SO_4$.

Description—Amphetamine Sulfate occurs as a white, odorless, crystalline powder. It has a slightly bitter taste. Its solutions are acid to litmus, having a pH of 5 to 6.

Solubility—Amphetamine Sulfate is freely soluble in water, and is slightly soluble in alcohol. It is practically insoluble in ether.

Identification—

A: Dissolve about 100 mg. of Amphetamine Sulfate in 5 ml. of water, add 5 ml. of sodium hydroxide T.S., cool to about 10°, add 1 ml. of a mixture of 1 volume of benzoyl chloride and 2 volumes of absolute ether, stopper, and shake well for 3 minutes. Filter the precipitate, wash it with about 10 ml. of cold water, and recrystallize it from diluted alcohol: the crystals of the benzoyl derivative of amphetamine so obtained, after drying at 80° for 2 hours, melt between 131° and 135°, page 814.

B: A solution of Amphetamine Sulfate (1 in 10) responds to the tests for *Sulfate*, page 810.

Loss on drying, page 814—Dry Amphetamine Sulfate at 105° for 2 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Amphetamine Sulfate yields not more than 0.2 percent of residue on ignition.

Dextroamphetamine—A solution of Amphetamine Sulfate (1 in 50) is optically inactive.

Assay—

Standard preparation—Prepare as directed for *Standard preparation* under *Amphetamine Assay*, page 776.

Assay preparation—Dissolve about 125 mg. of Amphetamine Sulfate, previously dried at 105° for 2 hours and accurately weighed, in 25 ml. of hydrochloric acid solution (1 in 100) in a 50-ml. volumetric flask, dilute to volume with the solvent, and mix. Pipet 2.0 ml. of the solution into a 100-ml. beaker containing 3 g. of purified siliceous earth, and mix until a fluffy mixture is obtained.

Procedure—Proceed as directed for *Procedure* under *Amphetamine Assay*, page 776. Calculate the quantity, in mg., of $(C_9H_{13}N)_2 . H_2SO_4$ in the portion of Amphetamine Sulfate taken by the formula $0.25C \times [(A_{U257} - A_{U280})/(A_{S257} - A_{S280})]$, in which C is the exact concentration, in mcg. per ml., of USP Dextroamphetamine Sulfate Reference Standard in the *Standard preparation*.

Packaging and storage—Preserve Amphetamine Sulfate in well-closed containers.

Category—Central stimulant.

Usual dose—Oral, **5 mg.** three times a day. Intramuscular and slow intravenous, for barbiturate poisoning, **10 mg.**

Usual dose range—Oral, **5** to **30 mg.** daily. Intravenous, **10** to **50 mg.**

Amphetamine Sulfate Injection

Amphetamine Sulfate Injection is a sterile solution of amphetamine sulfate in water for injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $(C_9H_{13}N)_2 . H_2SO_4$.

Identification—Amphetamine Sulfate Injection responds to the *Identification tests* under *Amphetamine Sulfate*, page 46.

pH, page 824—The pH of Amphetamine Sulfate Injection is between 4.0 and 6.3.

Other requirements—Amphetamine Sulfate Injection meets the requirements under *Injections*, page 810.

Assay—*Standard preparation*—Prepare as directed for *Standard preparation* under *Amphetamine Assay*, page 776.

Assay preparation—Transfer an accurately measured volume of Amphetamine Sulfate Injection, equivalent to about 125 mg. of amphetamine sulfate, to a 50-ml. volumetric flask, dilute to volume with hydrochloric acid solution (1 in 100), and mix. Pipet 2.0 ml. of the solution into a 100-ml. beaker containing 3 g. of purified siliceous earth, and mix until a fluffy mixture is obtained.

Procedure—Proceed as directed for *Procedure* under *Amphetamine Assay,* page 776. Calculate the quantity, in mg., of $(C_9H_{13}N)_2 \cdot H_2SO_4$ in each ml. of the Injection taken by the formula $0.25 \times (C/V) \times [(A_{U257} - A_{U280})/(A_{S257} - A_{S280})]$, in which C is the exact concentration, in mcg. per ml., of USP Dextroamphetamine Sulfate Reference Standard in the *Standard preparation,* and V is the volume, in ml., of the Injection taken.

Packaging and storage—Preserve Amphetamine Sulfate Injection in single-dose or in multiple-dose containers, preferably of Type I glass.

Injections available—Amphetamine Sulfate Injection usually available contains the following amounts of amphetamine sulfate: 20 mg. in 1 ml. and 600 mg. in 30 ml.

CATEGORY and DOSE—See Amphetamine Sulfate.

Amphetamine Sulfate Tables

Amphetamine Sulfate Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $(C_9H_{13}N)_2 \cdot H_2SO_4$.

Identification—Macerate a quantity of powdered Amphetamine Sulfate Tablets, representing about 50 mg. of amphetamine sulfate, with 10 ml. of water for 30 minutes, and filter into a small flask. To the filtrate add 3 ml. of sodium hydroxide T.S. Cool to about 10° to 15°, add 1 ml. of a mixture of 1 volume of benzoyl chloride and 2 volumes of absolute ether, stopper, and shake well for 3 minutes. Filter the precipitate, wash it with about 15 ml. of cold water, and recrystallize it twice from diluted alcohol. The crystals of the benzoyl derivative of amphetamine so obtained, after drying at 80° for 2 hours, melt between 131° and 135°, page 814.

Disintegration, page 878—The disintegration time limit for Amphetamine Sulfate Tablets is 15 minutes.

Content uniformity, *Method I,* page 799—Amphetamine Sulfate Tablets meet the requirements of the content uniformity test for tablets.

Assay—

Standard preparation—Prepare as directed for *Standard preparation* under *Amphetamine Assay,* page 776.

Assay preparation—Weigh and finely powder not less than 20 Amphetamine Sulfate Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 5 mg. of amphetamine sulfate, to a 100-ml. beaker, add 2 ml. of hydrochloric acid solution (1 in 100), swirl gently to wet the powder thoroughly, warm on a steam bath for about 1 minute, with occasional gentle swirling, and cool. Add 3 g. of purified siliceous earth, and mix until a fluffy mixture is obtained.

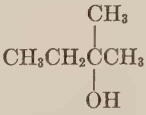
Procedure—Proceed as directed for *Procedure* under *Amphetamine Assay,* page 776. Calculate the quantity in mg., of $(C_9H_{13}N)_2 \cdot H_2SO_4$ in the portion of the Tablets taken by the formula $0.01C \times [(A_{U257} - A_{U280})/(A_{S257} - A_{S280})]$, in which C is the exact concentration, in mcg. per ml., of USP Dextroamphetamine Sulfate Reference Standard in the *Standard preparation.*

Packaging and storage—Preserve Amphetamine Sulfate Tablets in well-closed containers.

Tablets available—Amphetamine Sulfate Tablets usually available contain the following amounts of amphetamine sulfate: 5 and 10 mg.

CATEGORY and DOSE—See Amphetamine Sulfate.

Amylene Hydrate



$$\begin{array}{c} CH_3 \\ | \\ CH_3CH_2CCH_3 \\ | \\ OH \end{array}$$

tert-Pentyl Alcohol

$C_5H_{12}O$ Mol. wt. 88.15

Description—Amylene Hydrate occurs as a clear, colorless liquid, having a camphoraceous odor. Its solutions are neutral to litmus.

Solubility—Amylene Hydrate is freely soluble in water. It is miscible with alcohol, with chloroform, with ether, and with glycerin.

Identification—

A: Mix 2 ml. of Amylene Hydrate with 15 ml. of water, 5 ml. of sulfuric acid, and 10 g. of potassium dichromate, heat the mixture under a reflux condenser for 2 hours, then distil, collecting and reserving the first 2 ml. of the distillate. Continue the distillation until most of the water has distilled over, make this distillate alkaline with sodium hydroxide T.S., add diluted sulfuric acid dropwise until the solution is neutral to litmus paper, and carefully evaporate to dryness: the residue responds to the tests for *Acetate*, page 807.

B: To 1 ml. of the reserved distillate, obtained in *Identification test A*, add 5 drops of sodium nitroferricyanide T.S., 2 ml. of sodium hydroxide T.S., then a slight excess of acetic acid: a deep red liquid, which develops a violet tint when diluted with several volumes of water, is produced.

C: To 10 ml. of a solution of Amylene Hydrate (1 in 10) quickly add 5 ml. of a 1 in 100 solution of vanillin in sulfuric acid: a violet-red color is produced.

Specific gravity, page 866—The specific gravity of Amylene Hydrate is not less than 0.803 and not more than 0.807.

Distilling range, *Method I,* page 782—Amylene Hydrate distils completely between 97° and 103°.

Water—To 10 ml. of Amylene Hydrate add 1 g. of anhydrous cupric sulfate, and shake well: the cupric sulfate does not become blue.

Nonvolatile residue—Evaporate 10 ml. of Amylene Hydrate in a tared porcelain dish on a steam bath to a volume of about 1 ml., and allow it to evaporate spontaneously to dryness while protected from dust: the residue, if any, is colorless, and, when dried at 105° for 1 hour, weighs not more than 2 mg. (0.02 percent).

Heavy metals, page 806—Evaporate 2.5 ml. (2 g.) of Amylene Hydrate on a steam bath to dryness, warm the residue gently with 1 ml. of 0.1 *N* hydrochloric acid, add water to make 25 ml., and filter if necessary: the heavy metals limit for Amylene Hydrate is 5 parts per million.

Readily oxidizable substances—To 10 ml. of a solution of Amylene Hydrate (1 in 20) add 0.1 ml. of 0.1 *N* potassium permanganate: the pink color does not completely disappear within 10 minutes.

Aldehyde—To 10 ml. of a solution of Amylene Hydrate (1 in 20) add 1 ml. of silver-ammonium nitrate T.S., and heat the mixture on a water bath at 60° for 10 minutes: no darkening occurs.

Packaging and storage—Preserve Amylene Hydrate in tight containers.

CATEGORY—Solvent.

Amyl Nitrite

$(CH_3)_2CHCH_2CH_2ONO$

Isopentyl Nitrite

$C_5H_{11}NO_2$ Mol. wt. 117.15

Amyl Nitrite contains not less than 95.0 percent and not more than 105.0 percent of $C_5H_{11}NO_2$.

Caution: Amyl Nitrite is very flammable. Do not use where it may be ignited.

Description—Amyl Nitrite is a clear, yellowish liquid, having a peculiar, ethereal, fruity odor. It is volatile even at low temperatures and is flammable.

Solubility—Amyl Nitrite is practically insoluble in water, but is miscible with alcohol and with ether.

Identification—

A: To a mixture of 2 drops of Amyl Nitrite and 2 drops of water add 2 ml. of sulfuric acid, and then dilute with water: the odor of amyl valerate is perceptible.

B: To a few drops of Amyl Nitrite add a mixture of 1 ml. of ferrous sulfate T.S. and 5 ml. of diluted hydrochloric acid: a greenish brown color is produced.

Specific gravity, page 866—The specific gravity of Amyl Nitrite is not less than 0.871 and not more than 0.875.

Acidity—To 5 ml. of Amyl Nitrite, in a glass-stoppered cylinder, add a mixture of 1 ml. of 1 *N* sodium hydroxide, 10 ml. of water, and 1 drop of phenolphthalein T.S., and invert the cylinder 3 times: the red tint of the water layer is still perceptible.

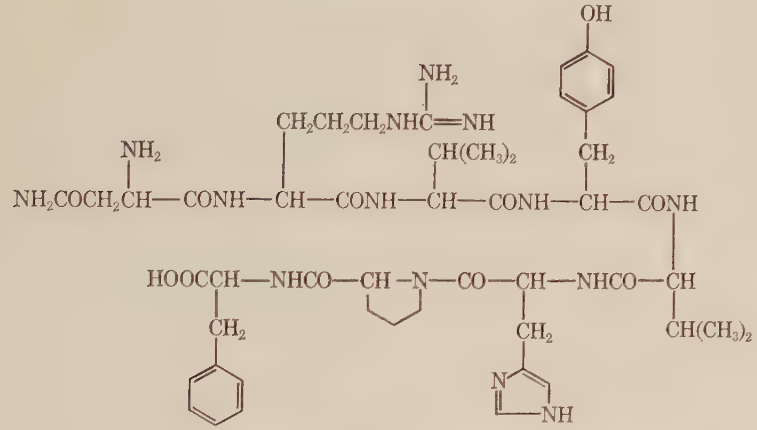
Assay—Shake about 3 ml. of Amyl Nitrite with 500 mg. of anhydrous potassium carbonate, decant carefully, transfer to a 100-ml. volumetric flask tared with about 20 ml. of alcohol, and weigh accurately. Add alcohol to volume, and mix. Fill a nitrometer with a saturated solution of sodium chloride, pipet into the funnel top 10.0 ml. of the alcohol solution, and, after drawing this into the measuring tube of the nitrometer without the admission of air, follow it with 5 ml. of alcohol as a rinse, then with 10 ml. of potassium iodide T.S., and afterwards with 5 ml. of diluted sulfuric acid, introducing each reagent separately into the measuring tube. When the volume of gas has become constant (in about 30 to 60 minutes), note the amount collected, the temperature at the nitrometer, and the barometric pressure. Multiply the volume of gas in ml. by 4.8, and divide the product by the weight of Amyl Nitrite taken. At 25° and 760 mm. pressure, the quotient represents the percentage of $C_5H_{11}NO_2$ in the liquid. The temperature correction is $^{1}/_{298}$ of the total percentage just found for each degree, added if the temperature is below 25°, and subtracted if it is above 25°. The barometric correction is $^{1}/_{760}$ of the total percentage just found for each mm., added if it is above 760 mm., and subtracted if it is below 760 mm.

Packaging and storage—Preserve Amyl Nitrite in tight containers. Containers for the administration of Amyl Nitrite by inhalation are wrapped loosely in gauze or other suitable material.

Category—Vasodilator.

Usual dose—Inhalation, **0.3 ml.** as required.

Angiotensin Amide



1-L-Asparagine-5-L-valineangiotensin II

$C_{49}H_{70}N_{14}O_{11}$ Mol. wt. 1031.19

Angiotensin Amide contains not less than 77.0 percent of $C_{49}H_{70}N_{14}O_{11}$.

Description—Angiotensin Amide occurs as a white to slightly off-white, odorless, amorphous powder.

Solubility—Angiotensin Amide is soluble in water, slightly soluble in methanol, and insoluble in ether and in chloroform.

Identification—Line the inside of a chromatographic chamber suitable for descending chromatography (see page 786) with filter paper. Fill the solvent trough with a mixture prepared by diluting 70 ml. of secondary butyl alcohol to 100 ml. with dilute ammonia T.S. (1 in 3) to serve as the mobile phase, and also place a sufficient amount of the same mixture on the bottom of the chamber to permit the liner to be in contact with it. Allow the chamber to equilibrate overnight. Prepare a 10 × 45-cm. strip of Whatman No. 1 or equivalent filter paper, draw a line across the narrow dimension about 6 cm. from one end, and mark two points for application of solutions along this line about 2.5 cm. from each edge of the paper. With a micropipet spot 10 μl. of an aqueous solution containing 5 mg. of Angiotensin Amide in each ml., and similarly spot in another position 10 μl. of an aqueous solution containing 5 mg. per ml. of NF Angiotensin Amide Reference Standard. Suspend the strip in the chamber, and allow to develop for 16 hours. Remove the strip, mark the solvent front, and dry the strip in air. Spray the strip with a visualizing solution prepared as follows: immediately before use, dissolve 100 mg. of sulfanilic acid in a mixture of 1 ml. of hydrochloric acid and 9 ml. of water, add 10 ml. of sodium nitrite solution (1 in 20), allow to stand for several minutes, and then add 20 ml. of sodium carbonate T.S.: The R_f value of the main spot from the sample solution corresponds to that obtained from the Reference Standard solution.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 20,000 solution of Angiotensin Amide in 2 *N* sodium hydroxide exhibits maxima and minima at the same wavelengths as that of NF Angiotensin Amide Reference Standard, similarly measured.

Specific rotation, page 822—Determine the apparent specific rotation of a solution of Angiotensin Amide in 0.5 *N* hydrochloric acid containing 10 mg. of Angiotensin Amide in each ml., at 20°, in a 1-decimeter tube: the corrected specific rotation, calculated by dividing the apparent specific rotation by the percent purity determined as directed in the *Assay,* is between $-68°$ and $-76°$.

Assay—

Tyrosine stock solution—Transfer about 150 mg. of NF Tyrosine Reference Standard, previously dried to constant weight at 110° and accurately weighed, to a 50-ml. volumetric flask, add sodium hydroxide T.S. to volume, and mix.

Acidic standard preparation—Transfer 10.0 ml. of *Tyrosine stock solution* to a 100-ml. volumetric flask, dilute to volume with 2 *N* hydrochloric acid, and mix. Transfer 10.0 ml. of this solution to a second 100-ml. volumetric flask, dilute to volume with 2 *N* hydrochloric acid, and mix.

Alkaline standard preparation—Transfer 10.0 ml. of *Tyrosine stock solution* to a 100-ml. volumetric flask, dilute to volume with 2 *N* sodium hydroxide, and mix. Transfer 10.0 ml. of this solution to a second 100-ml. volumetric flask, dilute to volume with 2 *N* sodium hydroxide, and mix.

Assay stock solution—Transfer about 100 mg. of Angiotensin Amide, accurately weighed, to a 25-ml. volumetric flask, add water to volume, and mix.

Acidic assay preparation—Transfer 5.0 ml. of *Assay stock solution* to a 100-ml. volumetric flask, dilute to volume with 2 *N* hydrochloric acid, and mix.

Alkaline assay preparation—Transfer 5.0 ml. of *Assay stock solution* to a 100-ml. volumetric flask, dilute to volume with 2 *N* sodium hydroxide, and mix.

Procedure—Concomitantly determine the absorbances of the *Acidic standard preparation,* the *Acidic assay preparation,* the *Alkaline standard preparation,* and the *Alkaline assay preparation,* in 1-cm. cells, at the maximum at about 294 mμ, with a suitable spectrophotometer, using 2 *N* hydrochloric acid as the blank for the acidic preparations and 2 *N* sodium hydroxide as the blank for the alkaline preparations. Calculate the quantity, in mg., of $C_{49}H_{70}N_{14}O_{11}$ in the Angiotensin Amide taken by the formula $0.5C \times 5.691 \times (A_{U1} - A_{U2})/(A_{S1} - A_{S2})$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparations,* 5.691 is the ratio of the molecular weight of angiotensin amide to tyrosine, A_{U1} is the absorbance of the *Alkaline assay preparation,* A_{U2} is the absorbance of the *Acidic assay preparation,* A_{S1} is the absorbance of the *Alkaline standard preparation,* and A_{S2} is the absorbance of the *Acidic standard preparation.*

Packaging and storage—Preserve Angiotensin Amide in tight, light-resistant containers.

Category—Vasopressor.

Usual Dose Range—Intravenous infusion, **3** to **10 mcg.** per minute as determined by blood pressure response.

Angiotensin Amide for Injection

Angiotensin Amide for Injection is a sterile, dry mixture of angiotensin amide with suitable diluents. It contains not less than 92.0 percent and not more than 108.0 percent of the labeled amount of $C_{49}H_{70}N_{14}O_{11}$.

Identification—Transfer to a 10-ml. volumetric flask a quantity of Angiotensin Amide for Injection, equivalent to about 2.5 mg. of angiotensin amide, add water to volume, and mix. Dilute 2.0 ml. of this solution to 10.0 ml. with 2 *N* hydrochloric acid, and dilute another 2.0-ml. portion of the solution to 10.0 ml. with 2 *N* sodium hydroxide. The ultraviolet absorption spectra of the solutions, respectively, exhibit maxima and minima at the same wavelengths as those of similar solutions prepared from NF Angiotensin Amide Reference Standard, similarly measured.

Pyrogen—Angiotensin Amide for Injection meets the requirements of the *Pyrogen Test,* page 851, the test dose being 1.0 ml. per kg. of a solution containing 500 mcg. of angiotensin amide in each ml.

pH, page 824—The pH of a solution of Angiotensin Amide for Injection containing about 500 mcg. of angiotensin amide in each ml. is between 5.0 and 6.5.

Content uniformity, *Method I,* page 798—Angiotensin Amide for Injection meets the requirements of the content uniformity test for sterile solids.

Water—

Standard preparation—Transfer 2.0 ml. of water to a 200-ml. volumetric flask, dilute to volume with methanol, and mix. Transfer 10.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with methanol, and mix. Determine the water content of this solution by the titrimetric method, page 900.

Test preparation—If the sample is in an ampul, open the ampul, quickly introduce and mix 100 µl. of methanol, using a 100-µl. syringe, and use immediately as directed in the *Procedure*. If the sample is in a vial, introduce 500 µl. of methanol through the stopper of the unopened vial, using a suitable syringe, and mix.

Procedure—Inject 10 µl. of methanol into a suitable gas-liquid chromatograph (see page 787), equipped with a 2-meter by 6-mm. (outside diameter) column packed with fluorinated ethylene-propylene resin on 40 to 60-mesh nonoxynol 9; the column is maintained at a temperature of 80°, and helium is used as the carrier gas at a flow rate of about 60 ml. per minute. Record the chromatogram. Similarly, inject 10 µl. each of the *Standard preparation* and of the *Test preparation*, and record the respective chromatograms. Calculate the quantity, in mg., of water in the sample by the formula $W \times V \times (A_U - A_B)/(A_S)$, in which W is the weight, in mg., of water per ml. of the *Standard preparation*, V is the volume, in ml., of methanol used in preparing the *Test preparation*, A_U is the area of the water peak from the *Test preparation*, A_B is the area of the water peak from the methanol blank, and A_S is the area of the water peak from the *Standard preparation:* not more than 1 percent of water is found.

Other requirements — Angiotensin Amide for Injection meets the requirements for *Sterility Tests*, page 874, and for *Labeling* under *Injections*, page 810.

Assay—

Acidic standard preparation and *Alkaline standard preparation*—Prepare as directed in the *Assay* under *Angiotensin Amide*, page 49.

Acidic assay preparation—Transfer an accurately weighed quantity of Angiotensin Amide for Injection, equivalent to about 2 mg. of angiotensin amide, to a 10-ml. volumetric flask, add 2 *N* hydrochloric acid to volume, and mix.

Alkaline assay preparation—Transfer an accurately weighed quantity of Angiotensin Amide for Injection, equivalent to about 2 mg. of angiotensin amide, to a 10-ml. volumetric flask, add 2 *N* sodium hydroxide to volume, and mix.

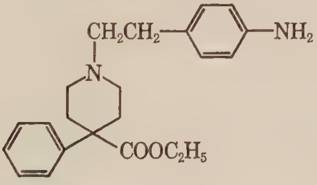
Procedure—Proceed as directed for *Procedure* in the *Assay* under *Angiotensin Amide*, page 49. Calculate the quantity, in mg., of $C_{49}H_{70}N_{14}O_{11}$ in the sample taken by the formula $0.01C \times 5.691 \times (A_{U1} - A_{U2})/(A_{S1} - A_{S2})$.

Packaging and storage—Preserve Angiotensin Amide for Injection in single-dose or multiple-dose containers, preferably of Type I glass.

Sizes available—Angiotensin Amide for Injection usually available contains the following amounts of angiotensin amide: 500 mcg. and 2.5 mg.

CATEGORY and DOSE—See Angiotensin Amide.

Anileridine*



Ethyl 1-(*p*-Aminophenethyl)-4-phenylisonipecotate

$C_{22}H_{28}N_2O_2$ Mol. wt. 352.48

Anileridine contains not less than 98.5 percent and not more than 101.0 percent of $C_{22}H_{28}N_2O_2$, calculated on the anhydrous basis.

Description—Anileridine occurs as a white to yellowish white, odorless to practically odorless crystalline powder. It oxidizes and darkens in air and on exposure to light. It exhibits polymorphism, and of two crystalline forms observed, one melts at about 80° and the other at about 89°.

Solubility—Anileridine is freely soluble in alcohol and in chloroform. It is very slightly soluble in water. It is soluble in ether although it may show turbidity.

---

* Patented. See notice, page ii.

WINE INSTITUTE LIBRARY

Identification—To 5 ml. of a solution of Anileridine in 0.1 *N* hydrochloric acid (1 in 5000) add 2 ml. of a solution of *p*-dimethylaminobenzaldehyde in alcohol (1 in 100): a yellow color develops immediately.

Ultraviolet absorption, page 866—Dissolve 40 mg. of Anileridine in 2.3 ml. of 0.1 *N* hydrochloric acid in a 100-ml. volumetric flask, dilute to volume with water, and mix (*Stock solution*). Transfer 4.0 ml. of this solution into a 100-ml. volumetric flask, and add 25 ml. of pH 7.0 *Buffer solution.* (Prepare the *Buffer solution* by dissolving 22.73 g. of anhydrous dibasic sodium phosphate and 14.52 g. of monobasic potassium phosphate in sufficient water to make 1000.0 ml. Dilute 25 ml. of the buffer to 100 ml.: the pH, determined potentiometrically, should be 7.0 ± 0.05.) Dilute to volume with water, and mix (*Solution A*). Transfer 20.0 ml. of the *Stock solution* to a 100-ml. volumetric flask, add 25 ml. of the pH 7.0 *Buffer solution,* dilute to volume with water, and mix (*Solution B*). The ultraviolet absorption spectrum of *Solution A* exhibits a maximum at 234 ± 1 mμ, and the ultraviolet absorption spectrum of *Solution B* exhibits a maximum at 285 ± 2 mμ. The ratio $5A_{234}/A_{285}$ is about 8.8.

Water, page 900—Determine the water content of Anileridine by the titrimetric method: not more than 1 percent is found.

Residue on ignition, page 858—Anileridine yields not more than 0.1 percent of residue on ignition.

Chloride, page 784—Dissolve 180 mg. of Anileridine in a mixture of 1 ml. of nitric acid and 40 ml. of water: the solution shows no more chloride than corresponds to 0.1 ml. of 0.02 *N* hydrochloric acid (0.04 percent).

Assay—Dissolve about 350 mg. of Anileridine, accurately weighed, in 50 ml. of glacial acetic acid, add 1 drop of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a blue-green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 17.62 mg. of $C_{22}H_{28}N_2O_2$.

Packaging and storage—Preserve Anileridine in tight, light-resistant containers.

CATEGORY—Analgesic (narcotic).

USUAL DOSE—Subcutaneous or intramuscular, **25** to **50 mg.** of Anileridine, present as the phosphate, repeated every 6 hours, if necessary.

USUAL DOSE RANGE—**25** to **75 mg.**

Anileridine Injection

Anileridine Injection is a sterile solution of anileridine in water for injection, prepared with the aid of phosphoric acid. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of $C_{22}H_{28}N_2O_2$, present as the phosphate.

Identification—

A: Dilute a volume of Anileridine Injection, equivalent to about 1.25 mg. of anileridine, to 5 ml. with water and add 2 ml. of a solution of *p*-dimethylaminobenzaldehyde in alcohol (1 in 100): a yellow color develops immediately.

B: Anileridine Injection, diluted with water to a concentration of about 25 mg. of anileridine in 1000 ml., exhibits absorbance maxima at 234 ± 1 mμ and 285 ± 2 mμ.

pH, page 824—The pH of Anileridine Injection is between 4.5 and 5.0.

Other requirements—Anileridine Injection meets the requirements under *Injections,* page 810.

Assay—

Standard preparation—Transfer to a 500-ml. volumetric flask about 120 mg. of NF Anileridine Hydrochloride, previously dried for 2 hours at 100° at a pressure not exceeding 5 mm. of mercury and accurately weighed, add 0.1 *N* hydrochloric acid to volume, and mix. (Each mg. of anileridine hydrochloride is equivalent to 0.8286 mg. of anileridine base.) Prepare a fresh *Standard preparation* on the day of the assay.

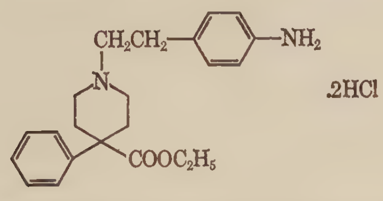
Assay preparation—Transfer to a 500-ml. volumetric flask an accurately measured volume of Anileridine Injection, equivalent to about 100 mg. of anileridine base, dilute to volume with 0.1 *N* hydrochloric acid, and mix.

Procedure—Pipet 5.0 ml. of the *Standard preparation,* of the *Assay preparation,* and of 0.1 *N* hydrochloric acid into separate 200-ml. volumetric flasks. To each flask add 25 ml. of water, 5 ml. of 1 *N* hydrochloric acid, and 5 ml. of sodium nitrite solution (1 in 1000), and mix. Allow to stand for 2 minutes, then add to each flask 5 ml. of ammonium sulfamate solution (1 in 200), and mix. Allow to stand for 3 minutes, then add 5 ml. of *N*-1-naphthylethylenediamine dihydrochloride solution (1 in 1000), and mix. Allow to stand for 1 hour, dilute to volume with water, and mix. Determine the absorbances of the solutions obtained from the *Standard preparation* and the *Assay preparation* at the maximum at about 560 mμ in a suitable spectrophotometer, using the reagent blank to set the instrument. Calculate the quantity, in mg., of $C_{22}H_{28}N_2O_2$ in each ml. of the Injection taken, by the formula $0.5 \times (C/V) \times 0.8286 \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of NF Anileridine Hydrochloride in the *Standard preparation*, V is the volume, in ml., of the Injection taken, A_U and A_S are the absorbances of the solutions obtained from the *Assay preparation* and the *Standard preparation*, respectively, and 0.8286 is the factor converting anileridine hydrochloride to anileridine.

Injections available—Anileridine Injection usually available contains the following amounts of anileridine: 25 mg. in 1 ml., 50 mg. in 2 ml., and 750 mg. in 30 ml.

CATEGORY and DOSE—See Anileridine.

Anileridine Hydrochloride*



Ethyl 1-(*p*-Aminophenethyl)-4-phenylisonipecotate Dihydrochloride

$C_{22}H_{28}N_2O_2 . 2HCl$ Mol. wt. 425.40

Anileridine Hydrochloride contains not less than 96.0 percent and not more than 102.0 percent of $C_{22}H_{28}N_2O_2 . 2HCl$, calculated on the dried basis.

Description—Anileridine Hydrochloride occurs as a white or nearly white, crystalline, odorless powder. It is stable in air. It melts at about 270° with decomposition.

Solubility—Anileridine Hydrochloride is freely soluble in water. It is sparingly soluble in alcohol, and practically insoluble in ether and in chloroform.

Identification—

A: To 5 ml. of a solution of Anileridine Hydrochloride (1 in 5000) add 2 ml. of a *p*-dimethylaminobenzaldehyde solution in alcohol (1 in 100): a yellow color develops immediately.

B: A solution of Anileridine Hydrochloride (1 in 100) responds to the tests for *Chloride*, page 784.

Ultraviolet absorption, page 866—Dissolve 50 mg. of Anileridine Hydrochloride in water in a 100-ml. volumetric flask, dilute to volume, and mix (*Stock solution*). Transfer 4.0 ml. of this solution to a 100-ml. volumetric flask, and add 25 ml. of a pH 7.0 *Buffer solution*. (Prepare the *Buffer solution* by dissolving 22.73 g. of anhydrous dibasic sodium phosphate and 14.52 g. of monobasic potassium phosphate in sufficient water to make 1000.0 ml. Dilute 25 ml. of the buffer to 100 ml.: the pH, determined potentiometrically, should be 7.0 ± 0.05.) Dilute to volume with water, and mix (*Solution A*). Transfer 20.0 ml. of the *Stock solution* to a 100-ml. volumetric flask, add 25 ml. of the pH 7.0 *Buffer solution*, dilute to volume with water, and mix (*Solution B*). The ultraviolet absorption spectrum of *Solution A* exhibits a maximum at 234 ± 1 mμ, and the ultraviolet absorption spectrum of *Solution B* exhibits a maximum at 285 ± 2 mμ. The ratio $5A_{234}/A_{285}$ is about 8.8.

pH, page 824—The pH of a solution of Anileridine Hydrochloride (1 in 20) is between 2.5 and 3.0.

Loss on drying, page 814—Dry Anileridine Hydrochloride at 100° in vacuum, maintaining the pressure below 5 mm. of mercury, for 2 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Anileridine Hydrochloride yields not more than 0.1 percent of residue on ignition.

Chloride content—Dissolve about 200 mg. of Anileridine Hydrochloride, accurately weighed, in 50 ml. of water in a glass-stoppered flask. Add 25.0 ml. of 0.1 *N* silver nitrate, then add 5 ml. of diluted nitric acid and 5 ml. of nitrobenzene, shake vigorously, add 2 ml. of ferric ammonium sulfate T.S., and titrate the excess silver nitrate with 0.1 *N* ammonium thiocyanate. Each ml. of 0.1 *N* silver nitrate is equivalent to 3.545 mg. of Cl. Not less than 16 percent and not more than 17.2 percent of Cl is found.

Assay—Dissolve about 200 mg. of Anileridine Hydrochloride, accurately weighed, in 10 ml. of glacial acetic acid by heating on a steam bath. Cool immediately in a cold water bath, add 5 ml. of mercuric acetate T.S., 20 ml. of acetone, and 0.5 ml. of indicator solution (70)mg.

---

* Patented. See notice, page ii.

α-naphtholbenzein, 10 mg. crystal violet, and 40 mg. quinaldine red in 100 ml. of glacial acetic acid), and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a gray-green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 21.27 mg. of $C_{22}H_{28}N_2O_2.2HCl$.

Packaging and storage—Preserve Anileridine Hydrochloride in tight, light-resistant containers.

CATEGORY—Analgesic (narcotic).

USUAL DOSE—**25 mg.** of anileridine, present as the dihydrochloride, repeated every 6 hours if necessary.

USUAL DOSE RANGE—**25** to **50 mg.**

Anileridine Hydrochloride Tablets

Anileridine Hydrochloride Tablets contain an amount of $C_{22}H_{28}N_2O_2.2HCl$ (anileridine hydrochloride) equivalent to not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{22}H_{28}N_2O_2$ (anileridine).

Identification—

A: Place a quantity of finely powdered Anileridine Hydrochloride Tablets, equivalent to about 50 mg. of anileridine hydrochloride, in a 250-ml. volumetric flask, add 100 ml. of water, and heat on a steam bath. Cool, dilute to volume with water, mix, and filter. Five ml. of the filtrate responds to *Identification test A* under *Anileridine Hydrochloride*, page 53.

B: Transfer to a 100-ml. volumetric flask a quantity of finely powdered Anileridine Hydrochloride Tablets, equivalent to about 50 mg. of anileridine hydrochloride. Add about 30 ml. of water, and heat on a steam bath. Cool, dilute to volume with water, mix, and filter (*Stock solution*). The filtrate responds to the *Ultraviolet absorption test* under *Anileridine Hydrochloride*, page 53, beginning with "Transfer 4.0 ml. of this solution. . . ."

Disintegration, page 878—The disintegration time limit for Anileridine Hydrochloride Tablets is 25 minutes.

Content uniformity, *Method I*, page 799—Anileridine Hydrochloride Tablets meet the requirements of the content uniformity test for tablets.

Assay—

Standard preparation—Transfer to a 500-ml. volumetric flask about 120 mg. of NF Anileridine Hydrochloride, previously dried for 2 hours at 100° at a pressure not exceeding 5 mm. of mercury and accurately weighed, add 0.1 *N* hydrochloric acid to volume, and mix. (Each mg. of anileridine hydrochloride is equivalent to 0.8286 mg. of anileridine base.) Prepare a fresh *Standard preparation* on the day of the assay.

Assay preparation—Weigh and finely powder not less than 20 Anileridine Hydrochloride Tablets. Weigh accurately a portion of the powder, equivalent to about 50 mg. of anileridine base, and transfer to a 250-ml. volumetric flask. Add 25 ml. of 1 *N* hydrochloric acid and 100 ml. of water, and heat on a water bath. Cool, dilute to volume with water, and mix. Filter the solution, discarding the first 25 ml. of the filtrate.

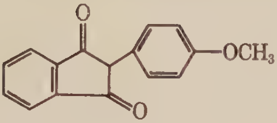
Procedure—Pipet 5.0 ml. of the *Standard preparation*, of the *Assay preparation*, and of 0.1 *N* hydrochloric acid into separate 200-ml. volumetric flasks. To each flask add 25 ml. of water, 5 ml. of 1 *N* hydrochloric acid, and 5 ml. of sodium nitrite solution (1 in 1000), and mix. Allow to stand for 2 minutes, then add to each flask 5 ml. of ammonium sulfamate solution (1 in 200), and mix. Allow to stand for 3 minutes, then add 5 ml. of *N*-1-naphthylethylenediamine dihydrochloride solution (1 in 1000), and mix. Allow to stand for 1 hour, dilute to volume with water, and mix. Concomitantly determine the absorbance of the solutions obtained from the *Standard preparation* and the *Assay preparation*, in 1-cm. cells, at 560 mμ with a suitable spectrophotometer, using the reagent blank to set the instrument. Calculate the quantity, in mg., of $C_{22}H_{28}N_2O_2$, in the portion of the Tablets taken, by the formula $0.25C \times 0.8286 \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of NF Anileridine Hydrochloride in the *Standard preparation*, A_U and A_S are the absorbances of the solutions obtained from the *Assay preparation* and the *Standard preparation*, respectively, and 0.8286 is the factor converting anileridine hydrochloride to anileridine.

Packaging and storage—Preserve Anileridine Hydrochloride Tablets in tight, light-resistant containers.

Tablets available—Anileridine Hydrochloride Tablets usually available contain the following amount of anileridine: 25 mg.

CATEGORY and DOSE—See Anileridine Hydrochloride.

Anisindione*



2-(*p*-Methoxyphenyl)-1,3-indandione

$C_{16}H_{12}O_3$ Mol. wt. 252.27

Anisindione contains not less than 97.0 percent and not more than 103.0 percent of $C_{16}H_{12}O_3$, calculated on the dried basis.

Description—Anisindione occurs as a white to creamy white powder. It is odorless or has a slightly sweet odor.

Solubility—Anisindione is practically insoluble in water, sparingly soluble in sodium hydroxide T.S., and slightly soluble in ether and in methanol. It is very slightly soluble in hydrochloric acid.

Identification—Dissolve about 10 mg. of Anisindione in 20 ml. of alcohol, and add a few drops of 0.1 *N* sodium hydroxide: a deep red color is produced.

Melting range, page 814—Anisindione melts between 152° and 158°.

Infrared absorption, page 866—The infrared absorption spectrum of a mineral oil dispersion of Anisindione, previously dried at 105° for 4 hours, exhibits maxima only at the same wavelengths as that of NF Anisindione Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 100,000 solution of Anisindione in 0.1 *N* sodium hydroxide exhibits maxima and minima at the same wavelengths as that of NF Anisindione Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance occurring at about 279 mμ, do not differ by more than 2.5 percent.

Loss on drying, page 814—Dry Anisindione at 105° for 4 hours: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Anisindione yields not more than 0.1 percent of residue on ignition.

Assay—Dissolve about 500 mg. of Anisindione, accurately weighed, in 100 ml. of acetone, and titrate rapidly with 0.1 *N* tetrabutylammonium hydroxide, determining the end-point potentiometrically and delivering the titrant from a buret equipped with a carbon dioxide absorption trap. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* tetrabutylammonium hydroxide is equivalent to 25.23 mg. of $C_{16}H_{12}O_3$.

Packaging and storage—Preserve Anisindione in tight containers.

CATEGORY—Anticoagulant.

USUAL DOSE—Initial, **300 mg.** the first day, **200 mg.** the second day, **100 mg.** the third day; maintenance, **75** to **100 mg.** per day.

USUAL DOSE RANGE—Maintenance, **25** to **250 mg.** per day, as determined by prothrombin time determinations.

---

* Patented. See notice, page ii.

Anisindione Tablets

Anisindione Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{16}H_{12}O_3$.

Identification—

A: Triturate a quantity of finely powdered Anisindione Tablets, equivalent to about 200 mg. of anisindione, with hot benzene, cool, filter, and evaporate to dryness on a steam bath: the residue so obtained responds to the *Identification test* under *Anisindione,* page 55.

B: Dry the remaining residue prepared in *Identification test A* at 105° for 1 hour: the anisindione so obtained melts at about 155°, page 814.

C: The solution prepared for measurement of absorbance in the *Assay* exhibits maxima at about 286 mμ and 338 mμ.

Disintegration, page 878—The disintegration time limit for Anisindione Tablets is 15 minutes.

Content uniformity, *Method I,* page 799—Anisindione Tablets meet the requirements of the content uniformity test for tablets.

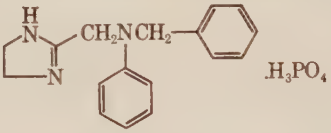
Assay—Weigh and finely powder not less than 20 Anisindione Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg. of anisindione, to a separator, add 50 ml. of water, and extract with four 45-ml. portions of chloroform, collecting each extract in a 200-ml. volumetric flask. Add chloroform to volume, and mix. Dilute 5.0 ml. of this solution to 50.0 ml. with chloroform, and mix. Transfer 5.0 ml. of this solution to a conical flask, evaporate the chloroform on a steam bath just to dryness, and cool. Dissolve the residue in about 20 ml. of 0.02 *N* alcoholic sodium hydroxide, quantitatively transfer the solution to a 50-ml. volumetric flask, dilute to volume with the alcoholic sodium hydroxide, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Anisindione Reference Standard, in the same medium, at a concentration of about 2.5 mcg. per ml. in 1-cm. cells, at the maximum at about 286 mμ, using 0.02 *N* alcoholic sodium hydroxide as the blank. Calculate the quantity, in mg., of $C_{16}H_{12}O_3$, in the portion of the Tablets taken by the formula $20C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Anisindione Tablets in tight containers.

Tablets available—Anisindione Tablets usually available contain the following amount of anisindione: 50 mg.

CATEGORY and DOSE—See Anisindione.

Antazoline Phosphate



2-[(*N*-Benzylanilino)methyl]-2-imidazoline Phosphate (1:1)

$C_{17}H_{19}N_3 . H_3PO_4$ Mol. wt. 363.36

Antazoline Phosphate contains not less than 98.0 percent and not more than 100.5 percent of $C_{17}H_{19}N_3 . H_3PO_4$, calculated on the dried basis.

Description—Antazoline Phosphate occurs as a white, crystalline powder, possessing a bitter taste.

Solubility—Antazoline Phosphate is soluble in water. It is sparingly soluble in methanol, and is practically insoluble in benzene and in ether.

Identification—

A: To 2 ml. of a solution of Antazoline Phosphate (1 in 100) add 10 drops of nitric acid: the solution turns red and then immediately turns dark green.

B: To 5 ml. of a solution of Antazoline Phosphate (1 to 100) add sufficient sodium hydroxide T.S. to make it distinctly alkaline, collect the precipitate on a filter, wash it with water, and dry: the free base so obtained melts between 118° and 122°, page 814.

C: A solution of Antazoline Phosphate (1 in 100) responds to the tests for *Phosphate*, page 809.

Melting range, page 814—Antazoline Phosphate melts with decomposition between 194° and 198°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Antazoline Phosphate, previously dried at 105° for 4 hours, exhibits maxima only at the same wavelengths as that of NF Antazoline Phosphate Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 100,000 solution of Antazoline Phosphate in alcohol exhibits maxima and minima at the same wavelengths as that of NF Antazoline Phosphate Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance occurring at about 242 mμ, do not differ by more than 2.5 percent.

pH, page 824—The pH of a solution of Antazoline Phosphate (1 in 50) is between 4.0 and 5.0.

Loss on drying, page 814—Dry Antazoline Phosphate at 105° for 4 hours: it loses not more than 0.5 percent of its weight.

Assay—Dissolve about 750 mg. of Antazoline Phosphate, accurately weighed, in 50 ml. of glacial acetic acid, add 1 drop of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a blue-green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 36.34 mg. of $C_{17}H_{19}N_3.H_3PO_4$.

Packaging and storage—Preserve Antazoline Phosphate in tight containers.

CATEGORY—Antihistaminic.

APPLICATION—1 or 2 drops of a 0.5 percent solution in each eye every 3 or 4 hours.

Antazoline Phosphate Ophthalmic Solution

Antazoline Phosphate Ophthalmic Solution is a sterile solution of antazoline phosphate in water. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{17}H_{19}N_3.H_3PO_4$.

Identification—Antazoline Phosphate Ophthalmic Solution responds to the *Identification tests* under *Antazoline Phosphate,* page 56.

Sterility—Antazoline Phosphate Ophthalmic Solution meets the requirements under *Sterility Tests,* page 874.

Assay—

Standard preparation—Prepare a solution in 0.5 *N* sulfuric acid, containing in each ml. about 500 mcg. of NF Antazoline Phosphate Reference Standard, accurately weighed.

Assay preparation—Transfer a portion of the Antazoline Phosphate Ophthalmic Solution, equivalent to about 25 mg. of antazoline phosphate and accurately measured, to a 50-ml. separator. Add 4 ml. of 0.5 *N* sulfuric acid, and mix thoroughly. Add 20 ml. of ether, shake carefully, and transfer the acid phase to a 125-ml. separator. Shake the ether phase with two successive 2-ml. portions of 0.5 *N* sulfuric acid, transfer each portion of acid into the 125-ml. separator, and discard the ether. To the acid extract, add 5 ml. of sodium hydroxide T.S. and 50 ml. of ether, shake carefully, and transfer the aqueous phase to a second 125-ml. separator containing 50 ml. of ether. Shake this separator carefully, and transfer the aqueous phase to a third 125-ml. separator containing 50 ml. of ether. Shake the third separator carefully, and discard the aqueous phase. Wash the ether extracts in the three separators, in succession, with one 20-ml. portion of water, and discard the water. Extract the separate ether phases successively with 20, 20, and 5 ml. of 0.5 *N* sulfuric acid, combine the acid extracts in a 50-ml. volumetric flask, dilute to volume with the acid, and mix.

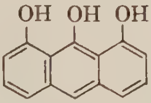
Procedure—Dilute 5.0 ml. each of the *Standard preparation* and of the *Assay preparation* to 250.0 ml. with 0.5 *N* sulfuric acid, and concomitantly determine the absorbances at the maximum at about 242 mμ in 1-cm. cells, with a suitable spectrophotometer, using 0.5 *N* sulfuric acid as the blank. Record the absorbance of the *Standard preparation* as A_S and that of the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{17}H_{19}N_3.H_3PO_4$ in each ml. of Solution taken by the formula $0.05 \times (C/V) \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation,* and V is the volume, in ml., of the Solution taken.

Packaging and storage—Preserve Antazoline Phosphate Ophthalmic Solution in well-closed containers.

Solution available—Antazoline Phosphate Ophthalmic Solution usually available contains 0.5 percent of antazoline phosphate.

CATEGORY and APPLICATION—See Antazoline Phosphate.

Anthralin



1,8,9-Anthracenetriol

$C_{14}H_{10}O_3$ Mol. wt. 226.23

Anthralin contains not less than 95.0 percent and not more than 100.5 percent of $C_{14}H_{10}O_3$, calculated on the dried basis.

Description—Anthralin occurs as a yellowish brown, crystalline powder. It is odorless and tasteless.

Solubility—Anthralin is insoluble in water. It is soluble in chloroform, in acetone, in benzene, and in solutions of alkali hydroxides. It is slightly soluble in alcohol, in ether, and in glacial acetic acid.

Identification—

A: Dissolve a few mg. of Anthralin in 5 ml. of sodium hydroxide T.S.: a yellowish to orange solution having a green fluorescence is produced, and when the solution is exposed to air, the color becomes strong orange-red.

B: Dissolve about 100 mg. of Anthralin in 10 ml. of alcohol, and add 0.1 ml. of ferric chloride T.S.: a greenish brown color is produced.

Melting range, page 814—Anthralin melts between 175° and 181°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Anthralin, previously dried over silica gel for 4 hours, exhibits maxima only at the same wavelengths as that of NF Anthralin Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 100,000 solution of Anthralin in chloroform exhibits maxima and minima at the same wavelengths as that of NF Anthralin Reference Standard, similarly measured.

Chloride—Add 1 g. of Anthralin to 15 ml. of water, mix, and filter. To 5 ml. of the filtrate, acidified with nitric acid, add a few drops of silver nitrate T.S.: no more opalescence is produced immediately than is present in a 5-ml. portion of the filtrate to which nothing has been added.

Sulfate—To 5 ml. of the untreated filtrate obtained in the test for *Chloride* add 3 drops of diluted hydrochloric acid and 5 drops of barium chloride T.S.: no more turbidity is produced than is present in a 5-ml. portion of the filtrate to which nothing has been added.

Reaction—Suspend Anthralin in water, and filter: the filtrate is neutral to litmus.

Loss on drying, page 814—Dry Anthralin over silica gel for 4 hours: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—The residue on ignition from 500 mg. of Anthralin is negligible.

Assay—Place about 50 mg. of Anthralin, accurately weighed, in a 50-ml. volumetric flask, add chloroform to volume, and mix. Dilute the solution with chloroform, quantitatively and stepwise, to a concentration of 10 mcg. per ml., and determine the absorbance of this solution in a 1-cm. cell at 354 mμ and at 432 mμ, with a suitable spectrophotometer, using chloroform as the blank. Calculate the quantity, in mg., of $C_{14}H_{10}O_3$ in the portion of Anthralin taken by the formula $5000 \times (A_{354}a'_{432} - A_{432}a'_{354})/(a_{354}a'_{432} - a_{432}a'_{354})$, in which A is the absorbance of the solution at the wavelength indicated by the subscript, and a and a' are the absorptivities (see page 866) of NF Anthralin Reference Standard and NF Danthron Reference Standard, respectively, determined in chloroform at the wavelengths indicated by the subscripts.

Packaging and storage—Preserve Anthralin in tight containers, protected from light.

CATEGORY—Local antieczematic.

FOR EXTERNAL USE—Topically, as a 0.1 to 1 percent ointment.

Anthralin Ointment

Anthralin Ointment is anthralin in a petrolatum or other suitable base. Anthralin Ointment labeled to contain more than 0.1 percent of anthralin contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of $C_{14}H_{10}O_3$, and that labeled to contain 0.1 percent or less of anthralin contains not less than 90.0 percent and not more than 130.0 percent of the labeled amount of $C_{14}H_{10}O_3$.

Danthron—Using the absorbances determined in the *Assay*, calculate the quantity, in mg., of danthron in the portion of Anthralin Ointment taken for assay by the formula $V \times (A_{432}a_{354} - A_{354}a_{432})/(a_{354}a'_{432} - a_{432}a'_{354})$, in which the symbols are as designated in the *Assay:* the content of danthron ($C_{14}H_8O_4$) is not more than one-tenth of the content of $C_{14}H_{10}O_3$ (anthralin) in Ointment labeled to contain more than 0.1 percent of anthralin, and not more than one-fifth of the content of $C_{14}H_{10}O_3$ (anthralin) in Ointment labeled to contain 0.1 percent or less of anthralin.

Assay—Weigh accurately a quantity of Anthralin Ointment equivalent to about 5 mg. of anthralin, dissolve in chloroform, and dilute quantitatively and stepwise with chloroform to make a solution containing 5 to 10 mcg. of anthralin in each ml. Determine the absorbance of this solution in a 1-cm. cell at 354 mμ and at 432 mμ, with a suitable spectrophotometer, using chloroform as the blank. Calculate the quantity, in mg., of $C_{14}H_{10}O_3$ in the portion of Anthralin Ointment taken by the formula $V \times (A_{354}a'_{432} - A_{432}a'_{354})/(a_{354}a'_{432} - a_{432}a'_{354})$, in which V is the total volume, in ml., to which the sample was diluted, A is the absorbance of the solution at the wavelength indicated by the subscript, and *a* and *a′* are the absorptivities (see page 866) of NF Anthralin Reference Standard and NF Danthron Reference Standard, respectively, determined in chloroform at the wavelengths indicated by the subscripts.

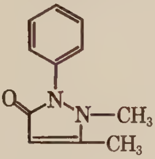
Packaging and storage—Preserve Anthralin Ointment in well-closed, light-resistant containers.

Ointments available—Anthralin Ointment is usually available in the following concentrations: 0.1, 0.25, 0.5 and 1 percent.

CATEGORY and APPLICATION—See Anthralin.

Anticoagulant Sodium Citrate Solution, page 642

Antipyrine



2,3-Dimethyl-1-phenyl-3-pyrazolin-5-one

$C_{11}H_{12}N_2O$ Mol. wt. 188.23

Antipyrine, dried at 60° for 2 hours, contains not less than 99.0 percent and not more than 100.5 percent of $C_{11}H_{12}N_2O$.

Description—Antipyrine occurs as colorless crystals, or as a white, crystalline powder. It is odorless, has a slightly bitter taste, and its solutions are neutral to litmus.

Solubility—Antipyrine is very soluble in water, and is freely soluble in alcohol and in chloroform. It is sparingly soluble in ether.

Completeness and color of solution—Antipyrine is completely soluble in its own weight of cold water, the solution being colorless or not more than slightly yellow when viewed transversely in a tube having a diameter of about 20 mm.

Identification—

A: Add tannic acid T.S. to a solution of Antipyrine: a white precipitate is produced.

B: Mix 100 mg. of sodium nitrite and 12 ml. of a solution of Antipyrine (1 in 100): the liquid is nearly colorless, but upon the addition of 1 ml. of diluted sulfuric acid a green color is produced.

C: Add 1 drop of ferric chloride T.S. to 2 ml. of a solution of Antipyrine (1 in 1000): a red color is produced which becomes greenish yellow upon the addition of 10 drops of sulfuric acid.

D: To 100 mg. of Antipyrine add 100 mg. of vanillin, 5 ml. of water, and 2 ml. of sulfuric acid, and heat the mixture to boiling: an orange-yellow precipitate is produced.

Melting range, page 814—Antipyrine melts between 110° and 112.5°.

Loss on drying, page 814—Dry Antipyrine at 60° for 2 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Antipyrine yields not more than 0.15 percent of residue on ignition.

Heavy metals, page 806—Dissolve 1 g. of Antipyrine in 2 ml. of diluted acetic acid, and add sufficient water to make 25 ml.: the heavy metals limit for Antipyrine is 20 parts per million.

Assay—Transfer about 100 mg. of Antipyrine, previously dried at 60° for 2 hours and accurately weighed, to a 250-ml. iodine flask, and dissolve in 25 ml. of water. Add 2 g. of sodium acetate and 20.0 ml. of 0.1 *N* iodine, mix, and allow to stand in a cool, dark place for 20 minutes. Add 25 ml. of alcohol to dissolve the precipitate, and titrate the excess iodine with 0.1 *N* sodium thiosulfate, using starch T.S. as the indicator. Each ml. of 0.1 *N* iodine is equivalent to 9.412 mg. of $C_{11}H_{12}N_2O$.

Packaging and storage—Preserve Antipyrine in tight containers.

CATEGORY—Analgesic.

APPLICATION—See Antipyrine and Benzocaine Solution.

Antipyrine and Benzocaine Solution

Antipyrine and Benzocaine Solution is a solution of antipyrine and benzocaine in glycerin. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of $C_{11}H_{12}N_2O$ (antipyrine) and $C_9H_{11}NO_2$ (benzocaine).

Identification—

A: Transfer 5 ml. of Antipyrine and Benzocaine Solution to a separator containing 25 ml. of water, and extract the solution with two 25-ml. portions of a mixture of equal volumes of ether and solvent hexane. Combine the extracts, and retain the water solution for *Identification test B.* Extract the ether-hexane solution with 50 ml. of water and discard the water layer. Evaporate the ether-hexane solution to dryness, dry the residue in vacuum at 40° to 50° for 1 hour, and dissolve the residue in 1 ml. of chloroform: the infrared absorption spectrum of this solution exhibits maxima at the same wavelengths as that of NF Benzocaine Reference Standard, similarly measured.

B: Add 5 ml. of 1 *N* sodium hydroxide solution to the water solution retained from *Identification test A*, and extract with two 25-ml. portions of chloroform. Evaporate the combined extracts to dryness, dry the residue in vacuum at 40° to 50° for 1 hour, and dissolve the residue in 3 ml. of chloroform: the infrared absorption spectrum of this solution exhibits maxima at the same wavelengths as that of NF Antipyrine Reference Standard, similarly measured.

Water, page 900—Determine the water content of Antipyrine and Benzocaine Solution by the titrimetric method: not more than 0.6 percent is found.

Assay for antipyrine—Transfer an accurately measured volume of Antipyrine and Benzocaine Solution, equivalent to about 250 mg. of antipyrine, to a 250-ml. separator. Add 40 ml. of water, extract with four 30-ml. portions of a mixture consisting of equal volumes of ether and solvent hexane, and transfer the aqueous layer to a second separator. To the separator add 10 ml. of sodium carbonate T.S., and extract with four 40-ml. portions of chloroform, collecting the extracts in a 250-ml. volumetric flask. Dilute to volume with chloroform, and mix. Transfer 5.0 ml. of this solution to a second 250-ml. volumetric flask, evaporate to dryness with a stream of nitrogen, add methanol to volume, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Antipyrine Reference Standard in methanol at a concentration of about 20 mcg. per ml., in 1-cm. cells, at the maximum at about 266 mμ, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg., of $C_{11}H_{12}N_2O$ in each ml. of the Solution taken by the formula $12.5 \times (C/V) \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, V is the volume, in ml., of the Solution taken, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Assay for benzocaine—

Standard preparation—Transfer about 50 mg. of NF Benzocaine Reference Standard, accurately weighed, to a 250-ml. volumetric flask, dissolve in 125 ml. of 0.1 *N* hydrochloric acid, dilute to volume with water, and mix. Transfer 5.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with water, and mix.

Assay preparation—Transfer an accurately measured volume of Antipyrine and Benzocaine Solution, equivalent to about 50 mg. of benzocaine, to a 250-ml. separator. Add 40 ml. of water, extract with four 30-ml. portions of a mixture consisting of equal volumes of ether and solvent hexane, and transfer the ether-solvent hexane layer to a separator. Wash with 20 ml. of water, discard the washings, and transfer the ether-solvent hexane layer to a 250-ml. round-bottom flask. To the flask add 1 ml. of 1 *N* hydrochloric acid, and evaporate the ether-solvent hexane under reduced pressure. Transfer the residual liquid to a 250-ml. volumetric flask with the aid of several small portions of water, dilute to volume with water, and mix. Transfer 5.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with water, and mix.

Procedure—Transfer 10.0 ml. each of the *Standard preparation*, of the *Assay preparation*, and of water to serve as the blank to separate 100-ml. volumetric flasks. To each flask add 40 ml. of water, 10.0 ml. of 1 *N* hydrochloric acid, and 1.0 ml. of sodium nitrite solution (1 in 200), and mix. Allow to stand for 5 minutes, swirling frequently, then add 5.0 ml. of ammonium sulfamate solution (1 in 40), and allow to stand for 10 minutes, swirling frequently. Add 1.0 ml. of *N*-1-naphthyl ethylenediamine dihydrochloride solution (1 in 1000), dilute to volume with water, mix, and allow to stand for 15 minutes, mixing frequently. Concomitantly determine the absorbances of the solutions in 1-cm. cells, at the maximum at about 550 mμ, with a suitable spectrophotometer, using the blank to set the instrument. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_9H_{11}NO_2$ in each ml. of the Solution taken by the formula 5 × $(C/V) \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*, and V is the volume, in ml., of the Solution taken.

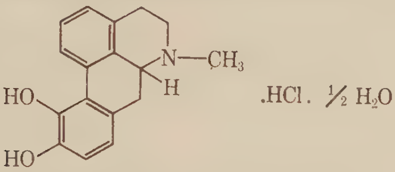
Packaging and storage—Preserve Antipyrine and Benzocaine Solution in tight, light-resistant containers.

Solution available—Antipyrine and Benzocaine Solution usually available contains 5.4 percent of antipyrine and 1.4 percent of benzocaine.

CATEGORY—Local anesthetic.

APPLICATION—Instilled into ear canal from three times a day to every 1 to 2 hours as needed.

Apomorphine Hydrochloride



Aporphine-10,11-diol Hydrochloride

$C_{17}H_{17}NO_2.HCl.{}^1/_2H_2O$ Mol. wt. 312.80

Apomorphine Hydrochloride contains not less than 98.5 percent and not more than 100.5 percent of $C_{17}H_{17}NO_2.HCl$, calculated on the dried basis.

Description—Apomorphine Hydrochloride occurs as minute, white or grayish white, glistening crystals or as a white powder. It is odorless. It gradually acquires a green color on exposure to light and air. Its solutions are neutral to litmus.

Solubility—Apomorphine Hydrochloride is sparingly soluble in water and in alcohol. It is soluble in water at 80°, and is very slightly soluble in chloroform and in ether.

Identification—

A: To 5 ml. of a solution of Apomorphine Hydrochloride (1 in 100) add a slight excess of sodium bicarbonate solution (1 in 20): a white or greenish white precipitate is formed. Add 3 drops of iodine T.S., and shake vigorously: an emerald-green color is produced. Add 5 ml. of ether and, after vigorous shaking, allow the layers to separate: the ether is colored deep ruby-red while the water layer retains its green color.

B: Dissolve Apomorphine Hydrochloride in nitric acid: a dark purple solution is produced.

C: To a solution of Apomorphine Hydrochloride add silver nitrate T.S.: a white precipitate, which is insoluble in nitric acid, is formed. This precipitate soon darkens by reduction to metallic silver, the reduction being accelerated by the addition of ammonia T.S.

Specific rotation, page 822—The specific rotation of Apomorphine Hydrochloride, calculated on the dried basis, determined in a solution in 0.02 N hydrochloric acid containing the equivalent of 150 mg. of Apomorphine Hydrochloride in each 10 ml., is between −49° and −51°.

Loss on drying, page 814—Dry Apomorphine Hydrochloride at 105° for 2 hours: it loses not less than 2 percent and not more than 3.5 percent of its weight.

Residue on ignition, page 858—Apomorphine Hydrochloride yields not more than 0.1 percent of residue on ignition.

Color of solution—Place 100 mg. of Apomorphine Hydrochloride in a suitable test tube, add 10 ml. of cold, oxygen-free water, and agitate gently until dissolved: the color of the resulting solution, observed promptly after the Apomorphine Hydrochloride has dissolved, is not more intense than that of a color standard prepared as directed below. Dissolve 5.0 mg. of Apomorphine Hydrochloride in 100 ml. of water. Pipet 1.0 ml. of this solution into a test tube of the same size as that used for the sample solution, dilute with 6 ml. of water, add 1 ml. of sodium bicarbonate solution (1 in 20), and follow with 0.5 ml. of iodine T.S. Allow to stand for 30 seconds, add 0.6 ml. of 0.1 N sodium thiosulfate, and dilute with water to 10 ml.

Decomposition products—Shake 100 mg. of Apomorphine Hydrochloride with 5 ml. of ether: the latter acquires not more than a pale reddish color.

Assay—Dissolve about 300 mg. of Apomorphine Hydrochloride in 100 ml. of glacial acetic acid with the aid of heat provided by a steam bath. Add 0.1 ml. of acetic anhydride to the hot solution and stir for 5 minutes. Cool to room temperature, add 5 ml. of mercuric acetate T.S., and 0.25 ml. of crystal violet T.S. and titrate with 0.1 N perchloric acid in glacial acetic acid to a blue end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 30.38 mg. of $C_{17}H_{17}NO_2.HCl$.

Packaging and storage—Preserve Apomorphine Hydrochloride in small, tight, light-resistant containers. Containers from which Apomorphine Hydrochloride is to be taken for immediate use in compounding prescriptions contain not more than 350 mg.

CATEGORY—Emetic.

USUAL DOSE—Subcutaneous, **5 mg.**

Apomorphine Hydrochloride Tablets

Apomorphine Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{17}H_{17}NO_2.HCl.{}^1/_2H_2O$.

Identification—To 5 ml. of a filtered solution of Apomorphine Hydrochloride Tablets, containing about 10 mg. of apomorphine hydrochloride, add sodium bicarbonate solution: a white or greenish precipitate is formed which rapidly becomes green on exposure to air. When the mixture is shaken with a few ml. of ether, the ether acquires a violet color, and the water solution an emerald-green color.

Color of solution—Dissolve a quantity of powdered Apomorphine Hydrochloride Tablets, equivalent to 5 mg. of apomorphine hydrochloride, in sufficient water to make 100.0 ml. Transfer 1.0 ml. of the solution to a test tube, dilute with 6 ml. of water and, if necessary, filter through a small pledget of cotton. Add 1 ml. of sodium bicarbonate solution (1 in 20) and follow with 0.5 ml. of iodine T.S. Allow to stand for 30 seconds, then add 0.6 ml. of 0.1 *N* sodium thiosulfate, and dilute with water to 10.0 ml. This solution represents the color standard.

Place a quantity of powdered Apomorphine Hydrochloride Tablets, equivalent to 50 mg. of apomorphine hydrochloride, in a test tube of suitably small size, add 10.0 ml. of cold, oxygen-free water, stopper the test tube, and agitate gently until no more dissolves; if necessary, filter at once through a small pledget of cotton. The color of the solution, observed promptly after preparation, is not more intense than that of the color standard. Use closely matched test tubes for the comparison.

Disintegration, page 878—The disintegration time limit for Apomorphine Hydrochloride Tablets is 15 minutes.

Content uniformity, *Method II*, page 799—Apomorphine Hydrochloride Tablets meet the requirements of the content uniformity test for tablets using the following special procedure: Place one tablet in a 500-ml. volumetric flask containing 100 ml. of 0.1 *N* hydrochloric acid, and shake for 15 minutes. Dilute to volume with 0.1 *N* hydrochloric acid, mix, and filter, discarding the first 20 ml. of filtrate. Dilute a portion of the subsequent filtrate quantitatively and stepwise, if necessary, with 0.1 *N* hydrochloric acid to provide a solution containing approximately 12 mcg. of apomorphine hydrochloride per ml. Concomitantly determine the absorbance of this solution and of a standard solution of NF Apomorphine Hydrochloride, in the same medium, at a concentration of about 12 mcg. per ml., in 1-cm. cells, at the maximum at about 273 mμ, with a suitable spectrophotometer, using 0.1 *N* hydrochloric acid as the blank. Calculate the quantity, in mg., of $C_{17}H_{17}NO_2.HCl.{}^1/_2H_2O$ in the tablet by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity, in mg., of apomorphine hydrochloride in the tablet; D is the exact concentration, in mcg. per ml., of apomorphine hydrochloride in the sample solution based upon the labeled quantity per tablet and the extent of dilution; C is the exact concentration of $C_{17}H_{17}NO_2.HCl.{}^1/_2H_2O$ in the standard solution, in mcg. per ml., A_U is the absorbance of the sample solution, and A_S is the absorbance of the standard solution.

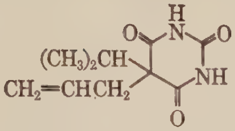
Assay—Weigh and finely powder not less than 20 Apomorphine Hydrochloride Tablets. Dissolve an accurately weighed portion of the powder, equivalent to about 50 mg. of apomorphine hydrochloride, in 25 ml. of water in a separator, add 500 mg. of sodium bicarbonate, and completely extract with successive small portions of ether. Combine the ether extracts and wash them with three 5-ml. portions of water. Shake the combined water washings with 10 ml. of ether and add this ether to the combined ether extracts. To the ether solution add 20.0 ml. of 0.02 *N* sulfuric acid, stir thoroughly, and warm until the ether is expelled. Cool, if necessary, add 3 drops of methyl red T.S., and titrate the excess acid with 0.02 *N* sodium hydroxide. Each ml. of 0.02 *N* sulfuric acid is equivalent to 6.256 mg. of $C_{17}H_{17}NO_2.HCl.{}^1/_2H_2O$.

Packaging and storage—Preserve Apomorphine Hydrochloride Tablets in tight, light-resistant containers.

Tablets available—Apomorphine Hydrochloride Tablets usually available contain the following amount of apomorphine hydrochloride: 6 mg.

CATEGORY and DOSE—See Apomorphine Hydrochloride.

Aprobarbital



5-Allyl-5-isopropylbarbituric Acid

$C_{10}H_{14}N_2O_3$ Mol. wt. 210.23

Aprobarbital, dried at 105° for 2 hours, contains not less than 98.5 percent and not more than 101.0 percent of $C_{10}H_{14}N_2O_3$.

Description—Aprobarbital occurs as a fine, white, odorless, crystalline powder, having a slightly bitter taste. It is stable in air. A saturated solution is acid to litmus.

Solubility—Aprobarbital is slightly soluble in cold water. It is soluble in alcohol, in chloroform, and in ether.

Identification—

A: Boil about 300 mg. of Aprobarbital with 10 ml. of sodium hydroxide solution (1 in 10): ammonia is evolved.

B: Shake about 300 mg. of Aprobarbital for 2 minutes with 1 ml. of sodium hydroxide T.S. and 5 ml. of water, filter, and divide the filtrate into 2 portions. To one portion add mercuric nitrate T.S.: a white precipitate is formed which is soluble in ammonia T.S. To the other portion add silver nitrate T.S., a few drops at a time: a white precipitate forms which at first redissolves, but becomes insoluble when an excess of silver nitrate has been added.

C: Dissolve about 100 mg. of Aprobarbital in 10 ml. of hot water, cool, filter, and divide the filtrate into two portions. To one portion add 1 ml. of acetic acid and 1 ml. of bromine T.S.: the bromine color is discharged immediately. To the other portion add 1 ml. of potassium permanganate T.S.: a yellow color is produced immediately which turns brown.

Melting range, page 814—Aprobarbital melts between 140° and 143°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Aprobarbital, previously dried at 105° for 2 hours, exhibits maxima only at the same wavelengths as that of NF Aprobarbital Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 75,000 solution of Aprobarbital in 0.1 *N* sodium hydroxide exhibits maxima and minima at the same wavelengths as that of NF Aprobarbital Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorption occurring at about 242 mμ, do not differ by more than 3 percent.

Loss on drying, page 814—Dry Aprobarbital at 105° for 2 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Aprobarbital yields not more than 0.1 percent of residue on ignition.

Readily carbonizable substances, page 856—Dissolve 500 mg. of Aprobarbital in 5 ml. of sulfuric acid T.S.: the solution has no more color than Matching Fluid A.

Assay—Dissolve about 200 mg. of Aprobarbital, previously dried at 105° for 2 hours and accurately weighed, in 20 ml. of dimethylformamide in a 100-ml. conical flask. Add 4 drops of thymol blue solution (1 in 200 in methanol) and titrate with 0.1 *N* lithium methoxide using a 10-ml. buret, a magnetic stirrer, and a cover for the flask to protect against atmospheric carbon dioxide. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* lithium methoxide is equivalent to 21.02 mg. of $C_{10}H_{14}N_2O_3$.

Packaging and storage—Preserve Aprobarbital in well-closed containers.

CATEGORY—Sedative.

USUAL DOSE RANGE—Sedative, **20** to **40 mg.** three times daily; hypnotic, **40** to **160 mg.** at night.

Aprobarbital Elixir

Aprobarbital Elixir contains not less than 92.5 percent and not more than 107.5 percent of the labeled amount of $C_{10}H_{14}N_2O_3$.

Identification—Transfer 30 ml. of Aprobarbital Elixir to a separator, extract with 50 ml. of ether, and evaporate the solvent on a steam bath in a conical flask, with the aid of a stream of nitrogen.

A: Shake one half of the residue

with 1 ml. of sodium hydroxide T.S. and 5 ml. of water, and filter. To the clear filtrate add mercuric nitrate T.S.: a white precipitate is formed which is soluble in ammonia T.S.

B: Dissolve the remaining residue in 10 ml. of hot water, cool, and filter. To the clear filtrate add 1 ml. of acetic acid and 1 ml. of bromine T.S.: the bromine color is discharged immediately.

Assay—Transfer an accurately measured volume of Aprobarbital Elixir, equivalent to about 200 mg. of aprobarbital, to a 250-ml. separator, add 50 ml. of water and 10 ml. of diluted hydrochloric acid, and extract with four 30-ml. portions of ether. Combine the ether extracts, and wash them with two 10-ml. portions of water. Shake the combined water washings with 10 ml. of ether, and add the ether to the combined ether extracts. Evaporate the ether on a steam bath, with the aid of a stream of nitrogen, dissolve the residue in 25 ml. of dehydrated alcohol, and evaporate the alcohol on a steam bath, with the aid of a stream of nitrogen. Dissolve the residue in 25 ml. of water by heating on a steam bath, cool, add 50 ml. of hydrochloric acid, and titrate with 0.1 *N* bromine, determining the end-point potentiometrically using suitable electrodes. Each ml. of 0.1 *N* bromine is equivalent to 10.51 mg. of $C_{10}H_{14}N_2O_3$.

Alcohol content—Determine the alcohol content by the gas-liquid chromatographic procedure, page 773, using *n*-propyl alcohol as the internal standard. Aprobarbital Elixir contains from 20 to 21.5 percent (v/v) of C_2H_5OH.

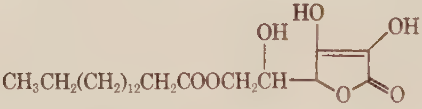
Packaging and storage—Preserve Aprobarbital Elixir in tight, light-resistant containers.

Elixir available—Aprobarbital Elixir usually available contains the following amount of aprobarbital: 40 mg. in 5 ml.

CATEGORY and DOSE—See Aprobarbital.

Aromatic Ammonia Spirit, page 42
Aromatic Castor Oil, page 142
Aromatic Eriodictyon Syrup, page 272

Ascorbyl Palmitate



L-Ascorbic Acid 6-Palmitate

$C_{22}H_{38}O_7$ Mol. wt. 414.54

Ascorbyl Palmitate contains not less than 95.0 percent and not more than 100.5 percent of $C_{22}H_{38}O_7$, calculated on the dried basis.

Description—Ascorbyl Palmitate occurs as a white to yellowish white powder having a characteristic odor.

Solubility—Ascorbyl Palmitate is very slightly soluble in water and in vegetable oils. It is soluble in alcohol.

Identification—Dissolve 1 g. of Ascorbyl Palmitate in 25 ml. of alcohol and add a 1 in 1000 solution of 2,6-dichlorophenolindophenol sodium: the resultant mixture is colorless.

Melting range, *Class Ia*, page 814—Ascorbyl Palmitate melts between 107° and 117°.

Specific rotation, page 822—The specific rotation of Ascorbyl Palmitate, determined in a solution in methanol containing 1 g. of Ascorbyl Palmitate in each 10 ml., calculated on the dried basis, is between +21° and +24°.

Loss on drying, page 814—Dry Ascorbyl Palmitate in vacuum at 60° for 1 hour: it loses not more than 2 percent of its weight.

Residue on ignition, page 858—Ascorbyl Palmitate yields not more than 0.1 percent of residue on ignition.

Heavy metals, *Method II*, page 806—The heavy metals limit for Ascorbyl Palmitate is 10 parts per million.

Assay—Dissolve about 300 mg. of Ascorbyl Palmitate, accurately weighed, in 50 ml. of alcohol, add 30 ml. of water, and immediately titrate with 0.1 *N* iodine to a yellow color which persists for at least 30 seconds. Each ml. of 0.1 *N* iodine is equivalent to 20.73 mg. of $C_{22}H_{38}O_7$.

Packaging and storage—Preserve Ascorbyl Palmitate in tight containers, preferably in a cool, dry place.

CATEGORY—Preservative (antioxidant).

Aspirin, Aluminum, page 30
Aspirin, Aluminum, Tablets, page 31

Aspirin Capsules

Aspirin Capsules contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_9H_8O_4$.

Identification—

A: Heat about 100 mg. of the contents of Aspirin Capsules with 10 ml. of water for several minutes, cool, and add 1 drop of ferric chloride T.S.: a violet-red color is produced

B: Boil about 500 mg. of the contents of Aspirin Capsules with 10 ml. of sodium hydroxide T.S. for a few minutes, cool, and add 10 ml. of diluted sulfuric acid: a white precipitate of salicylic acid is formed and the odor of acetic acid is perceptible. Filter, add to the filtrate 3 ml. of alcohol and 3 ml. of sulfuric acid, and warm: the odor of ethyl acetate is perceptible.

Weight variation, page 901—Aspirin Capsules meet the requirements of the weight variation test for capsules.

Free salicylic acid—

Ferric chloride-urea reagent—Dissolve by swirling, without the aid of heat, 60 g. of urea in a mixture of 8 ml. of ferric chloride solution (6 in 10) and 42 ml. of 0.05 *N* hydrochloric acid. Adjust the resulting solution to a pH of 3.2, if necessary, by the addition of 6 *N* hydrochloric acid.

Standard preparation—Transfer 75.0 mg. of salicylic acid, previously dried over silica gel for 3 hours and accurately weighed, to a 100-ml. volumetric flask, add chloroform to volume, and mix. Transfer 10.0 ml. of this solution to a second 100-ml. volumetric flask, dilute to volume with chloroform, and mix. Transfer 10.0 ml. of this last solution to a 50-ml. volumetric flask containing 10 ml. of methanol, 2 drops of hydrochloric acid, and 10 ml. of a 1 in 10 solution of glacial acetic acid in ether, dilute to volume with chloroform, and mix.

Test preparation—Pack a pledget of glass wool in the base of a 25 × 200-mm. chromatographic tube, and uniformly pack the tube with a mixture of 3 g. of chromatographic siliceous earth and 2 ml. of freshly prepared *Ferric chloride-urea reagent.* Weigh accurately an amount of the contents of Aspirin Capsules, equivalent to 100.0 mg. of aspirin, mix with 10 ml. of chloroform by stirring for 3 minutes, and then transfer to the chromatographic column with the aid of a few ml. of chloroform. Pass 50 ml. of chloroform through the column, rinse the tip of the chromatographic tube with chloroform, and discard the eluate. Prepare as a receiver a 50-ml. volumetric flask containing 10 ml. of methanol and 2 drops of hydrochloric acid, and elute any salicylic acid from the column by passing 10 ml. of a 1 in 10 solution of glacial acetic acid in ether that has been recently saturated with water, followed by 30 ml. of chloroform. Dilute the eluate to volume with chloroform, and mix.

Procedure—Concomitantly determine the absorbance of the solutions in 1-cm. cells, at the maximum at about 306 mμ, with a suitable spectrophotometer, using as the blank a solvent mixture of the same composition as that used for the *Standard preparation:* the absorbance of the *Test preparation* does not exceed that of the *Standard preparation* (0.75 percent, calculated on the labeled aspirin content).

Assay—[Note—In this assay use chloroform recently saturated with water.]

Chromatographic column—Insert a small pledget of glass wool above the stem constriction of a 25 × 200-mm. chromatographic tube, and uniformly pack with a mixture of about 3 g. of granular, 80 to 100-mesh, chromatographic siliceous earth and 2 ml. of freshly prepared sodium bicarbonate solution (1 in 12).

Standard preparation—Transfer about 50 mg., accurately weighed, of USP Aspirin Reference Standard to a 50-ml. volumetric flask, add 0.5 ml. of glacial acetic acid, and add chloroform to volume. Transfer 5.0 ml. of this solution to a 100-ml. volumetric flask, add a 1 in 100 solution of glacial acetic acid in chloroform to volume, and mix.

Assay preparation—Remove as completely as possible, the contents of not less than 20 Aspirin Capsules, and weigh accurately. Mix the combined contents thoroughly, and transfer an accurately weighed quantity of the powder, equivalent to about 50 mg. of aspirin, to a 50-ml. volumetric flask containing 1 ml. of a 1 in 50 solution of hydrochloric acid in methanol, add chloroform to volume, and mix.

Procedure—Pipet 5.0 ml. of the *Assay preparation* into the column, wash with 5 ml. and then with 25 ml. of chloroform, and discard the washings. Elute into a 100-ml. volumetric flask with about 10 ml. of a 1 in 10 solution of glacial acetic acid in chloroform, and then with about 85 ml. of a 1 in 100 solution of glacial acetic acid in chloroform, dilute with the latter solvent to volume, and mix. Without delay, concomitantly determine the absorbances of the eluted *Assay preparation* and the *Standard preparation,* in 1-cm. cells, at the wavelength of maximum absorbance at about 280 mμ, with a suitable spectrophotometer, using chloroform as the blank. Calculate the quantity, in mg., of $C_9H_8O_4$ in the portion of the Capsules taken by the formula $C \times (A_U/A_S)$, in which C is the concentration, in mcg. per ml., of the *Standard preparation*, and A_U and A_S are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

Packaging and storage—Preserve Aspirin Capsules in well-closed containers.

Capsules available—Aspirin Capsules usually available contain the following amount of aspirin: 300 mg.

CATEGORY—Analgesic.

USUAL DOSE OF ASPIRIN—**300** to **600 mg.** every 4 hours.

Aspirin, Phenacetin and Caffeine Tablets

Aspirin, Phenacetin and Caffeine Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of $C_9H_8O_4$ (aspirin), $C_{10}H_{13}NO_2$ (phenacetin), and $C_8H_{10}N_4O_2$ (caffeine).

Identification—

A: Crush an Aspirin, Phenacetin and Caffeine Tablet, boil it with 5 ml. of sodium hydroxide T.S. for a few minutes, cool, filter, and add 10 ml. of diluted sulfuric acid to the filtrate: a white precipitate of salicylic acid is formed. Filter and divide the filtrate into two parts. To one part of the filtrate add 1 ml. of alcohol and 1 ml. of sulfuric acid, and warm: the odor of ethyl acetate is perceptible. To the other portion of the filtrate add 1 or 2 drops of ferric chloride T.S., mix, and neutralize with ammonia T.S.: a violet to purple color is produced (*presence of aspirin*).

B: Boil about 200 mg. of the residue obtained in *Identification test A* for 1 minute with 1 ml. of hydrochloric acid, dilute with 10 ml. of water, cool, filter, and add 1 drop of potassium dichromate T.S. to the filtrate: the mixture slowly develops a ruby-red color (*presence of phenacetin*).

C: Crush one Aspirin, Phenacetin and Caffeine Tablet into a small evaporating dish, add 1 ml. of hydrochloric acid and 100 mg. of potassium chlorate, and evaporate to dryness on a steam bath. Invert the dish over a vessel containing a few drops of ammonia T.S.: the residue acquires a purple color, which disappears upon the addition of a solution of a fixed alkali (*presence of caffeine*).

Disintegration, page 878—The disintegration time limit for Aspirin, Phenacetin and Caffeine Tablets is 10 minutes.

Content uniformity, *Method I*, page 799—Aspirin, Phenacetin and Caffeine Tablets meet the requirements of the content uniformity test for tablets with respect to caffeine content.

Free salicylic acid—

Ferric chloride-urea reagent—Dissolve by swirling, without the aid of heat, 60 g. of urea in a mixture of 8 ml. of ferric chloride solution (6 in 10) and 42 ml. of 0.05 *N* hydrochloric acid. Adjust the resulting solution to a pH of 3.2, if necessary, by the addition of 6 *N* hydrochloric acid.

Standard preparation—Transfer 75.0 mg. of salicylic acid, previously dried over silica gel for 3 hours and accurately weighed, to a 100-ml. volumetric flask, add chloroform to volume, and mix. Transfer 10.0 ml. of this solution to a second 100-ml. volumetric flask, dilute to volume with chloroform, and mix. Transfer 10.0 ml. of this last solution to a 50-ml. volumetric flask containing 10 ml. of methanol, 2 drops of hydrochloric acid, and 10 ml. of a 1 in 10 solution of glacial acetic acid in ether, dilute to volume with chloroform, and mix.

Test preparation—Pack a pledget of glass wool in the base of a 25 × 200-mm. chromatographic tube, and uniformly pack the tube with a mixture of 3 g. of chromatographic siliceous earth and 2 ml. of freshly prepared *Ferric chloride-urea reagent*. Weigh accurately a quantity of finely powdered Aspirin, Phenacetin and Caffeine Tablets, equivalent to 100.0 mg. of aspirin, mix with 10 ml. of chloroform by stirring for 3 minutes, and then transfer to the chromatographic column with the aid of a few ml. of chloroform. Pass 50 ml. of chloroform through the column, rinse the tip of the chromatographic tube with chloroform, and discard the eluate. Prepare as a receiver a 50-ml. volumetric flask containing 10 ml. of methanol and 2 drops of hydrochloric acid, and elute any salicylic acid from the column by passing 10 ml. of a 1 in 10 solution of glacial acetic acid in ether that has been recently saturated with water, followed by 30 ml. of chloroform. Dilute the eluate to volume with chloroform, and mix.

Procedure—Concomitantly determine the absorbances of the solutions in 1-cm. cells, at the maximum at about 306 mμ, with a suitable spectrophotometer, using as the blank a solvent mixture of the same composition as that used for the *Standard preparation:* the absorbance of the *Test* *preparation* does not exceed that of the *Standard preparation* (0.75 percent, calculated on the labeled aspirin content).

Assay—

Preparation of chromatographic column—Pack a pledget of fine glass wool in the base of a chromatographic tube (25 × 200-mm. test tube to which is fused a 5-cm. length of 6 or 8-mm. tubing) with the aid of a tamping rod of stainless steel, aluminum, or glass, at least 30 cm. long and having a disk with a diameter about 1 mm. less than that of the chromatographic tube. To 2.0 g. of purified siliceous earth (see page 927) in a glass mortar add 2.0 ml. of approximately 4 *N* sulfuric acid and incorporate by kneading thoroughly with a flexible spatula blade until the mixture is fluffy. Transfer to the column and tamp gently to compress the material to a uniform mass. In like manner, mix intimately 2.0 g. of purified siliceous earth with 2.0 ml. of approximately 1 *N* sodium bicarbonate, transfer to the column, and gently compress with the tamping rod. Wash the column so prepared with one 20-ml. portion of water-washed ether and discard the washings.

Phenacetin standard solution—Transfer to a 100-ml. volumetric flask about 50 mg. of USP Phenacetin Reference Standard, previously dried at 60° for 1 hour and accurately weighed, add chloroform to volume, and mix. Transfer 10.0 ml. of this solution to a second 100-ml. volumetric flask, add isooctane to volume, and mix.

Aspirin standard solution—Transfer to a 100-ml. volumetric flask about 50 mg. of USP Aspirin Reference Standard, dried over silica gel for 5 hours, and accurately weighed. Add chloroform to volume, and mix. Transfer 10.0 ml. of this solution to a second 100-ml. volumetric flask, add 1 ml. of glacial acetic acid, dilute to volume with chloroform, and mix. Use within 3.5 hours.

Caffeine standard solution—Transfer to a 100-ml. volumetric flask about 100 mg. of NF Caffeine Reference Standard, previously dried at 80° for 4 hours and accurately weighed, add chloroform to volume, and mix. Transfer 10.0 ml. of this solution to a second 100-ml. volumetric flask, dilute to volume with chloroform, and mix. Transfer 10.0 ml. of this last solution to a third 100-ml. volumetric flask, dilute to volume with chloroform, and mix.

Assay preparation—Weigh and finely powder not less than 20 Aspirin, Phenacetin and Caffeine Tablets. Transfer to a 50-ml. volumetric flask an accurately weighed portion of the powder, equivalent to about 50 mg. of aspirin, add 30 ml. of chloroform, and mix thoroughly by shaking. Add 0.1 ml. of glacial acetic acid, dilute to volume with chloroform, and mix.

Procedure—(Use water-washed solvents.) Dilute 5.0 ml. of the *Assay preparation* with 20 ml. of ether and pass the solution into the column without pressure. After all of the solution has passed into the column, complete the elution of the phenacetin from the column with five 5-ml. portions of ether, allowing each portion to pass into the column before the next portion is added, and collecting the total ether eluate in a glass evaporating dish. Immediately after the last portion of ether has passed through the column, rinse the tip of the outlet tube with chloroform, collecting the rinsings in the evaporating dish, remove the dish, and replace it with a 50-ml. volumetric flask to receive the caffeine eluate in the next step. Evaporate the total eluate to dryness on a steam bath in a current of air. Dissolve the residue in 5 ml. of chloroform, transfer to a 50-ml. volumetric flask, dilute to volume with isooctane, and mix.

To elute the caffeine, pass 48 ml. of chloroform through the column, rinse the tip with chloroform, and add sufficient chloroform to make 50.0 ml. Replace the receiver with a 100-ml. volumetric flask, and elute the aspirin with a solution of 0.5 ml. of glacial acetic acid in 5 ml. of chloroform, followed by 90 ml. of a solution of glacial acetic acid in chloroform (1 in 100), dilute to volume with the latter solvent, and mix. The absorbance of the aspirin solution must be determined within 3.5 hours after preparation of the *Assay preparation*.

Determine the absorbance of each solution in 1-cm. cells, with a suitable spectrophotometer, at 285 mμ for the phenacetin solutions, at 276 mμ for the caffeine solutions, and at 280 and 310 mμ for the aspirin solutions, using as a blank the respective solvent employed for each solution. Record the absorbance of each *Standard solution* as A_S and that of the corresponding *Assay solution* as A_U.

Calculation for phenacetin—Calculate the quantity, in mg., of $C_{10}H_{13}NO_2$ per tablet by the formula $0.5C \times (A_U/A_S) \times$ (Av. Wt. per Tablet/Wt. of Sample), in which C is the exact quantity, in mcg., of phenacetin per ml. of the *Phenacetin standard solution*.

Calculation for aspirin—Calculate the quantity, in mg., of $C_9H_8O_4$ per tablet by the formula $C \times [(A_{U280} - 0.2A_{U310})/A_{S280}] \times$ (Av. Wt. per Tablet/Wt. of Sample), in which C is the exact quantity, in mcg., of aspirin per ml. of the *Aspirin standard solution*, and A_U and A_S are the absorbances of the sample solution and standard solution, respectively, at the wavelengths indicated by the subscripts.

Calculation for caffeine—Calculate the quantity, in mg., of $C_8H_{10}N_4O_2$ per tablet by the formula $0.5C \times (A_U/A_S) \times$ (Av. Wt. per Tablet/Wt. of Sample), in which C is the exact quantity, in mcg., of caffeine per ml. of the *Caffeine standard solution*.

Packaging and storage—Preserve Aspirin, Phenacetin, and Caffeine Tablets in well-closed containers.

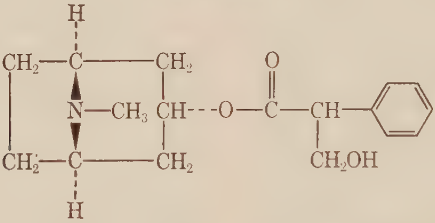
Tablets available—Aspirin, Phenacetin and Caffeine Tablets usually available contain the following amount of aspirin: 230 mg.; of phenacetin: 150 mg.; and of caffeine: 15 and 30 mg.

CATEGORY—Analgesic.

USUAL DOSE OF ASPIRIN—**300** to **600 mg.**; OF PHENACETIN—**300 mg.**; OF CAFFEINE—**200 mg.**

Aspirin, Phenacetin, Caffeine, and Codeine Phosphate Tablets, page 178
Aspirin and Propoxyphene Hydrochloride Capsules, page 606

Atropine



1αH,5αH-Tropan-3α-ol (±)-Tropate (Ester)

$C_{17}H_{23}NO_3$ Mol. wt. 289.38

Atropine contains not less than 99.0 percent and not more than 100.5 percent of $C_{17}H_{23}NO_3$.

Caution: Atropine is extremely poisonous.

Description—Atropine occurs as white crystals, usually needle-like, or as a white, crystalline powder. Its saturated solution is alkaline to phenolphthalein T.S. It is optically inactive, but usually contains some levorotatory hyoscyamine.

Solubility—Atropine is slightly soluble in water and sparingly soluble in water at 80°. It is freely soluble in alcohol and in chloroform, and is soluble in glycerin and in ether.

Identification—

A: To about 10 mg. of Atropine contained in a porcelain dish, add a few drops of fuming nitric acid, and evaporate to dryness on a steam bath: a yellow residue is obtained. To the cooled residue add a few drops of alcoholic potassium hydroxide T.S. and a fragment of potassium hydroxide: the mixture is intensely violet in color (*hyoscyamine* and *scopolamine*, similarly treated, produce the same color as Atropine, but the presence of *other alkaloids* obscures the color effect).

B: To a solution of Atropine (1 in 50) in diluted hydrochloric acid, add gold chloride T.S.: a lusterless precipitate is produced (*hyoscyamine* similarly treated yields a lustrous precipitate).

Melting range, page 814—Atropine melts between 114° and 118°.

Residue on ignition, page 858—Atropine yields not more than 0.1 percent of residue on ignition.

Readily carbonizable substances, page 856—Dissolve 200 mg. of Atropine in 5 ml. of sulfuric acid T.S.: the solution has no more color than Matching Fluid A and the solution is colored no more than light yellow upon the addition of 0.2 ml. of nitric acid.

Other alkaloids—Dissolve 200 mg. of Atropine in 1 ml. of 1 *N* hydrochloric acid and sufficient water to make 15.0 ml. of solution. To 5 ml. of the solution add a few drops of platinic chloride T.S.: no precipitate is formed. To a separate 5-ml. portion of the solution add 2 ml. of ammonia T.S., and shake vigorously: a slight opalescence may develop but no turbidity is produced.

Hyoscyamine—Dissolve 1 g. of Atropine, previously dried at 105° for 1 hour, in sufficient 50 percent alcohol (w/w) to make a volume of 20 ml. at 25°: the angular rotation of this solution, using a 200-mm. tube, does not exceed −0.70°, page 822.

Assay—Dissolve about 400 mg. of Atropine, accurately weighed, in 50 ml. of glacial acetic acid, add 1 drop of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 28.94 mg. of $C_{17}H_{23}NO_3$.

Packaging and storage—Preserve Atropine in tight, light-resistant containers.

CATEGORY—Anticholinergic.

USUAL DOSE—**250 mcg.** three times a day.

Atropine and Morphine Sulfates Tablets, page 464
Atropine Sulfate and Diphenoxylate Hydrochloride Solution, page 256
Atropine Sulfate and Diphenoxylate Hydrochloride Tablets, page 257

Azuresin*

Azure A Carbacrylic Resin

Azuresin is a complex combination of 3-amino-7-(dimethylamino)-phenazathionium chloride, known as azure A dye, and a carbacrylic cationic exchange resin. It contains, in each g., not less than 50 mg. and not more than 70 mg. of the dye, calculated on the dried basis.

Description—Azuresin occurs as moist, irregular, dark blue or purple colored granules. It has a slightly pungent odor.

Identification—To 2 g. of Azuresin add 50 ml. of water: the water does not acquire more than a slightly blue color. Add 2 ml. of 1 *N* hydrochloric acid: the water acquires a deep blue color.

Loss on drying, page 814—Dry Azuresin in vacuum at 38° for 18 hours: it loses not less than 18 percent and not more than 35 percent of its weight.

Elution test—Transfer 1.0 ± 0.005 g. of Azuresin, accurately weighed, into each of two glass-stoppered conical flasks. To one flask add 100 ml. of water that previously has been adjusted with hydrochloric acid to pH 1.5, and to the other add 100 ml. of water that has been adjusted with hydrochloric acid to pH 3.0. Close the flasks, and shake mechanically for 1 hour. Then determine the pH of the contents of each flask: in neither case has the pH changed by more than 0.10 unit.

Allow the resin in each flask to settle, and pipet 5.0 ml. of each of the supernatant solutions into separate, 500-ml. volumetric flasks, add 0.1 *N* hydrochloric acid to volume, and mix. Determine the absorbance of each solution in a 1-cm. cell at the maximum at about 630 mμ, with a suitable spectrophotometer, using 0.1 *N* hydrochloric acid as the blank: the absorbance of the solution prepared from the Azuresin held at pH 3.0 is not more than 0.1 *A* and that of the solution from Azuresin held at pH 1.5 is not less than 0.3 *A*, in which *A* is the absorbance at 690 mμ of the acid–alcohol solution prepared and measured in the *Assay.*

Assay—Transfer 500 ± 5 mg. of Azuresin, accurately weighed, to a glass-stoppered, 1000-ml. volumetric flask. Add, with shaking, sufficient of a mixture of 1 volume of hydrochloric acid and 2 volumes of diluted alcohol to make 1000.0 ml. Shake for 4 hours, and allow to stand overnight. Pipet 10.0 ml. of the supernatant liquid into a 50-ml. volumetric flask, dilute with the acid-alcohol mixture to volume, and mix. Concomitantly determine the absorbance of this solution and a solution of NF Azure A Reference Standard, in the same medium, at a concentration of about 6 mcg. per ml. in 1-cm. cells, at the maximum at about 690 mμ, with a suitable spectrophotometer, using the acid alcohol as the blank. Calculate the quantity, in mg., of Azure A dye in each g. of the resin by the formula $5 \times (C/W) \times (A_U/A_S)$, in which C is the exact concentration of the Reference Standard solution, in mcg. per ml., A_U is the absorbance of the sample solution, A_S is the absorbance of the Reference Standard solution, and W is the amount, in g., of Azuresin taken, corrected to the dried basis.

Packaging and storage—Preserve Azuresin in tight containers in the form of sealed packets.

Category—Diagnostic aid (gastric secretion).

Usual Dose—**2 g.** preceded by **500 mg.** of Caffeine and Sodium Benzoate.

Basic Fuchsin, page 322

Belladonna Extract

Belladonna Extract contains, in each 100 g., not less than 1.15 g. and not more than 1.35 g. of the alkaloids of belladonna leaf.

PILULAR BELLADONNA EXTRACT

Prepare an extract by percolating 1000 g. of belladonna leaf, using a mixture of 3 volumes of alcohol and 1 volume of water as the menstruum. Macerate the drug during 16 hours and then percolate it at a moderate rate. Evaporate the percolate to a pilular consistence under reduced pressure and at a temperature not exceeding 60°, and adjust the remaining extract, after assaying, by dilution with liquid glucose so that the finished Extract will contain, in each 100 g., 1.25 g. of the alkaloids of belladonna leaf.

Assay—Weigh accurately 3 g. of Pilular Belladonna Extract and mix with a suitable quantity of adsorbent (see *Alkaloidal Drug Assays*, page 774). Transfer completely, with the aid of a few ml. of alcohol or ether, to an extraction thimble, insert the thimble in a continuous-extraction apparatus, moisten with a mixture of 3 ml. of stronger ammonia water, 5 ml. of alcohol, and 10 ml. of ether, and mix thoroughly. Macerate overnight, and extract it for not less than 3 hours or until completely extracted (see *Extraction of Drugs*, page 774), using ether as the solvent. Transfer the liquid to a separator, rinse the container with 1 or more small volumes of the solvent, and add the rinsings to the separator. Completely remove the alkaloids from the immiscible solvent by extracting with successive portions of approximately 0.5 *N* sulfuric acid (see *Purification of the Alkaloids* under *Proximate Assays*, page 774), filtering each portion drawn off. Render the combined acid solutions distinctly alkaline with ammonia T.S., and completely remove the alkaloids at once by extracting with successive portions of chloroform. Evaporate the combined chloroform extracts to dryness on a steam bath and keep the dry residue at this temperature for 15 minutes. Again dissolve the residue in chloroform, evaporate to dryness on a steam bath, and continue the heating for 15 minutes. Dissolve, evaporate, and heat for the third time. Dissolve the resulting residue in a few ml. of chloroform, add 15.0 ml. of 0.02 *N* sulfuric acid, remove the chloroform by evaporation, cool, add 3 drops of methyl red T.S., and titrate the excess acid with 0.02 *N* sodium hydroxide. Perform a blank determination (see *Residual Titrations*, page 883). Each ml. of 0.02 *N* sulfuric acid is equivalent to 5.788 mg. of belladonna alkaloids.

The following alternate process for the extraction of the alkaloids may be used: Weigh accurately about 3 g. of Pilular Belladonna Extract, and intimately mix it with two to three times its weight of washed sand. Place the mixture in a sintered-glass funnel of about 50 ml. capacity, and insert the stem of the funnel in a 50-ml. test tube placed in a suction flask. To the funnel add 20 ml. of a mixture of 8 ml. of stronger ammonia water, 20 ml. of ether, and 10 ml. of chloroform, and allow to macerate for 30 minutes, keeping the funnel covered to prevent evaporation. Now apply slight suction until the contents of the funnel are dry. Release the suction, and transfer the filtrate to a separator. Repeat, in the same manner, the extraction of the contents of the funnel four times, using 10 ml. of ether each time, and reducing the maceration time to 5 minutes. Wash the residue in the funnel with three or more 10-ml. portions of approximately 0.5 *N* sulfuric acid until 1 ml. of the last washing gives a negative test with mercuric-potassium iodide T.S. (see *Purification of the Alkaloids* under *Proximate Assays*, page 774). Using these acid washings for removing the alkaloids from the immiscible solvent, proceed as directed above, beginning with "Completely remove the alkaloids from the immiscible solvent. . . ."

POWDERED BELLADONNA EXTRACT

Prepare an extract by percolating 1000 g. of belladonna leaf, using alcohol as the menstruum. Macerate the drug during 16 hours and then percolate it slowly. Evaporate the percolate to a soft extract under reduced pressure and at a temperature not exceeding 60°, add 50 g. of dry starch, and continue the evaporation, at the same temperature, until the product is dry. Powder the residue. The extract may be deprived of its fat by treating either the soft extract first obtained, or the dry and powdered extract, as directed under *Extracts*, page 828. Assay the powdered residue and add sufficient starch, dried at 100°, to make the finished Extract contain, in each 100 g., 1.25 g. of the alkaloids of belladonna leaf. Mix the powders thoroughly and pass the Extract through a fine sieve.

Assay—Weigh accurately about 3 g. of Powdered Belladonna Extract, place it in an extraction thimble, insert the thimble in a continuous-extraction apparatus, moisten the Extract with a mixture of 3 ml. of stronger ammonia water, 5 ml. of alcohol, and 10 ml. of ether, and mix thoroughly. Macerate overnight, and extract it for not less than 3 hours or until completely extracted (see *Extraction of Drugs*, page 774), using ether as the solvent. Then proceed as directed in the *Assay* under *Pilular Belladonna Extract*, page 70, beginning with "Transfer the liquid to a separator. . . ."

Powdered Belladonna Extract may also be assayed by the alternate method described under *Pilular Belladonna Extract*. Each ml. of 0.02 *N* sulfuric acid is equivalent to 5.788 mg. of belladonna alkaloids.

Packaging and storage—Preserve Belladonna Extract in tight containers, preferably at a temperature not above 30°.

CATEGORY—Anticholinergic.
USUAL DOSE—**15 mg.** three times daily.

Belladonna Leaf Fluidextract

Belladonna Leaf Fluidextract contains, in each 100 ml., not less than 270 mg. and not more than 330 mg. of the alkaloids of belladonna leaf.

Belladonna Leaf, in moderately coarse powder........... **1000 g.**

Prepare the Fluidextract from belladonna leaf by Process A, as modified for assayed fluidextracts, page 829, or by Process E, page 831.

By Process A, use a mixture of 3 volumes of alcohol and 1 volume of water as the menstruum, macerate the drug during 48 hours, and percolate at a moderate rate.

By Process E, use a mixture of 2 volumes of alcohol and 1 volume of water as the menstruum and proceed as follows: Mix 1000 g. of ground drug with 400 ml. of the menstruum, so that it is evenly and distinctly damp. Allow the dampened drug to stand for about 1 hour, then pack into a cylindrical percolator, or a series of such percolators joined together, with a length equal to about 30 times the diameter. Saturate the drug at a slow rate by forcing the menstruum under 6 to 15 pounds of air pressure through the packed drug. Allow to macerate during 48 hours, and proceed with percolation by forcing the menstruum through under pressure at a rate of about 1.5 ml. per minute until 950 ml. has been collected.

Adjust the concentrated fluid to contain, in each 100 ml., 300 mg. of the alkaloids of belladonna, and 60 percent of C_2H_5OH.

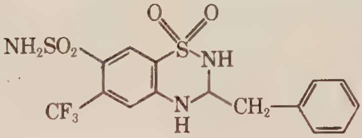
Assay—Transfer 10.0 ml. of Belladonna Leaf Fluidextract to a separator containing 25 ml. of chloroform. Add 25 ml. of water and render the mixture alkaline by the addition of ammonia T.S. Shake the mixture vigorously for about 1 minute, separate the chloroform layer, and complete the extraction of the alkaloids with successive portions of chloroform. Completely remove the alkaloids from the immiscible solvent by extracting with successive portions of approximately 0.5 *N* sulfuric acid (see *Purification of the Alkaloids* under *Proximate Assays*, page 774), filtering each portion drawn off. Render the combined acid solutions distinctly alkaline with ammonia T.S., and completely remove the alkaloids at once by extracting with successive portions of chloroform. Evaporate the combined chloroform extracts to dryness on a steam bath and keep the dry residue at this temperature for 15 minutes. Again dissolve the residue in chloroform, evaporate to dryness on a steam bath, and continue the heating for 15 minutes. Dissolve, evaporate, and heat for the third time. Dissolve the resulting residue in a few ml. of chloroform, add 15.0 ml. of 0.02 *N* sulfuric acid, remove the chloroform by evaporation, cool, add 3 drops of methyl red T.S., and titrate the excess acid with 0.02 *N* sodium hydroxide. Each ml. of 0.02 *N* sulfuric acid is equivalent to 5.788 mg. of the alkaloids of belladonna leaf.

Alcohol content, page 772—Belladonna Leaf Fluidextract contains from 57 to 63 percent (v/v) of C_2H_5OH.

Packaging and storage—Preserve Belladonna Leaf Fluidextract in tight, light-resistant containers and avoid exposure to direct sunlight or to excessive heat.

CATEGORY—Anticholinergic.
USUAL DOSE—**0.06 ml.** three times a day.

Bendroflumethiazide



3-Benzyl-3,4-dihydro-6-(trifluoromethyl)-2*H*-1,2,4-benzothiadiazine-7-sulfonamide 1,1-Dioxide

$C_{15}H_{14}F_3N_3O_4S_2$ Mol. wt. 421.42

Bendroflumethiazide contains not less than 98.0 percent and not more than 102.0 percent of $C_{15}H_{14}F_3N_3O_4S_2$, calculated on the anhydrous basis.

Description—Bendroflumethiazide occurs as a white to cream colored, finely divided, crystalline powder. It is odorless or has a slight odor. It melts at about 220°.

Solubility—Bendroflumethiazide is practically insoluble in water. It is freely soluble in alcohol and in acetone.

Identification—Mix 5 ml. of dilute hydrochloric acid (1 in 2) with 20 mg. of Bendroflumethiazide, boil gently for 1 minute, and cool in an ice bath. Add in succession 0.5 ml. of sodium nitrite solution (1 in 1000), 0.5 ml. of ammonium sulfamate solution (1 in 200), and 0.5 ml. of *N*-(1-naphthyl)ethylenediamine dihydrochloride solution (1 in 1000): a deep red color is produced.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Bendroflumethiazide, previously dried over a suitable desiccant, exhibits maxima only at the same wavelengths as that of NF Bendroflumethiazide Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 100,000 solution of Bendroflumethiazide in methanol exhibits maxima and minima at the same wavelengths as that of NF Bendroflumethiazide Reference Standard, similarly measured, and the respective absorptivities, calculated on the anhydrous basis, at the point of maximum absorbance occurring at about 271 mμ, do not differ by more than 4 percent.

Water, page 900—Determine the water content of Bendroflumethiazide by the titrimetric method: not more than 0.5 percent is found.

Residue on ignition, page 858—Bendroflumethiazide yields not more than 0.2 percent of residue on ignition.

Heavy metals, *Method II*, page 806—The heavy metals limit for Bendroflumethiazide is 20 parts per million.

Selenium—A *Test Preparation* prepared with 100 mg. of Bendroflumethiazide and 100 mg. of magnesium oxide meets the requirements of the *Selenium Limit Test*, page 865 (30 parts per million).

Diazotizable substances—

Standard preparation—Weigh accurately 50.0 mg. of NF 2,4-Disulfamoyl-5-trifluoromethylaniline Reference Standard, dissolve it in sufficient methanol to make 100.0 ml., and mix. Pipet 6.0 ml. of the solution into a 100-ml. volumetric flask, dilute to volume with methanol, and mix.

Test preparation—Dissolve 100.0 mg. of Bendroflumethiazide, accurately weighed, in sufficient methanol to make 50.0 ml., and mix.

Procedure—Transfer 5.0 ml. each of the *Standard preparation* and of the *Test preparation* to separate 50-ml. volumetric flasks, and transfer 5.0 ml. of water to a third 50-ml. volumetric flask to serve as a blank. To each flask add 1.0 ml. of freshly prepared sodium nitrite solution (1 in 100) and 2.0 ml. of 1 *N* hydrochloric acid, mix, and allow to stand for 3 minutes. Add 2.0 ml. of ammonium sulfamate solution (1 in 10) to each flask, and allow to stand for 5 minutes with frequent swirling. Add 1.0 ml. of freshly prepared *N*-(1-naphthyl)ethylenediamine dihydrochloride solution (1 in 50), dilute to volume with water, and mix. Concomitantly determine the absorbances of the solutions obtained from the *Standard preparation* and *Test preparation*, in 1-cm. cells, at 520 mμ, with a suitable spectrophotometer, using the blank to set the instrument: the absorbance of the solution from the *Test preparation* does not exceed that from the *Standard preparation*, corresponding to not more than 1.5 percent of diazotizable substances.

Assay—Dissolve about 320 mg. of Bendroflumethiazide, accurately weighed, in 25 ml. of dimethylformamide, and add 4 drops of a mixed indicator, prepared by dissolving 20 mg. of thymol blue and 5 mg. of quinaldine red in 10 ml. of methanol and diluting to 50 ml. with benzene. Titrate with 0.1 *N* lithium methoxide to a clear blue end-point, maintaining a gentle flushing with nitrogen during the titration. [Note—In conducting the titration, immediately add about 6 ml. of the titrant, and then approach the end-point at a rate of 1 to 2 drops per second.] Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* lithium methoxide is equivalent to 42.14 mg. of $C_{15}H_{14}F_3N_3O_4S_2$.

Packaging and storage—Preserve Bendroflumethiazide in tight containers.

Category—Diuretic; antihypertensive.

Usual dose range—Diuretic: Initial, **5** to **20 mg.** daily; maintenance, **2.5** to **5 mg.** daily. Antihypertensive; initial, **5** to **20 mg.** daily; maintenance, **2.5** to **15 mg.** daily.

Bendroflumethiazide Tablets

Bendroflumethiazide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{15}H_{14}F_3N_3O_4S_2$.

Identification—The solution prepared from Bendroflumethiazide Tablets as directed in the *Content uniformity test* exhibits an ultraviolet absorption maximum at 271 ± 2 mμ.

Disintegration, page 878—The disintegration time limit for Bendroflumethiazide Tablets is 30 minutes.

Content uniformity, *Method II*, page 799—Bendroflumethiazide Tablets meet the requirements of the content uniformity test for tablets, using the following special procedure: Transfer one finely powdered tablet to a 125-ml. glass-stoppered conical flask, add 50.0 ml. of acetone, insert a small funnel in the mouth of the flask, and heat on a steam bath for 3 minutes. Cool, stopper, and shake for 15 minutes. Centrifuge, and transfer a 5.0-ml. portion of the supernatant liquid to a 125-ml. conical flask. Evaporate to dryness on a steam bath, and dissolve the residue in sufficient methanol, accurately measured, to provide a concentration of 10 mcg. of bendroflumethiazide per ml. Concomitantly determine the absorbance of this solution and of a solution of NF Bendroflumethiazide Reference Standard, in the same medium, at a concentration of about 10 mcg. per ml., in 1-cm. cells, at the maximum at about 271 mμ, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg., of $C_{15}H_{14}F_3N_3O_4S_2$ in the tablet by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity, in mg., of bendroflumethiazide in the tablet; D is the exact concentration, in mcg. per ml., of bendroflumethiazide in the sample solution, based upon the labeled quantity per tablet and the extent of dilution; C is the exact concentration, in mcg. per ml., of the Reference Standard solution; A_U is the absorbance of the sample solution; and A_S is the absorbance of the Reference Standard solution.

Assay—

Standard preparation—Weigh accurately about 50 mg. of NF Bendroflumethiazide Reference Standard, transfer to a 100-ml. volumetric flask, dissolve in 75 ml. of 0.1 *N* sodium hydroxide, dilute to volume with water, and mix. Transfer 10.0 ml. of this solution to a second 100-ml. volumetric flask, dilute to volume with water, and mix.

Assay preparation—Weigh and finely powder not less than 20 Bendroflumethiazide Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 5 mg. of bendroflumethiazide, to a 100-ml. volumetric flask, add 50 ml. of 0.1 *N* sodium hydroxide, and shake well for 5 minutes. Dilute to volume with 0.1 *N* sodium hydroxide, mix, and centrifuge a 30-ml. aliquot for 15 minutes at high speed. Use the clear, supernatant liquid as directed in the *Procedure*.

Procedure—Transfer 5.0 ml. each of the *Standard preparation* and of the *Assay preparation*, to separate 50-ml. volumetric flasks, and transfer 5.0 ml. of 0.1 *N* sodium hydroxide to a third flask to serve as the blank. To each flask add 25 ml. of 0.1 *N* sodium hydroxide and 5.0 ml. of dilute hydrochloric acid (1 in 2), swirl, heat in a boiling water bath for 15 minutes, and cool for 10 minutes in an ice bath. Add 3.0 ml. of sodium nitrite solution (1 in 1000), wash the neck of each flask with 1 ml. of water, swirl, and allow to stand for 3 minutes. Add 3.0 ml. of ammonium sulfamate solution (1 in 200), wash the neck of each flask with 1 ml. of water, swirl, and allow to stand for 2 minutes. Add 3.0 ml. of *N*-(1-naphthyl)ethylenediamine dihydrochloride solution (1 in 1000), dilute to volume with water, and mix. Allow to stand for not less than 10 minutes and not more than 30 minutes, and then concomitantly determine the absorbances of the solutions obtained from the *Standard preparation* and the *Assay preparation* at 515 mμ, in 1-cm. cells with a suitable spectrophotometer, using the reagent blank in the reference cell. Calculate the quantity, in mg., of $C_{15}H_{14}F_3N_3O_4S_2$ in the portion of the Tablets taken by the formula $0.1C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of NF Bendroflumethiazide Reference Standard in the *Standard preparation*, and A_U and A_S are the absorbances of the solutions obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Packaging and storage—Preserve Bendroflumethiazide Tablets in tight containers.

Tablets available—Bendroflumethiazide Tablets usually available contain the following amounts of bendroflumethiazide: 2.5 mg. and 5 mg.

CATEGORY and DOSE—See Bendroflumethiazide.

Benzaldehyde

C_7H_6O Mol. wt. 106.13

Benzaldehyde contains not less than 98.0 percent and not more than 100.5 percent of C_7H_6O.

Description—Benzaldehyde is a colorless, strongly refractive liquid, having an odor resembling that of bitter almond oil, and a burning, aromatic taste. It is affected by light.

Solubility—Benzaldehyde is slightly soluble in water, and is miscible with alcohol, with ether, with fixed and with volatile oils.

Specific gravity, page 866—The specific gravity of Benzaldehyde is not less than 1.041 and not more than 1.046.

Refractive index, page 858—The refractive index of Benzaldehyde is not less than 1.544 and not more than 1.546 at 20°.

Hydrocyanic acid—Shake 0.5 ml. of Benzaldehyde with 5 ml. of water, add 0.5 ml. of sodium hydroxide T.S. and 0.1 ml. of ferrous sulfate T.S., and warm the mixture gently. Upon the addition of a slight excess of hydrochloric acid, no greenish blue color or blue precipitate is produced within 15 minutes.

Chlorinated compounds—Wind a strip of 20 mesh copper gauze 1.5 cm. wide and 5 cm. long around the end of a copper wire. Heat the gauze in the nonluminous flame of a Bunsen burner until it glows without coloring the flame green. Permit the gauze to cool and reheat several times until a good coat of oxide has formed. Apply with a medicine dropper, 2 drops of Benzaldehyde to the cooled gauze, ignite, and permit it to burn freely in the air. Again cool the gauze and add 2 more drops of Benzaldehyde and burn as before. This process is continued until a total of 6 drops has been added and ignited. Then hold the gauze in the outer edge of the Bunsen flame, adjusted to a height of about 4 cm.: not even a transient green color is imparted to the flame.

Nitrobenzene—Dissolve 1 ml. of Benzaldehyde in 20 ml. of alcohol and add water until a slight turbidity is produced. Add zinc and diluted sulfuric acid, maintaining a brisk evolution of hydrogen for 1 hour. Filter, evaporate the liquid to about 20 ml., and boil 10 ml. of the concentrated liquid with 1 drop of potassium dichromate T.S.: no purplish color is produced.

Assay—Transfer about 1 ml. of Benzaldehyde to a tared glass-stoppered weighing bottle, and weigh accurately. Loosen the stopper and transfer the weighing bottle and contents to a 250-ml. conical flask containing 25 ml. of a reagent prepared by dissolving 34.7 g. of hydroxylamine hydrochloride in 160 ml. of water and diluting this solution to 1000 ml. with alcohol. Rinse down the sides of the flask with an additional 50 ml. of the reagent. Allow to stand for 10 minutes, add 1 ml. of bromophenol blue T.S., and titrate the liberated hydrochloric acid with 1 *N* sodium hydroxide to a light green end-point. Perform a blank determination (see *Residual Titrations,* page 883), titrating to the same color as in the assay determination. To determine the number of ml. of 1 *N* sodium hydroxide required to neutralize the liberated hydrochloric acid, subtract the number of ml. of 1 *N* sodium hydroxide used in the blank from the number of ml. required in the assay. Each ml. of 1 *N* sodium hydroxide is equivalent to 106.1 mg. of C_7H_6O.

Packaging and storage—Preserve Benzaldehyde in well-filled, tight, light-resistant containers.

CATEGORY—Flavor.

Compound Benzaldehyde Elixir

Benzaldehyde	0.5	ml.
Vanillin	1	g.
Orange Flower Water	150	ml.
Alcohol	50	ml.
Syrup	400	ml.
Purified Water, a sufficient quantity,		
To make	1000	ml.

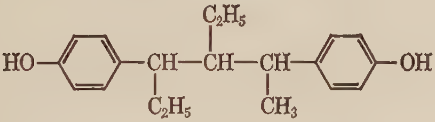
Dissolve the benzaldehyde and the vanillin in the alcohol; add the syrup, the orange flower water, and sufficient purified water, in several portions, shaking the mixture thoroughly after each addition, to make the product measure 1000 ml.; then filter, if necessary, until the product is clear.

Alcohol content, page 772—Compound Benzaldehyde Elixir contains from 3 to 5 percent (v/v) of C_2H_5OH.

Packaging and storage—Preserve Compound Benzaldehyde Elixir in tight, light-resistant containers.

CATEGORY—Vehicle.

Benzestrol



4,4′-(1,2-Diethyl-3-methyltrimethylene)diphenol

$C_{20}H_{26}O_2$ Mol. wt. 298.43

Benzestrol, dried at 105° for 1 hour, contains not less than 98.5 percent and not more than 100.5 percent of $C_{20}H_{26}O_2$.

Description—Benzestrol occurs as a white, crystalline powder. A solution of Benzestrol in ether (1 in 50) is clear and colorless. A 1 in 50 solution of Benzestrol in previously neutralized 80 percent alcohol is neutral to litmus.

Solubility—Benzestrol is practically insoluble in water and in dilute mineral acids. It is freely soluble in acetone, in alcohol, in ether, in methanol, and in sodium hydroxide T.S. It is soluble in vegetable oils, moderately soluble in glacial acetic acid, and slightly soluble in diluted alcohol, in benzene, in chloroform, and in solvent hexane.

Identification—

A: Dissolve about 10 mg. of Benzestrol in 2 ml. of sulfuric acid: a pale yellow color is produced which persists on dilution with water (*distinction from diethylstilbestrol, which yields an orange color*).

B: Add a few drops of a solution of antimony pentachloride in dry, alcohol-free chloroform (1 in 2) to a very dilute solution of Benzestrol in the same solvent: a green colored solution is produced which rapidly changes to brown (*distinction from diethylstilbestrol, which yields a red to bluish red color*).

C: Add 1 ml. of benzoyl chloride to 100 mg. of Benzestrol in a test tube. Boil gently for 5 minutes, cool, add 20 ml. of sodium hydroxide T.S., and shake until a white, solid mass separates. Filter, wash the precipitate with water, recrystallize it twice from hot alcohol, and dry at 80° for 30 minutes: the 2,4-bis(*p*-hydroxyphenyl)-3-ethylhexane dibenzoate so obtained melts between 118° and 120°, page 814.

Melting range, page 814—Benzestrol melts between 161° and 163°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Benzestrol, previously dried at 105° for 1 hour, exhibits maxima only at the same wavelengths as that of NF Benzestrol Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 20,000 solution of Benzestrol in alcohol exhibits maxima and minima at the same wavelengths as that of NF Benzestrol Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance occurring at about 278 mμ, do not differ by more than 2.5 percent.

Loss on drying, page 814—Dry Benzestrol at 105° for 1 hour: it loses not more than 0.1 percent of its weight.

Residue on ignition, page 858—Benzestrol yields not more than 0.05 percent of residue on ignition.

Assay—

Standard preparation—Weigh accurately about 100 mg. of NF Benzestrol Reference Standard, previously dried at 105° for 1 hour, dissolve it in sufficient alcohol to make 100.0 ml., and mix. Transfer 10.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with alcohol, and mix.

Assay preparation—Weigh accurately about 100 mg. of Benzestrol, previously dried at 105° for 1 hour, dissolve it in sufficient alcohol to make 100.0 ml., and mix. Transfer 10.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with alcohol, and mix.

Procedure—Pipet 5.0 ml. each of the *Standard preparation* and of the *Assay preparation* into separate 50-ml. volumetric flasks. To each flask add 2.0 ml. of diluted hydrochloric acid and 4.0 ml. of molybdophosphotungstate T.S., and mix. Let the flasks stand for 10 minutes, then add 10.0 ml. of sodium carbonate solution (1 in 4), add water to volume, and mix. Let the flasks stand for an hour, then centrifuge. Determine the absorbances of the clear, supernatant solutions in 1-cm. cells, at 750 mμ, with a suitable spectrophotometer, using as the blank a solution prepared from the same quantities of the same reagents and in the same manner. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{20}H_{26}O_2$ in the Benzestrol taken by the formula $C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation.*

Packaging and storage—Preserve Benzestrol in tight containers.

CATEGORY—Estrogen.
USUAL DOSE—Oral, **1** to **2 mg.** daily.
USUAL DOSE RANGE—**500 mcg.** to **5 mg.**

Benzestrol Tablets

Benzestrol Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{20}H_{26}O_2$.

Identification—Benzestrol, obtained as directed in the *Assay preparation,* responds to the *Identification tests* under *Benzestrol,* page 75.

Disintegration, page 878—The disintegration time limit for Benzestrol Tablets is 15 minutes.

Content uniformity, *Method I,* page 799—Benzestrol Tablets meet the requirements of the content uniformity test for tablets.

Assay—

Standard preparation—Prepare as directed in the *Assay* under *Benzestrol,* page 75.

Assay preparation—Weigh and finely powder not less than 20 Benzestrol Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 10 mg. of benzestrol, to a separator containing 30 ml. of water and 2 drops of hydrochloric acid, and extract with five 20-ml. portions of peroxide-free ether. Extract the combined ether extracts with one 25-ml. portion and three 15-ml. portions of sodium hydroxide T.S., and discard the ether solution. Acidify the combined sodium hydroxide extracts with diluted sulfuric acid, and extract with five 25-ml. portions of peroxide-free ether. Filter the combined ether extracts through peroxide-free, ether-washed cotton, wash the cotton with several small portions of the ether, and evaporate the ether by gentle warming. Dissolve the residue in 20 ml. of alcohol, transfer to a 100-ml. volumetric flask with the aid of alcohol, dilute to volume with alcohol, and mix.

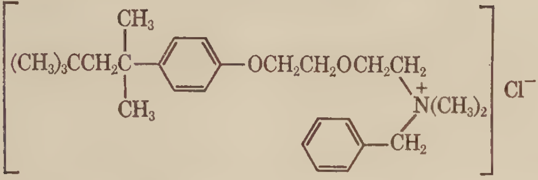
Procedure—Proceed as directed in the *Procedure* in the *Assay* under *Benzestrol,* page 75, beginning with "Pipet 5.0 ml. each. . . ." Calculate the quantity, in mg., of $C_{20}H_{26}O_2$ in the portion of the Tablets taken by the formula $0.1C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of NF Benzestrol Reference Standard in the *Standard preparation.*

Packaging and storage—Preserve Benzestrol Tablets in tight containers.

Tablets available—Benzestrol Tablets usually available contain the following amounts of benzestrol: 1, 2, and 5 mg.

CATEGORY AND DOSE—See Benzestrol.

Benzethonium Chloride



Benzyldimethyl[2-[2-[*p*-(1,1,3,3-tetramethylbutyl)phenoxy]ethoxy]ethyl]ammonium Chloride

$C_{27}H_{42}ClNO_2$ Mol. wt. 448.09

Benzethonium Chloride contains not less than 97.0 percent and not more than 103.0 percent of $C_{27}H_{42}ClNO_2$, calculated on the dried basis.

Description—Benzethonium Chloride occurs as colorless crystals. It has a mild odor and has a very bitter taste. Its 1 in 100 solution is slightly alkaline to litmus.

Solubility—Benzethonium Chloride is soluble in water, in alcohol, and in chloroform. It is only slightly soluble in ether.

Identification—

A: To 1 ml. of a solution of Benzethonium Chloride (1 in 100) add 2 ml. of alcohol, 0.5 ml. of diluted nitric acid and 1 ml. of silver nitrate T.S.: a white precipitate, which is insoluble in diluted nitric acid but soluble in diluted ammonia solution, is formed.

B: A solution of Benzethonium Chloride (1 in 100) forms precipitates with diluted nitric acid and with mercuric chloride T.S., both of which dissolve upon the addition of alcohol.

C: Dissolve 100 mg. of Benzethonium Chloride in 1 ml. of sulfuric acid, add 100 mg. of potassium nitrate, and heat on a steam bath for 3 minutes. Cautiously dilute the solution with water to 10 ml., add 500 mg. of granulated zinc, and warm the mixture for 10 minutes. Cool, add 200 mg. of sodium nitrite to 1 ml. of the clear liquid, and add this mixture to 20 mg. of naphthol sodium disulfonate in 1 ml. of stronger ammonia water: the solution turns orange-red and a brown precipitate may appear.

Melting range, page 814—Benzethonium Chloride, dried at 105° for 4 hours, melts between 158° and 163°.

Loss on drying, page 814—Dry Benzethonium Chloride at 105° for 4 hours: it loses not more than 5 percent of its weight.

Residue on ignition, page 858—Benzethonium Chloride yields not more than 0.1 percent of residue on ignition.

Ammonium compounds—To 5 ml. of a solution of Benzethonium Chloride (1 in 50) add 3 ml. of sodium hydroxide T.S., and heat to boiling: the odor of ammonia is not perceptible.

Assay—Dissolve about 300 mg. of Benzethonium Chloride, accurately weighed, in 75 ml. of water contained in a glass-stoppered, 250-ml. flask. Add 0.4 ml. of bromophenol blue solution (1 in 2000), 10 ml. of chloroform, and 1 ml. of sodium hydroxide T.S. Titrate with 0.02 *M* sodium tetraphenylboron until the blue color disappears from the chloroform layer. Add the last portions of the sodium tetraphenylboron solution dropwise, agitating vigorously after each addition. Each ml. of 0.02 *M* sodium tetraphenylboron is equivalent to 8.962 mg. of $C_{27}H_{42}ClNO_2$.

Packaging and storage—Preserve Benzethonium Chloride in tight, light-resistant containers.

CATEGORY—Local anti-infective.

APPLICATION—Topical, as a 1:750 solution to the skin or 1:5000 solution nasally.

Benzethonium Chloride Solution

Benzethonium Chloride Solution contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{27}H_{42}ClNO_2$.

Description—Benzethonium Chloride Solution is odorless and has a bitter taste. It is slightly alkaline to litmus.

Identification—The residue obtained by evaporating, on a steam bath, a volume of Benzethonium Chloride Solution equivalent to about 200 mg. of benzethonium chloride, responds to the *Identification* *tests* under *Benzethonium Chloride,* page 77.

Oxidizing substances—To 5 ml. of Benzethonium Chloride Solution add 0.5 ml. of potassium iodide T.S. and a few drops of diluted hydrochloric acid: the solution does not acquire a yellow color.

Nitrites—To 1 drop of Benzethonium Chloride Solution on a spot plate, add 1 drop each of glacial acetic acid, sulfanilic acid in acetic acid (1 in 100), and α-naphthylamine-acetic acid solution (prepared by boiling 30 mg. of α-naphthylamine in 70 ml. of water, decanting the colorless solution from the blue-violet residue, and mixing with 30 ml. of glacial acetic acid): no red color develops in the resulting solution within 10 minutes.

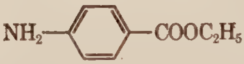
Assay—Pipet into a glass-stoppered flask a volume of Benzethonium Chloride Solution, equivalent to about 200 mg. of benzethonium chloride, and proceed as directed in the *Assay* under *Benzethonium Chloride,* page 77, beginning with "Add 0.4 ml. of bromophenol blue solution (1 in 2000) . . ."

Packaging and storage—Preserve Benzethonium Chloride Solution in tight, light-resistant containers.

Solutions available—Benzethonium Chloride Solution is usually available in the following concentrations: 1:750 and 3 percent.

Category and Application—See Benzethonium Chloride.

Benzocaine



Ethyl *p*-Aminobenzoate

$C_9H_{11}NO_2$ Mol. wt. 165.19

Benzocaine, dried over phosphorus pentoxide for 3 hours, contains not less than 98.0 percent and not more than 101.0 percent of $C_9H_{11}NO_2$.

Description—Benzocaine occurs as small, white crystals, or as a white, crystalline powder. It is odorless, and is stable in air. Benzocaine exhibits local anesthetic properties when placed upon the tongue.

Solubility—Benzocaine is very slightly soluble in water. It is freely soluble in alcohol, in chloroform, and in ether, and is sparingly soluble in almond oil or olive oil. It dissolves in dilute acids.

Identification—

A: Boil Benzocaine with sodium hydroxide T.S.: alcohol, recognizable by its odor, is produced.

B: Dissolve about 20 mg. of Benzocaine in 10 ml. of water with the aid of a few drops of diluted hydrochloric acid, and add 5 drops of a solution of sodium nitrite (1 in 10), followed by 2 ml. of a solution of 100 mg. of betanaphthol in 5 ml. of sodium hydroxide T.S.: an orange-red precipitate is formed.

C: To a solution of Benzocaine (1 in 50), prepared with the aid of a slight excess of diluted hydrochloric acid, add iodine T.S.: a precipitate is formed.

Melting range, page 814—Benzocaine melts, within a 2° range, between 88° and 92°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Benzocaine, previously dried over phosphorus pentoxide for 3 hours, exhibits maxima only at the same wavelengths as that of NF Benzocaine Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 200,000 solution of Benzocaine in chloroform exhibits maxima and minima at the same wavelengths as that of NF Benzocaine Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance occurring at about 292 mμ, do not differ by more than 3 percent.

Reaction—Dissolve 1 g. of Benzocaine in 10 ml. of neutralized alcohol: a clear solution results. Dilute this solution with 10 ml. of water, and add 2 drops of phenolphthalein T.S. and 1 drop of 0.1 *N* sodium hydroxide: a red color is produced.

Loss on drying, page 814—Dry Benzocaine over phosphorus pentoxide for 3 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Benzocaine yields not more than 0.1 percent of residue on ignition.

Chloride—To a solution of 200 mg. of Benzocaine in 5 ml. of alcohol, previously acidified with a few drops of diluted nitric acid, add a few drops of silver nitrate T.S.: no turbidity is produced immediately.

Heavy metals, *Method II*, page 806—The heavy metals limit for Benzocaine is 10 parts per million.

Readily carbonizable substances, page 856—Dissolve 500 mg. of Benzocaine in 5 ml. of sulfuric acid T.S.: the solution has no more color than Matching Fluid A.

Assay—Dissolve about 300 mg. of Benzocaine, previously dried over phosphorus pentoxide for 3 hours and accurately weighed, in a mixture of 100 ml. of water and 15 ml. of hydrochloric acid. Cool the solution in an ice bath to about 10°, and titrate with 0.1 *M* sodium nitrite until a blue color is produced immediately when the titrated solution is spotted on starch iodide paper. When the titration is complete, the end-point is reproducible after the mixture has been allowed to stand for 5 minutes. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *M* sodium nitrite is equivalent to 16.52 mg. of $C_9H_{11}NO_2$.

Packaging and storage—Preserve Benzocaine in well-closed containers.

CATEGORY—Local anesthetic.

APPLICATION—Topical, as a 1 to 20 percent ointment to the skin.

Benzocaine Ointment

Benzocaine Ointment contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_9H_{11}NO_2$ in a suitable ointment base.

Identification—

Ointments having water-soluble bases—Transfer an amount of Benzocaine Ointment, equivalent to about 5 mg. of benzocaine, into a small beaker, add 20 ml. of 0.5 *N* hydrochloric acid, warm gently to disperse the ointment, cool, and filter if necessary. To 10 ml. of the filtrate add 5 drops of a solution of sodium nitrite (1 in 10) and 2 drops of methyl red T.S., and neutralize with sodium hydroxide T.S. Add 2 ml. of a solution of 100 mg. of betanaphthol in 5 ml. of sodium hydroxide T.S.: an orange-red precipitate is formed.

Ointments having water-insoluble bases—Transfer an amount of Benzocaine Ointment, equivalent to about 2.5 mg. of benzocaine, into a small separator and dissolve in 20 ml. of ether. Extract with 10 ml. of 0.5 *N* hydrochloric acid and filter the aqueous phase through paper into a small beaker. Add 5 drops of a solution of sodium nitrite (1 in 10) and 2 drops of methyl red T.S., and neutralize with sodium hydroxide T.S. Add 2 ml. of a solution of 100 mg. of betanaphthol in 5 ml. of sodium hydroxide T.S.: an orange-red precipitate is formed.

Assay—

Ointments having water-soluble bases—Weigh accurately an amount of Benzocaine Ointment, equivalent to about 200 mg. of benzocaine, in a tared 250-ml. beaker. Add 50 ml. of water and 5 ml. of hydrochloric acid, and stir mechanically until solution is effected. Cool the solution in an ice bath to about 10°, and titrate slowly with 0.1 *M* sodium nitrite, determining the end-point electrometrically, using calomel and platinum electrodes. Each ml. of 0.1 *M* sodium nitrite is equivalent to 16.52 mg. of $C_9H_{11}NO_2$.

Ointments having water-insoluble bases—Weigh accurately an amount of Benzocaine Ointment, equivalent to about 200 mg. of benzocaine, and transfer to a 125-ml. separator. Suspend the ointment in 50 ml. of ether by shaking, and extract with three successive 25-ml. portions of 1 *N* hydrochloric acid, filtering each portion into a 250-ml. beaker, and proceed as directed under *Ointments having water-soluble bases* beginning with "Cool the solution. . . ."

Packaging and storage—Preserve Benzocaine Ointment in tight containers protected from light, and avoid prolonged exposure to temperatures above 30°.

Ointments available—Benzocaine Ointment usually available contains 1, 2.5, 5, 10, and 20 percent of benzocaine.

CATEGORY AND APPLICATION—See Benzocaine.

Benzocaine and Antipyrine Solution, page 60

Benzocaine and Trimethobenzamide Hydrochloride Suppositories, page 739

Benzonatate*

2,5,8,11,14,17,20,23,26-Nonaoxaoctacosan-28-yl *p*-(Butylamino)benzoate

$C_{30}H_{53}NO_{11}$ (av.) Mol. wt. (av.) 603

Benzonatate contains not less than 95.0 percent and not more than 105.0 percent of $C_{30}H_{53}NO_{11}$.

Description—Benzonatate occurs as a clear, pale yellow, viscous liquid having a faint, characteristic odor. Benzonatate has a bitter taste and exhibits local anesthetic properties when placed upon the tongue.

Solubility—Benzonatate is miscible with water in all proportions. It is freely soluble in chloroform, in alcohol, and in benzene.

Identification—Reflux about 2 g. of Benzonatate with 10 ml. of water and 20 ml. of 0.5 *N* sodium hydroxide for about 3 hours. Neutralize the solution to congo red with 0.5 *N* hydrochloric acid, filter, wash the precipitate with a small amount of cold water, and dry the crystals at 105° for 2 hours: the *p*-(butylamino)benzoic acid so obtained melts between 150° and 153°, page 814.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 67,000 solution of Benzonatate in water exhibits maxima and minima at the same wavelengths as that of NF Benzonatate Reference Standard, similarly measured.

Refractive index, page 858—The refractive index of Benzonatate, determined at 20°, is not less than 1.509 and not more than 1.511.

Water, page 900—Determine the water content of Benzonatate by the titrimetric method: not more than 0.3 percent is found.

Residue on ignition, page 858—Benzonatate yields not more than 0.1 percent of residue on ignition.

Arsenic—A *Test Preparation* prepared with 6.67 g. of Benzonatate, as directed for organic compounds, meets the requirements of the *Arsenic Test,* page 777 (1.5 parts per million As).

Chloride—To 20 ml. of a 1 in 20 solution of Benzonatate, add 1 ml. of nitric acid and 1 ml. of silver nitrate T.S. Dilute to 50 ml. with water, mix, and allow to stand protected from light for 10 minutes: no turbidity is produced.

Sulfate—To 5 ml. of a 1 in 20 solution of Benzonatate, add 5 ml. of water, 1 ml. of dilute hydrochloric acid, and 1 ml. of barium chloride T.S. Mix, and allow to stand for 10 minutes: no turbidity is produced.

Heavy metals, *Method II,* page 806—The heavy metals limit for Benzonatate is 10 parts per million.

Assay—Weigh accurately about 5 g. of Benzonatate, and reflux for 1 hour with 25.0 ml. of 0.5 *N* sodium hydroxide. Cool, add 25 ml. of water and 10 drops of bromothymol blue T.S., and titrate the excess alkali with 0.5 *N* hydrochloric acid. Perform a blank determination (see *Residual Titrations,* page 883). Each ml. of 0.5 *N* sodium hydroxide is equivalent to 301.5 mg. of $C_{30}H_{53}NO_{11}$.

Packaging and storage—Preserve Benzonatate in tight, light-resistant containers.

CATEGORY—Antitussive.
USUAL DOSE—**100 mg.** three times a day.
USUAL DOSE RANGE—**100** to **200 mg.**

---

* Patented. See notice, page ii.

Benzonatate Capsules

Benzonatate Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of benzonatate ($C_{30}H_{53}NO_{11}$ av.).

Identification—

A: Empty several Benzonatate Capsules, equivalent to about 2 g. of benzonatate, and reflux with 10 ml. of water and 20 ml. of sodium hydroxide T.S. for about 3 hours. Neutralize to congo red with 0.5 *N* hydrochloric acid, filter, wash the precipitate with a small amount of cold water, and dry the crystals at 105° for 2 hours: the *p*-(butylamino)benzoic acid so obtained melts between 150° and 153°, page 814.

B: The contents of Benzonatate Capsules meet the requirements of the test for *Ultraviolet absorption* under *Benzonatate,* page 80.

Content uniformity, *Method I,* page 798—Benzonatate Capsules meet the requirements of the content uniformity test for capsules.

Assay—

Standard preparation—Transfer about 50 mg. of NF Benzonatate Reference Standard, accurately weighed, to a 100-ml. volumetric flask, add water to volume, and mix.

Assay preparation—Mix a number of Benzonatate Capsules, equivalent to about 500 mg. of benzonatate, with 40 ml. of chloroform in a suitable high speed blending apparatus, and dilute to 50.0 ml. with chloroform. Transfer 5.0 ml. of this solution, equivalent to about 50 mg. of benzonatate, to a 100-ml. volumetric flask, and evaporate the chloroform on a steam bath with the aid of a current of air. Dissolve the residue in water, dilute to volume with water, and mix.

Procedure—Transfer 4.0 ml. each of the *Standard preparation*, of the *Assay preparation*, and of water to separate test tubes. To each tube add in succession 1.0 ml. of 1 *M* hydroxylamine hydrochloride and 1.0 ml. of 3.5 *M* sodium hydroxide, mixing well after each addition. Allow to stand for exactly 10 minutes, then add 1.0 ml. of 3.5 *M* hydrochloric acid, mix, add 1.0 ml. of 0.3 *M* ferric chloride, and mix. Allow to stand for exactly 30 minutes, and pass a stream of air through the solution to remove gas bubbles. Concomitantly determine the absorbances of the solutions in 1-cm. cells, at the maximum at about 500 mμ, with a suitable spectrophotometer, using the blank to set the instrument. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of benzonatate ($C_{30}H_{53}NO_{11}$ av.) in the number of Capsules taken by the formula $C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*.

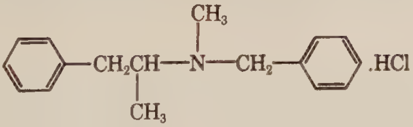
Packaging and storage—Preserve Benzonatate Capsules in tight, light-resistant containers.

Capsules available—Benzonatate Capsules usually available contain the following amounts of benzonatate: 50 and 100 mg.

CATEGORY and DOSE—See Benzonatate.

Benzoylpas, Calcium, page 116
Benzoylpas, Calcium, Tablets, page 117

Benzphetamine Hydrochloride



(+)-*N*-Benzyl-*N*,α-dimethylphenethylamine Hydrochloride

$C_{17}H_{21}N.HCl$ Mol. wt. 275.82

Benzphetamine Hydrochloride contains not less than 98.0 percent and not more than 101.0 percent of $C_{17}H_{21}N.HCl$, calculated on the dried basis.

Description — Benzphetamine Hydrochloride occurs as an odorless, white to off-white, crystalline powder.

Solubility—Benzphetamine Hydrochloride is freely soluble in water, in alcohol, and in chloroform. It is slightly soluble in ether.

Identification—

A: To a solution of Benzphetamine Hydrochloride (1 in 100) add picric acid T.S.: a yellow precipitate is formed which is soluble in alcohol.

B: A solution of Benzphetamine Hydrochloride (1 in 100) responds to the test for *Chloride*, page 808.

Melting range, page 814—Benzphetamine Hydrochloride melts between 152° and 158°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Benzphetamine Hydrochloride, previously dried in vacuum at 60° for 3 hours, exhibits maxima only at the same wavelengths as that of NF Benzphetamine Hydrochloride Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 1000 solution of Benzphetamine Hydrochloride in alcohol exhibits maxima and minima at the same wavelengths as that of NF Benzphetamine Hydrochloride Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance occurring at about

258 mμ, do not differ by more than 2.5 percent.

Specific rotation, page 822—The specific rotation of Benzphetamine Hydrochloride, calculated on the dried basis, determined in a solution in water containing 200 mg. of Benzphetamine Hydrochloride in each 10 ml., is between +22° and +26°.

Loss on drying, page 814—Dry Benzphetamine Hydrochloride in vacuum at 60° for 3 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Benzphetamine Hydrochloride yields not more than 0.2 percent of residue on ignition.

Methamphetamine hydrochloride—

Standard preparation—Weigh accurately about 30 mg. of USP Methamphetamine Hydrochloride Reference Standard and dissolve in sufficient water to make 200.0 ml. Transfer 1.0 ml. of this solution to a glass-stoppered 30-ml. tube.

Test preparation—Transfer about 20 mg. of Benzphetamine Hydrochloride, accurately weighed, to a glass-stoppered 30-ml. tube, and dissolve in 1.0 ml. of water.

Procedure—To the *Standard preparation,* to the *Test preparation,* and to a third glass-stoppered 30-ml. tube containing 1.0 ml. of water to serve as the blank, add 4.0 ml. of a freshly prepared mixture of 35 ml. of carbon disulfide, 25 ml. of pyridine, and 65 ml. of isopropyl alcohol, and then add 2.0 ml. of a solution prepared by dissolving 300 mg. of cupric sulfate ($CuSO_4.5H_2O$) in 250 ml. of water and diluting to 500 ml. with pyridine. Mix the contents of the tubes by swirling, and allow to stand for 10 minutes. To each tube add 3.0 ml. of dilute acetic acid (1 in 20) and 3.0 ml. of benzene. Shake the tubes, allow the layers to separate, and transfer the benzene layers to separate 10-ml. flasks, each containing 300 mg. of anhydrous sodium sulfate. Concomitantly determine the absorbance of each solution in 1-cm. cells, at the maximum at about 445 mμ, with a suitable spectrophotometer, using the blank to set the instrument. The absorbance of the solution from the *Test preparation* does not exceed that from the *Standard preparation,* indicating not more than 0.75 percent of methamphetamine hydrochloride.

Assay—Dissolve about 500 mg. of Benzphetamine Hydrochloride, accurately weighed, in a mixture of 50 ml. of glacial acetic acid and 10 ml. of mercuric acetate T.S., add 1 drop of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a blue-green endpoint. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 27.58 mg. of $C_{17}H_{21}N.HCl$.

Packaging and storage—Preserve Benzphetamine Hydrochloride in tight, light-resistant containers.

CATEGORY—Anorexiant.

USUAL DOSE RANGE—**25** to **50 mg.** one to three times daily.

Benzphetamine Hydrochloride Tablets

Benzphetamine Hydrochloride Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{17}H_{21}N.HCl$.

Identification—Powder a number of Benzphetamine Hydrochloride Tablets, equivalent to about 50 mg. of benzphetamine hydrochloride, and digest with 25 ml. of chloroform for 10 minutes. Filter, evaporate the filtrate to dryness, and dry at room temperature in a vacuum. The residue so obtained meets the requirements for *Infrared absorption* under *Benzphetamine Hydrochloride,* page 81.

Disintegration, page 878—The disintegration time limit for Benzphetamine Hydrochloride Tablets is 30 minutes.

Content uniformity, *Method I,* page 799—Benzphetamine Hydrochloride Tablets meet the requirements of the content uniformity test for tablets.

Assay—

Sodium lauryl sulfate, 0.02 N—Dissolve 5.8 g. of sodium lauryl sulfate in sufficient water to make 1000.0 ml., and mix. Determine the normality of the solution as directed in the *Procedure,* using NF Benzphetamine Hydrochloride Reference Standard as the primary standard.

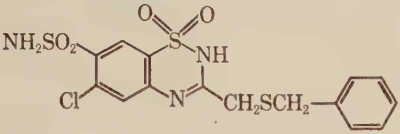
Procedure—Weigh and finely powder not less than 20 Benzphetamine Hydrochloride Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 125 mg. of benzphetamine hydrochloride, to a glass-stoppered 250-ml. conical flask with the aid of 20 ml. of water, add 4 drops of a solution of *p*-dimethylaminoazobenzene in alcohol (1 in 1000), 20 ml. of chloroform, and 5 ml. of 3 *N* sulfuric acid. Titrate with 0.02 *N* sodium lauryl sulfate, shaking vigorously after each addition of the titrant, until a red color appears in the chloroform layer. Each ml. of 0.02 *N* sodium lauryl sulfate is equivalent to 5.516 mg. of $C_{17}H_{21}N.HCl$.

Packaging and storage—Preserve Benzphetamine Hydrochloride Tablets in tight containers.

Tablets available—Benzphetamine Hydrochloride Tablets usually available contain the following amounts of benzphetamine hydrochloride: 25 and 50 mg.

Category and Dose—See Benzphetamine Hydrochloride.

Benzthiazide



3-[(Benzylthio)methyl]-6-chloro-2*H*-1,2,4-benzothiadiazine-7-sulfonamide 1,1-Dioxide

$C_{15}H_{14}ClN_3O_4S_3$ Mol. wt. 431.94

Benzthiazide contains not less than 98.0 percent and not more than 101.5 percent of $C_{15}H_{14}ClN_3O_4S_3$, calculated on the dried basis.

Description—Benzthiazide occurs as a white, crystalline powder having a characteristic odor. It melts at about 242°.

Solubility—Benzthiazide is practically insoluble in water. It is freely soluble in dimethylformamide and in solutions of fixed alkali hydroxides. It is slightly soluble in acetone and practically insoluble in ether and in chloroform

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Benzthiazide, previously dried in vacuum at 65° for 2 hours, exhibits maxima only at the same wavelengths as that of NF Benzthiazide Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 62,500 solution of Benzthiazide in 0.01 *N* alcoholic hydrochloric acid exhibits maxima and minima at the same wavelengths as that of NF Benzthiazide Reference Standard, similarly measured.

Loss on drying, page 814—Dry Benzthiazide in vacuum at 65° for 2 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Benzthiazide yields not more than 0.2 percent of residue on ignition.

Selenium—A *Test Preparation* prepared with 100 mg. of Benzthiazide and 100 mg. of magnesium oxide meets the requirements of the *Selenium Limit Test,* page 865 (30 parts per million).

Heavy Metals, *Method II,* page 806—The heavy metals limit for Benzthiazide is 25 parts per million.

Diazotizable substances—

Standard preparation—Weigh accurately 10.0 mg. of NF 4-Amino-6-chloro-1,3-benzenedisulfonamide Reference Standard, and dissolve in sufficient acetone to make 50.0 ml. Pipet 4.0 ml. of the solution into a 100-ml. volumetric flask, add acetone to volume, and mix.

Test preparation—Dissolve 80.0 mg. of Benzthiazide, accurately weighed, in sufficient acetone to make 100.0 ml., and mix.

Procedure—Transfer 1.0 ml. each of the *Standard preparation* and of the *Test Preparation* to separate tubes, and transfer 1.0 ml. of acetone to a third tube to serve as a blank. To each tube add 9.0 ml. of 1 *N* hydrochloric acid and 0.1 ml. of freshly prepared sodium nitrite solution (1 in 25), mix, and allow to stand for 1 minute. Add 0.8 ml. of ammonium sulfamate solution (1 in 50), mix and allow to stand for 3 minutes. Add 0.8 ml. of a solution of *N*-1-naphthylethylenediamine dihydrochloride in 50 percent alcohol (1 in 50) to each tube, and mix. After 2 minutes, concomitantly determine the absorbances of the solutions obtained from the *Standard preparation* and *Test preparation,* in 1-cm. cells, at 518 mμ, with a suitable spectrophotometer, using the blank to set the instrument: the absorbance of the solution from the *Test preparation* does not exceed that of the solution from the *Standard preparation,* corresponding to not more than 1.0 percent of diazotizable substances.

Assay—Transfer about 100 mg. of Benzthiazide, accurately weighed, to a 250-ml. volumetric flask, add 200 ml. of 0.01 *N* alcoholic hydrochloric acid, and stir for 1 hour to dissolve. Dilute to volume with 0.01 *N* alcoholic hydrochloric acid, and mix. Transfer 2.0 ml. of this solution to a 50-ml. volumetric flask, dilute to volume with 0.01 *N* alcoholic hydrochloric acid, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Benzthiazide Reference Standard, in the same medium at a concentration of about 16 mcg. per ml., in 1-cm.

cells, at the maximum at about 289 mμ, with a suitable spectrophotometer, using 0.01 *N* alcoholic hydrochloric acid as the blank. Calculate the quantity, in mg., of $C_{15}H_{14}ClN_3O_4S_3$ in the Benzthiazide taken by the formula $6.25C \times (A_U/A_S)$, in which *C* is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Benzthiazide in tight containers.

CATEGORY—Diuretic; antihypertensive.

USUAL DOSE RANGE—Diuretic—initial, **50** to **200 mg.** daily; maintenance, **50** to **150 mg.** daily. Antihypertensive—initial, **25** to **50 mg.** twice daily; maintenance, adjust to the response of the patient with a maximal dose of **50 mg.** three times a day.

Benzthiazide Tablets

Benzthiazide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{15}H_{14}ClN_3O_4S_3$.

Identification—The solution of benzthiazide, obtained from Benzthiazide Tablets as directed in the *Assay*, exhibits an absorbance maximum at 295 ± 2 mμ.

Disintegration, page 878—The disintegration time limit for Benzthiazide Tablets, using simulated gastric fluid T.S. as the test medium in place of water, is 30 minutes.

Content uniformity, *Method II*, page 799—Benzthiazide Tablets meet the requirements of the content uniformity test for tablets, using the following special procedure: Quantitatively transfer a finely powdered tablet to a 100-ml. volumetric flask, add 1 ml. of 0.1 *N* hydrochloric acid and 50 ml. of alcohol, and heat on a steam bath for 15 minutes. Cool, dilute to volume with alcohol, mix, and filter, discarding the first 20 ml. of filtrate. Dilute a portion of the subsequent filtrate with 0.01 *N* alcoholic hydrochloric acid to provide a solution containing approximately 20 mcg. of benzthiazide per ml. Concomitantly determine the absorbance of this solution and of a solution of NF Benzthiazide Reference Standard, in the same medium at a concentration of about 20 mcg. per ml., in 1-cm. cells, at the maximum at about 283 mμ, with a suitable spectrophotometer, using 0.01 *N* alcoholic hydrochloric acid as the blank. Calculate the quantity, in mg., of $C_{15}H_{14}ClN_3O_4S_3$ in the tablet by the formula $(T/D) \times C \times (A_U/A_S)$, in which *T* is the labeled quantity, in mg., of benzthiazide in the tablet; *D* is the exact concentration, in mcg. per ml., of benzthiazide in the sample solution, based upon the labeled quantity per tablet and the extent of dilution; *C* is the exact concentration in mcg. per ml., of the Reference Standard solution; A_U is the absorbance of the sample solution; and A_S is the absorbance of the Reference Standard solution.

Assay—Weigh and finely powder not less than 20 Benzthiazide Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg. of benzthiazide, to a 100-ml. volumetric flask, add 0.2 *N* sodium hydroxide to volume, and mix. Filter through fast filter paper, discarding the first 20 ml. of filtrate, and transfer 10.0 ml. of the subsequent filtrate to a separator. To the separator add 3 ml. of dilute hydrochloric acid, shake vigorously for 2 minutes, and then extract successively with one 50-ml. portion and two 25-ml. portions of ether. Evaporate the combined ether extracts to a volume of about 5 ml. on a steam bath. Add 10 ml. of 0.2 *N* sodium hydroxide while washing down the sides of the container, and continue the evaporation until all traces of ether are expelled. Cool, and dissolve the residual liquid in 0.2 *N* sodium hydroxide. Quantitatively transfer the solution to a 100-ml. volumetric flask with the aid of 0.2 *N* sodium hydroxide, dilute to volume with 0.2 *N* sodium hydroxide, and mix. Transfer 20.0 ml. of this solution to a 50-ml. volumetric flask, dilute to volume with 0.2 *N* sodium hydroxide, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Benzthiazide Reference Standard, in the same medium at a concentration of about 20 mcg. per ml., in 1-cm. cells, at the maximum at about 295 mμ, with a suitable spectrophotometer, using 0.2 *N* sodium hydroxide as the blank. Calculate the quantity, in mg., of $C_{15}H_{14}ClN_3O_4S_3$ in the portion of Tablets taken by the formula $2.5C \times (A_U/A_S)$, in which *C* is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Benzthiazide Tablets in tight containers.

Tablets available—Benzthiazide Tablets usually available contain the following amount of benzthiazide: 50 mg.

CATEGORY and DOSE—See Benzthiazide.

Benzyl Alcohol

C_7H_8O Mol. wt. 108.14

Description—Benzyl Alcohol is a colorless liquid with a faint, aromatic odor and a sharp burning taste. Benzyl Alcohol boils without decomposition at about 206°. It is neutral to litmus.

Solubility—Benzyl Alcohol is sparingly soluble in water and is freely soluble in 50 percent alcohol. It is miscible with alcohol, with ether, and with chloroform.

Identification—Add 2 or 3 drops of Benzyl Alcohol to 5 ml. of a solution of potassium permanganate (1 in 20), and acidify with diluted sulfuric acid: the odor of benzaldehyde is noticeable.

Specific gravity, page 866—The specific gravity of Benzyl Alcohol is not less than 1.042 and not more than 1.047.

Distilling range, *Method II*, page 782—Not less than 94 percent, by volume, of Benzyl Alcohol distils between 202.5° and 206.5°.

Refractive index, page 858—The refractive index of Benzyl Alcohol is not less than 1.538 and not more than 1.540 at 20°.

Residue on ignition—Evaporate 10 ml. of Benzyl Alcohol in a suitable crucible and ignite to constant weight: the weight of the residue on ignition is negligible.

Chlorinated compounds—Wind a strip of 20 mesh copper gauze 1.5 cm. wide and 5 cm. long around the end of a copper wire. Heat the gauze in the nonluminous flame of a Bunsen burner until it glows without coloring the flame green. Permit the gauze to cool and re-heat several times until a good coat of oxide has formed. Apply with a medicine dropper, 2 drops of Benzyl Alcohol to the cooled gauze, ignite, and permit it to burn freely in the air. Again cool the gauze and add 2 more drops of Benzyl Alcohol and burn as before. This process is continued until a total of 6 drops has been added and ignited. Then hold the gauze in the outer edge of the Bunsen flame, adjusted to a height of about 4 cm.: not even a transient green color is imparted to the flame.

Aldehyde—Transfer 5.0 ml. of Benzyl Alcohol to a 250-ml. conical flask containing 75 ml. of a reagent prepared by dissolving 34.7 g. of hydroxylamine hydrochloride in 160 ml. of water and diluting this solution to 1000 ml. with alcohol. Allow to stand for 10 minutes, add 1 ml. of bromophenol blue T.S. and titrate to a light green end-point with 0.1 *N* sodium hydroxide. Perform a blank determination (see *Residual Titrations*, page 883). Match the color of the end-point with that of the titrated sample solution: the net volume of 0.1 *N* sodium hydroxide consumed does not exceed 1.0 ml. (0.2 percent as benzaldehyde).

Packaging and storage—Preserve Benzyl Alcohol in tight containers, remote from fire.

CATEGORY—Bacteriostatic (injections).

Benzyl Benzoate Lotion

Benzyl Benzoate Lotion contains not less than 26.0 percent and not more than 30.0 percent (w/w) of $C_{14}H_{12}O_2$.

Benzyl Benzoate	**250 ml.**
Triethanolamine	**5 g.**
Oleic acid	**20 g.**
Purified Water	**750 ml.**
To make about	**1000 ml.**

Mix the triethanolamine with the oleic acid, add the benzyl benzoate, and mix. Transfer the mixture to a suitable container of about 2000-ml. capacity, add 250 ml. of purified water, and shake the mixture thoroughly. Finally add the remaining 500 ml. of purified water, and again shake thoroughly.

pH, page 824—The pH of Benzyl Benzoate Lotion is between 8.5 and 9.2.

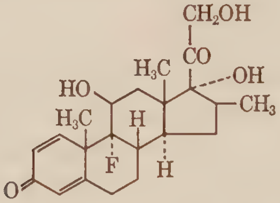
Assay—Place about 5 g. of Benzyl Benzoate Lotion, accurately weighed, in a conical flask. Add 25 ml. of alcohol and 2 drops of phenolphthalein T.S. Cool the solution to about 15°, and titrate quickly with 0.1 *N* sodium hydroxide to a slight pink color. Add 50.0 ml. of 0.5 *N* alcoholic potassium hydroxide, connect the flask to a reflux condenser, and boil gently for 1 hour. Cool, promptly add phenolphthalein T.S., and titrate with 0.5 *N* hydrochloric acid. Perform a blank determination (see *Residual Titrations,* page 883). Each ml. of 0.5 *N* alcoholic potassium hydroxide is equivalent to 106.1 mg. of $C_{14}H_{12}O_2$.

Packaging and storage—Preserve Benzyl Benzoate Lotion in tight containers.

CATEGORY—Scabicide.

FOR EXTERNAL USE—Topically, as lotion over previously dampened skin of entire body, except face.

Betamethasone*



9-Fluoro-11β,17,21-trihydroxy-16β-methylpregna-1,4-diene-3,20-dione

$C_{22}H_{29}FO_5$ Mol. wt. 392.47

Betamethasone contains not less than 96.0 percent and not more than 104.0 percent of $C_{22}H_{29}FO_5$, calculated on the dried basis.

Description—Betamethasone occurs as a white to practically white, odorless, crystalline powder. When tested by the method under *Class Ia,* page 815, it melts at about 240° with some decomposition.

Solubility—Betamethasone is sparingly soluble in acetone, in alcohol, in dioxane, and in methanol. It is very slightly soluble in chloroform, and in ether, and is insoluble in water.

Identification—Prepare a solution of Betamethasone in chloroform containing 500 mcg. per ml. On a suitable thin-layer chromatographic plate (see page 791), coated with a 0.25-mm. layer of silica gel G, spot 10 μl. of this solution and 10 μl. of a chloroform solution of NF Betamethasone Reference Standard containing 500 mcg. per ml. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of chloroform and diethylamine (2:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by lightly spraying with dilute sulfuric acid (1 in 2) and heating on a hot plate or under a lamp until spots appear. The R_f value of the main spot obtained from the sample solution corresponds to that obtained from the Reference Standard solution.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Betamethasone, previously dried at 105° for 3 hours, exhibits maxima only at the same wavelengths as that of NF Betamethasone Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 100,000 solution of Betamethasone in methanol exhibits maxima and minima at the same wavelengths as that of NF Betamethasone Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance, occurring at about 239 mμ, do not differ by more than 3 percent.

Specific rotation, page 822—The specific rotation of Betamethasone, calculated on the dried basis, determined in a solution in dioxane containing 100 mg. of Betamethasone in each 10 ml., is between +112° and +120°.

Loss on drying, page 814—Dry Betamethasone at 105° for 3 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Betamethasone yields not more than 0.2 percent of residue on ignition.

Foreign steroids and other impurities—*Standard preparation*—Prepare as directed under *Steroid Chromatographic Purity,* page 876, using NF Betamethasone Reference Standard.

Test preparation—Weigh accurately about 80 mg. of Betamethasone previously dried at 105° for 3 hours, dissolve it in a sufficient quantity of a mixture of equal volumes of alcohol and chloroform to make 10.0 ml., and mix.

Procedure—Proceed as directed for *Procedure* under *Steroid Chromatographic Pur-*

---

* Patent pending. See notice, page ii.

ity, page 876, using a solvent system consisting of chloroform, methanol, and water (90:7.5:0.5). Use 25.0 ml. of methanol, rather than dehydrated alcohol, to elute the steroid from the silica gel. Determine the absorbance at the maximum at about 240 mμ, and calculate the percentage of chromatographic impurities by the formula $100 - [100 \times 10 \times (C/W) \times (A_U/A_S)]$, in which C is the exact concentration, in mg. per ml., of the *Standard preparation,* and W is the weight, in mg., of Betamethasone taken: not more than 3 percent is found.

Assay—

Standard preparation—Prepare as directed under *Steroid Assay,* page 876, using NF Betamethasone Reference Standard.

Assay preparation—Weigh accurately about 100 mg. of Betamethasone, dissolve it in sufficient alcohol to make 200.0 ml., and mix. Pipet 5.0 ml. of this solution into a 250-ml. volumetric flask, add alcohol to volume, and mix. Pipet 20.0 ml. of this solution into a glass-stoppered, 50-ml. conical flask.

Procedure—Proceed as directed under *Steroid Assay,* page 876, except add 1.0 ml. of glacial acetic acid after maintaining at 45 ± 1° for 90 minutes. Calculate the quantity, in mg., of $C_{22}H_{29}FO_5$ in the portion of Betamethasone taken by the formula $10C \times (A_U/A_S)$.

Packaging and storage—Preserve Betamethasone in well-closed containers.

CATEGORY—Glucocorticoid.

USUAL DOSE—Initial, **2.4** to **4.8 mg.** daily in divided doses; maintenance, **600 mcg.** to **1.2 mg.** daily.

USUAL DOSE RANGE—**600 mcg.** to **8.4 mg.** daily.

APPLICATION—Topically, as a 0.2 percent cream applied to the skin two or three times a day.

Betamethasone Cream

Betamethasone Cream is betamethasone in a suitable water-miscible base. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of $C_{22}H_{29}FO_5$.

Identification—Concentrate 30 ml. of the first dilution obtained in the *Assay preparation* to 3 ml. on a steam bath, and apply 10 μl. of the solution to a thin-layer chromatographic plate coated with a 0.25-mm. layer of silica gel G. Apply to the same plate 10 μl. of a solution containing 1 mg. per ml. of NF Betamethasone Reference Standard in dehydrated alcohol. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of chloroform and diethylamine (2:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, and allow the solvent to evaporate. Spray the plate with a mixture of sulfuric acid, methanol, and nitric acid (10:10:1), and heat at 105° for 10 minutes: the R_f value of the main spot obtained from the sample solution corresponds to that obtained from the Reference Standard solution.

Weight variation, page 901—Betamethasone Cream meets the requirements of the weight variation test for creams.

Assay—

Standard preparation—Prepare, by quantitative and stepwise dilution, a solution in dehydrated alcohol containing about 10 mcg. per ml. of NF Betamethasone Reference Standard, previously dried at 105° for 3 hours and accurately weighed.

Assay preparation—Transfer an accurately weighed portion of Betamethasone Cream, equivalent to about 10 mg. of betamethasone, to a beaker, add 40 ml. of dehydrated alcohol, and warm on a steam bath with constant stirring for 20 minutes. Chill in an ice water bath for 30 minutes, and filter through a medium-porosity, sintered-glass funnel into a 100-ml. volumetric flask. Transfer the residue on the funnel to the beaker, add 40 ml. of dehydrated alcohol, warm and then chill as described herein, and filter through the funnel into the same volumetric flask. Allow the contents of the flask to come to room temperature, dilute to volume with dehydrated alcohol, and mix. (Retain 30 ml. of this solution for the *Identification test.*) Pipet 10.0 ml. into a second 100-ml. volumetric flask, dilute to volume with dehydrated alcohol, and mix.

Procedure—Flush three low-actinic glass-stoppered, 50-ml. conical flasks with a stream of nitrogen for 10 seconds and stopper. Pipet 20.0 ml. of the *Standard preparation* into one flask, 20.0 ml. of the *Assay preparation* into the second flask, and 20.0 ml. of dehydrated alcohol into the last flask to serve as the blank. To each flask add 2.0 ml. each of a 1 in 200 solution of triphenyltetrazolium chloride in alcohol and a 3 in 20 solution of tetramethylammonium hydroxide (1 in 10) in alcohol, mix, flush with nitrogen, and stopper. Maintain the flasks at 45° for 30 minutes in a water bath, then add 1.0 ml. of glacial acetic acid to each flask, and allow to cool to room temperature. Concomitantly determine the absorbances of the solutions, in 1-cm. cells, at the maximum at about 485 mμ, with a suitable spectrophotometer, using the blank to set the instrument. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{22}H_{29}FO_5$ in the portion of the Cream taken by the formula $C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation.*

Packaging and storage—Preserve Betamethasone Cream in collapsible tubes, or in tight containers.

Cream available—Betamethasone Cream usually available contains 0.2 percent of betamethasone.

CATEGORY and APPLICATION—See Betamethasone.

Betamethasone Tablets

Betamethasone Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{22}H_{29}FO_5$.

Identification—Evaporate 50 ml. of the *Assay preparation* from the *Assay* on a steam bath just to dryness and dissolve the residue in 1 ml. of chloroform. Proceed as directed for *Identification* under *Betamethasone*, page 86, beginning with "On a suitable thin-layer chromatographic plate. . . ."

Disintegration, page 878—The disintegration time limit for Betamethasone Tablets is 30 minutes.

Content uniformity, *Method I,* page 799—Betamethasone Tablets meet the requirements of the content uniformity test for tablets.

Assay—

Standard preparation—Prepare as directed under *Steroid Assay,* page 876, using NF Betamethasone Reference Standard.

Assay preparation—Weigh and finely powder not less than 10 Betamethasone Tablets. Weigh accurately a portion of the powder, equivalent to about 2.5 mg. of betamethasone, and transfer with the aid of 15 ml. of water to a separator. Extract the betamethasone completely, using four 25-ml. portions of chloroform, filtering each extract through chloroform-washed cotton into a 250-ml. volumetric flask. Add chloroform to volume, and mix. Pipet 20.0 ml. of this solution into a glass-stoppered, 50-ml. conical flask, evaporate the chloroform on a steam bath just to dryness, cool, and dissolve the residue in 20.0 ml. of alcohol.

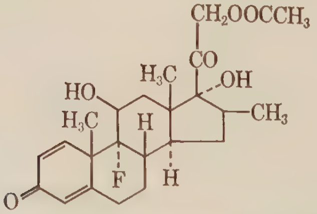
Procedure—Proceed as directed under *Steroid Assay,* page 876, except add 1.0 ml. of glacial acetic acid after maintaining at 45 ± 1° for 90 minutes. Calculate the quantity, in mg., of $C_{22}H_{29}FO_5$ in the portion of the Tablets taken by the formula $0.25\ C \times (A_U/A_S)$.

Packaging and storage—Preserve Betamethasone Tablets in well-closed containers.

Tablets available—Betamethasone Tablets usually available contain the following amount of betamethasone: 600 mcg.

CATEGORY AND DOSE—See Betamethasone.

Betamethasone Acetate*



9-Fluoro-11β,17,21-trihydroxy-16β-methylpregna-1,4-diene-3,20-dione 21-Acetate

$C_{24}H_{31}FO_6$ Mol. wt. 434.51

Betamethasone Acetate contains not less than 97.0 percent and not more than 103.0 percent of $C_{24}H_{31}FO_6$, calculated on the anhydrous basis.

---

* Patented. See notice, page ii.

Description—Betamethasone Acetate occurs as a white to creamy white, odorless powder. When tested by the method under *Class Ia*, page 814, it sinters and resolidifies at about 165°, and remelts with decomposition between 200° and 220°.

Solubility—Betamethasone Acetate is practically insoluble in water. It is freely soluble in acetone, and is soluble in alcohol and in chloroform.

Identification—

A: Prepare a solution of Betamethasone Acetate in chloroform containing 500 mcg. per ml. On a suitable thin-layer chromatographic plate (see page 791), coated with a 0.25-mm. layer of silica gel G, spot 10 µl. of this solution and 10 µl. of a chloroform solution of NF Betamethasone Acetate Reference Standard containing 500 mcg. per ml. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of chloroform and diethylamine (2:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by lightly spraying with dilute sulfuric acid (1 in 2) and heating on a hot plate or under a lamp until spots appear: the R_f value of the main spot obtained from the sample solution corresponds to that obtained from the Reference Standard solution.

B: To about 50 mg. of Betamethasone Acetate contained in a test tube, add 2 ml. of alcoholic potassium hydroxide T.S., and heat in a boiling water bath for 5 minutes. Cool, add 2 ml. of dilute sulfuric acid (1 in 3.5), and boil gently for about 1 minute: the odor of ethyl acetate is perceptible.

Infrared absorption, page 866—The infrared absorption spectrum of a mineral oil dispersion of Betamethasone Acetate, previously dried over a suitable desiccant, exhibits maxima only at the same wavelengths as that of NF Betamethasone Acetate Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 50,000 solution of Betamethasone Acetate in methanol exhibits maxima and minima at the same wavelengths as that of NF Betamethasone Acetate Reference Standard, similarly measured, and the respective absorptivities, at the point of maximum absorbance occurring at about 239 mµ, do not differ by more than 2.5 percent.

Specific rotation, page 822—The specific rotation of Betamethasone Acetate, calculated on the anhydrous basis, determined in a solution in dioxane containing 100 mg. of Betamethasone Acetate in each 10 ml., is between +120° and +128°.

Water, page 900—Determine the water content of Betamethasone Acetate by the titrimetric method: not more than 4 percent is found.

Residue on ignition—The residue on ignition from 100 mg. of Betamethasone Acetate is negligible.

Foreign steroids and other impurities—

Standard preparation—Prepare as directed under *Steroid Chromatographic Purity*, page 876, using NF Betamethasone Acetate Reference Standard.

Test preparation—Weigh accurately about 80 mg. of Betamethasone Acetate previously dried at 105° for 3 hours, dissolve it in a sufficient quantity of a mixture of equal volumes of alcohol and chloroform to make 10.0 ml., and mix.

Procedure—Proceed as directed for *Procedure* under *Steroid Chromatographic Purity*, page 876, using a solvent system consisting of chloroform, methanol and water (90:7.5:0.5). Use 25.0 ml. of methanol, rather than dehydrated alcohol, to elute the steroid from the silica gel. Determine the absorbance at the maximum at about 240 mµ, and calculate the percentage of chromatographic impurities by the formula $100 - [100 \times 10 \times (C/W) \times (A_U/A_S)]$, in which C is the exact concentration, in mg. per ml., of the *Standard preparation*, and W is the weight, in mg., of Betamethasone Acetate taken: not more than 3 percent is found.

Assay—

Standard preparation—Prepare as directed under *Steroid Assay*, page 876, using NF Betamethasone Acetate Reference Standard, except prepare a solution in alcohol containing about 20 mcg. per ml., and pipet 20.0 ml. into a glass-stoppered, 50-ml. low-actinic flask.

Assay preparation—Dissolve about 100 mg. of Betamethasone Acetate, accurately weighed, in sufficient alcohol to make 200.0 ml., and mix. Pipet 10.0 ml. of this solution into a 250-ml. volumetric flask, add alcohol to volume, and mix. Pipet 20.0 ml. of this solution into a glass-stoppered, 50-ml. low-actinic flask.

Procedure—Proceed as directed under *Steroid Assay*, page 876, except keep the flasks in a constant-temperature bath at 50° for 90 minutes, and then add 1.0 ml. of glacial acetic acid. Calculate the quantity, in mg., of $C_{24}H_{31}FO_6$ in the portion of Betamethasone Acetate taken by the formula $5C \times (A_U/A_S)$.

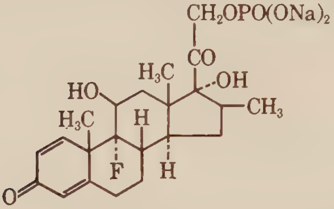
Packaging and storage—Preserve Betamethasone Acetate in tight containers.

CATEGORY—Glucocorticoid.

USUAL DOSE—See Sterile Betamethasone Sodium Phosphate and Betamethasone Acetate Suspension.

Betamethasone Acetate and Betamethasone Sodium Phosphate Suspension, Sterile, page 91

Betamethasone Sodium Phosphate*



9-Fluoro-11β,17,21-trihydroxy-16β-methylpregna-1,4-diene-3,20-dione 21-(Disodium Phosphate)

$C_{22}H_{28}FNa_2O_8P$ Mol. wt. 516.42

Betamethasone Sodium Phosphate contains not less than 97.0 percent and not more than 103.0 percent of $C_{22}H_{28}FNa_2O_8P$, calculated on the anhydrous basis.

Description—Betamethasone Sodium Phosphate occurs as a white to practically white, odorless powder. It is hygroscopic.

Solubility—Betamethasone Sodium Phosphate is freely soluble in water and in methanol. It is practically insoluble in acetone and in chloroform.

Identification—

A: Prepare a solution of Betamethasone Sodium Phosphate in a benzene-alcohol-water mixture (5:5:1) containing 1 mg. per ml. On a suitable thin-layer chromatographic plate (see page 791), coated with a 0.25-mm. layer of silica gel G, spot 10 μl. of this solution and 10 μl. of a benzene-alcohol-water (5:5:1) solution of NF Betamethasone Sodium Phosphate Reference Standard containing 1 mg. per ml. Allow the spots to dry, and develop the chromatogram in a solvent system, consisting of *n*-butyl alcohol saturated with 1 *N* hydrochloric acid, until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by spraying the plate with a mixture of sulfuric acid, methanol, and nitric acid (10:10:1), and then heating at 105° for 10 minutes: the R_f value of the main spot obtained from the sample solution corresponds to that obtained from the Reference Standard solution.

B: Ignite Betamethasone Sodium Phosphate at 800° (page 858): the residue responds to the tests for *Sodium*, page 810, and for *Phosphate*, page 809.

Infrared absorption, page 866—The infrared absorption spectrum of a mineral oil dispersion of Betamethasone Sodium Phosphate, previously dried over a suitable desiccant, exhibits maxima only at the same wavelengths as that of NF Betamethasone Sodium Phosphate Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 50,000 solution of Betamethasone Sodium Phosphate in water exhibits maxima and minima at the same wavelengths as that of NF Betamethasone Sodium Phosphate Reference Standard, similarly measured.

Specific rotation, page 822—The specific rotation of Betamethasone Sodium Phosphate, calculated on the anhydrous basis, determined in a solution in water containing 100 mg. of Betamethasone Sodium Phosphate in each 10 ml., is between +99° and +105°.

Water, page 900—Determine the water content of Betamethasone Sodium Phosphate by the titrimetric method: not more than 10 percent is found.

Phosphate ions—

Ammonium molybdate solution—Dissolve 6.4 g. of ammonium molybdate in 40 ml. of water. Add 50 ml. of 10 *N* sulfuric acid, shake, and dilute to 100.0 ml. with water. This solution is stable for approximately 2 weeks.

Stannous chloride solution—Dissolve 1.0 g. of stannous chloride in 5.0 ml. of hydrochloric acid. Dilute 1.0 ml. of this solution to 100 ml. with water just before use.

Procedure—Dissolve about 200 mg. of Betamethasone Sodium Phosphate, accurately weighed, in sufficient water to make 100.0 ml., and mix. Pipet 10.0 ml. of this solution in a 100-ml. volumetric flask containing 50 ml. of water, add 10.0 ml. of 10 *N* sulfuric acid, 10.0 ml. of *Ammonium*

---

* Patented. See notice, page ii.

molybdate solution, and 10.0 ml. of water, mixing well after each addition. Slowly, with shaking, add 5.0 ml. of *Stannous chloride solution*, dilute to volume with water, stopper, mix, and allow to stand for 10 minutes. Determine the absorbance of the solution at 675 mμ, with a suitable spectrophotometer: the absorbance does not exceed that of 10 ml. of a solution of sodium phosphate prepared in water to contain 20 mcg. of phosphate (PO_4) in each ml. and treated as directed above, beginning with "Pipet 10.0 ml. of this solution . . ." (1 percent).

Free betamethasone—Dissolve about 25.0 mg. of Betamethasone Sodium Phosphate, accurately weighed, in sufficient water to make 25.0 ml. Pipet 5.0 ml. of the solution into a separator, and extract with three 25-ml. portions of chloroform. Filter each extract through a chloroform-saturated cotton pledget, combining the filtrates in a conical flask. Evaporate the chloroform to dryness on a steam bath with the aid of a current of air, and dissolve the residue in 25.0 ml. of methanol. Determine the absorbance (A) of this solution at the maximum at about 240 mμ, in a 1-cm. cell, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg., of free betamethasone in the sample of Betamethasone Sodium Phosphate taken by the formula $3.125 \times A$: not more than 250 mcg. is found (1 percent).

Foreign steroids and other impurities—

Standard preparation—Prepare as directed under *Steroid Chromatographic Purity*, page 876, using NF Betamethasone Sodium Phosphate Reference Standard and a 1:2 mixture of water and acetone as the solvent.

Test preparation—Weigh accurately about 80 mg. of Betamethasone Sodium Phosphate, previously dried at 105° for 3 hours, dissolve it in a sufficient quantity of a 1:2 mixture of water and acetone to make 10.0 ml., and mix.

Procedure—Proceed as directed for *Procedure* under *Steroid Chromatographic Purity*, page 876, using a solvent system consisting of *n*-butanol saturated with 1 *N* hydrochloric acid. Use 25.0 ml. of water, rather than dehydrated alcohol, to elute the steroid from the silica gel. Determine the absorbance at the maximum at about 242 mμ, and calculate the percentage of chromatographic impurities by the formula $100 - [100 \times 10 \times (C/W) \times (A_U/A_S)]$, in which C is the exact concentration, in mg. per ml., of the *Standard preparation*, and W is the weight, in mg., of Betamethasone Sodium Phosphate taken: not more than 3 percent is found.

Assay—Weigh accurately about 50 mg. of Betamethasone Sodium Phosphate, dissolve in sufficient water to make 250.0 ml., and mix. Dilute 10.0 ml. of this solution to 100.0 ml. of water, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Betamethasone Sodium Phosphate Reference Standard, in the same medium, at a concentration of about 20 mcg. per ml., in 1-cm. cells, at the maximum at about 241 mμ, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg., of $C_{22}H_{28}FNa_2O_8P$ in the portion of Betamethasone Sodium Phosphate taken by the formula $2.5C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Betamethasone Sodium Phosphate in tight containers.

CATEGORY—Glucocorticoid.

USUAL DOSE—See Sterile Betamethasone Sodium Phosphate and Betamethasone Acetate Suspension.

Sterile Betamethasone Sodium Phosphate and Betamethasone Acetate Suspension

Sterile Betamethasone Sodium Phosphate and Betamethasone Acetate Suspension is a sterile preparation of betamethasone sodium phosphate in solution and betamethasone acetate in suspension in water for injection. It contains an amount of $C_{22}H_{28}FNa_2O_8P$ (betamethasone sodium phosphate) equivalent to not less than 90.0 percent and not more than 115.0 percent of the labeled amount of $C_{22}H_{29}FO_5$ (betamethasone), and not less than 90.0 percent and not more than 115.0 percent of the labeled amount of $C_{24}H_{31}FO_6$ (betamethasone acetate).

Identification—

A: Dilute 2 ml. of Sterile Betamethasone Sodium Phosphate and Betamethasone Acetate Suspension with 2 ml. of methanol. On a suitable thin-layer chromatographic plate (see page 791), coated with a 0.25-mm. layer of silica gel G, spot 10 µl. of this solution and 10 µl. of a methanol-water solution (1:1) of NF Betamethasone Sodium Phosphate Reference Standard containing 2 mg. per ml. Proceed as directed for *Identification test A* under *Betamethasone Sodium Phosphate*, page 90, beginning with "Allow the spots to dry. . . ."

B: On a suitable thin-layer chromatographic plate (see page 791), coated with a 0.25-mm. layer of silica gel G, spot 10 µl. of the solution prepared for *Identification test A* and 10 µl. of a methanol-water solution (1:1) of NF Betamethasone Acetate Reference Standard containing 1.5 mg. per ml. Proceed as directed for *Identification test A* under *Betamethasone Acetate*, page 88, beginning with "Allow the spots to dry. . . ."

pH, page 824—The pH of Sterile Betamethasone Sodium Phosphate and Betamethasone Acetate Suspension is between 6.8 and 7.2.

Other requirements—Sterile Betamethasone Sodium Phosphate and Betamethasone Acetate Suspension meets the requirements under *Injections*, page 810.

Assay for betamethasone sodium phosphate—

Standard preparation—Weigh accurately about 40 mg. of NF Betamethasone Sodium Phosphate Reference Standard, dissolve in sufficient 0.1 *N* hydrochloric acid to make 250.0 ml., and mix.

Assay preparation—Pipet, with a "to contain" pipet, a volume of Sterile Betamethasone Sodium Phosphate and Betamethasone Acetate Suspension, equivalent in betamethasone sodium phosphate content to 6 mg. of betamethasone, into a 50-ml. volumetric flask, rinse the pipet with 0.1 *N* hydrochloric acid adding the rinsings to the flask, dilute to volume with 0.1 *N* hydrochloric acid, and mix.

Procedure—Transfer 40.0 ml. each of the *Standard preparation* and of the *Assay preparation* into separate separators. Extract each preparation with three 40-ml. portions of chloroform, and wash the aqueous phase with 40 ml. of solvent hexane. Pipet 20.0 ml. of the aqueous phase into a 100-ml. volumetric flask, dilute to volume with 0.1 *N* hydrochloric acid, and mix. Concomitantly determine the absorbances of the solutions, in 1-cm. cells, at the maximum at about 241 mµ, with a suitable spectrophotometer, using 0.1 *N* hydrochloric acid as the blank. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{22}H_{29}FO_5$ (betamethasone), equivalent to the quantity of $C_{22}H_{28}FNa_2O_8P$ (betamethasone sodium phosphate), in each ml. of the Suspension taken by the formula $0.05 \times (C/V) \times 0.7585 \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., calculated on the anhydrous basis, of NF Betamethasone Sodium Phosphate Reference Standard in the *Standard preparation*, V is the volume, in ml., of the Suspension taken, and 0.7585 is the factor converting betamethasone sodium phosphate to betamethasone.

Assay for betamethasone acetate—

Standard preparation—Prepare as directed under *Steroid Assay*, page 876, using NF Betamethasone Acetate Reference Standard, except prepare a solution in alcohol containing about 22.5 mcg. per ml.

Assay preparation—Pipet, with a "to contain" pipet, a volume of Sterile Betamethasone Sodium Phosphate and Betamethasone Acetate Suspension, equivalent to about 15 mg. of betamethasone acetate, into a fine-porosity, sintered-glass funnel, and rinse the pipet with 1 ml. of cold water, adding the rinsings to the funnel. Wash the residue on the funnel with 1 ml. of cold water, and discard the filtrate. Dissolve the residue in 25 ml. of alcohol, wash the funnel with two 4-ml. portions of alcohol, transfer the alcohol solutions to a 100-ml. volumetric flask, dilute to volume with alcohol, and mix. Pipet 15.0 ml. of this solution into a 100-ml. volumetric flask, dilute to volume with alcohol, and mix.

Procedure—Transfer 20.0 ml. each of the *Standard preparation* and of the *Assay preparation*, to separate low-actinic 50-ml. flasks, and proceed as directed under *Steroid Assay*, page 876, but keep the flasks in a constant-temperature bath at 50° for 90 minutes, and then add 1.0 ml. of glacial acetic acid. Calculate the quantity, in mg., of $C_{24}H_{31}FO_6$ in each ml. of the Suspension taken by the formula $0.667 \times (C/V) \times (A_U/A_S)$.

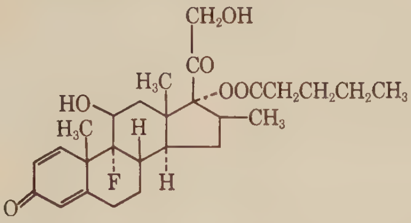
Packaging and storage—Preserve Sterile Betamethasone Sodium Phosphate and Betamethasone Acetate Suspension in multiple-dose containers, preferably of Type I glass.

Suspension available—Sterile Betamethasone Sodium Phosphate and Betamethasone Acetate Suspension usually available contains the following amounts of betamethasone sodium phosphate and betamethasone acetate: betamethasone sodium phosphate, equivalent to 15 mg. of betamethasone, and 15 mg. of betamethasone acetate in 5 ml.

CATEGORY—Glucocorticoid.

USUAL DOSE—Intramuscular, **1 ml.** (equivalent to 3 mg. of betamethasone acetate and 3 mg. of betamethasone) repeated at intervals of 3 days to 1 week. Intra-articular, **0.25** to **2 ml.** depending on the size of the joint.

Betamethasone Valerate*



9-Fluoro-11β,17,21-trihydroxy-16β-methylpregna-1,4-diene-3,20-dione 17-Valerate

$C_{27}H_{37}FO_6$ Mol. wt. 476.59

Betamethasone Valerate contains not less than 97.0 percent and not more than 103.0 percent of $C_{27}H_{37}FO_6$, calculated on the dried basis.

Description—Betamethasone Valerate occurs as a white to practically white, odorless powder. When tested by the method under *Class Ia*, page 815, it melts at about 190° with decomposition.

Solubility—Betamethasone Valerate is freely soluble in acetone and in chloroform. It is soluble in alcohol, slightly soluble in benzene and in ether, and is practically insoluble in water.

Identification—Prepare a solution of Betamethasone Valerate in chloroform–methylene chloride (1:1) containing 500 mcg. per ml. On a suitable thin-layer chromatographic plate (see page 791), coated with a 0.25-mm. layer of chromatographic silica gel mixture, spot 10 µl. of this solution and 10 µl. of a solution of NF Betamethasone Valerate Reference Standard in chloroform–methylene chloride (1:1) containing 500 mcg. per ml. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of benzene and ethyl acetate (1:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, and allow the solvent to evaporate. Spray the plate with a mixture of sulfuric acid, methanol, and nitric acid (10:10:1), and heat at 105° for 15 minutes: the R_f value of the main spot obtained from the sample solution corresponds to that obtained from the Reference Standard solution.

Infrared absorption, page 866—The infrared absorption spectrum of a mineral oil dispersion of Betamethasone Valerate, previously dried at 105° for 3 hours, exhibits maxima only at the same wavelengths as that of NF Betamethasone Valerate Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 50,000 solution of Betamethasone Valerate in methanol exhibits maxima and minima at the same wavelengths as that of NF Betamethasone Valerate Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance occurring at about 239 mµ, do not differ by more than 3 percent.

Specific rotation, page 822—The specific rotation of Betamethasone Valerate, previously dried at 105° for 3 hours, determined in a solution in dioxane containing 100 mg. of Betamethasone Valerate in each 10 ml., is between +75° and +82°.

Loss on drying, page 814—Dry Betamethasone Valerate at 105° for 3 hours: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Betamethasone Valerate yields not more than 0.1 percent of residue on ignition.

Foreign steroids and other impurities—*Standard preparation*—Prepare as directed under *Steroid Chromatographic Purity*, page 876, using NF Betamethasone Valerate Reference Standard.

Test preparation—Weigh accurately about 80 mg. of Betamethasone Valerate previously dried at 105° for 3 hours, dissolve it in a sufficient quantity of a mixture of equal volumes of alcohol and chloroform to make 10.0 ml., and mix.

Procedure—Proceed as directed for *Procedure* under *Steroid Chromatographic Purity*, page 876, using a solvent system consisting of benzene and ethyl acetate (1:1). Use 25.0 ml. of methanol, rather than dehydrated alcohol, to elute the steroid from the silica gel. Determine the absorbance at the maximum at about 239 mµ, and calculate the percentage of chromatographic impurities by the formula $100 - [100 \times 10 \times (C/W) \times (A_U/A_S)]$, in which C is the exact concentration, in mg. per ml., of the *Standard preparation*, and W is the weight, in mg., of Betamethasone Valerate taken: not more than 3 percent is found.

---

* Patented. See notice, page ii.

Assay—

Standard preparation—Prepare as directed under *Steroid Assay,* page 876, using NF Betamethasone Valerate Reference Standard, except prepare a solution in alcohol containing about 20 mcg. per ml., and pipet 20.0 ml. into a glass-stoppered, low-actinic 50-ml. flask.

Assay preparation—Weigh accurately about 50 mg. of Betamethasone Valerate, dissolve it in sufficient alcohol to make 100.0 ml., and mix. Pipet 4.0 ml. of this solution into a 100-ml. volumetric flask, add alcohol to volume, and mix. Pipet 20.0 ml. of this solution into a glass-stoppered, low-actinic 50-ml. flask.

Procedure—Proceed as directed under *Steroid Assay,* page 876, except keep the flasks in a constant-temperature bath at 45° for 90 minutes, and then add 1.0 ml. of glacial acetic acid. Calculate the quantity, in mg., of $C_{27}H_{37}FO_6$ in the portion of Betamethasone Valerate taken by the formula $2.5C \times (A_U/A_S)$.

Packaging and storage—Preserve Betamethasone Valerate in tight containers.

Category—Glucocorticoid.

Application—Topically as a cream, containing the equivalent of 0.1 percent of betamethasone, to the affected area one to three times a day.

Betamethasone Valerate Cream

Betamethasone Valerate Cream contains an amount of $C_{27}H_{37}FO_6$ (betamethasone valerate), equivalent to not less than 95.0 percent and not more than 115.0 percent of the labeled amount of $C_{22}H_{29}FO_5$ (betamethasone), in a suitable cream base.

Identification—Evaporate to dryness on a steam bath the remaining alcoholic filtrate, obtained as directed in the *Assay* under *Assay preparation,* and dissolve the residue in 3 ml. of chloroform–methylene chloride (1:1). This solution responds to the *Identification test* under *Betamethasone Valerate,* page 93.

Weight variation, page 901—Betamethasone Valerate Cream meets the requirements of the weight variation test for creams.

Assay—

Equilibrated chloroform—Equilibrate 50-ml. portions of chloroform with a mixture of 20 ml. of water and 2 ml. of 0.1 *N* hydrochloric acid. Use a new water-acid mixture for each 200 ml. of chloroform, equilibrating about 700 ml. for each assay to be performed.

Standard preparation—Transfer about 30 mg. of NF Betamethasone Valerate Reference Standard, accurately weighed, to a 50-ml. volumetric flask, dissolve in and dilute to volume with *Equilibrated chloroform,* and mix. Pipet 4.0 ml. of this solution into a 200-ml. volumetric flask, add *Equilibrated chloroform* to volume, and mix.

Assay preparation—Transfer an accurately weighed amount of Betamethasone Valerate Cream, equivalent to about 2 mg. of betamethasone, to a separator, add 20 ml. of water and 2 ml. of 0.1 *N* hydrochloric acid, and mix. Extract with four 50-ml. portions of chloroform, and combine the extracts.

Procedure—Filter the *Standard preparation,* the *Assay preparation,* and 200 ml. of *Equilibrated chloroform* to serve as the blank through cotton pledgets, previously layered over with anhydrous sodium sulfate and washed with a few ml. of chloroform, into separate beakers. Wash the funnels with three 5-ml. portions of chloroform, add the washes to the beakers, and evaporate the filtrates to dryness on a steam bath under a current of dry nitrogen. Add 25 ml. of alcohol to the residues, heat on a steam bath for 5 minutes, stirring occasionally, and then cool the solutions to room temperature. Transfer the solutions to separate 100-ml. volumetric flasks (a waxy white mass may settle out on cooling and addition of alcohol; do not transfer this substance to the volumetric flasks), dilute to volume with alcohol, and mix. Filter the solutions through paper, discarding the first 10 ml. of filtrate. Pipet 20.0 ml. of each filtrate into separate low-actinic, glass-stoppered 50-ml. flasks, pipet 2.0 ml. of blue tetrazolium T.S. into each flask, mix, then add 2.0 ml. of dilute tetramethylammonium hydroxide T.S. in alcohol (1 in 10) to each flask. Mix, maintain in a constant-temperature bath at 45° for 90 minutes, remove from the bath, and immediately add 1.0 ml. of glacial acetic acid. Swirl the contents of the flasks, cool in an ice-water bath for 1 minute, and then allow the contents to come to room temperature. Concomitantly determine the absorbance of the solutions in 1-cm. cells, at the maximum at about 525 mμ, with a suitable spectrophotometer, using the blank to set the instrument. Record the absorbance of the *Standard preparation* as A_S and that of the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{22}H_{29}FO_5$ (betamethasone) equivalent to the quantity of $C_{27}H_{37}FO_6$ (betamethasone valerate) in the portion of the Cream taken by the formula $0.2C \times 0.8235 \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of NF Betamethasone

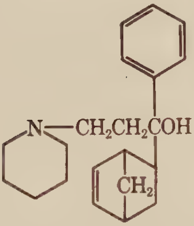
Valerate Reference Standard in the *Standard preparation*, and 0.8235 is the factor converting betamethasone valerate to betamethasone.

Packaging and storage—Preserve Betamethasone Valerate Cream in collapsible tubes, or in tight containers.

Cream available—Betamethasone Valerate Cream usually available contains betamethasone valerate equivalent to 0.1 percent of betamethasone.

CATEGORY and APPLICATION—See Betamethasone Valerate.

Biperiden*



α-5-Norbornen-2-yl-α-phenyl-1-piperidinepropanol

$C_{21}H_{29}NO$ Mol. wt. 311.47

Biperiden contains not less than 98.0 percent and not more than 101.0 percent of $C_{21}H_{29}NO$, calculated on the dried basis.

Description—Biperiden occurs as a white, practically odorless, crystalline powder.

Solubility—Biperiden is practically insoluble in water. It is sparingly soluble in ethanol and freely soluble in chloroform.

Identification—

A: Dissolve about 20 mg. of Biperiden in 5 ml. of 85 percent phosphorus acid: a green color is produced.

B: Dissolve 200 mg. of Biperiden in 80 ml. of water with the aid of 0.5 ml. of 25 percent hydrochloric acid, warming if necessary to effect solution, and then cool. To 5 ml. of the solution add 1 drop of hydrochloric acid and several drops of mercuric chloride T.S.: a white precipitate is formed. To a second 5-ml. portion of the solution add bromine T.S. dropwise: a yellow precipitate forms which redissolves on shaking, and finally, upon the addition of more bromine T.S., a permanent precipitate forms.

Melting range, page 814—Biperiden melts between 112° and 116°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Biperiden, previously dried at 105° for 3 hours, exhibits maxima only at the same wavelengths as that of NF Biperiden Reference Standard, similarly measured.

Ultraviolet absorption, page 866—Transfer about 180 mg. of Biperiden, accurately weighed, to a 200-ml. volumetric flask, add 1 ml. of lactic acid, dilute to volume with water, and mix. The ultraviolet absorption spectrum of this solution exhibits maxima and minima at the same wavelengths as that of NF Biperiden Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorption occurring at about 257 mμ, do not differ by more than 3 percent.

Loss on drying, page 814—Dry Biperiden at 105° for 3 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Biperiden yields not more than 0.1 percent of residue on ignition.

Assay—Dissolve about 500 mg. of Biperiden, accurately weighed, in 20 ml. of benzene, add 2 drops of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to an emerald-green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 31.15 mg. of $C_{21}H_{29}NO$.

Packaging and storage—Preserve Biperiden in well-closed, light-resistant containers.

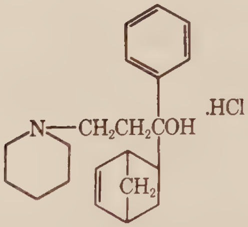
CATEGORY—Anticholinergic.

USUAL DOSE—Intramuscular, **2 mg.** (as the lactate) which may be repeated every half-hour until relief is obtained, but no more than four consecutive doses should be given in a 24-hour period; intravenous, **5 mg.** (as the lactate) given slowly, this dose may be repeated once in a 24-hour period.

---

* Patented. See notice, page ii.

Biperiden Hydrochloride*



α-5-Norbornen-2-yl-α-phenyl-1-piperidinepropanol Hydrochloride

$C_{21}H_{29}NO.HCl$ Mol. wt. 347.93

Biperiden Hydrochloride contains not less than 98.0 percent and not more than 101.0 percent of $C_{21}H_{29}NO.HCl$, calculated on the dried basis.

Description—Biperiden Hydrochloride occurs as a white, practically odorless, crystalline powder. It melts at about 275° with decomposition. It is optically inactive.

Solubility—Biperiden Hydrochloride is slightly soluble in water and in ether, sparingly soluble in methanol, and slightly soluble in alcohol and in chloroform.

Identification—

A: Dissolve about 20 mg. of Biperiden Hydrochloride in 5 ml. of 85 percent phosphoric acid: a green color is produced.

B: To 5 ml. of a solution of Biperiden Hydrochloride (1 in 500) add bromine T.S. dropwise: a yellow precipitate, which dissolves on shaking, is formed. Addition of more bromine T.S. produces a precipitate which does not dissolve on shaking.

C: A 5-ml. portion of a solution of Biperiden Hydrochloride (1 in 500) responds to the tests for *Chloride*, page 808.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Biperiden Hydrochloride, previously dried at 105° for 3 hours, exhibits maxima and minima at the same wavelengths as that of NF Biperiden Hydrochloride Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 1000 solution of Biperiden Hydrochloride in water exhibits maxima and minima at the same wavelengths as that of NF Biperiden Hydrochloride Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance occurring at about 257 mμ, do not differ by more than 3 percent.

Loss on drying, page 814—Dry Biperiden Hydrochloride at 105° for 3 hours: it loses not more than 0.5 percent of its weight.

Assay—Weigh accurately about 500 mg. of Biperiden Hydrochloride, and dissolve in 80 ml. of glacial acetic acid, warming slightly if necessary to effect solution. Cool, add 1 drop of crystal violet T.S. and 10 ml. of mercuric acetate T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to an emerald-green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 34.79 mg. of $C_{21}H_{29}NO.HCl$.

Packaging and storage—Preserve Biperiden Hydrochloride in well-closed, light-resistant containers.

CATEGORY—Anticholinergic.

USUAL DOSE RANGE—**2 mg.** three to four times a day.

---

* Patented. See notice, page ii.

Biperiden Hydrochloride Tablets

Biperiden Hydrochloride Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{21}H_{29}NO.HCl$.

Identification—Biperiden Hydrochloride Tablets meet the requirements under *Identification—Organic Nitrogenous Bases,* page 810.

Disintegration, page 878—The disintegration time limit for Biperiden Hydrochloride Tablets is 15 minutes.

Content uniformity, *Method I,* page 799

—Biperiden Hydrochloride Tablets meet the requirements of the content uniformity test for tablets.

Assay—

Phosphate buffer-bromocresol purple solution—Dissolve 38 g. of monobasic sodium phosphate and 2 g. of anhydrous dibasic sodium phosphate in water to make 1000 ml. Adjust the pH of the solution to 5.3 ± 0.1, if necessary (*Solution A*). Dissolve 400 mg. of bromocresol purple in 30 ml. of water, add 6.3 ml. of 0.1 *N* sodium hydroxide, and dilute to 500 ml. with water (*Solution B*). Mix equal volumes of *Solution A*, *Solution B*, and chloroform, shake for about 5 minutes in a separator, and discard the chloroform.

Standard preparation—Transfer about 80 mg. of NF Biperiden Hydrochloride Reference Standard, previously dried at 105° for 3 hours and accurately weighed, to a 100-ml. volumetric flask, add methanol to volume, and mix. Transfer 5.0 ml. of this solution to a second 100-ml. volumetric flask, add 25 ml. of water, dilute to volume with methanol, and mix.

Assay preparation—Weigh and finely powder not less than 20 Biperiden Hydrochloride Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 2 mg. of biperiden hydrochloride, to a 50-ml. volumetric flask, add 12.5 ml. of water, and heat on a steam bath for 15 minutes. Cool, dilute to volume with methanol, and mix.

Procedure—Transfer 5.0 ml. each of the *Standard preparation*, of the *Assay preparation*, and of a methanol-water mixture (3:1) to separate separators each containing 10.0 ml. of *Phosphate buffer-bromocresol purple solution*. Extract the solution in each separator for 10 minutes with 40.0 ml. of chloroform. After the layers have separated, filter each chloroform extract through Whatman No. 31 or equivalent filter paper into separate glass-stoppered containers, discarding the first 10 ml. of filtrate. Concomitantly determine the absorbances of the solutions in 1-cm. cells, at the maximum at about 408 mμ, with a suitable spectrophotometer, using the blank to set the instrument. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{21}H_{29}NO.HCl$ in the portion of Tablets taken by the formula $0.05C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*.

Packaging and storage—Preserve Biperiden Hydrochloride Tablets in tight containers.

Tablets available—Biperiden Hydrochloride Tablets usually available contain the following amount of biperiden hydrochloride: 2 mg.

CATEGORY and DOSE—See Biperiden Hydrochloride.

Biperiden Lactate Injection

Biperiden Lactate Injection is a sterile solution of $C_{21}H_{29}NO.C_3H_6O_3$ (biperiden lactate) in water for injection, prepared from biperiden with the aid of lactic acid. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{21}H_{29}NO.C_3H_6O_3$.

Identification—The ultraviolet absorption spectrum of Biperiden Lactate Injection, diluted with water to a concentration of about 1 mg. of biperiden lactate per ml., exhibits maxima and minima at the same wavelengths as that of a similar solution of NF Biperiden Reference Standard prepared with the aid of lactic acid solution (1 in 200) and similarly measured.

pH, page 824—The pH of Biperiden Lactate Injection is between 4.8 and 5.8.

Other requirements—Biperiden Lactate Injection meets the requirements under *Injections*, page 810.

Assay—

Phosphate buffer-bromocresol purple solution—Dissolve 38 g. of monobasic sodium phosphate and 2 g. of anhydrous dibasic sodium phosphate in water to make 1000 ml. Adjust the pH of the solution to 5.3 ± 0.1, if necessary (*Solution A*). Dissolve 400 mg. of bromocresol purple in 30 ml. of water, add 6.3 ml. of 0.1 *N* sodium hydroxide, and dilute to 500 ml. with water (*Solution B*). Mix equal volumes of *Solution A*, *Solution B*, and chloroform, shake for about 5 minutes in a separator, and discard the chloroform.

Standard preparation—Transfer about 80 mg. of NF Biperiden Reference Standard, accurately weighed, to a 100-ml. volumetric flask, add methanol to volume, and mix. Transfer 5.0 ml. of this solution to a second 100-ml. volumetric flask, add 25 ml. of water, dilute to volume with methanol, and mix.

Assay preparation—Transfer an accurately measured volume of Biperiden Lactate Injection, equivalent to about 5 mg. of biperiden lactate, to a 100-ml. volumetric flask, add 25 ml. of water, dilute to volume with methanol, and mix.

Procedure—Transfer 5.0 ml. each of the

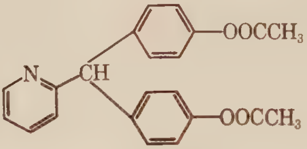
Standard preparation, of the *Assay preparation*, and of a methanol-water mixture (3:1) to serve as the blank to separate separators, each containing 10.0 ml. of *Phosphate buffer-bromocresol purple solution.* Extract the solution in each separator for 10 minutes with 50.0 ml. of chloroform. After the layers have separated, filter each chloroform extract through Whatman No. 31 or equivalent filter paper into separate glass-stoppered containers, discarding the first 10 ml. of filtrate. Concomitantly determine the absorbance of the subsequent filtrate from each solution in 1-cm. cells, at the maximum at about 408 mμ, with a suitable spectrophotometer, using the blank to set the instrument. Record the absorbance of the solution from the *Standard preparation* as A_S, and that from the *Assay preparation* as A_U. Calculate the quantity, in mg. of $C_{21}H_{29}NO.C_3H_6O_3$ in each ml. of the Injection taken by the formula $0.1 \times (C/V) \times 1.289 \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*, V is the volume, in ml., of the Injection taken, and 1.289 is the factor converting biperiden to biperiden lactate.

Packaging and storage—Preserve Biperiden Lactate Injection in single-dose containers, preferably of Type I glass, protected from light.

Injection available—Biperiden Lactate Injection usually available contains the following amount of biperiden lactate: 5 mg. in 1 ml.

CATEGORY and DOSE—See Biperiden.

Bisacodyl*



4,4′-(2-Pyridylmethylene)diphenol Diacetate (ester)

$C_{22}H_{19}NO_4$ Mol. wt. 361.40

Bisacodyl contains not less than 98.0 percent and not more than 101.0 percent of $C_{22}H_{19}NO_4$, calculated on the dried basis.

Caution: Avoid inhalation and contact with the eyes, skin, and mucous membranes.

Description—Bisacodyl occurs as a white to off-white, crystalline powder in which particles of the order of 50 μ in diameter or less predominate.

Solubility—Bisacodyl is very slightly soluble in water. It is freely soluble in chloroform and in alcohol, soluble in methanol and in benzene, and slightly soluble in ether.

Identification—

A: Mix about 5 mg. of Bisacodyl with 2 ml. of sulfuric acid: a cherry-red to violet color is produced.

B: Mix about 20 mg. of Bisacodyl with 1 ml. of dilute hydrochloric acid (1 in 2), and add 2 ml. of phosphomolybdic acid solution (1 in 10): a yellow precipitate, which turns blue upon the addition of 1 ml. of sodium hydroxide solution (15 in 100), is formed.

Melting range, *Class Ia*, page 815—Bisacodyl melts between 131° and 135°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Bisacodyl, previously dried at 105° for 2 hours, exhibits maxima only at the same wavelengths as that of NF Bisacodyl Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 50,000 solution of Bisacodyl in 0.05 *N* hydrochloric acid exhibits maxima and minima at the same wavelengths as that of NF Bisacodyl Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorption occurring at about 263 mμ, do not differ by more than 3 percent.

Loss on drying, page 814—Dry Bisacodyl at 105° for 2 hours: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Bisacodyl yields not more than 0.1 percent of residue on ignition.

Heavy metals, *Method II*, page 806—The heavy metals limit for Bisacodyl is 10 parts per million.

Assay—Dissolve about 250 mg. of Bisacodyl, accurately weighed, in 70 ml. of glacial acetic acid, add 3 drops of *p*-

---

* Patented. See notice, page ii.

naphtholbenzein T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 36.14 mg. of $C_{22}H_{19}NO_4$.

Packaging and storage—Preserve Bisacodyl in well-closed containers.

CATEGORY—Cathartic.
USUAL DOSE—Oral and rectal, **10 mg.**
USUAL DOSE RANGE—Oral, **10** to **30 mg.**

Bisacodyl Suppositories*

Bisacodyl Suppositories contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{22}H_{19}NO_4$.

Identification—Transfer a quantity of Bisacodyl Suppositories, equivalent to about 150 mg. of bisacodyl, to a 500-ml. conical flask, add 150 ml. of solvent hexane, and heat on a steam bath until the suppositories melt. Filter the solution, with the aid of vacuum, through a medium-porosity sintered-glass funnel, and wash the residue with warm solvent hexane, using about 100 ml., until free from fat. Continue the vacuum until the residue appears dry. Dissolve the residue by rinsing the filter with about 50 ml. of warm acetone, collecting the filtrate in a 150-ml. beaker, and then evaporate the filtrate on a steam bath to a volume of about 5 ml. To the residual liquid add about 75 ml. of water, heat on a steam bath for 15 minutes, and then cool. Scratch the sides of the beaker to induce crystallization, filter off the crystals, and dry at 100° for about 15 minutes: the bisacodyl so obtained melts between 129° and 135° (*Class Ia*, page 815), and responds to *Identification test A* under *Bisacodyl*, page 98.

Assay—

Standard preparation—Transfer about 50 mg. of NF Bisacodyl Reference Standard, accurately weighed, to a 100-ml. volumetric flask, add 1 *N* hydrochloric acid to volume, and mix. Transfer 20.0 ml. of this solution to a 50-ml. volumetric flask, dilute to volume with 1 *N* hydrochloric acid, and mix. Transfer 10.0 ml. of the last solution to a 100-ml. volumetric flask, dilute to volume with water, and mix.

Assay preparation—Place a number of Bisacodyl Suppositories, equivalent to about 50 mg. of bisacodyl, in a 250-ml. beaker, add 40 ml. of anhydrous ether, and warm gently on a steam bath until the suppositories melt completely. While still warm, filter the solution through a high-porosity sintered-glass funnel. Rinse the beaker and filter with two 10-ml. portions and one 5-ml. portion of hot ether. Transfer the filtrate with the aid of 25 ml. of ether to a 125-ml. separator, and extract with three 25-ml. portions of 1 *N* hydrochloric acid. Combine the hydrochloric acid extracts in a 100-ml. volumetric flask, dilute to volume with 1 *N* hydrochloric acid, and mix. Transfer 20.0 ml. of this solution to a 50-ml. volumetric flask, dilute to volume with 1 *N* hydrochloric acid, and mix. Transfer 10.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with water, and mix.

Procedure—Concomitantly determine the absorbances of the solutions, in 1-cm. cells, at the maximum at about 263 mμ, with a suitable spectrophotometer, using 0.1 *N* hydrochloric acid as the blank. Record the absorbance of the *Standard preparation* as A_S and that of the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{22}H_{19}NO_4$ in the Suppositories taken by the formula $2.5C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*.

Packaging and storage—Preserve Bisacodyl Suppositories in tight containers at temperatures below 37°.

Suppositories available—Bisacodyl Suppositories usually available contain the following amount of bisacodyl: 10 mg.

CATEGORY and DOSE—See Bisacodyl.

---

* Patented. See notice, page ii.

Bisacodyl Tablets*

Bisacodyl Tablets contain not less than 94.0 percent and not more than 106.0 percent of the labeled amount of $C_{22}H_{19}NO_4$. Bisacodyl Tablets are enteric-coated.

Identification—Macerate a portion of powdered Bisacodyl Tablets, equivalent to about 150 mg. of bisacodyl, with 30 ml. of chloroform, reflux on a water bath for about 10 minutes, and cool. Filter the extract, evaporate to dryness, and moisten about 5 mg. of the bisacodyl so obtained with several drops of sulfuric acid: a cherry-red to violet color is produced.

---

* Patented. See notice, page ii.

Disintegration, page 878—Test Bisacodyl Tablets as directed for *Enteric-Coated Tablets*, page 879, but do not use disks. Bisacodyl Tablets do not dissolve after 1 hour of agitation in simulated gastric fluid T.S., but then dissolve within 45 minutes in simulated intestinal fluid T.S. (without disks).

Content uniformity, *Method I*, page 799—Bisacodyl Tablets meet the requirements of the content uniformity test for tablets.

Assay—Weigh and finely powder not less than 20 Bisacodyl Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 25 mg. of bisacodyl, to a 50-ml. conical flask, add 20 ml. of chloroform, and shake mechanically for 15 minutes. Filter the mixture through a fine-porosity sintered-glass funnel into a 250-ml. separator, rinsing the flask and funnel with three 5-ml. portions of chloroform and collecting the rinsings in the separator. To the separator add 75 ml. of ether, and then extract with three 75-ml. portions of 1 *N* hydrochloric acid. Collect the extracts in a 250-ml. volumetric flask, dilute to volume with 1 *N* hydrochloric acid, and mix. Transfer 20.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with 1 *N* hydrochloric acid, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Bisacodyl Reference Standard, in the same medium at a concentration of about 20 mcg. per ml., in 1-cm. cells, at the maximum at about 263 mμ, with a suitable spectrophotometer, using 1 *N* hydrochloric acid as the blank. Calculate the quantity, in mg., of $C_{22}H_{19}NO_4$ in the portion of Tablets taken by the formula $1.25C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Store Bisacodyl Tablets in tight containers at a temperature not exceeding 30°.

Labeling—Label Bisacodyl Tablets to indicate that they are enteric-coated.

Tablets available—Bisacodyl Tablets usually available contain the following amount of bisacodyl: 5 mg.

CATEGORY and DOSE—See Bisacodyl.

Bishydroxycoumarin Capsules

Bishydroxycoumarin Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{19}H_{12}O_6$.

Identification—

A: Fuse a portion of the contents of Bishydroxycoumarin Capsules with an equal quantity of potassium hydroxide, cool, extract the melt with 5 ml. of water, filter, and acidify the filtrate with hydrochloric acid: a white, crystalline precipitate of salicylic acid is obtained.

B: The solution prepared for measurement of absorbance in the *Assay* exhibits maxima and minima at the same wavelengths as that of USP Bishydroxycoumarin Reference Standard, similarly measured.

Content uniformity, *Method II*, page 798—Bishydroxycoumarin Capsules meet the requirements of the content uniformity test for capsules using the following special procedure: Quantitatively transfer the contents of one capsule to a 100-ml. volumetric flask, rinse the capsule with chloroform, and add the rinsings to the flask. Add 50 ml. of chloroform, shake mechanically for 15 minutes, dilute to volume with chloroform, and filter, discarding the first 20 ml. of filtrate. Quantitatively dilute a portion of the subsequent filtrate to provide a solution containing approximately 5 mcg. per ml. of bishydroxycoumarin. Concomitantly determine the absorbance of this solution and of a solution of USP Bishydroxycoumarin Reference Standard, previously dried at 105° for 3 hours, in the same medium at a concentration of about 5 mcg. per ml., in 1-cm. cells, at the maximum at about 309 mμ, with a suitable spectrophotometer, using chloroform as the blank. Calculate the quantity, in mg., of $C_{19}H_{12}O_6$ in the capsule by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity, in mg., of bishydroxycoumarin in the capsule; D is the exact concentration, in mcg. per ml., of bishydroxycoumarin in the sample solution, based upon the labeled quantity per capsule and the extent of dilution; C is the exact concentration, in mcg. per ml., of the Reference Standard solution; A_U is the absorbance of the sample solution; and A_S is the absorbance of the Reference Standard solution.

Assay—Transfer as completely as possible the contents of not less than 20 Bishydroxycoumarin Capsules to a tared weighing bottle, and weigh. Transfer an accurately weighed quantity of the powder, equivalent to about 50 mg. of bishydroxycoumarin, to a 100-ml. volumetric flask, add about 60 ml. of chloroform, and heat on a steam bath to boiling. Cool to room temperature, add chloroform to volume, and mix. Centrifuge about 40 ml. of this solution. Pipet 10.0 ml. of the clear solution into a 125-ml. separator, and extract with four 25-ml. portions of sodium hydroxide T.S. Combine the alkaline extracts in a 250-ml. separator, acidify with hydrochloric acid, and extract with four 25-ml. portions of chloroform. Wash the combined extracts with 25 ml. of dilute hydrochloric acid (1 in 100), and filter the chloroform solution through chloroform-washed cotton into a 200-ml. volumetric flask. Extract the acid wash with 25 ml. of chloroform, and filter the chloroform layer into the same volumetric flask. Rinse the filter with chloroform, add chloroform to volume, and mix. Pipet 20.0 ml. of this solution into a 50-ml. volumetric flask, add chloroform to volume, and mix. Concomitantly determine the absorbance of this solution and of a similarly prepared solution of USP Bishydroxycoumarin Reference Standard, previously dried at 105° for 3 hours, in the same medium, at a concentration of about 10 mcg. per ml., in 1-cm. cells, at the maximum at about 309 mμ, with a suitable spectrophotometer, using chloroform as the blank. Calculate the quantity, in mg., of $C_{19}H_{12}O_6$ in the portion of the Capsules taken by the formula $5C \times (A_U/A_S)$, in which C is the exact concentration of the Reference Standard solution, in mcg. per ml., A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Bishydroxycoumarin Capsules in well-closed containers.

Capsules available—Bishydroxycoumarin Capsules usually available contain the following amounts of bishydroxycoumarin: 25, 50, and 100 mg.

Category—Anticoagulant.

Usual dose of bishydroxycoumarin—Initial, **200** to **300** **mg.** Maintenance, **25** to **200** **mg.** daily, according to prothrombin determinations.

Milk of Bismuth

Milk of Bismuth contains bismuth hydroxide and bismuth subcarbonate in suspension in water, and yields not less than 5.2 percent and not more than 5.8 percent (w/w) of Bi_2O_3 (bismuth trioxide).

Bismuth Subnitrate	**80 g.**
Nitric Acid	**120 ml.**
Ammonium Carbonate	**10 g.**
Strong Ammonia Solution,	
Purified Water, each, a sufficient quantity,	
To make	**1000 ml.**

Mix the bismuth subnitrate with 60 ml. of purified water and 60 ml. of nitric acid in a suitable container, and agitate, warming gently until solution is effected. Pour this solution, with constant stirring, into 5000 ml. of purified water containing 60 ml. of nitric acid. Dilute 160 ml. of strong ammonia solution with 4300 ml. of purified water in a glazed or glass vessel of at least 12,000-ml. capacity. Dissolve the ammonium carbonate in this solution, and then pour the bismuth solution quickly into it with constant stirring. If the mixture is not distinctly alkaline, add sufficient diluted ammonia solution to make it so, and allow it to stand until the precipitate has settled; then pour or siphon off the supernatant liquid, and wash the precipitate twice with purified water, by decantation. Afterward transfer the magma to a strainer of close texture, so as to provide continuous washing with purified water, the outlet tube being elevated to prevent the surface of the magma from becoming dry, and allow the operation to proceed until the washings cease to yield a pink color with phenolphthalein T.S. Then drain the moist preparation, transfer it to a graduated vessel, add sufficient purified water to make the product measure 1000 ml., and mix it thoroughly.

Note: The method of preparation as given above may be varied provided the product meets the requirements given below.

Description—Milk of Bismuth is a thick, white, opaque suspension which separates upon standing. It is odorless and almost tasteless. Milk of Bismuth is miscible with water and with alcohol.

Identification—

A: Milk of Bismuth responds to the tests for *Bismuth*, page 808, and for *Carbonate*, page 808.

B: One ml. of diluted hydrochloric acid added to 1 ml. of Milk of Bismuth produces a clear solution. Pour the clear solution into 10 volumes of water: a white precipitate is formed.

Water-soluble substances—Boil 10 ml. of Milk of Bismuth with 90 ml. of water for 10 minutes, cool, add sufficient water to make the total volume 100 ml., mix, and filter. Evaporate 50 ml. of the filtrate to dryness, and ignite it gently: the weight of the residue does not exceed 5 mg. (0.1 percent).

Alkalies and alkaline earths—Dissolve 2 ml. of Milk of Bismuth in 5 ml. of hydrochloric acid, dilute with water to 100 ml., pass in hydrogen sulfide to precipitate the bismuth completely, and filter. To 50 ml. of the clear filtrate add 5 drops of sulfuric acid, evaporate to dryness and ignite: the weight of the residue does not exceed 3 mg. (0.3 percent).

Arsenic—Evaporate 12.5 ml. of Milk of Bismuth to dryness on a steam bath, add 2 ml. of sulfuric acid, and heat until fumes of sulfur trioxide are copiously evolved. Allow to cool and then cautiously dilute with water to 35 ml. The solution meets the requirements of the *Arsenic Test*, page 777 (0.8 part per million As).

Lead—To 5 ml. of Milk of Bismuth add warm nitric acid, dropwise, until it is just dissolved, and pour the solution into 50 ml. of water: a white precipitate may form. Filter, if necessary, evaporate the filtrate on a steam bath to 15 ml., again filter, and to 10 ml. of the filtrate add an equal volume of diluted sulfuric acid: no precipitate is formed.

Assay—Evaporate to dryness an accurately weighed quantity of Milk of Bismuth and ignite the residue to constant weight. From the weight of the Bi_2O_3 so obtained determine the percentage in the sample.

Packaging and storage—Preserve Milk of Bismuth in tight containers and protect it from freezing.

Category—Astringent; antacid.

Usual dose—**5 ml.**

Bismuth Subnitrate

Bismuth Subnitrate is a basic salt which, dried at 105° for 2 hours, yields upon ignition not less than 79.0 percent of Bi_2O_3 (bismuth trioxide).

Description—Bismuth Subnitrate occurs as a white, slightly hygroscopic powder. When brought in contact with moistened blue litmus paper, it shows an acid reaction.

Solubility—Bismuth Subnitrate is practically insoluble in water and in alcohol, but is readily dissolved by hydrochloric or nitric acid.

Identification—Bismuth Subnitrate responds to the tests for *Bismuth*, page 808, and for *Nitrate*, page 809.

Loss on drying, page 814—Dry Bismuth Subnitrate at 105° for 2 hours: it loses not more than 3 percent of its weight.

Carbonate—Add 3 g. of Bismuth Subnitrate to 3 ml. of warm nitric acid: no effervescence occurs. Pour the solution into 100 ml. of water: a white precipitate forms. Filter, evaporate the filtrate on a steam bath to 30 ml., again filter the liquid, divide the latter filtrate into portions of 5 ml. each, and use these several portions in the tests for *Chloride, Sulfate, Copper, Lead,* and *Silver*.

Chloride, page 784—A 10-ml. portion of the test liquid retained in the test for *Carbonate* shows no more chloride than corresponds to 0.5 ml. of 0.02 *N* hydrochloric acid (0.035 percent).

Sulfate—To a 5-ml. portion of the test liquid retained in the test for *Carbonate* add 5 drops of barium nitrate T.S.: no turbidity is produced immediately.

Alkalies and alkaline earths—Boil 1 g. of Bismuth Subnitrate with 20 ml. of a mixture of equal volumes of acetic acid and water, cool, and filter. Add 2 ml. of diluted hydrochloric acid, precipitate the bismuth by the addition of hydrogen sulfide, boil the mixture, and filter it. Add 5 drops of sulfuric acid to the filtrate, evaporate it to dryness, and ignite to constant weight: the weight of the residue does not exceed 5 mg. (0.5 percent).

Ammonium salts—Boil about 100 mg. of Bismuth Subnitrate with 5 ml. of sodium hydroxide T.S.: the vapor does not turn moistened red litmus blue.

Arsenic—Mix 1.25 g. of Bismuth Subnitrate with 5 ml. of water, cautiously add 2 ml. of sulfuric acid, heat the mixture until fumes of sulfur trioxide are copiously evolved. Cool, cautiously add 10 ml. of water, and again evaporate to strong fuming, repeating if necessary to remove any trace of nitric acid. Cool, and cautiously dilute with water to 35 ml. This solution meets the requirements of the *Arsenic Test*, page 777 (8 parts per million As).

Copper—To a 5-ml. portion of the test liquid retained in the test for *Carbonate* add a slight excess of ammonia T.S.: the liquid does not exhibit a bluish color.

Lead—Mix a 5-ml. portion of the test liquid retained in the test for *Carbonate* with an equal volume of diluted sulfuric acid: the liquid does not become cloudy.

Silver—To a 5-ml. portion of the test liquid retained in the test for *Carbonate* add hydrochloric acid, dropwise: no precipitate is formed which is insoluble in a slight excess of hydrochloric acid, but soluble in ammonia T.S.

Assay—Weigh accurately in a porcelain crucible about 1 g. of Bismuth Subnitrate, previously dried at 105° for 2 hours, and ignite to constant weight. From the weight of Bi_2O_3 so obtained determine the percentage in the sample taken.

Packaging and storage—Preserve Bismuth Subnitrate in well-closed containers.

CATEGORY—Antacid.

USUAL DOSE—See Milk of Bismuth.

Bitter Orange Peel, page 499

Blood Group Specific Substances A and B

Blood Group Specific Substances A and B is a sterile, isotonic solution of the polysaccharide-containing complexes that are capable of reducing the titer of the anti-A and the anti-B isoagglutinins of group O blood. The blood group specific substance A is usually isolated from hog gastric mucin and the blood group specific substance B is usually isolated from the glandular portion of horse gastric mucosa. Blood Group Specific Substances A and B contains a suitable preservative.

Description—Blood Group Specific Substances A and B is a clear solution, which may have a slight odor due to the preservative.

pH, page 824—The pH of Blood Group Specific Substances A and B is between 6.0 and 6.8.

Other requirements—Blood Group Specific Substances A and B complies with the requirements under *Biologics*, page 781, and with the identity, pyrogen, safety, sterility, potency, nonanaphylactic and other requirements of the U. S. Public Health Service.

Packaging and storage—Preserve Blood Group Specific Substances A and B in single-dose containers, at a temperature between 2° and 8°. Dispense it in the unopened container in which it was placed by the manufacturer.

Expiration date—The expiration date for Blood Group Specific Substances A and B is not more than 2 years after date of manufacture or date of issue.

Size available—Blood Group Specific Substances A and B is usually available in the following amount: 10 ml. (to be added to 500 ml. of group O blood).

CATEGORY—Blood neutralizer (isoagglutinins, group O blood).

USUAL DOSE—Intravenous, one transfusion unit (10 ml.) in approximately 500 ml. of group O blood.

Boric Acid

H_3BO_3 Mol. wt. 61.83

Boric Acid contains not less than 99.5 percent and not more than 100.5 percent of H_3BO_3, calculated on the dried basis.

Description—Boric Acid occurs as colorless, odorless scales of a somewhat pearly luster, as crystals, or as a white powder that is slightly unctuous to the touch. It is stable in air.

Solubility—Boric Acid is soluble in water and in alcohol. It is freely soluble in glycerin, in boiling water, and in boiling alcohol.

Completeness of solution—One g. of Boric Acid dissolves in 25 ml. of water, producing a clear solution.

Solubility in alcohol—One g. of Boric Acid dissolves completely in 10 ml. of boiling alcohol.

Identification—Boric Acid responds to the tests for *Borate*, page 808.

Loss on drying, page 814—Dry Boric Acid over silica gel for 5 hours: it loses not more than 0.5 percent of its weight.

Arsenic—A solution of 1.25 g. of Boric Acid in water meets the requirements of the *Arsenic test*, page 777 (8 parts per million As).

Heavy metals, page 806—Dissolve 1 g. of Boric Acid in 23 ml. of water, and add 2 ml. of diluted acetic acid: the heavy metals limit is 20 parts per million.

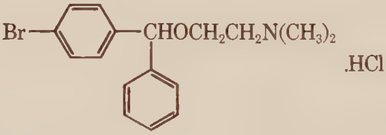
Assay—Dissolve about 2 g. of Boric Acid, accurately weighed, in 100 ml. of a mixture of equal volumes of glycerin and water, previously neutralized to phenolphthalein T.S., and titrate with 1 *N* sodium hydroxide. Discharge the pink color by the addition of 50 ml. of glycerin, neutralized to phenolphthalein T.S., and continue the titration until the pink color reappears. Each ml. of 1 *N* sodium hydroxide is equivalent to 61.83 mg. of H_3BO_3.

Labeling—The container label bears a warning that Boric Acid is not for internal use.

Packaging and storage—Preserve Boric Acid in well-closed containers.

CATEGORY—Buffer.

Bromodiphenhydramine Hydrochloride*



2-[(*p*-Bromo-α-phenylbenzyl)oxy]-*N*,*N*-dimethylethylamine Hydrochloride

$C_{17}H_{20}BrNO.HCl$ Mol. wt. 370.72

Bromodiphenhydramine Hydrochloride contains not less than 98.0 percent and not more than 101.0 percent of $C_{17}H_{20}BrNO.HCl$, calculated on the dried basis.

Description—Bromodiphenhydramine Hydrochloride occurs as a white to pale buff, crystalline powder, having no more than a faint odor.

Solubility—Bromodiphenhydramine Hydrochloride is freely soluble in water and in alcohol. It is soluble in isopropyl alcohol, and insoluble in ether and in solvent hexane.

Melting range, *Class Ia*, page 815—Bromodiphenhydramine Hydrochloride melts between 148° and 152°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Bromodiphenhydramine Hydrochloride, previously dried at 105° for 3 hours, exhibits maxima only at the same wavelengths as that of NF Bromodiphenhydramine Hydrochloride Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 67,000 solution of Bromodiphenhydramine Hydrochloride in 0.1 *N* sulfuric acid exhibits maxima and minima at the same wavelengths as that of NF Bromodiphenhydramine Hydrochloride Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorption occurring at about 230 mμ, do not differ by more than 3 percent.

Loss on drying, page 814—Dry Bromodiphenhydramine Hydrochloride at 105° for 3 hours: it loses not more than 0.5 percent of its weight.

Assay—Dissolve about 700 mg. of Bromodiphenhydramine Hydrochloride, accurately weighed, in 50 ml. of glacial acetic acid, and add 10 ml. of benzene and 15 ml. of mercuric acetate T.S. Add 2 drops of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 37.07 mg. of $C_{17}H_{20}BrNO.HCl$.

---

* Patented. See notice, page ii.

Packaging and storage—Preserve Bromodiphenhydramine Hydrochloride in tight containers.

CATEGORY—Antihistaminic.

USUAL DOSE—**25 mg.** three times daily.

USUAL DOSE RANGE—**25** to **50 mg.**

Bromodiphenhydramine Hydrochloride Capsules

Bromodiphenhydramine Hydrochloride Capsules contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{17}H_{20}BrNO.HCl$.

Identification—Transfer the final solution obtained in the *Assay* to a separator, add about 1 ml. of 0.1 *N* sulfuric acid, and shake with 25 ml. of ether. (Methyl red enters the ether phase.) Drain the aqueous layer into another separator, add 5 ml. of sodium hydroxide T.S., and shake with 10 ml. of chloroform. Drain the chloroform layer into a small flask containing 2 g. of anhydrous sodium sulfate, and swirl. Pour the chloroform solution through a small cotton pledget, prerinsed with chloroform, into a beaker and evaporate to about 5 ml. Apply a few drops of the solution directly to a potassium bromide plate, and completely remove the chloroform by warming for 2 to 3 minutes under an infrared lamp: the infrared absorption spectrum of the bromodiphenhydramine base so prepared exhibits maxima at the same wavelengths as that of a similar preparation obtained from NF Bromodiphenhydramine Hydrochloride Reference Standard, similarly measured.

Content uniformity, *Method II*, page 798—Bromodiphenhydramine Hydrochloride Capsules meet the requirements of the content uniformity test for capsules using the following special procedure: Transfer as completely as possible the contents of one capsule to a suitable small flask, add a quantity of alcohol, accurately measured, to yield a concentration of about 50 mg. of bromodiphenhydramine hydrochloride per 100 ml., stopper securely, and mix thoroughly by swirling intermittently for a few minutes. Centrifuge a portion of the mixture at about 2000 r.p.m. until the solution becomes clear. Pipet 3.0 ml. of the supernatant liquid into a 100-ml. volumetric flask containing 10 ml. of 1 *N* sulfuric acid, dilute to volume with alcohol, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Bromodiphenhydramine Hydrochloride Reference Standard, in a mixture of 1 *N* sulfuric acid in alcohol (1 in 10), at a concentration of about 15 mcg. per ml., in 1-cm. cells, at the maximum at about 230 mμ, with a suitable spectrophotometer, using the 1 *N* sulfuric acid in alcohol (1 in 10) solution as the blank. Calculate the quantity, in mg., of $C_{17}H_{20}BrNO.HCl$ in the Capsule by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity, in mg., of bromodiphenhydramine hydrochloride in the capsule; D is the exact concentration, in mcg. per ml., of bromodiphenhydramine hydrochloride in the sample solution based upon the labeled quantity per capsule and the extent of dilution; C is the exact concentration of the Reference Standard solution, in mcg. per ml.; A_U is the absorbance of the sample solution; and A_S is the absorbance of the Reference Standard solution.

Assay—

Chromatographic column—Pack a small pledget of cotton in the base of a 2.5 × 25-cm. chromatographic tube equipped with a stopcock. Thoroughly mix 7.5 g. of purified siliceous earth with 5 ml. of water, transfer the mixture to the tube, and tamp gently to compress the material into a uniform mass.

Assay preparation—Remove as completely as possible the contents of not less than 20 Bromodiphenhydramine Hydrochloride Capsules, and weigh. Mix, and transfer an accurately weighed portion of the powder, equivalent to about 250 mg. of bromodiphenhydramine hydrochloride, to a 250-ml. beaker. Add 4 ml. of water, mix, add 1 ml. of 2 *N* sodium hydroxide, and mix. Add 10 g. of purified siliceous earth, and intimately mix by kneading with a flexible spatula until the mixture is fluffy.

Procedure—Transfer the *Assay preparation* to the column in divided portions, and tamp the column gently to compress the material into a uniform mass. Rinse the beaker in which the *Assay preparation* was prepared with a mixture of 3 g. of purified siliceous earth and 2 ml. of water, transfer to the column, and tamp to compress. Place a thin layer of cotton on top of the column, and pass ether through the column at a rate of 2 to 4 ml. per minute, collecting 75 ml. of eluate in a 125-ml. separator. Extract the eluate with 10.0 ml. of 0.1 *N* sulfuric acid followed by two 5-ml. portions of water, and combine the extracts in a conical flask. To the flask add 3 drops of methyl red T.S., and titrate the excess acid with 0.02 *N* sodium hydroxide. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* sulfuric acid is equivalent to 37.07 mg. of $C_{17}H_{20}BrNO.HCl$.

Packaging and storage—Preserve Bromodiphenhydramine Hydrochloride Capsules in tight containers.

Capsules available—Bromodiphenhydramine Hydrochloride Capsules usually available contain the following amount of bromodiphenhydramine hydrochloride: 25 mg.

CATEGORY and DOSE—See Bromodiphenhydramine Hydrochloride.

Bromodiphenhydramine Hydrochloride Elixir

Bromodiphenhydramine Hydrochloride Elixir contains not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{17}H_{20}BrNO.HCl$.

Identification—Proceed as directed for *Identification* under *Bromodiphenhydramine Hydrochloride Capsules,* page 105.

Assay—Evaporate an accurately measured volume of Bromodiphenhydramine Hydrochloride Elixir, equivalent to about 250 mg. of bromodiphenhydramine hydrochloride, to about half the original volume, using a suitable vacuum evaporator. Transfer the concentrated solution to a 250-ml. separator, with the aid of sufficient warm water to bring the volume to the original volume. Add 20 g. of sodium chloride, and shake until dissolved. Add 5 ml. of sodium hydroxide T.S., shake with 100 ml. of ether, and drain the aqueous layer into a second separator containing 50 ml. of ether. Shake, and discard the aqueous layer. Wash the ether solutions with two 20-ml. portions of water, shaking each aqueous portion successively in the two separators, and then discard the aqueous solutions. Extract the ether solutions successively with 10.0 ml. of 0.1 *N* sulfuric acid, followed by two 5-ml. portions of water, and collect the aqueous extracts in a conical flask. Add 3 drops of methyl red T.S. to the solution in the flask, and titrate the excess acid with 0.02 *N* sodium hydroxide. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* sulfuric acid is equivalent to 37.07 mg. of $C_{17}H_{20}BrNO.HCl$.

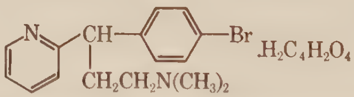
Alcohol content, page 772—Bromodiphenhydramine Hydrochloride Elixir contains from 12 to 15 percent (v/v) of C_2H_5OH.

Packaging and storage—Preserve Bromodiphenhydramine Hydrochloride Elixir in tight, light-resistant containers.

Elixir available—Bromodiphenhydramine Hydrochloride Elixir usually available contains the following amount of bromodiphenhydramine hydrochloride: 12.5 mg. in 5 ml.

CATEGORY and DOSE—See Bromodiphenhydramine Hydrochloride.

Brompheniramine Maleate



2-[*p*-Bromo-α-[2-(dimethylamino)ethyl]benzyl]pyridine Maleate (1:1)

$C_{16}H_{19}BrN_2.C_4H_4O_4$ Mol. wt. 435.32

Brompheniramine Maleate, dried at 105° for 3 hours, contains not less than 98.0 percent and not more than 100.5 percent of $C_{16}H_{19}BrN_2.C_4H_4O_4$.

Description—Brompheniramine Maleate occurs as a white, odorless, crystalline powder.

Solubility—Brompheniramine Maleate is freely soluble in water, and is soluble in alcohol and in chloroform. It is slightly soluble in ether and in benzene.

Melting range, page 814—Brompheniramine Maleate melts between 130° and 135°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Brompheniramine Maleate, previously dried at 105° for 3 hours, exhibits maxima only at the same wavelengths as that of NF Brompheniramine Maleate Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 30,000 solution of Brompheniramine Maleate in methanol exhibits maxima and minima at the same wavelengths as that of NF Brompheniramine Maleate Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance occurring at about 262 mμ, do not differ by more than 3 percent.

pH, page 824—The pH of a solution of Brompheniramine Maleate (1 in 100) is between 4.0 and 5.0.

Loss on drying, page 814—Dry Brompheniramine Maleate at 105° for 3 hours: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Brompheniramine Maleate yields not more than 0.15 percent of residue on ignition.

Assay—Dissolve about 425 mg. of Brompheniramine Maleate, previously dried at 105° for 3 hours and accurately weighed, in 50 ml. of glacial acetic acid. Add 1 drop of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 21.77 mg. of $C_{16}H_{19}BrN_2.C_4H_4O_4$.

Packaging and storage—Preserve Brompheniramine Maleate in tight, light-resistant containers.

CATEGORY—Antihistaminic.

USUAL DOSE—Oral, **4 mg.** one to four times a day.

USUAL DOSE RANGE—**4** to **8 mg.**

Brompheniramine Maleate Elixir

Brompheniramine Maleate Elixir contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{16}H_{19}BrN_2.C_4H_4O_4$.

Identification—Transfer a volume of Brompheniramine Maleate Elixir, equivalent to about 50 mg. of brompheniramine maleate, to a separator, make distinctly alkaline with sodium hydroxide T.S., and extract with two 50-ml. portions of chloroform, shaking gently to avoid emulsification. Wash the combined chloroform extracts with 10 ml. of water, wash the latter with 20 ml. of chloroform, and discard the aqueous phase. Filter the combined chloroform extracts into a conical flask, and evaporate the solvent on a steam bath, with the aid of a current of air. To the residue add 25 ml. of 0.01 *N* hydrochloric acid, and proceed as directed under *Identification—Organic Nitrogenous Bases*, page 810, beginning with "Transfer the liquid to a separator. . . .": the Elixir meets the requirements of the test.

pH, page 824—The pH of Brompheniramine Maleate Elixir is between 2.5 and 3.5.

Assay—Transfer an accurately measured volume of Brompheniramine Maleate Elixir, equivalent to about 20 mg. of brompheniramine maleate, to a separator, make distinctly alkaline with sodium hydroxide T.S., and extract with ten 10-ml. portions of chloroform, shaking gently to avoid emulsification. Wash the combined chloroform extracts with 10 ml. of water, wash the latter with 20 ml. of chloroform, and discard the aqueous phase. Quantitatively filter the combined chloroform extracts and washing into a conical flask, and evaporate the solvent on a steam bath, with the aid of a current of air. To the residue add 25 ml. of glacial acetic acid and 5 ml. of acetic anhydride, agitate, and allow to stand for about 15 minutes. Add 1 drop of crystal violet T.S., and titrate with 0.01 *N* perchloric acid in glacial acetic acid to a blue-green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.01 *N* perchloric acid is equivalent to 2.177 mg. of $C_{16}H_{19}BrN_2.C_4H_4O_4$.

Alcohol content, page 772—Brompheniramine Maleate Elixir contains from 2.7 to 3.3 percent (v/v) of C_2H_5OH.

Packaging and storage—Preserve Brompheniramine Maleate Elixir in well-closed, light-resistant containers.

Elixir available—Brompheniramine Maleate Elixir usually available contains the following amount of brompheniramine maleate: 2 mg. in 5 ml.

CATEGORY AND DOSE—See Brompheniramine Maleate.

Brompheniramine Maleate Tablets

Brompheniramine Maleate Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{16}H_{19}BrN_2.C_4H_4O_4$.

Identification—Brompheniramine Maleate Tablets meet the requirements under *Identification—Organic Nitrogenous Bases,* page 810.

Disintegration, page 878—The disintegration time limit for Brompheniramine Maleate Tablets, determined in simulated gastric fluid T.S., is 30 minutes.

Content uniformity, *Method I,* page 799—Brompheniramine Maleate Tablets meet the requirements of the content uniformity test for tablets.

Assay—Weigh and finely powder not less than 30 Brompheniramine Maleate Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 80 mg. of brompheniramine maleate, to a 200-ml. volumetric flask, add 10 ml. of water, and warm on a steam bath until the powder has formed a wet paste. Add 10 ml. of diluted hydrochloric acid, dilute to volume with water, and mix. Transfer 20.0 ml. to a separator, add 5 ml. of sodium hydroxide T.S., and extract with five 35-ml. portions of chloroform. Combine the extracts in a 200-ml. volumetric flask, dilute to volume with chloroform, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Brompheniramine Maleate Reference Standard, in the same medium, at a concentration of about 40 mcg. per ml., in 1-cm. cells, at the maximum, at about 263 mμ, with a suitable spectrophotometer, using chloroform as the blank. Calculate the quantity, in mg., of $C_{16}H_{19}BrN_2 \cdot C_4H_4O_4$ in the portion of Tablets taken by the formula $2C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Brompheniramine Maleate Tablets in tight containers.

Tablets available—Brompheniramine Maleate Tablets usually available contain the following amount of brompheniramine maleate: 4 mg.

Category and Dose—See Brompheniramine Maleate.

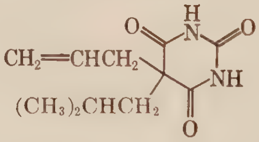
Butabarbital, Sodium, Tablets, page 639

Butalbital



5-Allyl-5-isobutylbarbituric Acid

$C_{11}H_{16}N_2O_3$ Mol. wt. 224.26

Butalbital, dried at 105° for 2 hours, contains not less than 97.5 percent and not more than 101.5 percent of $C_{11}H_{16}N_2O_3$.

Description—Butalbital occurs as a white, crystalline powder. It is odorless, has a slightly bitter taste, and is stable in air. Its saturated solution is acid to litmus.

Solubility—Butalbital is freely soluble in alcohol, in ether, and in chloroform. It is slightly soluble in cold water and soluble in boiling water. It is soluble in solutions of fixed alkalies and alkali carbonates.

Melting range, page 814—Butalbital melts between 137° and 140°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Butalbital, previously dried at 105° for 2 hours, exhibits maxima only at the same wavelengths as that of NF Butalbital Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 20,000 solution of Butalbital in 0.1 *N* sodium hydroxide exhibits maxima and minima at the same wavelengths as that of NF Butalbital Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance, occurring at about 245 mμ, do not differ by more than 2.5 percent.

Loss on drying, page 814—Dry

Butalbital at 105° for 2 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Butalbital yields not more than 0.1 percent of residue on ignition.

Heavy metals, page 806—Boil about 100 mg. of Butalbital with 10 ml. of water for 2 minutes, cool, and filter. Add 10 ml. of hydrogen sulfide T.S. to the filtrate: no color or precipitate is produced.

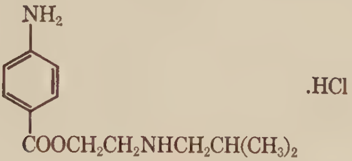
Readily carbonizable substances, page 856—Dissolve about 500 mg. of Butalbital in 5 ml. of sulfuric acid T.S.: the solution has no more color than *Matching Fluid A.*

Assay—Dissolve about 300 mg. of Butalbital, previously dried at 105° for 2 hours and accurately weighed, in 10 ml. of alcohol, add 10 ml. of water, and titrate to the first faint blue color with 0.1 *N* sodium hydroxide, using thymolphthalein T.S. as the indicator. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* sodium hydroxide is equivalent to 22.43 mg. of $C_{11}H_{16}N_2O_3$.

Packaging and storage—Preserve Butalbital in well-closed containers.

CATEGORY—Sedative.
USUAL DOSE—**50 mg.** every 6 hours.
USUAL DOSE RANGE—**50** to **100 mg.**

Butethamine Hydrochloride



2-(Isobutylamino)ethanol *p*-Aminobenzoate (Ester) Monohydrochloride

$C_{13}H_{20}N_2O_2 . HCl$ Mol. wt. 272.78

Butethamine Hydrochloride, dried at 105° for 2 hours, contains not less than 98.5 percent and not more than 100.5 percent of $C_{13}H_{20}N_2O_2 . HCl$.

Description—Butethamine Hydrochloride occurs as small, white crystals, or as a white, crystalline powder. It is odorless, and is stable in air. Butethamine Hydrochloride exhibits local anesthetic properties when placed upon the tongue. The pH of a 1 in 100 solution is about 5.

Solubility—Butethamine Hydrochloride is sparingly soluble in water, slightly soluble in alcohol and in chloroform, very slightly soluble in benzene, and practically insoluble in ether.

Identification—

A: To 5 ml. of Butethamine Hydrochloride solution (1 in 500) add 1 ml. of silver nitrate T.S.: a curdy, white precipitate, insoluble in nitric acid but soluble in ammonia T.S., separates.

B: To 5 ml. of Butethamine Hydrochloride solution (1 in 500) add 0.5 ml. of diluted hydrochloric acid and 0.5 ml. of a solution of sodium nitrite (1 in 10), followed by 200 mg. of betanaphthol dissolved in 10 ml. of ammonia T.S.: an orange precipitate forms which is soluble in ether.

C: To 2 ml. of Butethamine Hydrochloride solution (1 in 500) add 1 ml. of mercuric-potassium iodide T.S.: a white precipitate forms.

Melting range, page 814—Butethamine Hydrochloride melts between 193° and 197°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Butethamine Hydrochloride, previously dried at 105° for 2 hours, exhibits maxima only at the same wavelengths as that of NF Butethamine Hydrochloride Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 50,000 solution of Butethamine Hydrochloride exhibits maxima and minima at the same wavelengths as that of NF Butethamine Hydrochloride Reference Standard, similarly measured.

Loss on drying, page 814—Dry Butethamine Hydrochloride at 105° for 2 hours: it loses not more than 0.2 percent of its weight.

Residue on ignition, page 858—Butethamine Hydrochloride yields not more than 0.1 percent of residue on ignition.

Assay—Transfer about 200 mg. of Butethamine Hydrochloride, previously dried at 105° for 2 hours and accurately weighed, to a 100-ml. volumetric flask, add water to volume, and mix. Pipet 10.0 ml. of this solution into a 1000-ml. volumetric flask, dilute to volume with water, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Butethamine Hydrochloride Reference Standard, previously dried at 105° for 2 hours, in water at a concentration of about 20 mcg. per ml., in 1-cm. cells, at the maximum at about 290 mμ, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg., of $C_{13}H_{20}N_2O_2.HCl$ in the Butethamine Hydrochloride taken by the formula $10C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Butethamine Hydrochloride in well-closed containers.

Category—Local anesthetic (dental).

Usual dose—Local injection **1.8** to **2.2 ml.** of a 1.5% solution with epinephrine 1:100,000 or a 2% solution with epinephrine 1:50,000.

Butethamine Hydrochloride and Epinephrine Injection

Butethamine Hydrochloride and Epinephrine Injection is a sterile solution of butethamine hydrochloride and epinephrine in water for injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{13}H_{20}N_2O_2.HCl$ (butethamine hydrochloride) and not less than 95.0 percent and not more than 110.0 percent of the labeled amount of $C_9H_{13}NO_3$ (epinephrine).

Identification—Butethamine Hydrochloride and Epinephrine Injection responds to *Identification test B* under *Butethamine Hydrochloride,* page 109.

Other requirements—Butethamine Hydrochloride and Epinephrine Injection meets the requirements under *Injections,* page 810.

pH, page 824—The pH of Butethamine Hydrochloride and Epinephrine Injection is between 3.3 and 5.5.

Assay for butethamine hydrochloride—

Standard preparation—Weigh accurately about 20 mg. of NF Butethamine Hydrochloride Reference Standard, previously dried at 105° for 2 hours, transfer to a 1000-ml. volumetric flask, dilute to volume with water, and mix.

Assay preparation—Transfer to a separator an accurately measured volume of Butethamine Hydrochloride and Epinephrine Injection, equivalent to about 200 mg. of butethamine hydrochloride, add 3 ml. of ammonia T.S., and completely extract the butethamine by shaking with successive portions of chloroform. Filter the chloroform extracts into a beaker, wash the filter with chloroform, and evaporate the combined filtrate and washings in a current of warm air nearly to dryness. To the residue add 30 ml. of 0.1 *N* hydrochloric acid, heat on a steam bath until the odor of chloroform is no longer perceptible, cool, transfer quantitatively to a 100-ml. volumetric flask, dilute to volume with water, and mix. Pipet 10.0 ml. of this solution into a 1000-ml. volumetric flask, dilute to volume with water, and mix.

Procedure—Determine the absorbance of each solution, in 1-cm. cells, at the maximum at about 290 mμ, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg., of $C_{13}H_{20}N_2O_2.HCl$ in each ml. of the Injection taken by the formula $10 \times (C/V) \times (A_U/A_S)$, in which A_U is the absorbance of the *Assay preparation,* A_S is that of the *Standard preparation,* C is the exact concentration, in mcg. per ml., of the *Standard preparation* and V is the volume, in ml., of the Injection taken.

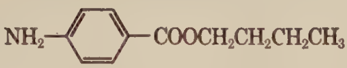
Assay for epinephrine—Proceed as directed under *Epinephrine Assay,* page 803.

Packaging and storage—Preserve Butethamine Hydrochloride and Epinephrine Injection in single-dose or multiple-dose containers, preferably of Type I glass.

Injections available—Butethamine Hydrochloride and Epinephrine Injection usually available contains the following amounts of butethamine hydrochloride and epinephrine: 1 percent butethamine hydrochloride and 1 in 75,000 epinephrine in 5-ml. cartridges; 1.5 percent butethamine hydrochloride and 1 in 100,000 epinephrine in 5-ml. cartridges; and in 30-ml. bottles; 1.5 percent butethamine hydrochloride and 1 in 30,000 epinephrine in 5-ml. cartridges; 2 percent butethamine hydrochloride and 1 in 50,000 epinephrine in 1.8-, 2-, 2.2-, and 2.5-ml. cartridges; in 2-ml. ampuls; and in 30-, 60-, and 125-ml. bottles.

Category and Dose—See Butethamine Hydrochloride.

Butyl Aminobenzoate



Butyl *p*-Aminobenzoate

$C_{11}H_{15}NO_2$ Mol. wt. 193.25

Butyl Aminobenzoate, dried over phosphorus pentoxide for 3 hours, contains not less than 98.0 percent and not more than 101.0 percent of $C_{11}H_{15}NO_2$.

Description—Butyl Aminobenzoate occurs as a white, crystalline powder. It is odorless and tasteless.

Solubility—Butyl Aminobenzoate is very slightly soluble in water. It is soluble in dilute acids, in alcohol, in chloroform, in ether, and in fixed oils. It is slowly hydrolyzed when boiled with water.

Identification—

A: Add a few drops of a solution of sodium nitrite (1 in 10) to 2 ml. of a solution of Butyl Aminobenzoate in 0.1 *N* hydrochloric acid (1 in 100), and add the mixture to a solution of 200 mg. of beta-naphthol in 10 ml. of a solution of sodium hydroxide (1 in 10): a scarlet red precipitate is produced.

B: To 1 ml. of a solution of Butyl Aminobenzoate in 0.1 *N* hydrochloric acid (1 in 100) add a few drops of iodine T.S., shake the mixture, and allow it to stand for 10 minutes with occasional shaking: a dark brown precipitate is formed which changes into large, reddish brown prisms (under the same conditions *benzocaine* gives lustrous scales).

Melting range, page 814—Butyl Aminobenzoate melts between 57° and 59°.

Residue on ignition, page 858—Butyl Aminobenzoate yields not more than 0.15 percent of residue on ignition.

Reaction—Dissolve 1 g. of Butyl Aminobenzoate in 10 ml. of neutralized alcohol: a clear solution results. Dilute this solution with 10 ml. of water, add 2 drops of phenolphthalein T.S. and 1 drop of 0.1 *N* sodium hydroxide: a red color is produced.

Loss on drying, page 814—Dry Butyl Aminobenzoate over phosphorus pentoxide for 3 hours: it loses not more than 1 percent of its weight.

Completeness and color of solution—One g. of Butyl Aminobenzoate dissolves completely in 30 ml. of alcohol and in 30 ml. of ether, and the solutions are colorless.

Chloride—To a solution of 200 mg. of Butyl Aminobenzoate in 10 ml. of alcohol add 1 ml. of diluted nitric acid and a few drops of silver nitrate T.S.: no turbidity is produced.

Heavy metals, page 806—Dissolve 1 g. of Butyl Aminobenzoate in 2 ml. of diluted acetic acid and sufficient alcohol to make 25 ml.: the heavy metals limit for Butyl Aminobenzoate is 10 parts per million.

Assay—Dissolve about 400 mg. of Butyl Aminobenzoate, previously dried over phosphorus pentoxide for 3 hours and accurately weighed, in a mixture of 100 ml. of water and 20 ml. of hydrochloric acid. Cool the solution in an ice bath to about 10°, and titrate with 0.1 *M* sodium nitrite until a blue color is produced immediately when the titrated solution is spotted on starch iodide paper. When the titration is complete, the end-point is reproducible after the mixture has been allowed to stand for 5 minutes. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *M* sodium nitrite is equivalent to 19.32 mg. of $C_{11}H_{15}NO_2$.

Packaging and storage—Preserve Butyl Aminobenzoate in well-closed containers.

CATEGORY—Local anesthetic.

Caffeine and Ergotamine Tartrate Suppositories, page 268
Caffeine and Ergotamine Tartrate Tablets, page 270
Caffeine, Phenacetin, and Aspirin Tablets, page 68
Caffeine, Phenacetin, Aspirin, and Codeine Phosphate Tablets, page 178

Citrated Caffeine

Citrated Caffeine is a mixture of caffeine and citric acid containing, when dried at 80° for 4 hours, not less than 48.0 percent and not more than 52.0 percent of $C_8H_{10}N_4O_2$ (anhydrous caffeine), and not less than 48.0 percent and not more than 52.0 percent of $C_6H_8O_7$ (anhydrous citric acid). The sum of the percentages of anhydrous caffeine and anhydrous citric acid is not less than 98.5 and not more than 101.0.

Description—Citrated Caffeine occurs as a white, odorless powder, having a slightly bitter, acid taste. Its solutions are acid to litmus.

Solubility—Citrated Caffeine is freely soluble in warm water. On diluting the solution with an equal volume of water, a portion of the caffeine gradually separates, but redissolves on the further addition of water.

Identification—

A: Dissolve about 20 mg. of Citrated Caffeine in 1 ml. of hydrochloric acid in a porcelain dish, add 100 mg. of potassium chlorate, and evaporate to dryness on a steam bath. Invert the dish over a vessel containing a few drops of ammonia T.S.: the residue acquires a purple color, which disappears upon the addition of a solution of a fixed alkali.

B: Dissolve about 100 mg. of Citrated Caffeine in 10 ml. of water, and add 1 ml. of calcium chloride T.S. and 3 drops of bromothymol blue T.S. Add 0.1 *N* sodium hydroxide, dropwise, until the color of the solution just changes to a clear blue, then boil the solution gently for 3 minutes, agitating it gently during the heating period: a white, crystalline precipitate appears in the liquid.

C: Add 1 ml. of mercuric sulfate T.S. to 5 ml. of a solution of Citrated Caffeine (1 in 100), heat the mixture to boiling, and add 1 ml. of potassium permanganate T.S.: a white precipitate appears.

D: The residue obtained in the *Assay for caffeine*, when recrystallized from hot water and dried at 80° for 4 hours, melts between 235° and 237.5°, page 814.

Loss on drying, page 814—Dry Citrated Caffeine at 80° for 4 hours: it loses not more than 5 percent of its weight.

Residue on ignition, page 858—Citrated Caffeine yields not more than 0.1 percent of residue on ignition.

Heavy metals, page 806—Dissolve 1 g. of Citrated Caffeine in 15 ml. of water, and dilute to 25 ml. with water: the heavy metals limit for Citrated Caffeine is 15 parts per million.

Readily carbonizable substances, page 856—Heat a mixture of 250 mg. of Citrated Caffeine and 5 ml. of sulfuric acid T.S. in a porcelain dish on a steam bath for 15 minutes, protecting it from dust: the solution has no more color than Matching Fluid K.

Assay for caffeine—Accurately weigh about 1 g. of Citrated Caffeine, previously dried at 80° for 4 hours, and dissolve it in 10 ml. of hot water. Add 8 ml. of sodium hydroxide T.S., cool the solution, and shake it in a separator with three or more successive 20-ml. portions of chloroform to effect complete extraction of the caffeine. Filter the combined chloroform solutions through a small filter, previously moistened with chloroform, into a tared dish. Wash the stem of the separator, the filter, and the funnel with 10 ml. of hot chloroform, adding the washings to the dish, and evaporate the combined chloroform solutions on a steam bath, adding 2 ml. of alcohol just before the last trace of chloroform is expelled. Complete the evaporation of the solvent, and dry the residue consisting of $C_8H_{10}N_4O_2$ at 80° for 4 hours, and weigh.

Assay for citric acid—Weigh accurately about 400 mg. of Citrated Caffeine, previously dried at 80° for 4 hours, and dissolve it in 25 ml. of water. Add 3 drops of phenolphthalein T.S., and titrate with 0.1 *N* sodium hydroxide to a faint pink color. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* sodium hydroxide is equivalent to 6.404 mg. of $C_6H_8O_7$.

Packaging and storage—Preserve Citrated Caffeine in tight containers.

CATEGORY—Central stimulant.
USUAL DOSE—**300 mg.** as necessary.
USUAL DOSE RANGE—**100** to **500 mg.**

Citrated Caffeine Tablets

Citrated Caffeine Tablets contain an amount of $C_8H_{10}N_4O_2$ (anhydrous caffeine) equivalent to not less than 45.0 percent and not more than 55.0 percent of the labeled amount of citrated caffeine.

Identification—Citrated Caffeine Tablets respond to the *Identification tests* under *Citrated Caffeine*, page 111.

Disintegration, page 878–The disintegration time limit for Citrated Caffeine Tablets is 30 minutes.

Content uniformity, *Method II*, page 799—Citrated Caffeine Tablets meet the requirements of the content uniformity test for tablets, using the following special procedure: Quantitatively transfer a finely powdered tablet to a 200-ml.

volumetric flask, add 100 ml. of chloroform, and shake mechanically for 30 minutes. Dilute to volume with chloroform, mix and filter, discarding the first 20 ml. of filtrate. Dilute a portion of the subsequent filtrate quantitatively and stepwise, if necessary, with chloroform to provide a solution containing approximately 7.5 mcg. of anhydrous caffeine per ml. Concomitantly determine the absorbance of this solution and of a standard solution of NF Caffeine Reference Standard, in the same medium, at a concentration of about 7.5 mcg. per ml., in 1-cm. cells, at the maximum at about 276 mμ, with a suitable spectrophotometer, using chloroform as the blank. Calculate the quantity, in mg., of $C_8H_{10}N_4O_2$ in the tablet by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity of anhydrous caffeine, in mg., in the tablet; D is the exact concentration, in mcg. per ml., of the sample solution based upon the labeled quantity per tablet and the extent of dilution; C is the exact concentration of the Reference Standard solution, in mcg. per ml., A_U is the absorbance of the sample solution, and A_S is the absorbance of the standard solution.

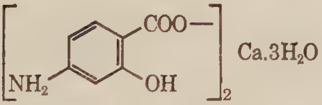
Assay—Weigh and finely powder not less than 20 Citrated Caffeine Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 500 mg. of citrated caffeine, to a separator, and dissolve it, as completely as possible, in 10 ml. of water. Add 1 drop of phenolphthalein T.S., then add sodium hydroxide T.S. until a permanent pink color is produced. Extract the caffeine completely from the mixture with successive portions of chloroform, pass each portion through a filter which has been previously moistened with chloroform, and wash the stem of the funnel and the filter with a few ml. of hot chloroform. Evaporate the filtrate on a steam bath, adding 2 ml. of alcohol just before the chloroform is all evaporated. Complete the evaporation, and dry the residue at 80° for 4 hours. The weight of residue obtained represents the yield of $C_8H_{10}N_4O_2$.

Packaging and storage—Preserve Citrated Caffeine Tablets in tight containers.

Tablets available—Citrated Caffeine Tablets usually available contain the following amounts of citrated caffeine: 60 and 150 mg.

CATEGORY and DOSE—See Citrated Caffeine.

Calcium Aminosalicylate



Calcium 4-Aminosalicylate

$C_{14}H_{12}CaN_2O_6 \cdot 3H_2O$ Mol. wt. 398.39

Calcium Aminosalicylate contains not less than 98.0 percent and not more than 100.5 percent of $C_{14}H_{12}CaN_2O_6$, calculated on the anhydrous basis.

Caution: Prepare solutions of Calcium Aminosalicylate within 24 hours of administration. Under no circumstances use a solution if its color is darker than that of a freshly prepared solution.

Description—Calcium Aminosalicylate occurs as white to cream-colored crystals or powder. It is odorless and has an alkaline, slightly bitter-sweet taste. It is somewhat hygroscopic. Its solutions decompose slowly and darken in color.

Solubility—Calcium Aminosalicylate is freely soluble in water; it is slightly soluble in alcohol.

Identification—

A: Dissolve about 3 g. of Calcium Aminosalicylate in 50 ml. of water, and add acetic acid, dropwise, until the mixture is distinctly acid. Filter with suction, retaining the filtrate for *Identification test C*. Wash the precipitate with several small portions of water, and dry in vacuum over phosphorus pentoxide. Place about 1 g. of the aminosalicylic acid so obtained in a small, round-bottom flask, and add 10 ml. of acetic anhydride. Heat the flask on a steam bath for 30 minutes, add 40 ml. of water, mix, filter, and cool. Allow to stand until the diacetyl derivative has precipitated. Collect the precipitate on a filter, wash well with water, and dry at 105° for 1 hour: the diacetyl derivative so obtained melts between 191° and 197°, page 814.

B: Shake 100 mg. of the aminosalicylic acid obtained in *Identification test A* with 10 ml. of water, and filter. To 5 ml. of the filtrate add 1 drop of ferric chloride T.S.: a violet color is produced.

C: The filtrate obtained in *Identification test A* responds to the tests for *Calcium*, page 808.

Ultraviolet absorption, page 866—Dissolve 250 mg. of the aminosalicylic acid obtained in *Identification test A* in 3 ml. of sodium hydroxide T.S., transfer to a 500-ml. volumetric flask, add water to volume, and mix. Transfer a 5-ml. aliquot to a 250-ml. volumetric flask containing 12.5 ml. of pH 7 buffer (page 783), add water to volume, and mix. This solution, when compared in a suitable spectrophotometer against a blank of the same buffer in the same concentration, exhibits absorbance maxima at 265 ± 2 mμ and 299 ± 2 mμ, and the ratio A_{265}/A_{299} is between 1.50 and 1.56.

pH, page 824—The pH of a solution of Calcium Aminosalicylate (1 in 50) is between 6.0 and 8.0.

Water, page 900—Determine the water content of Calcium Aminosalicylate by the titrimetric method: it contains not less than 12.5 percent and not more than 14.5 percent of water.

Clarity of solution—A solution of 1 g. of Calcium Aminosalicylate in 50 ml. of water shows no more turbidity than that produced by adding 0.10 ml. of 0.02 *N* hydrochloric acid to a mixture of 48 ml. of water, 1 ml. of nitric acid, and 1 ml. of silver nitrate T.S., the comparisons being made in glass cylinders of the same internal diameter by viewing horizontally against a white and a black background.

Clarity of solution in diluted nitric acid—One g. of Calcium Aminosalicylate dissolves in a mixture of 5 ml. of nitric acid and 45 ml. of water to give a clear solution that has not more than a slight color.

Chloride, page 784—A 500-mg. portion of Calcium Aminosalicylate shows no more chloride than corresponds to 0.3 ml. of 0.02 *N* hydrochloric acid (0.042 percent).

Heavy metals, *Method II*, page 806—The heavy metals limit for Calcium Aminosalicylate is 30 parts per million.

Hydrogen sulfide and sulfur dioxide—Dissolve about 500 mg. of Calcium Aminosalicylate in 5 ml. of water, add 5 ml. of diluted hydrochloric acid, and stir vigorously: no odor of hydrogen sulfide or of sulfur dioxide is perceptible and there is not more than a faint odor of amyl alcohols. A piece of moistened lead acetate test paper held over the mixture does not become discolored.

***m*-Aminophenol**—Weigh accurately an amount, calculated on the basis of the *Assay*, of Calcium Aminosalicylate equivalent to 562 mg. of anhydrous calcium aminosalicylate (500 mg. of aminosalicylic acid), and transfer to a 100-ml. volumetric flask. Add 1.8 ml. of sodium hydroxide T.S., and dilute to about 80 ml. with water. Add 10 ml. of dilute sulfuric acid (1 in 10), add water to volume, and mix. Within 150 seconds from the time the acid is added, pipet 5.0 ml. of this solution into a second 100-ml. volumetric flask, immersed in an ice bath and containing 50 ml. of water at 0° to 5°, and add 2.5 ml. of sodium nitrite solution (1 in 100). Mix, and allow to stand in the ice bath for 3 minutes ± 5 seconds. Add 25 ml. of sodium carbonate T.S., mix, and place the flask in a water bath at 25° for 15 minutes. Add water to volume, mix, and allow the solution to stand at 25° for 3 hours. Determine the absorbance of the clear supernatant solution at the absorbance maximum observed in a range of 425 to 435 mμ in a 1-cm. cell, with a suitable spectrophotometer, using water as the blank. Calculate the percent of *m*-aminophenol by the formula $(A - 0.320)/1.09$, in which A is the absorbance of the solution, 0.320 is the absorbance correction factor representing color produced other than by the reaction of *m*-aminophenol initially present, and 1.09 is the factor converting absorbance to percent of *m*-aminophenol in Calcium Aminosalicylate: not more than 0.20 percent of *m*-aminophenol is found.

Assay—Dissolve about 350 mg. of Calcium Aminosalicylate, accurately weighed, in about 25 ml. of water, and allow to stand with occasional swirling for about 10 minutes. Add 25 ml. of glacial acetic acid and 20 ml. of potassium bromide solution (1 in 4). Cool to 15°, add 5 ml. of hydrochloric acid, and immediately titrate with 0.1 *M* sodium nitrite, stirring vigorously, determining the end-point electrometrically using suitable electrodes. Each ml. of 0.1 *M* sodium nitrite is equivalent to 17.22 mg. of $C_{14}H_{12}CaN_2O_6$.

Packaging and storage—Preserve Calcium Aminosalicylate in tight, light-resistant containers.

CATEGORY—Antibacterial (tuberculostatic).

USUAL DOSE—**4 g.** four times a day.

USUAL DOSE RANGE—**10** to **25 g.** daily in 4 divided doses.

Calcium Aminosalicylate Capsules

Calcium Aminosalicylate Capsules contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{14}H_{12}CaN_2O_6 . 3H_2O$.

Identification—Digest the contents of a sufficient number of Calcium Aminosalicylate Capsules, equivalent to about 3 g. of calcium aminosalicylate, with 50 ml. of water, and filter. Add 15 ml. of diluted acetic acid to the filtrate and allow to stand until precipitation has occurred. Collect the precipitate on a filter, wash well with water, and dry at 105° for 30 minutes: the residue responds to *Identification tests A* and *B* and the test for *Ultraviolet absorption* under *Calcium Aminosalicylate*, page 113, and the filtrate responds to the tests for *Calcium*, page 808.

Weight variation, page 901—Calcium Aminosalicylate Capsules meet the requirements of the weight variation test for capsules.

***m*-Aminophenol**—Transfer an accurately weighed portion, calculated on the basis of the *Assay*, of the contents of Calcium Aminosalicylate Capsules, equivalent to 1.300 g. of calcium aminosalicylate (1 g. of aminosalicylic acid), to a 100-ml. volumetric flask, and dissolve the soluble portion in about 50 ml. of water. Add water to volume, mix, and filter, discarding the first 15 ml. of filtrate. Pipet 50.0 ml. of the subsequent filtrate into a 100-ml. volumetric flask, and continue as directed in the test for *m-Aminophenol* under *Calcium Aminosalicylate*, page 113, beginning with "... dilute to about 80 ml. with water ...": not more than 0.77 percent of *m*-aminophenol is found.

Assay—Transfer as completely as possible the contents of not less than 20 Calcium Aminosalicylate Capsules to a suitable tared container, and determine the average weight per capsule. Mix the combined contents thoroughly, and transfer an accurately weighed portion, equivalent to about 400 mg. of calcium aminosalicylate, to a 150-ml. beaker. Add about 25 ml. of water, and allow to stand with occasional swirling for about 10 minutes, warming gently, if necessary to effect complete solution. Add 25 ml. of glacial acetic acid and 20 ml. of potassium bromide solution (1 in 4), and continue as directed in the *Assay* under *Calcium Aminosalicylate*, page 113, beginning with "Cool to 15° ... " Each ml. of 0.1 *M* sodium nitrite is equivalent to 19.92 mg. of $C_{14}H_{12}CaN_2O_6 . 3H_2O$.

Packaging and storage—Preserve Calcium Aminosalicylate Capsules in tight, light-resistant containers.

Capsules available—Calcium Aminosalicylate Capsules usually available contain the following amount of calcium aminosalicylate: 500 mg.

CATEGORY and DOSE—See Calcium Aminosalicylate.

Calcium Aminosalicylate Tablets

Calcium Aminosalicylate Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{14}H_{12}CaN_2O_6 . 3H_2O$.

Identification—Digest a quantity of powdered Calcium Aminosalicylate Tablets, equivalent to about 3 g. of calcium aminosalicylate, with 50 ml. of water, and filter. Add 15 ml. of diluted acetic acid to the filtrate and allow to stand until precipitation has occurred. Collect the precipitate on a filter, wash well with water, and dry at 105° for 30 minutes: the residue responds to the *Identification tests A* and *B*, and the filtrate responds to *Identification test C* under *Calcium Aminosalicylate*, page 113.

Ultraviolet absorption—A portion of the residue obtained under *Identification* meets the requirements for *Ultraviolet absorption* under *Calcium Aminosalicylate*, page 113.

Disintegration, page 878—The disintegration time limit for Calcium Aminosalicylate Tablets is 30 minutes.

Weight variation, page 901—Calcium Aminosalicylate Tablets meet the requirements of the weight variation test for tablets.

***m*-Aminophenol**—Weigh accurately a quantity, calculated on the basis of the *Assay*, of powdered Calcium Aminosalicylate Tablets, equivalent to 1.300 g. of calcium aminosalicylate trihydrate (1.0 g. of aminosalicylic acid). Transfer the weighed sample to a 100-ml. volumetric flask, and dissolve the soluble portion in about 50 ml. of water. Add water to volume, mix, and filter. Pipet 50.0 ml. of the clear filtrate into a 100-ml. volumetric flask, and proceed as directed in the test for *m-Aminophenol* under *Calcium Aminosalicylate*, page 113, beginning with "...dilute to about 80 ml. with water...." Calculate the percent of *m*-aminophenol in the calcium aminosalicylate obtained from the Tablets by the formula (*A* − 0.320)/1.09 in which *A* is the absorbance of the solution, 0.320 is the absorbance correction factor representing color produced other than by the reaction of *m*-aminophenol initially present, and 1.09 is the factor converting absorbance to percent of *m*-aminophenol in calcium aminosalicylate: the calcium aminosalicylate obtained from the Tablets contains not more than 0.77 percent of *m*-aminophenol.

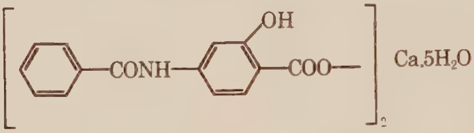
Assay—Weigh and finely powder not less than 20 Calcium Aminosalicylate Tablets. Weigh accurately a portion of the powder, equivalent to about 400 mg. of calcium aminosalicylate, transfer it to a wide-mouth, 250-ml. conical flask, add about 25 ml. of water, and shake the mixture frequently during 10 minutes, or until all of the calcium aminosalicylate is dissolved. Add 25 ml. of glacial acetic acid and 20 ml. of potassium bromide solution (1 in 4), and proceed as directed in the *Assay* under *Calcium Aminosalicylate*, page 113, beginning with "Cool to 15°. . . ." Each ml. of 0.1 *M* sodium nitrite is equivalent to 19.92 mg. of $C_{14}H_{12}CaN_2O_6.3H_2O$.

Packaging and storage—Preserve Calcium Aminosalicylate Tablets in tight, light-resistant containers.

Tablets available—Calcium Aminosalicylate Tablets usually available contain the following amounts of calcium aminosalicylate: 500, 580, and 690 mg.

CATEGORY and DOSE—See Calcium Aminosalicylate.

Calcium Benzoylpas



Calcium 4-Benzamidosalicylate

$C_{28}H_{20}CaN_2O_8.5H_2O$ Mol. wt. 642.64

Calcium Benzoylpas contains not less than 98.0 percent and not more than 101.5 percent of $C_{28}H_{20}CaN_2O_8$, calculated on the anhydrous basis.

Description—Calcium Benzoylpas occurs as a white to cream-colored, odorless powder.

Solubility—Calcium Benzoylpas is slightly soluble in water and in methanol. It is very slightly soluble in alcohol, and is practically insoluble in chloroform and in ether.

Identification—

A: Suspend about 1 g. of Calcium Benzoylpas in 20 ml. of 2 *N* acetic acid, shake vigorously for 5 minutes, and filter: the filtrate responds to the tests for *Calcium*, page 808.

B: Dissolve about 100 mg. of Calcium Benzoylpas in 5 ml. of methanol, and add 5 ml. of diluted acetic acid in small portions while mixing. Collect the precipitate on a sintered-glass filter, wash with six 5-ml. portions of water, and dry at 105° for 1 hour: the 4-benzamidosalicylic acid so obtained melts between 243° and 246°.

Infrared absorption, page 866—The infrared absorption spectrum of a mineral oil dispersion of Calcium Benzoylpas, previously dried to constant weight over a suitable desiccant, exhibits maxima only at the same wavelengths as that of NF Calcium Benzoylpas Reference Standard, similarly measured.

Ultraviolet absorption, page 866—Transfer about 100 mg. of Calcium Benzoylpas, accurately weighed, to a 200-ml. volumetric flask, dissolve in 20 ml. of methanol, dilute to volume with water, and mix. Transfer 5.0 ml. of this solution to a 250-ml. volumetric flask, add 25 ml. of pH 6.0 phosphate buffer, dilute to volume with water, and mix: the ultraviolet absorption spectrum of this solution exhibits maxima and minima at the same wavelengths as that of NF Calcium Benzoylpas Reference Standard, similarly measured, and the respective absorptivities, calculated on the anhydrous basis, at the point of maximum absorption at about 274 mμ, do not differ by more than 2 percent.

Water, page 900—Determine the water content of Calcium Benzoylpas by the titrimetric method: not less than 13 percent and not more than 15 percent of water is found.

Chloride, page 784—Dissolve 500 mg. of Calcium Benzoylpas in 40 ml. of acetone, add 4 ml. of diluted nitric acid, and mix. Add 1 ml. of silver nitrate T.S. in sufficient water to make 50 ml., and mix: this solution shows no more chloride than corresponds to 0.1 ml. of 0.02 *N* hydrochloric acid (0.014 percent).

Heavy metals, *Method II,* page 806—The heavy metals limit for Calcium Benzoylpas is 30 parts per million.

3′-Hydroxybenzamide, *m*-aminophenol, and 4-aminosalicylic acid—Transfer 2.00 g. of Calcium Benzoylpas to a 40-ml. centrifuge tube, add 10.0 ml. of methanol, and shake for 1 minute. Add 10.0 ml. of 2 *N* acetic acid, shake for 15 minutes, and centrifuge until a clear supernatant layer is obtained. Spot 10 µl. of the clear liquid on a suitable thin-layer chromatographic plate (see page 791), coated with a 0.25-mm. layer of chromatographic silica gel mixture. Apply to the same plate 5-µl. portions of separate methanol control solutions containing, respectively, in each ml., 200.0 mcg. of 3′-hydroxybenzamide, 100.0 mcg. of *m*-aminophenol, and 400.0 mcg. of 4-aminosalicylic acid. Also, apply to the same plate 5 µl. of a combined control solution in methanol containing in each ml. 200.0 mcg. of 3′-hydroxybenzamide, 100.0 mcg. of *m*-aminophenol, 400.0 mcg. of 4-aminosalicylic acid, and 1.0 mg. of NF Calcium Benzoylpas Reference Standard. Allow the spots to dry, and develop the chromatogram in *n*-butanol saturated with stronger ammonia water (prepared as follows: mix 200 ml. of *n*-butanol with 150 ml. of stronger ammonia water, shake carefully, let stand for at least 12 hours, and discard the aqueous layer) until the solvent front has moved at least 12 cm. from the origin. Remove the plate from the developing chamber, and allow the solvent to evaporate. Locate the spots on the plate by exposing to shortwave ultraviolet light, then spraying with a 1 in 100 solution of 2,6-dichloroquinone-chlorimide in alcohol, and finally expose the plate to fumes of stronger ammonia water for a few minutes: any spots from the sample solution are not greater in size or intensity than the spots, occurring at the respective R_f values, produced by the control solutions of 3′-hydroxybenzamide (0.1 percent), *m*-aminophenol (0.05 percent), and 4-aminosalicylic acid (0.2 percent).

Assay—Transfer about 400 mg. of Calcium Benzoylpas, accurately weighed, to a 200-ml. volumetric flask, dissolve in 40 ml. of anhydrous methanol, immediately add 30 ml. of water, and with constant swirling add 30.0 ml. of 0.1 *N* silver nitrate. Shake well, dilute to volume with water, and mix. When the precipitate has coagulated, filter, avoiding evaporation of the filtrate. To 100.0 ml. of the clear filtrate add 3 ml. of nitric acid and 5 ml. of ferric ammonium sulfate T.S., and titrate the excess silver nitrate with 0.1 *N* ammonium thiocyanate. Perform a blank determination (see *Residual Titrations,* page 883). Each ml. of 0.1 *N* silver nitrate is equivalent to 27.63 mg. of $C_{28}H_{20}CaN_2O_8$.

Packaging and storage—Preserve Calcium Benzoylpas in tight, light-resistant containers.

CATEGORY—Antibacterial (tuberculostatic).

USUAL DOSE RANGE—**10** to **15 g.** daily in two or three divided doses.

Calcium Benzoylpas Tablets

Calcium Benzoylpas Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{28}H_{20}CaN_2O_8 . 5H_2O$.

Identification—

A: Suspend a quantity of powdered Calcium Benzoylpas Tablets, equivalent to about 1 g. of calcium benzoylpas, in 20 ml. of 2 *N* acetic acid, shake vigorously for 5 minutes, and filter: the clear filtrate responds to the tests for *Calcium,* page 808.

B: The ultraviolet absorption spectrum of the solution employed for measurement of absorbance in the *Assay* exhibits maxima and minima at the same wavelengths as that of the Reference Standard solution, prepared as directed in the *Assay.*

Disintegration, page 878—The disintegration time limit for Calcium Benzoylpas Tablets is 30 minutes.

Weight variation, page 901—Calcium Benzoylpas Tablets meet the requirements of the weight variation test for tablets.

3′-Hydroxybenzamide, *m*-aminophenol, and 4-aminosalicylic acid—Weigh accurately a quantity of finely powdered Calcium Benzoylpas Tablets, equivalent to 2.0 g. of calcium benzoylpas, and transfer to a 40-ml. centrifuge tube. Proceed as directed in the test for *3′-Hydroxybenzamide, m-aminophenol, and 4-aminosalicylic acid* under *Calcium Benzoylpas,* page 116, beginning with ". . . add 10 ml. of methanol, and shake for 1 minute," except use 10-µl. portions, rather than 5-µl. portions, of each control solution: any spots from the sample solution are not greater in size or intensity than the spots, occurring at the respective R_f values, produced by the control solutions of 3′-hydroxybenzamide (0.2 percent), *m*-aminophenol (0.1 percent), and 4-aminosalicylic acid (0.4 percent).

Assay—Weigh and finely powder not less than 20 Calcium Benzoylpas Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 80 mg. of calcium benzoylpas, to a 200-ml. volumetric flask, add 20 ml. of methanol, shake to disperse the powder, dilute to volume with water, and mix. Filter, discarding the first 20 ml. of filtrate. Transfer 5.0 ml. of the subsequent clear filtrate to a 250-ml. volumetric flask, add 25 ml. of pH 6.0 phosphate buffer, dilute to volume with water, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Calcium Benzoylpas Reference Standard, in the same medium, at a concentration of about 8 mcg. per ml., in 1-cm. cells, at the maximum at about 274 mμ, with a suitable spectrophotometer, using as the blank a solution consisting of 25 ml. of pH 6.0 phosphate buffer, 5 ml. of methanol, and 220 ml. of water. Calculate the quantity, in mg., of $C_{28}H_{20}CaN_2O_8 . 5H_2O$ in the portion of Tablets taken by the formula $10C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Calcium Benzoylpas Tablets in well-closed, light-resistant containers.

Tablets available—Calcium Benzoylpas Tablets usually available contain the following amount of calcium benzoylpas: 500 mg.

Category and Dose—See Calcium Benzoylpas.

Calcium Carbonate Tablets

Calcium Carbonate Tablets contain not less than 92.5 percent and not more than 107.5 percent of the labeled amount of $CaCO_3$.

Identification—The addition of acetic acid to Calcium Carbonate Tablets produces effervescence, and the resulting solution, after being boiled to expel carbon dioxide and neutralized with ammonia T.S., responds to the tests for *Calcium*, page 808.

Barium or strontium—Powder several Calcium Carbonate Tablets, mix a portion of the powder, equivalent to about 2 g. of calcium carbonate, with 100 ml. of water, and add hydrochloric acid dropwise, with agitation, until no more effervescence takes place: this solution does not impart a yellowish green or red color to a nonluminous flame.

Disintegration, page 878—The disintegration time limit for Calcium Carbonate Tablets, using simulated gastric fluid T.S. as the test medium in place of water, is 30 minutes.

Weight variation, page 901—Calcium Carbonate Tablets meet the requirements of the weight variation test for tablets.

Assay—Weigh and finely powder not less than 20 Calcium Carbonate Tablets. Weigh accurately a portion of the powder, equivalent to about 200 mg. of calcium carbonate, transfer to a suitable crucible, and ignite to constant weight. Cool the crucible, add 10 ml. of water, and dissolve the residue by adding sufficient diluted hydrochloric acid, dropwise, to achieve complete solution. Transfer the solution completely to a suitable container, dilute to 150 ml. with water, add 15 ml. of sodium hydroxide T.S., and 300 mg. of hydroxy naphthol blue, and titrate with 0.05 *M* disodium ethylenediaminetetraacetate until the solution is deep blue in color. Each ml. of 0.05 *M* disodium ethylenediaminetetraacetate is equivalent to 5.004 mg. of $CaCO_3$.

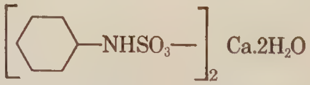
Packaging and storage—Preserve Calcium Carbonate Tablets in well-closed containers.

Tablets available—Calcium Carbonate Tablets usually available contain the following amounts of calcium carbonate: 600 mg. and 1 g.

Category—Antacid.

Usual dose of calcium carbonate—**1** to **2 g.** between meals.

Calcium Cyclamate



Calcium Cyclohexanesulfamate

$C_{12}H_{24}CaN_2O_6S_2 . 2H_2O$ Mol. wt. 432.57

Calcium Cyclamate contains not less than 98.0 percent and not more than 101.0 percent of $C_{12}H_{24}CaN_2O_6S_2$, calculated on the anhydrous basis.

Description—Calcium Cyclamate occurs as white crystals or as a white, crystalline powder. It is odorless. Calcium Cyclamate in dilute solution is about 30 times as sweet as sucrose. Its solutions are neutral to litmus.

Solubility—Calcium Cyclamate is freely soluble in water and in propylene glycol. It is sparingly soluble in alcohol, and is practically insoluble in chloroform and in ether.

Identification—

A: To 10 ml. of a solution of Calcium Cyclamate (1 in 100) add 1 ml. of hydrochloric acid, then add 1 ml. of barium chloride T.S.: the solution remains clear. Add 1 ml. of sodium nitrite solution (1 in 10): a white precipitate is formed.

B: A 1 in 100 solution of Calcium Cyclamate responds to the tests for *Calcium*, page 808.

Water, page 900—Determine the water content of Calcium Cyclamate by the titrimetric method: not less than 6 percent and not more than 9 percent is found.

Arsenic—A *Test Preparation* prepared with 3.33 g. of Calcium Cyclamate, as directed for organic compounds, meets the requirements of the *Arsenic Test*, page 777 (3 parts per million As).

Selenium—A *Test Preparation* prepared with 200 mg. of Calcium Cyclamate meets the requirements of the *Selenium Limit Test*, page 865 (30 parts per million).

Heavy metals, page 806—Dissolve 1 g. of Calcium Cyclamate in 25 ml. of water: the heavy metals limit for Calcium Cyclamate is 10 parts per million.

Cyclohexylamine—

Alkaline disodium edetate solution—Mix 100 g. of disodium edetate with 400 ml. of water, add 340 ml. of sodium hydroxide solution (1 in 10), dilute to 1000 ml. with water, and mix to dissolve.

Methyl orange-boric acid solution—Dissolve 200 mg. of methyl orange and 3.5 g. of boric acid in 100 ml. of water, heating on a steam bath to effect solution. Allow to stand for at least 24 hours, and filter before use.

Standard preparation—Transfer 100.0 mg. of cyclohexylamine to a 100-ml. volumetric flask, dissolve in a mixture of 50 ml. of water and 0.5 ml. of hydrochloric acid, dilute to volume with water, and mix. Transfer 5.0 ml. of the solution to a second 100-ml. volumetric flask, dilute to volume with water, and mix. Transfer 5.0 ml. of this last solution to a third 100-ml. volumetric flask, dilute to volume with water, and mix.

Test preparation—Transfer 10.0 g. of Calcium Cyclamate to a 100-ml. volumetric flask, dissolve in water, dilute to volume with water, and mix.

Procedure—Transfer 10.0 ml. each of the *Standard preparation* and of the *Test preparation* to separate 50-ml. glass-stoppered centrifuge tubes, and transfer 10.0 ml. of water to a third tube to serve as a blank. To each tube add 3.0 ml. of *Alkaline disodium edetate solution* and 15.0 ml. of a 20:1 mixture of chloroform and *n*-butanol, shake the tubes for 2 minutes, and centrifuge. Remove and discard the aqueous layer in each tube, and then transfer 10.0 ml. of the chloroform solution from each tube to separate centrifuge tubes. To each tube add 2.0 ml. of *Methyl orange-boric acid solution,* shake the tubes for 2 minutes, and centrifuge. Remove and discard the aqueous layer in each tube, then add to each tube 1 g. of anhydrous sodium sulfate, shake well, and allow to settle. Transfer 5.0 ml. of each clear chloroform solution into separate test tubes, add 0.5 ml. of a 50:1 mixture of methanol and sulfuric acid, and mix. Concomitantly determine the absorbance of the solutions, in 1-cm. cells, at the maximum at about 520 mμ, with a suitable spectrophotometer, using the blank to set the instrument: the absorbance of the solution from the *Test preparation* does not exceed that from the *Standard preparation,* corresponding to not more than 25 parts per million of cyclohexylamine.

Dicyclohexylamine—

Alkaline disodium edetate solution—Prepare as directed under *Cyclohexylamine.*

Reagent solution A—To about 60 ml. of water add 75 mg. of bromophenol blue followed by 10 ml. of 0.1 *M* sodium bicarbonate, and stir without heating until solution is complete. Adjust the pH to 4.0 with 0.2 *N* hydrochloric acid, dilute to 100 ml. with water, and mix. Store in a cool, dark place and do not use after 48 hours.

Reagent solution B—Mix 200 ml. of 1 *N* hydrochloric acid with 166 ml. of glacial acetic acid, dilute to 1000 ml. with water, and mix.

Procedure—Transfer 10.0 g. of Calcium Cyclamate to a separator, dissolve in 100 ml. of *Alkaline disodium edetate solution,* and extract with one 10-ml. portion and two 5-ml. portions of chloroform, combining the extracts in a second separator. To the second separator add 100 ml. of water, 3.0 ml. of *Reagent solution B*, and 1.0 ml. of *Reagent solution A*, then shake the mixture for 3 minutes, and allow to stand for 30 minutes protected from direct sunlight. Quantitatively transfer the chloroform layer to a 25-ml. volumetric flask, dilute to volume with chloroform, and mix. Determine the absorbance of this solution in a

5-cm. cell, at the maximum at about 410 mμ, with a suitable spectrophotometer, using chloroform as the blank. Concomitantly determine the absorbance of a reagent blank prepared with the same quantities of the same reagents, omitting only the test sample: the difference between the absorbance of the solution from the sample and that of the reagent blank is not greater than 0.075, indicating no measurable quantity of dicyclohexylamine in the sample.

Assay—Transfer about 400 mg. of Calcium Cyclamate, accurately weighed, to a 250-ml. beaker, and dissolve in a mixture of 50 ml. of water and 5 ml. of hydrochloric acid. Titrate at room temperature with 0.1 *M* sodium nitrite. Add the last 1 ml. of titrant dropwise until a blue color is produced immediately when a glass rod dipped into the titrated solution is spotted on starch iodide paper. When the titration is complete, the endpoint is reproducible after the solution has been allowed to stand for 1 minute. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *M* sodium nitrite is equivalent to 19.83 mg. of $C_{12}H_{24}CaN_2O_6S_2$.

Packaging and storage—Preserve Calcium Cyclamate in well-closed containers.

CATEGORY—Non-nutritive sweetener.

Calcium Cyclamate and Calcium Saccharin Solution[*]

Calcium Cyclamate and Calcium Saccharin Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of $C_{12}H_{24}CaN_2O_6S_2.2H_2O$ (calcium cyclamate) and of $C_{14}H_8CaN_2O_6S_2.3^1/_2H_2O$ (calcium saccharin). The labeled concentration of calcium cyclamate is not less than 6.0 percent and is at least 10 times the labeled concentration of calcium saccharin.

Description—Calcium Cyclamate and Calcium Saccharin Solution is a clear, colorless liquid having a sweet taste.

Identification—

A: Dilute 1 ml. of Calcium Cyclamate and Calcium Saccharin Solution with water to 10 ml., acidify with hydrochloric acid, and add 1 ml. of barium chloride T.S.: the solution remains clear. Add 1 ml. of sodium nitrite solution (1 in 10): a white precipitate is formed.

B: The solution employed for measurement of absorbance in the *Assay for calcium saccharin* exhibits an absorbance maximum at 266 ± 2 mμ, and a minimum at 247 ± 2 mμ.

C: Calcium Cyclamate and Calcium Saccharin Solution responds to the tests for *Calcium*, page 808.

Assay for calcium cyclamate—Transfer an accurately measured volume of Calcium Cyclamate and Calcium Saccharin Solution, equivalent to about 500 mg. of calcium cyclamate, to a 250-ml. beaker, and add about 50 ml. of water and 5 ml. of hydrochloric acid. Proceed as directed in the *Assay* under *Calcium Cyclamate*, page 118, beginning with "Titrate at room temperature. . . ." Each ml. of 0.1 *M* sodium nitrite is equivalent to 21.63 mg. of $C_{12}H_{24}CaN_2O_6S_2.2H_2O$.

Assay for calcium saccharin—Transfer an accurately measured volume of Calcium Cyclamate and Calcium Saccharin Solution, equivalent to about 150 mg. of calcium saccharin, to a 250-ml. separator, and wash with three 50-ml. portions of chloroform, discarding the chloroform layer after each extraction. Filter the aqueous layer after each extraction. Filter the aqueous layer through paper previously moistened with water, into a 100-ml. volumetric flask. Add the water rinsings of the separator and the filter to the flask, add water to volume, and mix. Pipet 5.0 ml. of the solution into another 100-ml. volumetric flask, add water to volume, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Saccharin Reference Standard, in the same medium, at a concentration of about 60 mcg. per ml. in 1-cm. cells, at the maximum at about 266 mμ, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg., of $C_{14}H_8CaN_2O_6S_2.3^1/_2H_2O$ in each ml. of the Solution taken by the formula $2 \times (C/V) \times 1.276\,(A_U/A_S)$, in which C is the exact concentration of the Reference Standard solution, in mcg. per ml., V is the volume, in ml., of the Solution taken, A_U is the absorbance of the sample solution, A_S is the absorbance of the Reference Standard solution, and 1.276 is the conversion factor relating calcium saccharin to saccharin.

Packaging and storage—Preserve Calcium Cyclamate and Calcium Saccharin Solution in tight containers.

Solution available—Calcium Cyclamate and Calcium Saccharin solution usually available contains 6 percent of calcium cyclamate and 0.6 percent of calcium saccharin.

CATEGORY—See Calcium Cyclamate.

---

[*] Patented. See notice, page ii.

Calcium Cyclamate and Calcium Saccharin Tablets*

Calcium Cyclamate and Calcium Saccharin Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of $C_{12}H_{24}CaN_2O_6S_2 \cdot 2H_2O$ (calcium cyclamate) and of $C_{14}H_8CaN_2O_6S_2 \cdot 3^1/_2H_2O$ (calcium saccharin). The labeled content of calcium cyclamate is at least 10 times the labeled content of calcium saccharin.

Identification—

A: Dissolve 4 Calcium Cyclamate and Calcium Saccharin Tablets in 20 ml. of water: the solution responds to *Identification tests A* and *C* under *Calcium Cyclamate and Calcium Saccharin Solution*, page 120.

B: The ultraviolet absorption spectrum of the solution employed for measurement of absorbance in the *Assay for calcium saccharin* exhibits a maximum at 266 ± 2 mμ, and a minimum at 247 ± 2 mμ.

Solution—Place 5 Calcium Cyclamate and Calcium Saccharin Tablets in a 250-ml. beaker containing 150 ml. of water at 25°. Stir the solution for 5 minutes: all of the tablets dissolve.

Weight variation, page 901—Calcium Cyclamate and Calcium Saccharin Tablets meet the requirements of the weight variation test for tablets.

Assay for calcium cyclamate—Weigh and finely powder not less than 20 Calcium Cyclamate and Calcium Saccharin Tablets. Weigh accurately a portion of the powder, equivalent to about 400 mg. of calcium cyclamate, transfer to a 250-ml. beaker, and dissolve in a mixture of 50 ml. of water and 5 ml. of hydrochloric acid. Proceed as directed in the *Assay* under *Calcium Cyclamate*, page 118, beginning with "Titrate at room temperature. . . ." Each ml. of 0.1 *M* sodium nitrite is equivalent to 21.63 mg. of $C_{12}H_{24}CaN_2O_6S_2 \cdot 2H_2O$.

Assay for calcium saccharin—Weigh accurately a portion of the powdered Calcium Cyclamate and Calcium Saccharin Tablets prepared for the *Assay for calcium cyclamate*, equivalent to about 10 mg. of calcium saccharin, transfer to a 100-ml. volumetric flask, add water to volume, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Saccharin Reference Standard, in the same medium, at a concentration of about 100 mcg. per ml. in 1-cm. cells, at the maximum at about 266 mμ, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg., of $C_{14}H_8CaN_2O_6S_2 \cdot 3^1/_2H_2O$ in the portion of the Tablets taken by the formula $0.1C \times 1.276 (A_U/A_S)$, in which C is the exact concentration of the Reference Standard solution, in mcg. per ml., A_U is the absorbance of the sample solution, A_S is the absorbance of the Reference Standard solution, and 1.276 is the conversion factor relating calcium saccharin to saccharin.

Packaging and storage—Preserve Calcium Cyclamate and Calcium Saccharin Tablets in tight containers.

Tablets available—Calcium Cyclamate and Calcium Saccharin Tablets usually available contain the following: 50 mg. of calcium cyclamate and 5 mg. of calcium saccharin.

CATEGORY—See Calcium Cyclamate.

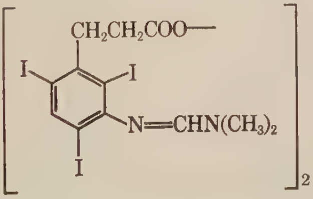
Calcium Ipodate



Calcium 3-[[(Dimethylamino)methylene]amino]-2,4,6-triiodohydrocinnamate

$C_{24}H_{24}CaI_6N_4O_4$ Mol. wt. 1233.99

Calcium Ipodate contains not less than 97.5 percent and not more than 102.5 percent of $C_{24}H_{24}CaI_6N_4O_4$, calculated on the anhydrous basis.

Description—Calcium Ipodate occurs as a white to off-white, odorless, fine crystalline powder.

Solubility—Calcium Ipodate is slightly soluble in water, in alcohol, in chloroform, and in methanol.

Identification—

A: Heat about 500 mg. of Calcium Ipodate in a porcelain crucible over a free flame: violet vapors of iodine are evolved.

B: Dissolve about 200 mg. of Calcium Ipodate in 10 ml. of acetic acid, and add 2 ml. of ammonium oxalate T.S.: a white precipitate, which is soluble in diluted hydrochloric acid, is produced.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Calcium Ipodate, previously dried over a suitable desiccant, exhibits maxima only at the same wavelengths as that of NF Calcium Ipodate Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 100,000 solution of Calcium Ipodate in methanol exhibits maxima and minima at the same wavelengths as that of NF Calcium Ipodate Reference Standard, similarly measured, and the respective absorptivities, calculated on the anhydrous basis, at the point of maximum absorption occurring at about 235 mμ, do not differ by more than 3 percent.

Water, page 900—Determine the water content of Calcium Ipodate by the titrimetric method: not more than 3.5 percent is found.

Iodide or iodine—Dissolve about 200 mg. of Calcium Ipodate in 10 ml. of acetic acid, add 1 ml. of chloroform, and shake vigorously. Allow the layers to separate: the chloroform layer shows no violet color (absence of free iodine). Add 1 ml. of 0.1 *N* potassium iodate, shake vigorously, and allow the layers to separate: the chloroform layer shows at most a slight trace of violet color.

Heavy metals, *Method II*, page 806—The heavy metals limit for Calcium Ipodate is 30 parts per million.

Assay—Transfer about 300 mg. of Calcium Ipodate, accurately weighed, to a 250-ml. glass-stoppered flask, add 30 ml. of sodium hydroxide solution (1 in 20) and 500 mg. of powdered zinc, and reflux the mixture for 60 minutes. Cool, wash the condenser with 20 ml. of water, and filter the mixture. Wash the flask and filter with small portions of water, adding the washings to the filtrate. Add to the filtrate 5 ml. of glacial acetic acid and 3 drops of eosin Y T.S., and titrate with 0.05 *N* silver nitrate until the entire mixture changes to a permanent pink color. Each ml. of 0.05 *N* silver nitrate is equivalent to 10.28 mg. of $C_{24}H_{24}CaI_6N_4O_4$.

Packaging and storage—Preserve Calcium Ipodate in tight containers.

CATEGORY—Diagnostic aid (radiopaque—cholangiography and cholecystography).

USUAL DOSE—**3** to **6 g.,** as a single dose given 10 to 12 hours before the examination.

Calcium Ipodate for Oral Suspension

Calcium Ipodate for Oral Suspension is a dry mixture of calcium ipodate and one or more suitable suspending, dispersing, and flavoring agents. It contains not less than 85.0 percent and not more than 115.0 percent of the labeled amount of $C_{24}H_{24}CaI_6N_4O_4$.

Identification—Stir an amount of Calcium Ipodate for Oral Suspension, equivalent to about 2 g. of calcium ipodate, with 100 ml. of water for several minutes, and filter the suspension with the aid of suction. Wash the filter with several small portions of water, and dry the residue in vacuum at 60° for 4 hours: the calcium ipodate so obtained responds to the *Identification tests* under *Calcium Ipodate*, page 121.

Assay—Weigh accurately the contents of not less than 10 containers of Calcium Ipodate for Oral Suspension, and mix well. Transfer an accurately weighed portion of the granules, equivalent to about 300 mg. of calcium ipodate, to a 250-ml. glass-stoppered flask, and continue as directed in the *Assay* under *Calcium Ipodate*, page 121, beginning with " . . . add 30 ml. of sodium hydroxide solution (1 in 20). . . . "

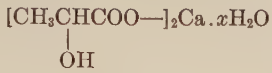
Weight variation, page 901—Calcium Ipodate for Oral Suspension meets the requirements of the weight variation test for powders.

Packaging and storage—Preserve Calcium Ipodate for Oral Suspension in well-closed containers.

Size available—Calcium Ipodate for Oral Suspension usually available contains the following amount of calcium ipodate: 3 g.

CATEGORY and DOSE—See Calcium Ipodate.

Calcium Lactate



$$[\mathrm{CH_3\underset{\underset{OH}{|}}{C}HCOO—}]_2\mathrm{Ca}.x\mathrm{H_2O}$$

$C_6H_{10}CaO_6.xH_2O$ Mol. wt. (anhydrous) 218.22

Calcium Lactate contains not less than 98.0 percent and not more than 101.0 percent of $C_6H_{10}CaO_6$, calculated on the dried basis.

Description—Calcium Lactate occurs as white, almost odorless, granules or powder. The pentahydrate is somewhat efflorescent and at 120° becomes anhydrous.

Solubility—Calcium Lactate pentahydrate is soluble in water. It is practically insoluble in alcohol.

Identification—A solution of Calcium Lactate (1 in 20) responds to the tests for *Calcium*, page 808, and for *Lactate*, page 809.

Loss on drying, page 814—Distribute a 1-g. to 2-g. sample of Calcium Lactate evenly in a suitable weighing dish to a depth not exceeding 3 mm., and dry at 120° for 4 hours: the pentahydrate loses not less than 24 percent and not more than 30 percent of its weight; the trihydrate loses not less than 15 percent and not more than 20 percent of its weight; the monohydrate loses not less than 5 percent and not more than 8 percent of its weight; and the dried form loses not more than 3 percent of its weight.

Acidity—Titrate 20 ml. of a solution of Calcium Lactate (1 in 20) with 0.1 *N* sodium hydroxide, using phenolphthalein T.S. as the indicator: not more than 0.5 ml. is required for neutralization (0.45 percent as lactic acid).

Heavy metals, page 806—Dissolve 1 g. of Calcium Lactate in 2.5 ml. of diluted acetic acid, and dilute to 25 ml. with water: the heavy metals limit for Calcium Lactate is 20 parts per million.

Magnesium and alkali salts—Mix 1 g. of Calcium Lactate with 40 ml. of water, carefully add 1 ml. of hydrochloric acid, heat the solution to boiling, and add rapidly 40 ml. of oxalic acid T.S. Add immediately to the warm mixture 2 drops of methyl red T.S., and then ammonia T.S., dropwise, from a buret, until the mixture is just alkaline. Cool to room temperature, transfer to a 100-ml. graduated cylinder, dilute to 100 ml. with water, mix, and let stand for 4 hours or overnight. Filter, and transfer 50 ml. of the clear filtrate, to which has been added 0.5 ml. of sulfuric acid, to a tared platinum dish. Evaporate the mixture on a steam bath to a small volume. Carefully heat over a free flame to dryness, and continue heating to complete decomposition and volatilization of ammonium salts. Finally ignite the residue to constant weight. The weight of the residue does not exceed 5 mg. (1 percent).

Volatile fatty acid—Stir about 500 mg. of Calcium Lactate with 1 ml. of sulfuric acid, and warm: the mixture does not emit an odor of volatile fatty acid.

Assay—Weigh accurately an amount of Calcium Lactate, equivalent to about 350 mg. of $C_6H_{10}CaO_6$, transfer to a suitable container, and dissolve it in 150 ml. of water containing 2 ml. of diluted hydrochloric acid. While stirring, preferably with a magnetic stirrer, add about 30 ml. of 0.05 *M* disodium ethylenediaminetetraacetate from a 50-ml. buret, then add 15 ml. of sodium hydroxide T.S. and 300 mg. of hydroxy naphthol blue indicator, and continue the titration to a blue end-point. Each ml. of 0.05 *M* disodium ethylenediaminetetraacetate is equivalent to 10.91 mg. of $C_6H_{10}CaO_6$.

Labeling—The label shall declare the degree of hydration of Calcium Lactate or whether it is the dried form. When the quantity of Calcium Lactate is indicated in the labeling of any preparation containing Calcium Lactate, this shall be understood to be in terms of Calcium Lactate pentahydrate ($C_6H_{10}CaO_6.5H_2O$).

Packaging and storage—Preserve Calcium Lactate in tight containers.

CATEGORY—Calcium supplement.

USUAL DOSE RANGE—**1** to **5 g.** three times a day.

Calcium Lactate Tablets

Calcium Lactate Tablets contain not less than 94.0 percent and not more than 106.0 percent of the labeled amount of $C_6H_{10}CaO_6.5H_2O$.

NOTE: An equivalent amount of calcium lactate with less water of hydration may be used in place of $C_6H_{10}CaO_6.5H_2O$ in preparing Calcium Lactate Tablets.

Identification—A filtered solution of Calcium Lactate Tablets, equivalent to calcium lactate solution (1 in 20), responds to the tests for *Calcium*, page 808, and for *Lactate*, page 809.

Disintegration, page 878—The disintegration time limit for Calcium Lactate Tablets is 30 minutes.

Weight variation, page 901—Calcium Lactate Tablets meet the requirements of the weight variation test for tablets.

Assay—Weigh and finely powder not less than 20 Calcium Lactate Tablets. Weigh accurately a portion of the powder, equivalent to about 350 mg. of $C_6H_{10}CaO_6$, transfer to a suitable crucible, and ignite, gently at first, until free from carbon. Cool the crucible, add 10 ml. of water, and dissolve the residue by adding sufficient diluted hydrochloric acid, dropwise, to achieve complete solution. Transfer the solution completely to a suitable container, and dilute to 150 ml. While stirring, preferably with magnetic stirrer, add about 30 ml. of 0.05 *M* disodium ethylenediaminetetraacetate from a 50-ml. buret, then add 15 ml. of sodium hydroxide T.S. and 300 mg. of hydroxy naphthol blue indicator, and continue the titration to a blue endpoint. Each ml. of 0.05 *M* disodium ethylenediaminetetraacetate is equivalent to 15.42 mg. of $C_6H_{10}CaO_6 . 5H_2O$.

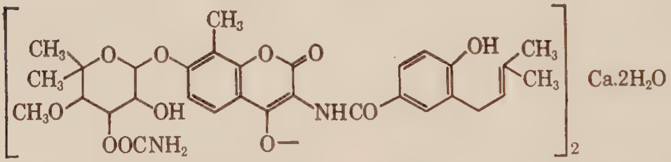
Labeling—The quantity of calcium lactate in the labeling of Calcium Lactate Tablets shall be in terms of calcium lactate pentahydrate.

Packaging and storage—Preserve Calcium Lactate Tablets in tight containers.

Tablets available—Calcium Lactate Tablets usually available contain the following amounts of calcium lactate (pentahydrate): 300 and 600 mg.

CATEGORY and DOSE—See Calcium Lactate.

Calcium Novobiocin



$C_{62}H_{70}CaN_4O_{22} . 2H_2O$ Mol. wt. 1299.37

Calcium Novobiocin contains the equivalent of not less than 80.0 percent of novobiocin (as the free acid, $C_{31}H_{36}N_2O_{11}$), calculated on the dried basis. Calcium Novobiocin conforms to the regulations of the federal Food and Drug Administration concerning certification of antibiotic drugs.

Description—Calcium Novobiocin is a white or practically white, crystalline powder. It is odorless or practically odorless.

Solubility—Calcium Novobiocin is slightly soluble in water and in ether. It is sparingly soluble in alcohol, and is very slightly soluble in chloroform.

Packaging and storage—Preserve Calcium Novobiocin in tight containers.

CATEGORY—Antibacterial.

USUAL DOSE—The equivalent of **250 mg.** of novobiocin acid every 6 hours.

USUAL DOSE RANGE—**250** to **500 mg.** of novobiocin acid.

Calcium Novobiocin Oral Suspension

Calcium Novobiocin Oral Suspension is a suspension of calcium novobiocin in an aqueous vehicle, containing one or more suitable suspending agents, colors, flavors, and preservatives. It contains, in each 100 ml., an amount of calcium novobiocin equivalent to not less than 2.25 g. and not more than 3.00 g. of novobiocin (as the free acid, $C_{31}H_{36}N_2O_{11}$). Calcium Novobiocin Oral Suspension conforms to the regulations of the federal Food and Drug Administration concerning certification of antibiotic drugs.

Packaging and storage—Preserve Calcium Novobiocin Oral Suspension in tight containers, protected from light.

CATEGORY and DOSE—See Calcium Novobiocin.

Calcium Oxytetracycline

$C_{44}H_{46}CaN_4O_{18}$ Mol. wt. 958.95

Calcium Oxytetracycline has a potency of not less than 865 mcg. of oxytetracycline per mg., calculated on the anhydrous basis. Calcium Oxytetracycline conforms to the regulations of the federal Food and Drug Administration concerning certification of antibiotic drugs.

Description—Calcium Oxytetracycline is a yellow to light brown, crystalline powder. The pH of a 1 in 40 suspension is about 7.0.

Solubility—Calcium Oxytetracycline is insoluble in water.

Packaging and storage—Preserve Calcium Oxytetracycline in tight, light-resistant containers in a cool place.

CATEGORY—Antibacterial.

USUAL DOSE—**250 mg.** four times a day.

USUAL DOSE RANGE—**250 to 500 mg.**

Calcium Oxytetracycline Oral Suspension*

Calcium Oxytetracycline Oral Suspension is a suspension of calcium oxytetracycline in an aqueous vehicle containing one or more suitable suspending agents, flavors, colors, and preservatives. It contains the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of $C_{22}H_{24}N_2O_9$ (anhydrous oxytetracycline). Calcium Oxytetracycline Oral Suspension conforms to the regulations of the federal Food and Drug Administration concerning certification of antibiotic drugs.

Packaging and storage—Preserve Calcium Oxytetracycline Oral Suspension in tight, light-resistant containers in a cool place.

Suspension available—Calcium Oxytetracycline Oral Suspension usually available contains an amount of calcium oxytetracycline equivalent to 125 mg. of oxytetracycline in each 5 ml.

CATEGORY and DOSE—See Calcium Oxytetracycline.

---

* Patented. See notice, page ii.

Dibasic Calcium Phosphate

$CaHPO_4$ Mol. wt. (anhydrous) 136.06

Dibasic Calcium Phosphate is anhydrous or contains two molecules of water of hydration. It contains an amount of calcium pyrophosphate ($Ca_2P_2O_7$) equivalent to not less than 98.0 percent and not more than 100.5 percent of $CaHPO_4$, calculated on the ignited basis.

Description—Dibasic Calcium Phosphate occurs as a white, odorless, tasteless powder and is stable in air.

Solubility—Dibasic Calcium Phosphate is practically insoluble in water, soluble in diluted hydrochloric and nitric acids, and is insoluble in alcohol.

Identification—

A: Dissolve about 100 mg. of Dibasic Calcium Phosphate by warming with a mixture of 5 ml. of diluted hydrochloric acid and 5 ml. of water, add 2.5 ml. of ammonia T.S. dropwise, with shaking, and then add 5 ml. of ammonium oxalate T.S.: a white precipitate is formed.

B: To 10 ml. of a warm solution (1 in 100) of Dibasic Calcium Phosphate in a slight excess of nitric acid add 10 ml.

of ammonium molybdate T.S.: a yellow precipitate of ammonium phosphomolybdate is formed.

Loss on ignition—Weigh accurately about 1 g. of Dibasic Calcium Phosphate and ignite, preferably in a muffle furnace at 800° to 825°, to constant weight: anhydrous Dibasic Calcium Phosphate loses not less than 6.6 percent and not more than 8.5 percent of its weight, and hydrous Dibasic Calcium Phosphate loses not less than 24.5 percent and not more than 26.5 percent of its weight.

Acid-insoluble substances—Heat 5 g. of Dibasic Calcium Phosphate with a mixture of 40 ml. of water and 10 ml. of hydrochloric acid until no more dissolves, and dilute to 100 ml. with water. If an insoluble residue remains, filter, wash with hot water until the last washing does not give a reaction for chloride, and dry the residue at 105° for 1 hour: the weight of the residue does not exceed 5 mg. (0.1 percent).

Carbonate—Mix 1 g. of Dibasic Calcium Phosphate with 5 ml. of water, and add 2 ml. of hydrochloric acid: no effervescence occurs.

Chloride, page 784—To 300 mg. of Dibasic Calcium Phosphate add 10 ml. of water and 2 ml. of nitric acid, and warm gently, if necessary, until no more dissolves. Dilute to 25 ml., filter if necessary, and add 1 ml. of silver nitrate T.S.: the turbidity does not exceed that produced by 1 ml. of 0.02 *N* hydrochloric acid (0.25 percent).

Fluoride—Place 2 g. of Dibasic Calcium Phosphate together with 5 ml. of perchloric acid, 15 ml. of water, and a few glass beads in a 50-ml. distilling flask connected with a condenser. The flask also is equipped with a thermometer and a capillary tube, both of which extend into the liquid. Connect a small dropping funnel, filled with water, to the capillary tube. Support the flask on an asbestos mat with a hole that exposes about one-third of the flask to the flame. Distil until the temperature reaches 135°, receiving the distillate under the surface of a few ml. of water, and then maintain at 135° to 140° by adding water from the funnel. Continue the distillation until 70 ml. has been collected, dilute the distillate to 80 ml. with water, and mix. Place 40 ml. of the solution in a 50-ml. color-comparison tube. In a similar tube place 40 ml. of water as a control. Add to each tube 0.1 ml. of sodium alizarinsulfonate solution (1 in 1000), and mix. Add dropwise, and with stirring, 0.05 *N* sodium hydroxide to the tube containing the distillate until the color just matches that of the control, which is faintly pink. Then add to each tube 1.0 ml. of 0.1 *N* hydrochloric acid, and mix. From a buret, graduated in 0.05-ml. intervals, add slowly to the tube containing the distillate enough thorium nitrate solution, made by dissolving 250 mg. of thorium nitrate in 1000 ml. of water, so that, after mixing, the color of the liquid just changes to a faint pink. Note the volume of thorium nitrate solution added, add exactly the same volume to the control, and mix. Then add sodium fluoride T.S. from a buret to the control to make the colors of the two tubes match after dilution to the same volume. Mix, and allow all air bubbles to escape before making the final color comparison. Check the end-point by adding 1 or 2 drops of sodium fluoride T.S. to the control: a distinct change in color takes place. Not more than 5 ml. of the sodium fluoride T.S. is required (50 parts per million). Each ml. of sodium fluoride T.S. is equivalent to 10 mcg. of fluoride (F).

Sulfate, page 784—Dissolve 1 g. of Dibasic Calcium Phosphate in the smallest possible amount of diluted hydrochloric acid, dilute to 100.0 ml. with water and filter if necessary. To 20 ml. of the filtrate add 1 ml. of barium chloride T.S.: the turbidity does not exceed that produced by 1 ml. of 0.02 *N* sulfuric acid (0.5 percent).

Arsenic—A solution of 1.25 g. of Dibasic Calcium Phosphate in 25 ml. of diluted hydrochloric acid meets the requirements of the *Arsenic Test,* page 777 (8 parts per million As).

Barium—Heat 500 mg. of Dibasic Calcium Phosphate with 10 ml. of water, and add hydrochloric acid dropwise, stirring after each addition, until no more dissolves. Filter, and to the filtrate add 2 ml. of potassium sulfate T.S.: no turbidity is produced within 10 minutes.

Heavy metals, page 806—Warm 1 g. of Dibasic Calcium Phosphate with 3 ml. of diluted hydrochloric acid until no more dissolves, dilute to 50 ml. with water, and filter: the heavy metals limit, determined in 25 ml. of the filtrate, is 30 parts per million.

Assay—Dissolve about 300 mg. of Dibasic Calcium Phosphate, previously ignited at 800° to 825° to constant weight and accurately weighed, in 10 ml. of diluted hydrochloric acid, add about 120 ml. of water and 3 drops of methyl orange T.S., and boil for 30 minutes in a covered container, maintaining the volume of solution constant and acidic during the boiling period by adding diluted hydrochloric acid or water, if necessary. Add 30 ml. of ammonium oxalate T.S. and 2 drops of methyl red T.S., then add dropwise, with constant stirring, a mixture of equal volumes of ammonia T.S. and water until the pink color of the indicator just disappears. Digest on a steam bath for 30 minutes. Cool to room temperature, allow the precipitate to settle, and filter the supernatant liquid through an asbestos mat in a porcelain filter crucible, using gentle suction. Wash the precipitate in the beaker with about 30 ml. of cold (below 20°) wash solution, prepared by diluting 10 ml. of ammonium oxalate T.S. to one liter. Allow the precipitate to settle, and pour the supernatant liquid through the filter. Repeat this washing by decantation three more times. Using the wash solution, transfer the precipitate as completely as possible to the filter. Finally wash the beaker and the filter with two 10-ml. portions of cold (below 20°) water. Place the porcelain filter crucible in the beaker, and add 100 ml. of water and 50 ml. of cold dilute sulfuric acid (1 in 6). Add from a buret 35 ml. of 0.1 *N* potassium permanganate, and stir until the color disappears. Heat to about 70°, and complete the titration with 0.1 *N* potassium permanganate. Each ml. of 0.1 *N* potassium permanganate is equivalent to 6.352 mg. of $CaHPO_4$.

Packaging and storage—Preserve Dibasic Calcium Phosphate in well-closed containers.

Labeling—Label Dibasic Calcium Phosphate to indicate whether it is anhydrous or hydrous.

CATEGORY—Source of Calcium.
USUAL DOSE—**1 g.** three times a day.
USUAL DOSE RANGE—**1** to **5 g.**

Tribasic Calcium Phosphate

Tribasic Calcium Phosphate consists of a variable mixture of calcium phosphates having the approximate composition $10CaO.3P_2O_5.H_2O$. It contains an amount of phosphate (PO_4) equivalent to not less than 90.0 percent of tribasic calcium phosphate, $Ca_3(PO_4)_2$, calculated on the ignited basis.

Description—Tribasic Calcium Phosphate occurs as a white, odorless, and tasteless powder, which is stable in air.

Solubility—Tribasic Calcium Phosphate dissolves readily in diluted hydrochloric and nitric acids. It is insoluble in alcohol and almost insoluble in water.

Identification—

A: To a warm solution of Tribasic Calcium Phosphate in a slight excess of nitric acid, add ammonium molybdate T.S.: a yellow precipitate forms.

B: Dissolve about 100 mg. of Tribasic Calcium Phosphate by warming with 5 ml. of diluted hydrochloric acid and 5 ml. of water, add 1 ml. of ammonia T.S., dropwise, with shaking, and then add 5 ml. of ammonium oxalate T.S.: a white precipitate forms.

C: Tribasic Calcium Phosphate responds to the flame test for *Calcium*, page 808.

Loss on ignition—Ignite Tribasic Calcium Phosphate at about 800° for 30 minutes: it loses not more than 8 percent of its weight.

Water-soluble substances—Digest 2 g. of Tribasic Calcium Phosphate with 100 ml. of water for 30 minutes on a steam bath, cool, add sufficient water to restore the original volume, stir well, and filter. Evaporate to dryness 50 ml. of the filtrate in a tared porcelain dish on a steam bath, and dry the residue at 120° to constant weight: the weight of the residue does not exceed 5 mg. (0.5 percent).

Acid-insoluble substances—If an insoluble residue remains in the test for *Carbonate*, boil the solution, filter, wash the residue well with hot water until the last washing is free from chloride, and ignite the residue to constant weight: the weight of the residue does not exceed 4 mg. (0.2 percent).

Carbonate—Mix 2 g. of Tribasic Calcium Phosphate with 20 ml. of water, and add diluted hydrochloric acid, dropwise, to effect solution: no effervescence occurs when the acid is added.

Chloride, page 784—Dissolve 500 mg. of Tribasic Calcium Phosphate in 25 ml. of diluted nitric acid, and add 1 ml. of silver nitrate T.S.: the turbidity does not exceed that produced by 1 ml. of 0.02 *N* hydrochloric acid (0.14 percent).

Fluoride—Place 2 g. of Tribasic Calcium Phosphate, 5 ml. of perchloric acid, 15 ml. of water, and a few glass beads in a 50-ml. distilling flask connected with a condenser. The flask is also equipped with a thermometer and a capillary tube, both of which must extend into the liquid. Connect a small dropping funnel, filled with water, to the capillary tube. Support the flask on an asbestos mat with a hole which exposes about one-third of the flask to the flame. Distil until the temperature reaches 135°, receiving the distillate under the surface of a few ml. of water; then maintain at 135° to 140° by adding water from the funnel. Continue the distillation until 70 ml. has been collected, dilute the distillate to 80 ml. with water, and mix. Place 40 ml. of the solution in a 50-ml. color-comparison tube. In another similar color-comparison tube place 40 ml. of water as a control. Add to each tube 0.1 ml. of sodium alizarinsulfonate solution (1 in 1000) and mix. Add, dropwise, and with stirring, 0.05 *N* sodium hydroxide to the tube containing the distillate until its color just matches that of the control, which is faintly pink. Then add to each tube 1.0 ml. of 0.1 *N* hydrochloric acid, and mix. From a buret, graduated in 0.05 ml., add slowly to the tube containing the distillate enough thorium nitrate solution, made by dissolving 250 mg. of thorium nitrate in 1000 ml. of water, so that, after mixing, the color of the liquid just changes to a faint pink. Note the volume of thorium nitrate solution added, add exactly the same volume to the control, and mix. Now add to the control sodium fluoride T.S. from a buret to make the colors of the two tubes match after dilution to the same volume. Mix, and allow all air bubbles to escape before making the final color comparison. Check the endpoint by adding 1 or 2 drops of sodium fluoride T.S. to the control: a distinct change in color should take place. Not more than 5 ml. of the sodium fluoride T.S. is required (50 parts per million). Each ml. of sodium fluoride T.S. is equivalent to 10 mcg. of fluoride (F).

Nitrate—Mix 200 mg. of Tribasic Calcium Phosphate with 5 ml. of water, and add just sufficient hydrochloric acid to effect solution. Dilute with water to 10 ml., add 0.1 ml. of indigo carmine T.S., then add, with stirring, 10 ml. of sulfuric acid: the blue color persists for at least 5 minutes.

Sulfate, page 784—Dissolve 500 mg. of Tribasic Calcium Phosphate in the smallest possible amount of diluted hydrochloric acid, dilute to 100 ml. with water, filter, if necessary, and to 25 ml. of the filtrate add 1 ml. of barium chloride T.S.: the turbidity does not exceed that produced by 1 ml. of 0.02 *N* sulfuric acid (0.8 percent).

Arsenic—A solution of 1.25 g. of Tribasic Calcium Phosphate in just sufficient diluted hydrochloric acid to dissolve the sample meets the requirements of the *Arsenic Test,* page 777 (8 parts per million As).

Barium—Mix 500 mg. of Tribasic Calcium Phosphate with 10 ml. of water, heat, and add hydrochloric acid, dropwise, until solution is effected, then add 2 drops of the acid in excess. Filter, and add to the filtrate 1 ml. of potassium sulfate T.S.: no turbidity appears within 15 minutes.

Dibasic salt and calcium oxide—Weigh accurately about 2 g. of Tribasic Calcium Phosphate, and dissolve it by warming with 50.0 ml. of 1 *N* hydrochloric acid. Cool, add 1 or 2 drops of methyl orange T.S., and slowly titrate the excess of 1 *N* hydrochloric acid with 1 *N* sodium hydroxide to a yellow color, vigorously shaking the mixture during titration. Not less than 12.5 ml. and not more than 13.8 ml. of 1 *N* hydrochloric acid is consumed for each g. of salt, calculated on the ignited basis.

Heavy metals, page 806—Mix thoroughly 2 g. of Tribasic Calcium Phosphate with 9 ml. of diluted hydrochloric acid, dilute to 50 ml. with water, and heat to boiling. Cool to room temperature, and filter. Use 25 ml. of the filtrate for the test: the heavy metals limit for Tribasic Calcium Phosphate is 30 parts per million. (NOTE: filter the mixture after the pH adjustment.)

Assay—Weigh accurately about 200 mg. of Tribasic Calcium Phosphate, and dissolve it in a mixture of 25 ml. of water and 10 ml. of diluted nitric acid. Filter, if necessary, wash any precipitate, add sufficient ammonia T.S. to the filtrate to produce a slight precipitate, then dissolve the precipitate by the addition of 1 ml. of diluted nitric acid. Adjust the temperature to about 50°, add 75 ml. of ammonium molybdate T.S., and maintain the temperature at about 50° for 30 minutes, stirring occasionally. Wash the precipitate once or twice with water by decantation, using from 30 to 40 ml. each time. Transfer the precipitate to a filter, and wash with potassium nitrate solution (1 in 100) until the last washing is not acid to litmus paper. Transfer the precipitate and filter to the precipitation vessel with 50 ml. of water, add 40.0 ml. of 1 *N* sodium hydroxide, agitate until the precipitate is dissolved, add 3 drops of phenolphthalein T.S., and then titrate the excess alkali with 1 *N* sulfuric acid. Each ml. of 1 *N* sodium hydroxide is equivalent to 6.743 mg. of $Ca_3(PO_4)_2$.

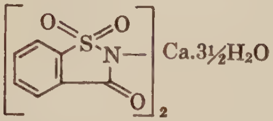
Packaging and storage—Preserve Tribasic Calcium Phosphate in well-closed containers.

CATEGORY—Calcium supplement.

USUAL DOSE RANGE—**1** to **5 g.** three times a day.

Calcium Saccharin and Calcium Cyclamate Solution, page 120
Calcium Saccharin and Calcium Cyclamate Tablets, page 121

Calcium Saccharin



1,2-Benzisothiazolin-3-one 1,1-Dioxide Calcium Salt

$C_{14}H_8CaN_2O_6S_2 . 3^1/_2H_2O$ Mol. wt. 467.49

Calcium Saccharin contains not less than 95.0 percent and not more than 100.5 percent of $C_{14}H_8CaN_2O_6S_2$, calculated on the anhydrous basis.

Description—Calcium Saccharin occurs as white crystals or as a white, crystalline powder. It is odorless or has a faint, aromatic odor, and has an intensely sweet taste even in dilute solutions. Calcium Saccharin in dilute solution is about 300 times as sweet as sucrose.

Solubility—Calcium Saccharin is freely soluble in water.

Identification—

A: Dissolve about 100 mg. of Calcium Saccharin in 5 ml. of sodium hydroxide solution (1 in 20), evaporate the solution to dryness, and gently fuse the residue over a small flame until it no longer evolves ammonia. Allow the residue to cool, dissolve it in 20 ml. of water, neutralize the solution with diluted hydrochloric acid, and filter: the addition of a drop of ferric chloride T.S. to the filtrate produces a violet color.

B: Mix 20 mg. of Calcium Saccharin with 40 mg. of resorcinol, add 10 drops of sulfuric acid, and heat the mixture in a suitable liquid bath at 200° for 3 minutes. Allow it to cool, and add 10 ml. of water and an excess of sodium hydroxide T.S.: a fluorescent green liquid results.

C: A solution of Calcium Saccharin (1 in 10) responds to the tests for *Calcium,* page 808.

D: To 10 ml. of a solution of Calcium Saccharin (1 in 10) add 1 ml. of hydrochloric acid: a crystalline precipitate of saccharin is formed. Wash the precipitate well with cold water, and dry at 105° for 2 hours: it melts between 226° and 230°, page 814.

Water, page 900—Determine the water content of Calcium Saccharin by the titrimetric method: not less than 3 percent and not more than 15 percent is found.

Benzoate and salicylate—To 10 ml. of a solution of Calcium Saccharin (1 in 20), previously acidified with 5 drops of acetic acid, add 3 drops of ferric chloride T.S.: no precipitate or violet color appears.

Arsenic—A *Test Preparation* prepared with 3.33 g. of Calcium Saccharin, as directed for organic compounds, meets the requirements of the *Arsenic Test,* page 777 (3 parts per million As).

Selenium—A *Test Preparation* prepared with 200 mg. of Calcium Saccharin meets the requirements of the *Selenium Limit Test,* page 865 (30 parts per million).

Heavy metals, page 806—Dissolve 2 g. of Calcium Saccharin in 48 ml. of water, add 2 ml. of 1 *N* hydrochloric acid, mix, and rub the inner wall of the vessel with a glass rod until crystallization begins. Allow the solution to stand for 1 hour, then filter through a dry filter, rejecting the first 10 ml. of filtrate: the heavy metals limit for Calcium Saccharin, determined in 25 ml. of the subsequent filtrate, is 10 parts per million.

Readily carbonizable substances—Dissolve 200 mg. of Calcium Saccharin in 5 ml. of sulfuric acid T.S., and keep at a temperature of 48° to 50° for 10 minutes: the solution has no more color than Matching Fluid A (see page 856).

Assay—Weigh accurately about 500 mg. of Calcium Saccharin, and transfer completely to a separator with the aid of 10 ml. of water. Add 2 ml. of diluted hydrochloric acid, and extract the precipitated saccharin first with 30 ml., then with four 20-ml. portions, of a solvent composed of 9 volumes of chloroform and 1 volume of alcohol, filtering each extract through a small filter paper moistened with the solvent. Evaporate the combined filtrates on a steam bath, with the aid of a current of air, to dryness, then dissolve the residue in 75 ml. of hot water, cool, add 3 drops of phenolphthalein T.S., and titrate with 0.1 *N* sodium hydroxide. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* sodium hydroxide is equivalent to 20.22 mg. of $C_{14}H_8CaN_2O_6S_2$.

Packaging and storage—Preserve Calcium Saccharin in well-closed containers.

CATEGORY—Non-nutritive sweetener.

Calcium Stearate

Calcium Stearate is a compound of calcium with a mixture of solid organic acids obtained from fats, and consists chiefly of variable proportions of calcium stearate and calcium palmitate. It contains the equivalent of not less than 9.0 percent and not more than 10.5 percent of CaO (calcium oxide).

Description—Calcium Stearate occurs as a fine, white to yellowish white, bulky powder having a slight, characteristic odor. It is unctuous and is free from grittiness.

Solubility—Calcium Stearate is insoluble in water, in alcohol, and in ether.

Identification—

A: Heat 1 g. of Calcium Stearate with a mixture of 25 ml. of water and 5 ml. of hydrochloric acid. Fatty acids are liberated and appear as an oily layer floating on the surface of the liquid. The water layer responds to the tests for *Calcium*, page 808.

B: Mix 25 g. of Calcium Stearate with 200 ml. of hot water, then add 60 ml. of diluted sulfuric acid, and heat the mixture, with frequent stirring, until the separated fatty acid layer is clear. Wash the fatty acids with boiling water until free from sulfate, collect them in a small beaker, and warm on a steam bath until the water has separated and the fatty acids are clear. Allow the acids to cool, pour off the water layer, then melt the acids, filter into a dry beaker, and dry at 105° for 20 minutes: the fatty acids so obtained congeal at a temperature not below 54° (page 814).

Loss on drying, page 814—Dry Calcium Stearate to constant weight at 105°, using 2-hour increments of heating: it loses not more than 4 percent of its weight.

Arsenic—Mix 3.3 g. of Calcium Stearate with 25 ml. of hydrochloric acid and 1 ml. of bromine T.S., and heat on a steam bath until the separated fatty acid layer is clear. Add 50 ml. of water, evaporate to about 25 ml., and filter while hot. Cool, neutralize with a solution of sodium hydroxide (1 in 2), and dilute to 35 ml. with water: this solution meets the requirements of the *Arsenic Test*, page 777 (3 parts per million As).

Heavy metals, page 806—Place 2.5 g. of Calcium Stearate in a porcelain dish, place a 500-mg. portion in a second dish for the control, and to each add 5 ml. of a solution of magnesium nitrate (1 in 4) in alcohol. Cover the dishes with 7.5 cm. short-stem funnels so that the stems are straight up. Heat for 30 minutes on a hot plate at low heat, then heat for 30 minutes at medium heat, and cool. Remove the funnels, add 20 mcg. of lead ion (Pb) to the control, and heat each dish over a suitable burner until most of the carbon is burned off. Cool, add 10 ml. of nitric acid, and transfer the solutions into 250-ml. beakers. Add 5 ml. of 70 percent perchloric acid, cautiously evaporate to dryness, then add 2 ml. of hydrochloric acid to the residues, and wash down the inside of the beakers with water. Evaporate carefully to dryness again, swirling near the dry point to avoid spattering. Repeat the hydrochloric acid treatment, then cool, and dissolve the residues in about 10 ml. of water. To each solution add 1 drop of phenolphthalein T.S. and sufficient sodium hydroxide T.S. until the solutions just turn pink, and then add diluted hydrochloric acid until the solutions become colorless. Add 1 ml. of diluted acetic acid and a small amount of charcoal to each solution, and filter through Whatman No. 2 or equivalent filter paper into 50-ml. color-comparison tubes. Wash with water, dilute to 40 ml. with water, and add 10 ml. of hydrogen sulfide T.S. to each tube: the color in the solution of the sample does not exceed that produced in the control (10 parts per million).

Assay—Boil about 1.2 g. of Calcium Stearate, accurately weighed, with 50 ml. of 0.1 *N* hydrochloric acid for 10 minutes, or until the separated fatty acid layer is clear, adding water if necessary to maintain the original volume. Cool, filter, and wash the filter and flask thoroughly with water until the last washing is not acid to litmus. Neutralize the filtrate to litmus paper with sodium hydroxide T.S. While stirring, preferably with a magnetic stirrer, titrate with 0.05 *M* disodium ethylenediaminetetraacetate as follows: add about 30 ml. from a 50-ml. buret, then add 15 ml. of sodium hydroxide T.S. and 300 mg. of hydroxy naphthol blue, and continue the titration to a blue end-point. Each ml. of 0.05 *M* disodium ethylenediaminetetraacetate is equivalent to 2.804 mg. of CaO.

Packaging and storage—Preserve Calcium Stearate in well-closed containers.

CATEGORY—Tablet lubricant.

Calcium Sulfate

$CaSO_4$ Mol. wt. 136.14

Calcium Sulfate is anhydrous or contains two molecules of water of hydration. When dried at 250° to constant weight, it contains not less than 99.0 percent and not more than 101.0 percent of $CaSO_4$.

Description—Calcium Sulfate occurs as a fine, white to slightly yellow-white, odorless powder.

Solubility—Calcium Sulfate dissolves in diluted hydrochloric acid. It is slightly soluble in water.

Identification—Dissolve about 200 mg. of Calcium Sulfate by warming in a mixture of 4 ml. of diluted hydrochloric acid and 16 ml. of water. This solution responds to the tests for *Calcium*, page 808, and for *Sulfate*, page 810.

Loss on drying, page 814—Dry Calcium Sulfate at 250° to constant weight: the anhydrous form loses not more than 1.5 percent of its weight; the dihydrate loses not less than 17 percent and not more than 21 percent of its weight.

Carbonate—Mix 1 g. of Calcium Sulfate with 5 ml. of water, and add a few drops of diluted hydrochloric acid: no effervescence occurs when the acid is added.

Iron—Dissolve 200 mg. of Calcium Sulfate and about 50 mg. of ammonium persulfate in 10 ml. of diluted hydrochloric acid, dilute to 50 ml. with water, and mix. To this solution add 3 ml. of ammonium thiocyanate T.S., and mix thoroughly: the color obtained is no darker than that produced in 50 ml. of a solution containing 140 mcg. of ferrous ammonium sulfate (equivalent to 20 mcg. of Fe) when treated in the same manner (100 parts per million of Fe).

Heavy metals, page 806—Mix 2 g. of Calcium Sulfate with 20 ml. of water, add 25 ml. of diluted hydrochloric acid, and heat to boiling to dissolve the sample. Cool, and add stronger ammonia water to a pH of 7. Filter, evaporate to a volume of about 25 ml., and refilter if necessary to obtain a clear solution: the heavy metals limit for Calcium Sulfate is 10 parts per million.

Assay—Dissolve about 300 mg. of Calcium Sulfate, previously dried at 250° to constant weight and accurately weighed, in 100 ml. of water and 4 ml. of diluted hydrochloric acid. While stirring, preferably with a magnetic stirrer, titrate as follows: add about 30 ml. of 0.05 *M* disodium ethylenediaminetetraacetate from a 50-ml. buret, then add 15 ml. of sodium hydroxide T.S. and 300 mg. of hydroxy naphthol blue, and continue the titration to a blue endpoint. Each ml. of 0.05 *M* disodium ethylenediaminetetraacetate is equivalent to 6.807 mg. of $CaSO_4$.

Packaging and storage—Preserve Calcium Sulfate in well-closed containers.

Labeling—The label should indicate whether the Calcium Sulfate is anhydrous or the dihydrate.

CATEGORY—Tablet diluent.

Camphor Spirit

Camphor Spirit is an alcohol solution containing, in each 100 ml., not less than 9.0 g. and not more than 11.0 g. of $C_{10}H_{16}O$.

Camphor	**100 g.**
Alcohol, a sufficient quantity,	
To make	**1000 ml.**

Dissolve the camphor in about 800 ml. of alcohol, then add alcohol to make the product measure 1000 ml. Filter if necessary.

Assay—Pipet 2.0 ml. of Camphor Spirit into a suitable pressure bottle containing 50 ml. of freshly prepared dinitrophenylhydrazine T.S. Close the pressure bottle, immerse it in a water bath, and maintain at about 75° for 4 hours. Cool to room temperature, and transfer the contents to a beaker with the aid of 100 ml. of dilute sulfuric acid (1 in 12). Allow to stand not less than 12 hours at room temperature, transfer the precipitate to a tared filter crucible, and wash with 100 ml. of dilute sulfuric acid (1 in 12) followed by 75 ml. of cold water in divided portions. Continue the suction until the excess water is removed, dry the crucible and precipitate at 80° for 2 hours, cool, and weigh. The weight of the precipitate so obtained, multiplied by 0.4581, represents the weight of $C_{10}H_{16}O$ in the sample taken.

Alcohol content, page 772—Camphor Spirit contains from 80 to 87 percent (v/v) of C_2H_5OH.

Packaging and storage—Preserve Camphor Spirit in tight containers.

CATEGORY—Local irritant.

Camphorated Parachlorophenol

Camphorated Parachlorophenol contains not less than 33.0 percent and not more than 37.0 percent of C_6H_5ClO (parachlorophenol) and not less than 63.0 percent and not more than 67.0 percent of $C_{10}H_{16}O$ (camphor). The sum of the percentages of parachlorophenol and camphor is not less than 97.0 and not more than 103.0.

Parachlorophenol	**350 g.**
Camphor	**650 g.**
To make	**1000 g.**

Triturate the parachlorophenol and the camphor together until they liquefy and are thoroughly mixed.

Assay for parachlorophenol—Transfer about 1 g. of Camphorated Parachlorophenol, accurately weighed, to a wide-mouth conical flask, add a few glass beads, 6 ml. of sodium hydroxide solution (1 in 2), and 130 ml. of water. Heat the solution to boiling, add 70 ml. of potassium permanganate solution (6 in 100), and continue to boil for 20 minutes. To the hot solution, add 40 ml. of approximately 0.1 *N* silver nitrate. Add 50 ml. of 50 percent sulfuric acid, and sodium sulfite crystals, in divided portions and with swirling until the permanganate color is discharged and no manganese dioxide remains. Boil until the vapors are no longer acid to litmus, keeping the volume nearly constant by the addition of water. Add 5 ml. of nitric acid and continue to boil for 5 minutes. Cool and collect the precipitate on a tared filter crucible, wash well with water followed by 10 ml. of alcohol, dry at 105° for 1 hour, cool, and weigh. Each g. of silver chloride is equivalent to 897.0 mg. of C_6H_5ClO.

Assay for camphor—Transfer about 300 mg. of Camphorated Parachlorophenol, accurately weighed, into a 200-ml. pressure bottle containing 50 ml. of freshly prepared dinitrophenylhydrazine T.S. Close the pressure bottle, immerse it in a water bath, and maintain at about 75° for 4 hours. Cool to room temperature, then transfer the contents to a beaker with the aid of 100 ml. of dilute sulfuric acid (1 in 12), and allow it to stand overnight. Collect the precipitate on a tared filter crucible, wash with 100 ml. of dilute sulfuric acid (1 in 12) and then with 75 ml. of cold water, in divided portions, to remove the acid. Dry for 2 hours at 80°, cool, and weigh. The weight of the precipitate so obtained, multiplied by 0.4581, represents the weight of $C_{10}H_{16}O$ in the sample taken.

Packaging and storage—Preserve Camphorated Parachlorophenol in tight, light-resistant containers.

Category—Local anti-infective (dental).

Candicidin

Candicidin is a substance produced by the growth of *Streptomyces griseus* Waksman and Henrici (Fam. *Streptomycetaceæ*). Candicidin, dried at 40° for 3 hours at a pressure of 5 mm. or less of mercury, has a potency of not less than 1000 mcg. per mg. Candicidin conforms to the regulations of the federal Food and Drug Administration concerning certification of antibiotic drugs.

Description—Candicidin occurs as a yellow to brown powder.

Solubility—Candicidin is sparingly soluble in water, and is very slightly soluble in alcohol, in acetone, and in *n*-butanol.

Packaging and storage—Preserve Candicidin in tight containers, in a refrigerator.

Category—Local antifungal.

Application—Vaginal, **3 mg.** inserted twice daily for 14 days.

Candicidin Ointment

Candicidin Ointment is candicidin dispersed in a suitable ointment base. It contains not less than 90.0 percent and not more than 140.0 percent of the labeled amount of candicidin. Candicidin Ointment conforms to the regulations of the federal

Food and Drug Administration concerning certification of antibiotic drugs.

Packaging and storage—Preserve Candicidin Ointment in well-closed containers, in a refrigerator.

Ointment available—Candicidin Ointment usually available contains 0.06 percent of candicidin.

Category and Application—See Candicidin.

Candicidin Suppositories

Candicidin Suppositories contain not less than 90.0 percent and not more than 140.0 percent of the labeled amount of candicidin. Candicidin Suppositories conform to the regulations of the federal Food and Drug Administration concerning certification of antibiotic drugs.

Packaging and storage—Preserve Candicidin Suppositories in tight containers, in a refrigerator.

Suppositories available—Candicidin Suppositories usually available contain the following amount of candicidin: 3 mg.

Category and Application—See Candicidin.

Caramel

Caramel is a concentrated solution of the product obtained by heating sugar or glucose until the sweet taste is destroyed and a uniform dark brown mass results, a small amount of alkali, alkaline carbonate, or a trace of mineral acid being added while heating.

Description—Caramel is a thick, dark brown liquid with the characteristic odor of burnt sugar, and a pleasant, bitter taste. One part of Caramel dissolved in 1000 parts of water yields a clear solution having a distinct yellowish orange color. The color of this solution is not changed and no precipitate is formed after exposure to sunlight for 6 hours. Caramel spread in a thin layer on a glass plate appears homogeneous, reddish brown, and transparent.

Solubility—Caramel is miscible with water and is soluble in dilute alcohol up to 55 percent (v/v). It is immiscible with ether, chloroform, acetone, benzene, and solvent hexane.

Specific gravity, page 866—The specific gravity of Caramel is not less than 1.30.

Purity—The addition of 0.5 ml. of phosphoric acid to 20 ml. of a solution of Caramel (1 in 20) produces no precipitate.

Ash—Caramel swells when incinerated, and forms a coke-like charcoal which burns off only after prolonged heating at a high temperature. It yields not more than 8 percent of ash.

Packaging and storage—Preserve Caramel in tight containers.

Category—Color.

Caraway

Caraway is the dried ripe fruit of *Carum carvi* Linné (Fam. *Umbelliferæ*).

Unground Caraway occurs chiefly as separated mericarps from about 4 mm. up to about 7 mm. in length and from 1 to 2 mm. in diameter. The mericarp is oblong, curved, and tapers toward base and apex to which half of the stylopodium is attached. Externally, it is dark brown to weak brown and shows 5 lighter-colored, filiform primary ribs, between each pair of which, on the dorsal surface, occurs a secondary rib. The odor and taste are characteristically aromatic.

Histology—The mericarp of Caraway is nearly equilaterally pentagonal in transverse section and shows a fibrovascular bundle in each primary rib. The epicarp consists of tabular-polygonal epidermal cells with thick outer walls possessing a striated cuticle and with occasional stomata. The mesocarp, each located between primary rib regions, is composed of collapsed, thin-walled parenchyma normally bearing 4 dorsal vittæ in the intervals and 2 commissural vittæ, sometimes one or more additional. The endocarp consists of broad, slightly undulate, inner epidermal cross cells which are coherent with the collapsed cells of the spermoderm. The endosperm consists of thick-walled reserve parenchyma containing fixed oil and aleurone grains up to 10 μ in diameter, the latter with embedded rosette aggregates of calcium oxalate up to 4 μ in diameter. An embryo is embedded in the upper end of the endosperm.

Powdered Caraway is moderate yellowish brown to light olive-brown. It shows fragments of the epicarp with striped cuticle; numerous polyhedral endosperm cells containing aleurone grains with embedded calcium oxalate rosette aggregates; few fragments of slightly lignified fibers and spiral vessels; fragments of cross cells of endocarp; orange to yellow fragments of vittæ; no reticulate parenchyma.

Acid-insoluble ash, page 886—Caraway yields not more than 1.5 percent of acid-insoluble ash.

Foreign organic matter, page 886—The amount of other fruits, seeds, or other foreign organic matter in Caraway does not exceed 3 percent.

Packaging and storage—Preserve Caraway in well-closed containers. Caraway is susceptible to attack by insects, page 14.

CATEGORY—Flavor.

Caraway Oil

Caraway Oil is a volatile oil distilled from the dried, ripe fruit of *Carum carvi* Linné (Fam. *Umbelliferæ*). Caraway Oil yields not less than 50.0 percent (v/v) of $C_{10}H_{14}O$ (carvone).

Description—Caraway Oil is a colorless to pale yellow liquid, with the characteristic odor and taste of caraway.

Solubility test—One volume of Caraway Oil is soluble in 8 volumes of 80 percent alcohol.

Specific gravity, page 866—The specific gravity of Caraway Oil is not less than 0.900 and not more than 0.910.

Angular rotation, page 822—The angular rotation of Caraway Oil is not less than +70° and not more than +80° when determined in a 100-mm. tube.

Refractive index, page 858—The refractive index of Caraway Oil at 20° is not less than 1.484 and not more than 1.488.

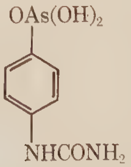
Heavy metals, page 806—Caraway Oil meets the requirements of the test for heavy metals in volatile oils.

Assay—Introduce 10 ml. of Caraway Oil, accurately measured, into a cassia flask, and add 50 ml. of a saturated solution of sodium sulfite which has been rendered neutral to 2 drops of phenolphthalein T.S. by means of a saturated sodium bisulfite solution. Heat the flask in boiling water, and shake it repeatedly, neutralizing the mixture from time to time by the addition of a few drops of the saturated sodium bisulfite solution. When no coloration appears upon adding a few more drops of phenolphthalein T.S. and heating for 15 minutes, cool the mixture to room temperature, and when the liquids have separated completely, add sufficient sodium sulfite solution to raise the lower level of the oily layer within the graduated portion of the neck of the flask. Note the volume of the residual oily liquid. This volume does not exceed 5 ml., indicating the presence in Caraway Oil of not less than 50.0 percent (v/v) of $C_{10}H_{14}O$ (carvone).

Packaging and storage—Preserve Caraway Oil in tight, light-resistant containers.

CATEGORY—Flavor.

Carbarsone



N-Carbamoylarsanilic Acid

$C_7H_9AsN_2O_4$ Mol. wt. 260.08

Carbarsone contains not less than 97.5 percent and not more than 101.0 percent of $C_7H_9AsN_2O_4$, calculated on the dried basis.

Description—Carbarsone occurs as a white, almost odorless powder, having a slightly acid taste. Its saturated solution is acid to litmus.

Solubility—Carbarsone is slightly soluble in water and in alcohol and is very slightly soluble in chloroform and in ether. It is soluble in solutions of alkali hydroxides and carbonates.

Identification—

A: Warm about 500 mg. of Carbarsone in a test tube with 5 ml. of sodium hydroxide solution (1 in 5): a piece of moistened red litmus paper held over the mouth of the tube turns blue.

B: Dissolve about 1 g. of Carbarsone in a mixture of 10 ml. of sodium hydroxide T.S. and 10 ml. of water, add 2 g. of sodium hydrosulfite, and warm the mixture to 50°: a light yellow precipitate is formed, which is insoluble in an excess of sodium hydroxide T.S.

C: Acidify a portion of the solution obtained in the *Assay* with hydrochloric acid, and add hydrogen sulfide T.S.: a yellow precipitate of arsenic sulfide is formed, which is soluble in ammonium carbonate T.S.

Loss on drying, page 814—Dry Carbarsone at 80° for 6 hours: it loses not more than 1.5 percent of its weight.

Free arsanilic acid—Transfer 125 mg. of Carbarsone, accurately weighed, to a 250-ml. volumetric flask, dissolve in a minimum volume of sodium hydroxide solution (1 in 1000), dilute to volume with water, and mix. Pipet 5.0 ml. of this solution into a 25-ml. volumetric flask, add 0.5 ml. of diluted hydrochloric acid, chill in an ice bath, add 2 ml. of sodium nitrite solution (1 in 1000), and cool for 3 minutes. Add 2 ml. of ammonium sulfamate solution (1 in 100), mix, and return to the ice bath for 1 minute. Add 1 ml. of *N*-1-naphthyl ethylenediamine dihydrochloride solution (prepared by dissolving 50 mg. of the reagent in 15 ml. of water, adding 35 ml. of propylene glycol, and mixing), mix, and dilute to volume with water. Determine the absorbance of the solution, with a suitable spectrophotometer, at the maximum at about 538 mμ: the absorbance does not exceed that of 5 ml. of a solution of arsanilic acid prepared with the aid of sodium hydroxide solution (1 in 1000) to contain 5 mcg. in each ml. and treated as directed above, beginning with "Pipet 5.0 ml. of the solution . . . ." (1.0 percent).

Arsenate—Dissolve 500 mg. of Carbarsone in 2 ml. of ammonia T.S., dilute to 5 ml., add 3 ml. of magnesia mixture T.S., and shake vigorously: no precipitate forms within 30 minutes.

Assay—Transfer about 250 mg. of Carbarsone accurately weighed, to a small Kjeldahl flask. Add 10 g. of potassium sulfate and 20 ml. of sulfuric acid, and swirl the acid so that the Carbarsone is thoroughly wetted. Slowly digest the mixture over a low flame, keeping the temperature below the boiling point, until the solution becomes colorless. Cool, cautiously add 150 ml. of water, then add a saturated solution of sodium hydroxide until the solution is slightly alkaline to litmus, keeping the flask under cool water. Cautiously render the solution slightly acid with diluted sulfuric acid, and allow to cool. Add to the solution a small excess (1.5 g.) of sodium bicarbonate, swirl to dissolve, and titrate with 0.1 *N* iodine, adding starch T.S. as the end-point is neared. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* iodine is equivalent to 13.00 mg. of $C_7H_9AsN_2O_4$.

Packaging and storage—Preserve Carbarsone in well-closed containers.

Category—Antiamebic.

Usual dose—**250 mg.** two or three times a day for 10 days.

Usual dose range—**100 to 250 mg.**

Carbarsone Capsules

Carbarsone Capsules contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_7H_9AsN_2O_4$.

Identification—Add 10 ml. of sodium hydroxide T.S., and 10 ml. of water to about 1 g. of the contents of Carbarsone Capsules, shake well for a few minutes, and filter. To the clear filtrate add 2 g. of sodium hydrosulfite, and warm to 50°: a light yellow precipitate, which is insoluble in an excess of sodium hydroxide T.S., is formed.

Weight variation, page 901—Carbarsone Capsules meet the requirements of the weight variation test for capsules.

Assay—Transfer, as completely as possible, the contents of not less than 20 Carbarsone Capsules to a small tared dish, and weigh. Mix well with a glass rod or spatula, then transfer an accurately weighed portion of the powder, equivalent to about 250 mg. of carbarsone, to a small Kjeldahl flask. Add 10 g. of potassium sulfate and 20 ml. of sulfuric acid and swirl the acid so that the carbarsone is thoroughly wetted. Slowly digest the mixture over a low flame, keeping the temperature below the boiling point, until the solution becomes colorless. Cool, cautiously add 150 ml. of water, then add a saturated solution of sodium hydroxide until the solution is slightly alkaline to litmus paper, keeping the flask under cool water. Cautiously render the solution slightly acid with diluted sulfuric acid, and allow to cool. Dissolve in the solution a small excess (1.5 g.) of sodium bicarbonate, and titrate with 0.1 *N* iodine, using starch T.S. if desired. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* iodine is equivalent to 13.00 mg. of $C_7H_9AsN_2O_4$.

Packaging and storage—Preserve Carbarsone Capsules in well-closed containers.

Capsules available—Carbarsone Capsules usually available contain the following amount of carbarsone: 250 mg.

CATEGORY and DOSE—See Carbarsone.

Carbarsone Tablets

Carbarsone Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_7H_9AsN_2O_4$.

Identification—Add 10 ml. of sodium hydroxide T.S. and 10 ml. of water to about 1 g. of powdered Carbarsone Tablets, shake well for a few minutes, and filter. To the clear filtrate add 2 g. of sodium hydrosulfite, and warm to 50°: a light yellow precipitate is formed, which is insoluble in an excess of sodium hydroxide T.S.

Disintegration, page 878—The disintegration time limit for Carbarsone Tablets is 30 minutes.

Weight variation, page 901—Carbarsone Tablets meet the requirements of the weight variation test for tablets.

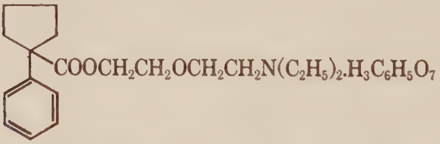
Assay—Weigh and finely powder not less than 20 Carbarsone Tablets. Weigh accurately a portion of the powder, equivalent to about 250 mg. of carbarsone, transfer to a small Kjeldahl flask, and proceed as directed in the *Assay* under *Carbarsone,* page 134, beginning with "Add 10 g. of potassium sulfate . . . ."

Packaging and storage—Preserve Carbarsone Tablets in well-closed containers.

Tablets available—Carbarsone Tablets usually available contain the following amount of carbarsone: 250 mg.

CATEGORY and DOSE—See Carbarsone.

Carbetapentane Citrate



2-[2-(Diethylamino)ethoxy]ethyl 1-Phenylcyclopentanecarboxylate Citrate (1:1)

$C_{20}H_{31}NO_3 . C_6H_8O_7$ Mol. wt. 525.60

Carbetapentane Citrate contains not less than 98.0 percent and not more than 100.5 percent of $C_{20}H_{31}NO_3 . C_6H_8O_7$, calculated on the anhydrous basis.

Description—Carbetapentane Citrate occurs as a white, or practically white, odorless, crystalline powder.

Solubility—Carbetapentane Citrate is freely soluble in water and in chloroform, slightly soluble in alcohol, and practically insoluble in ether.

Melting range, *Class Ia,* page 815—Carbetapentane Citrate melts between 90° and 95°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Carbetapentane Citrate, previously dried over a suitable desiccant, exhibits maxima only at the same wavelengths as that of NF Carbetapentane Citrate Reference Standard, similarly measured.

Water, page 900—Determine the water content of Carbetapentane Citrate by the titrimetric method: not more than 1 percent of water is found.

Residue on ignition, page 858—Carbetapentane Citrate yields not more than 0.5 percent of residue on ignition. Retain the residue from a 1-g. sample for the *Heavy metals test.*

Heavy metals, page 806—Dissolve the residue from *Residue on ignition* in nitric acid and evaporate to dryness. Add 10 ml. of ammonium acetate T.S., and digest in a covered crucible on a steam bath for

30 minutes. Filter, and wash the residue with sufficient water to make 25 ml.: the heavy metals limit for Carbetapentane Citrate is 25 parts per million.

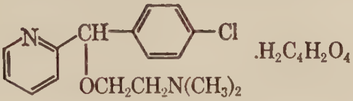
Assay—Dissolve about 250 mg. of Carbetapentane Citrate, accurately weighed, in 10 ml. of chloroform. Add 50 ml. of glacial acetic acid, 5 ml. of acetic anhydride, and 5 drops of a solution of quinaldine red in glacial acetic acid (1 in 1000), and titrate with 0.1 *N* perchloric acid in glacial acetic acid. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 52.56 mg. of $C_{20}H_{31}NO_3 . C_6H_8O_7$.

Packaging and storage—Preserve Carbetapentane Citrate in tight containers.

CATEGORY—Antitussive.

USUAL DOSE—**15** to **30 mg.** three to four times a day.

Carbinoxamine Maleate*



2-[*p*-Chloro-α-[2-(dimethylamino)ethoxy]benzyl]pyridine Maleate (1:1)

$C_{16}H_{19}ClN_2O . C_4H_4O_4$ Mol. wt. 406.87

Carbinoxamine Maleate, dried at 105° for 2 hours, contains not less than 98.0 percent and not more than 102.0 percent of $C_{16}H_{19}ClN_2O . C_4H_4O_4$.

Description—Carbinoxamine Maleate occurs as a white, odorless, crystalline powder.

Solubility—Carbinoxamine Maleate is very soluble in water, freely soluble in alcohol and in chloroform, and very slightly soluble in ether.

Melting range, *Class Ia,* page 815—Carbinoxamine Maleate, previously dried at 105° for 2 hours, melts between 116° and 121°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Carbinoxamine Maleate, previously dried at 105° for 2 hours, exhibits maxima only at the same wavelengths as that of NF Carbinoxamine Maleate Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 20,000 solution of Carbinoxamine Maleate in methanol exhibits maxima and minima at the same wavelengths as that of NF Carbinoxamine Maleate Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance, occurring at about 260 mμ, do not differ by more than 3 percent.

pH, page 824—The pH of a solution of Carbinoxamine Maleate (1 in 100) is between 4.6 and 5.1.

Loss on drying, page 814—Dry Carbinoxamine Maleate at 105° for 2 hours: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Carbinoxamine Maleate yields not more than 0.1 percent of residue on ignition.

Assay—Dissolve about 400 mg. of Carbinoxamine Maleate, previously dried at 105° for 2 hours and accurately weighed, in 50 ml. of glacial acetic acid, add 1 drop of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a blue-green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 20.34 mg. of $C_{16}H_{19}ClN_2O . C_4H_4O_4$.

Packaging and storage—Preserve Carbinoxamine Maleate in tight, light-resistant containers.

CATEGORY—Antihistaminic.

USUAL DOSE—**4 mg.** three or four times a day.

USUAL DOSE RANGE—**4** to **8 mg.**

---

* Patented. See notice, page ii.

Carbinoxamine Maleate Elixir

Carbinoxamine Maleate Elixir contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{16}H_{19}ClN_2O . C_4H_4O_4$.

Identification—A 1 in 50,000 solution of carbinoxamine maleate in 0.5 *N* sulfuric acid prepared from Carbinoxamine Maleate Elixir as directed under *Salts of Organic Nitrogenous Bases*, page 865, exhibits an absorbance maximum at 263 ± 2 mμ. The absorptivity at 263 mμ is within 7 percent of that of a 1 in 50,000 solution of NF Carbinoxamine Maleate Reference Standard in 0.5 *N* sulfuric acid, similarly measured.

pH, page 824—The pH of Carbinoxamine Maleate Elixir is between 5.0 and 6.7.

Assay—Transfer an accurately measured volume of Carbinoxamine Maleate Elixir, equivalent to about 80 mg. of carbinoxamine maleate, to a 250-ml. separator, add 4 g. of sodium bicarbonate, and mix. Extract with five 20-ml. portions of chloroform, and filter the extracts into a beaker through a small pledget of cotton. Evaporate the combined chloroform extracts to about 50 ml. on a steam bath, and add 50 ml. of glacial acetic acid. Add 1 drop of crystal violet T.S., and titrate with 0.05 *N* perchloric acid in glacial acetic acid to a blue-green end-point. Each ml. of 0.05 *N* perchloric acid is equivalent to 10.17 mg. of $C_{16}H_{19}ClN_2O . C_4H_4O_4$.

Alcohol content, page 772—Carbinoxamine Maleate Elixir contains from 6.5 to 8 percent (v/v) of C_2H_5OH.

Packaging and storage—Preserve Carbinoxamine Maleate in tight, light-resistant containers.

Elixir available—Carbinoxamine Maleate Elixir usually available contains the following amount of carbinoxamine maleate: 4 mg. in 5 ml.

CATEGORY and DOSE—See Carbinoxamine Maleate.

Carbinoxamine Maleate Tablets

Carbinoxamine Maleate Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{16}H_{19}ClN_2O . C_4H_4O_4$.

Identification—A 1 in 50,000 solution of carbinoxamine maleate in 0.5 *N* sulfuric acid prepared from Carbinoxamine Maleate Tablets as directed under *Salts of Organic Nitrogenous Bases*, page 865, exhibits an absorbance maximum at 263 ± 2 mμ. The absorptivity of the solution at 263 mμ is within 7 percent of that of a 1 in 50,000 solution of NF Carbinoxamine Maleate Reference Standard in 0.5 *N* sulfuric acid, similarly measured.

Disintegration, page 878—The disintegration time limit for Carbinoxamine Maleate Tablets is 15 minutes.

Content uniformity, *Method II*, page 799—Carbinoxamine Maleate Tablets meet the requirements of the content uniformity test for tablets, using the following special procedure: Place one tablet in a 100-ml. volumetric flask, add 10 ml. of water, and shake mechanically for 15 minutes. Dilute to volume with methanol, and filter, discarding the first 20 ml. of filtrate. Dilute a portion of the subsequent filtrate quantitatively and stepwise, if necessary, with methanol-water mixture (9:1) to provide a solution containing approximately 40 mcg. of carbinoxamine maleate per ml. Concomitantly determine the absorbance of this solution and of a solution of NF Carbinoxamine Maleate Reference Standard, in the same medium, at a concentration of about 40 mcg. per ml., in 1-cm. cells, at the maximum at about 260 mμ, with a suitable spectrophotometer, using methanol-water mixture (9:1) as the blank. Calculate the quantity, in mg., of $C_{16}H_{19}ClN_2O.C_4H_4O_4$ in the tablet by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity of carbinoxamine maleate, in mg., in the tablet; D is the exact concentration, in mcg. per ml., of carbinoxamine maleate in the sample solution, based upon the labeled quantity per tablet and the extent of dilution; C is the exact concentration of the Reference Standard solution, in mcg. per ml.; A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Assay—Weigh and finely powder not less than 20 Carbinoxamine Maleate Tablets. Transfer to a separator an accurately weighed portion of the powder, equivalent to about 100 mg. of carbinoxamine maleate, add 35 ml. of water and 3 g. of sodium bicarbonate, and mix. Extract with one 30-ml. portion, two 20-ml. portions, and two 15-ml. portions of chloroform, filtering the extracts through a pledget of cotton. Evaporate the combined chloroform extracts just to dryness on a steam bath, dissolve the residue in 50 ml. of glacial acetic acid, add 1 drop of crystal violet T.S., and titrate with 0.05 *N* perchloric acid in glacial acetic acid to a blue-green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.05 *N* perchloric acid is equivalent to 10.17 mg. of $C_{16}H_{19}ClN_2O . C_4H_4O_4$.

Packaging and storage—Preserve Carbinoxamine Maleate Tablets in tight, light-resistant containers.

Tablets available—Carbinoxamine Maleate Tablets usually available contain the following amount of carbinoxamine maleate: 4 mg.

CATEGORY and DOSE—See Carbinoxamine Maleate.

Carbol-Fuchsin Solution

Basic Fuchsin	**3 g.**
Phenol	**45 g.**
Resorcinol	**100 g.**
Acetone	**50 ml.**
Alcohol	**100 ml.**
Purified Water, a sufficient quantity,	
To make	**1000 ml.**

Dissolve the basic fuchsin in a mixture of the acetone and alcohol, and add to this solution the phenol and resorcinol previously dissolved in 725 ml. of purified water. Then, add sufficient purified water to make the product measure 1000 ml. Mix thoroughly.

Description—Carbol-Fuchsin Solution is a dark purple liquid which appears purplish red when spread in a thin film.

Specific gravity, page 866—The specific gravity of Carbol-Fuchsin Solution is not less than 0.990 and not more than 1.050.

Alcohol content, page 772—Carbol-Fuchsin Solution contains from 7 to 10 percent (v/v) of C_2H_5OH.

Packaging and storage—Preserve Carbol-Fuchsin Solution in tight, light-resistant containers.

CATEGORY—Local antifungal.

FOR EXTERNAL USE—Topically, apply undiluted once or twice daily.

Carboxymethylcellulose, Sodium, Tablets, page 640

Cardamom Seed

Cardamom Seed is the dried ripe seed of *Elettaria cardamomum* (Linné) Maton (Fam. *Zingiberaceæ*).

Cardamom Seed should be recently removed from the capsule.

Unground Cardamom Seed occurs usually in agglutinated groups of 2 to 7 seeds and as separate seeds surrounded by an adhering membranous aril. The individual seeds are oblong-ovoid or irregularly 3- to 4-sided, from 3 to 4 mm. in length; convex on the dorsal side, strongly longitudinally grooved on the ventral side and coarsely tuberculated; externally pale orange to dark brown. The odor is aromatic. The taste is aromatic, pungent, and slightly bitter.

Histology—Sections of Cardamom Seed show a loosely attached membranous aril; a brownish seed-coat consisting of an epidermal layer of thick-walled cells, a pigment layer of small cells with red to orange contents, a layer of volatile oil cells with suberized walls and a single layer of radially elongated, strongly lignified stone cells with inner walls heavily thickened, and a minute lumen containing silica; a large, colorless perisperm surrounding a central, orange to yellow endosperm in which a small straight embryo is embedded.

Powdered Cardamom Seed is brown to weak yellow to light olive-green. It consists chiefly of fragments of perisperm, endosperm, embryo, and seed-coat. The endosperm and perisperm cells are filled with starch grains from 1 to 4 μ in diameter or may contain one or more prisms of calcium oxalate from 10 to 25 μ in diameter. The seed-coat is characterized by its red to orange colored cells, polygonal in surface view and about 20 μ in diameter. Fragments of pericarp tissue with spiral vessels and with accompanying slightly lignified fibers are relatively few.

Acid-insoluble ash, page 886—Cardamom Seed yields not more than 4 percent of acid-insoluble ash.

Packaging and storage—Preserve Cardamom Seed against attack by insects, page 14.

CATEGORY—Flavor.

Compound Cardamom Tincture

Cardamom Seed, in moderately coarse powder	20 g.
Cinnamon, in fine powder	25 g.
Caraway, in moderately coarse powder	12 g.
To make	1000 ml.

Prepare a tincture by Process M, page 838, macerating the mixed powders in 750 ml. of a mixture of 50 ml. of glycerin and 950 ml. of diluted alcohol, and completing the preparation by using first the remainder of the mixture of alcohol and glycerin prepared as directed above, and then diluted alcohol.

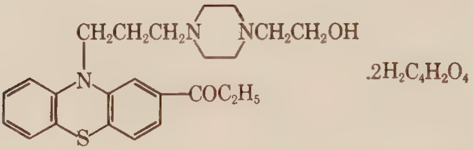
NOTE: Compound Cardamom Tincture may be colored with one or more colors (see page 8).

Alcohol content, page 772—Compound Cardamom Tincture contains from 43 to 47 percent (v/v) of C_2H_5OH.

Packaging and storage—Preserve Compound Cardamom Tincture in tight, light-resistant containers, and avoid exposure to direct sunlight and to excessive heat.

CATEGORY—Flavor.

Carphenazine Maleate*



1-[10-[3-[4-(2-Hydroxyethyl)-1-piperazinyl]-propyl]phenothiazin-2-yl]-1-propanone Maleate (1:2)

$C_{24}H_{31}N_3O_2S.2C_4H_4O_4$ Mol. wt. 657.75

Carphenazine Maleate contains not less than 98.0 percent and not more than 102.0 percent of $C_{24}H_{31}N_3O_2S.2C_4H_4O_4$, calculated on the anhydrous basis.

Description—Carphenazine Maleate occurs as a yellow, finely divided, odorless powder.

Solubility—Carphenazine Maleate is slightly soluble in alcohol and in water. It is practically insoluble in ether.

Identification—

A: Dissolve about 15 mg. of Carphenazine Maleate in 10 ml. of water, place 5 drops of the solution on a spot plate, and add 1 drop of a solution of chloramine T (1 in 10): a violet precipitate forms, slowly changing to gray. To another 5 drops of the solution add 1 drop of *Buffered palladous chloride solution,* prepared as directed in the *Assay:* a red color develops.

B: Dissolve about 15 mg. of Carphenazine Maleate in 10 ml. of alcohol, and place 1 drop of the solution on a piece of filter paper. Allow the solvent to evaporate, and examine the residue under a shortwave ultraviolet lamp: a yellow fluorescence is observed.

Melting range, *Class Ia,* page 815—Carphenazine Maleate melts between 162° and 167°, with decomposition.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Carphenazine Maleate, previously dried over a suitable desiccant, exhibits maxima only at the same wavelengths as that of NF Carphenazine Maleate Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 50,000 solution of Carphenazine Maleate in 0.1 *N* hydrochloric acid exhibits maxima and minima at the same wavelengths as that of NF Carphenazine Maleate Reference Standard, similarly measured, and the respective absorptivities, calculated on the anhydrous basis, at the point of maximum absorbance occurring at about 243 $m\mu$, do not differ by more than 3 percent.

pH, page 824—The pH of a 1 in 100 suspension in water of Carphenazine Maleate is between 2.5 and 3.5.

Water, page 900—Determine the water content of Carphenazine Maleate by the titrimetric method: not more than 1 percent is found.

Residue on ignition, page 858—Carphenazine Maleate yields not more than 0.2 percent of residue on ignition.

---

* Patented. See notice, page ii.

Assay—

Buffered palladous chloride solution—Transfer 500 mg. of palladous chloride to a 250-ml. beaker, add 5 ml. of hydrochloric acid, and warm on a steam bath. Add 200 ml. of hot water in small portions, and continue heating until solution is complete. Cool, dilute to 500.0 ml. with water, and mix. Transfer 75.0 ml. of this solution to a 500-ml. volumetric flask, add 50 ml. of 1 *N* sodium acetate and 44 ml. of 1 *N* hydrochloric acid, dilute to volume with water, and mix.

Standard preparation—Transfer about 50 mg. of NF Carphenazine Maleate Reference Standard, accurately weighed, to a 250-ml. volumetric flask, add diluted alcohol to volume, and mix.

Assay preparation—Transfer about 50 mg. of Carphenazine Maleate, accurately weighed, to a 250-ml. volumetric flask, add diluted alcohol to volume, and mix.

Procedure—Transfer 3.0 ml. each of the *Standard preparation*, of the *Assay preparation*, and of diluted alcohol to serve as the blank to separate glass-stoppered tubes. To each tube add 4.0 ml. of *Buffered palladous chloride solution*, and mix. Within 10 minutes, concomitantly determine the absorbances of the solutions, in 1-cm. cells, at the maximum at about 490 mμ, with a suitable spectrophotometer, using the blank to set the instrument. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{24}H_{31}N_3O_2S.2C_4H_4O_4$ in the Carphenazine Maleate taken by the formula $0.25C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*.

Packaging and storage—Preserve Carphenazine Maleate in tight, light-resistant containers.

CATEGORY—Tranquilizer (major).

USUAL DOSE RANGE—**12.5** to **50 mg.** three times a day; increased by **12.5** to **50 mg.** daily at intervals of from 4 days to 1 week. The maximal daily dose recommended is 400 mg.

Carphenazine Maleate Tablets

Carphenazine Maleate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{24}H_{31}N_3O_2S . 2C_4H_4O_4$.

Identification—Transfer to a glass-stoppered flask an amount of powdered Carphenazine Maleate Tablets, equivalent to about 25 mg. of carphenazine maleate, add 100 ml. of alcohol, and shake occasionally during 15 minutes. Filter through a medium-porosity sintered-glass filter, discarding the first 20 ml. of filtrate. Evaporate 6 ml. of the subsequent filtrate to dryness on a water bath with the aid of a current of air, and dissolve the residue in 1 ml. of water: the solution responds to the *Identification tests* under *Carphenazine Maleate*, page 140.

Disintegration, page 878—The disintegration time limit for Carphenazine Maleate Tablets is 30 minutes.

Content uniformity, *Method I*, page 799—Carphenazine Maleate Tablets meet the requirements of the content uniformity test for tablets.

Assay—

Standard preparation—Prepare as directed in the *Assay* under *Carphenazine Maleate*, page 140.

Assay preparation—Weigh and finely powder not less than 20 Carphenazine Maleate Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 20 mg. of carphenazine maleate, to a medium-porosity sintered-glass funnel, and extract the powder with successive 5-ml. portions of alcohol, using suction and collecting the extracts in a 100-ml. volumetric flask containing 50 ml. of water. Dilute to volume with alcohol, and mix.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Carphenazine Maleate*, page 140. Calculate the quantity, in mg., of $C_{24}H_{31}N_3O_2S.2C_4H_4O_4$ in the portion of Tablets taken by the formula $0.1C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*.

Packaging and storage—Preserve Carphenazine Maleate Tablets in tight, light-resistant containers.

Tablets available—Carphenazine Maleate Tablets usually available contain the following amounts of carphenazine maleate: 12.5, 25, and 50 mg.

CATEGORY and DOSE—See Carphenazine Maleate.

Cascara Tablets

Cascara Tablets are prepared from cascara sagrada extract.

Disintegration, page 878—The disintegration time limit for Cascara Tablets is 60 minutes.

Weight variation, page 901—Cascara Tablets meet the requirements of the weight variation test for tablets.

Packaging and storage—Preserve Cascara Tablets in tight containers. If the Tablets are coated, well-closed containers may be used.

Tablets available—Cascara Tablets usually available contain the following amounts of cascara sagrada extract: 120, 200, and 300 mg.

CATEGORY and DOSE—See Cascara Sagrada Extract.

Cascara Sagrada Extract

One g. of Cascara Sagrada Extract represents 3 g. of cascara sagrada.

Mix 900 g. of cascara sagrada, in coarse powder, with 4000 ml. of boiling water, and macerate the mixture during 3 hours. Then transfer it to a percolator, allow it to drain, and exhaust it by percolation, using boiling water as the menstruum, and collecting about 5000 ml. of percolate. Evaporate the percolate to dryness, reduce the extract to a fine powder, and add sufficient starch, dried at 100°, to make the product weigh 300 g. Mix the powders thoroughly, and pass the Extract through a fine sieve.

Packaging and storage—Preserve Cascara Sagrada Extract in tight, light-resistant containers, preferably at a temperature not above 30°.

CATEGORY—Cathartic.
USUAL DOSE—**300 mg.**

Cascara Sagrada Fluidextract

Cascara Sagrada, in very coarse powder	**1000 g.**

Prepare a fluidextract by Process D, page 830. Evaporate the percolate until it measures 800 ml., and when it is cold, gradually add 200 ml. of alcohol and, if necessary, sufficient water to make the product measure 1000 ml. Mix thoroughly.

Alcohol content, page 772—Cascara Sagrada Fluidextract contains from 17 to 19 percent (v/v) of C_2H_5OH.

Packaging and storage—Preserve Cascara Sagrada Fluidextract in tight, light-resistant containers, and avoid exposure to direct sunlight and to excessive heat.

CATEGORY—Cathartic.
USUAL DOSE—**1 ml.**

Aromatic Castor Oil

Cinnamon Oil	**3 ml.**
Clove Oil	**1 ml.**
Saccharin	**500 mg.**
Vanillin	**1 g.**
Alcohol	**30 ml.**
Castor Oil, a sufficient quantity,	
To make	**1000 ml.**

Dissolve the volatile oils and the solids in the alcohol, add the castor oil, and mix thoroughly.

Alcohol content, page 772—Aromatic Castor Oil contains from 2 to 3 percent (v/v) of C_2H_5OH.

Packaging and storage—Preserve Aromatic Castor Oil in tight containers.

CATEGORY—Cathartic.
USUAL DOSE—**15 ml.**

Microcrystalline Cellulose

Microcrystalline Cellulose is purified, partially depolymerized cellulose prepared by treating alpha cellulose, obtained as a pulp from fibrous plant material, with mineral acids.

Description—Microcrystalline Cellulose occurs as a fine, white, odorless, crystalline powder. It consists of free-flowing, nonfibrous particles which may be compressed into self-binding tablets which disintegrate rapidly in water.

Solubility—Microcrystalline Cellulose is insoluble in water, in dilute acids, and in most organic solvents. It is slightly soluble in sodium hydroxide solution (1 in 20).

Identification—Mix 30 g. of Microcrystalline Cellulose with 270 ml. of water in a high-speed (18,000 r.p.m.) power blender for 5 minutes. Transfer 100 ml. of the mixture to a 100-ml. graduated cylinder, and allow to stand for 3 hours: a white, opaque, bubble-free dispersion, which does not form a supernatant liquid at the surface, is obtained.

pH, page 824—Shake about 5 g. of Microcrystalline Cellulose with 40 ml. of water for 20 minutes, and centrifuge: the pH of the supernatant liquid is between 5.5 and 7.0.

Loss on drying, page 814—Dry Microcrystalline Cellulose at 105° for 3 hours: it loses not more than 5 percent of its weight.

Residue on ignition, page 858—Microcrystalline Cellulose yields not more than 0.05 percent of residue on ignition.

Water-soluble substances—Shake 5 g. of Microcrystalline Cellulose with about 80 ml. of water for 10 minutes, filter through Whatman No. 42 or equivalent filter paper into a tared beaker, evaporate to dryness on a steam bath, and dry at 105° for 1 hour: not more than 8 mg. of residue is obtained (0.16 percent).

Heavy metals, *Method II,* page 806—The heavy metals limit for Microcrystalline Cellulose is 10 parts per million.

Starch—To 20 ml. of the dispersion of Microcrystalline Cellulose obtained in the *Identification test,* add a few drops of iodine T.S., and mix: no purplish to blue or blue color is produced.

Packaging and storage—Preserve Microcrystalline Cellulose in well-closed containers.

CATEGORY—Tablet diluent.

Cetyl Alcohol

$CH_3(CH_2)_{14}CH_2OH$

1-Hexadecanol

$C_{16}H_{34}O$ Mol. wt. 242.45

Cetyl Alcohol is a mixture of solid alcohols consisting chiefly of cetyl alcohol.

Description—Cetyl Alcohol occurs as unctuous, white flakes, granules, cubes, or castings. It has a faint characteristic odor and a bland, mild taste.

Solubility—Cetyl Alcohol dissolves in alcohol and in ether, the solubility increasing with an increase in temperature. It is insoluble in water.

Melting range, page 814—Cetyl Alcohol melts between 45° and 50°, by a *Class I* procedure, except that the sample is inserted into the bath at about room temperature.

Acid value, page 804—The acid value of Cetyl Alcohol is not more than 2.

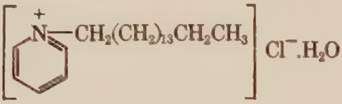
Iodine value, page 804—The iodine value of Cetyl Alcohol is not more than 5.

Hydroxyl number—Transfer into a dry 250-ml. iodine flask about 2 g. of Cetyl Alcohol, accurately weighed, and add 2.0 ml. of pyridine followed by 10 ml. of toluene, using the latter to rinse the neck of the flask. To the mixture add 10.0 ml. of approximately 1.5 *M* acetyl chloride in toluene, stopper the flask and immerse in a water bath at 60° to 65° for 20 minutes. Add 25 ml. of water, stopper the flask, shake it vigorously for 1 or 2 minutes, and allow to stand for 5 minutes to decompose the excess acetyl chloride. Add 1 ml. of phenolphthalein T.S., and titrate with 1 *N* sodium hydroxide to a permanent pink endpoint, shaking the flask vigorously toward the end of the titration to maintain the contents in an emulsified condition. Run a blank under identical conditions, using the same amounts of reagents as in the determination. Subtract the number of ml. of 1 *N* sodium hydroxide used for the sample from the number of ml. used for the blank. Multiply the difference by 56.11 and divide by the weight of sample to obtain the hydroxyl number, which is the number of mg. of potassium hydroxide equivalent to the hydroxyl content of 1 g. of the sample. The hydroxyl number of Cetyl Alcohol is not less than 218 and not more than 238.

Packaging and storage—Preserve Cetyl Alcohol in well-closed containers.

CATEGORY—Emulsifying and stiffening agent.

Cetylpyridinium Chloride



1-Hexadecylpyridinium Chloride

$C_{21}H_{38}ClN \, . \, H_2O$ Mol. wt. 358.01

Cetylpyridinium Chloride contains not less than 99.0 percent and not more than 102.0 percent of $C_{21}H_{38}ClN$, calculated on the anhydrous basis.

Description—Cetylpyridinium Chloride occurs as a white powder having a slight, characteristic odor.

Solubility—Cetylpyridinium Chloride is very soluble in water, in alcohol, and in chloroform. It is slightly soluble in benzene and in ether.

Identification—

A: Heat about 250 mg. of Cetylpyridinium Chloride in a test tube until it melts and a brown color develops: the odor of pyridine becomes perceptible.

B: Dissolve 100 mg. of Cetylpyridinium Chloride in 50 ml. of water: a 10-ml. portion of the solution responds to the tests for *Chloride*, page 808, except a turbidity is produced, rather than a curdy white precipitate, when the silver nitrate T.S. is added.

C: To 10 ml. of the solution prepared in *Identification test B* add 10 ml. of 0.01 *M* potassium ferricyanide: a yellow precipitate is formed.

D: To 1 ml. of the solution prepared in *Identification test B* add 1 ml. of a saturated solution of potassium thiocyanate: a white, gelatinous precipitate is formed.

Melting range, page 814—Cetylpyridinium Chloride melts between 80° and 84°, the preliminary drying treatment being omitted.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Cetylpyridinium Chloride exhibits maxima only at the same wavelengths as that of NF Cetylpyridinium Chloride Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 8000 solution of Cetylpyridinium Chloride exhibits maxima and minima at the same wavelengths as that of NF Cetylpyridinium Chloride Reference Standard, similarly measured, and the respective absorptivities, calculated on the anhydrous basis, at the point of maximum absorbance occurring at about 259 mμ, do not differ by more than 3 percent.

Acidity—Dissolve 500 mg., accurately weighed, of Cetylpyridinium Chloride in 50 ml. of water, add phenolphthalein T.S., and titrate with 0.02 *N* sodium hydroxide: not more than 2.5 ml. is required for neutralization.

Water, page 900—Determine the water content of Cetylpyridinium Chloride by the titrimetric method: not less than 4.5 percent and not more than 5.5 percent is found.

Residue on ignition, page 858—Cetylpyridinium Chloride yields not more than 0.2 percent of residue on ignition, calculated on the anhydrous basis.

Heavy metals, *Method II*, page 806—The heavy metals limit for Cetylpyridinium Chloride is 20 parts per million.

Pyridine—Dissolve 1 g. of Cetylpyridinium Chloride in 10 ml. of sodium hydroxide solution (1 in 10) without heating: the odor of pyridine is not immediately perceptible.

Assay—Transfer about 200 mg., accurately weighed, of Cetylpyridinium Chloride to a glass-stoppered 250-ml. flask containing 75 ml. of water. Add 10 ml. of chloroform, 0.4 ml. of bromophenol blue solution (1 in 2000), and 5 ml. of a freshly prepared solution of sodium bicarbonate (4.2 in 1000), and titrate with 0.02 *M* sodium tetraphenylboron until the blue color disappears from the chloroform layer. Add the last portions of the sodium tetraphenylboron solution dropwise, agitating vigorously after each addition. Each ml. of 0.02 *M* sodium tetraphenylboron is equivalent to 6.800 mg. of $C_{21}H_{38}ClN$.

Packaging and storage—Preserve Cetylpyridinium Chloride in well-closed containers.

CATEGORY—Local anti-infective.

APPLICATION—Topically as a 1:100 to 1:1000 solution to intact skin; 1:1000 for minor lacerations; 1:2000 to 1:10,000 to mucous membranes.

Cetylpyridinium Chloride Solution

Cetylpyridinium Chloride Solution contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{21}H_{38}ClN . H_2O$.

Description—Cetylpyridinium Chloride Solution is a clear liquid. It is colorless unless a color has been added. It has an aromatic odor and a bitter taste.

Identification—

A: Evaporate a volume of Cetylpyridinium Chloride Solution, equivalent to about 500 mg. of cetylpyridinium chloride, on a steam bath to one-half its original volume: the resulting solution responds to *Identification tests B, C, and D* under *Cetylpyridinium Chloride*, page 144.

B: Dilute a volume of Cetylpyridinium Chloride Solution to a concentration equivalent to 125 mcg. of cetylpyridinium chloride in each ml.: the resulting solution exhibits ultraviolet absorption maxima and minima at the same wavelengths exhibited by a solution of NF Cetylpyridinium Chloride Reference Standard, similarly measured.

Assay—Pipet into a glass-stoppered 250-ml. flask a volume of Cetylpyridinium Chloride Solution, equivalent to about 150 mg. of cetylpyridinium chloride, and proceed as directed in the *Assay* under *Cetylpyridinium Chloride*, page 144, beginning with "Add 10 ml. of chloroform, ..." Each ml. of 0.02 *M* sodium tetraphenylboron is equivalent to 7.160 mg. of $C_{21}H_{38}ClN . H_2O$.

Packaging and storage—Preserve Cetylpyridinium Chloride Solution in tight containers.

Solution available—Cetylpyridinium Chloride Solution is usually available in the following concentration: 1:1000.

CATEGORY and APPLICATION—See Cetylpyridinium Chloride.

Chloral Betaine*

$$CCl_3CH(OH)_2 . (CH_3)_3\overset{+}{N}CH_2COO^-$$

Chloral Hydrate Betaine (1:1) Compound

$C_7H_{14}Cl_3NO_4$ Mol. wt. 282.55

Chloral Betaine is an adduct formed by the reaction of chloral hydrate with betaine. It contains not less than 56.0 percent and not more than 59.5 percent of $C_2H_3Cl_3O_2$ (chloral hydrate), and not less than 40.0 percent and not more than 44.0 percent of $C_5H_{11}NO_2$ (betaine).

Description—Chloral Betaine occurs as a white, crystalline powder having a bitter taste and a faint, penetrating and slightly acrid odor resembling that of chloral hydrate. When tested by the procedure for *Class Ia*, page 815, it melts at about 124° with decomposition.

Solubility—Chloral Betaine is very soluble in water. It is freely soluble in alcohol and is very slightly soluble in chloroform.

Identification—To about 250 mg. of Chloral Betaine add a few ml. of sodium hydroxide T.S.: chloroform, recognizable by its odor, is formed.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Chloral Betaine, previously dried over a suitable desiccant, exhibits maxima only at the same wavelengths as that of NF Chloral Betaine Reference Standard, similarly measured.

Water, page 900—Determine the water content of Chloral Betaine by the titrimetric method: not less than 5.9 percent and not more than 7.4 percent is found.

Residue on ignition, page 858—Chloral Betaine yields not more than 0.2 percent of residue on ignition.

Chloride—Dissolve 10.0 g. of Chloral Betaine in 50 ml. of water, add 10.0 ml. of 0.1 *N* silver nitrate, 3 ml. of nitric acid,

---

* Patented. See notice, page ii.

5 ml. of nitrobenzene, and 2 ml. of ferric ammonium sulfate T.S., and titrate the excess silver nitrate with 0.1 *N* ammonium thiocyanate. Each ml. of 0.1 *N* silver nitrate is equivalent to 3.545 mg. of Cl. Not more than 0.1 percent is found.

Heavy metals, *Method II*, page 806—The heavy metals limit for Chloral Betaine is 20 parts per million.

Chlorobenzenes—

Solvent hexane—Use pretested solvent hexane that has proven to give a distinct peak for each of the four chlorobenzenes, when tested with the USP Chlorobenzenes Reference Standard, and produces no detectable peaks at the retention times of the four chlorobenzenes when tested separately.

Procedure—Transfer 2.5 g. of Chloral Betaine, accurately weighed, to a 5-ml. volumetric flask, add water to volume, and mix. Pipet 0.5 ml. of *Solvent hexane* into the flask, shake for 2 minutes, and allow the layers to separate. Inject a 1-μl. portion of the hexane layer into a suitable gas chromatograph (see page 787). Preferably use an apparatus of the general type in which a stainless steel column about 3 to 4 meters in length and about 3 to 4 mm. in outside diameter is packed with 80- to 100-mesh chromatographic siliceous earth prepared for gas chromatography. Use as the liquid phase a suitable silicone fluid in 10 percent concentration. Use helium, flowing at the rate of 50 to 60 ml. per minute, as the carrier gas. Precondition the column at 200° to 205° for 36 hours. Maintain the injection port temperature at about 240° and the column temperature at about 120°. Preferably use a high-sensitivity detector. The operating conditions of the apparatus may vary, depending upon the particular instrument used, but a suitable chromatogram is one in which the resolution factor, *R*, is not less than 0.9 between the chlorobenzene peaks in the standard.

Similarly, carry 2.5 g. of USP Chlorobenzenes Reference Standard through the foregoing procedure. Each μl. of the hexane solution prepared contains 0.1 mcg. of monochlorobenzene and 0.05 mcg. each of *ortho-*, *meta-*, and *para*-dichlorobenzene. Identify the peaks corresponding to the four chlorobenzenes contained in the USP Chlorobenzenes Reference Standard, and measure the area under each peak.

Calculate the concentration, in parts per million, of each chlorobenzene in the Chloral Betaine by the formula $200C \times (A_U/A_S)$, in which C is the concentration, in mcg. per μl., of the corresponding chlorobenzene in the hexane solution prepared from USP Chlorobenzenes Reference Standard, and A_U and A_S are the areas under the curves for the sample and standard, respectively, for each chlorobenzene contained in the Reference Standard. The total chlorobenzene content of Chloral Betaine does not exceed 100 parts per million.

Assay for chloral hydrate—Dissolve about 500 mg. of Chloral Betaine, accurately weighed, in 25 ml. of water, add 25.0 ml. of 0.1 *N* sodium hydroxide, swirl to mix, and allow the mixture to stand for 2 minutes. Add 3 drops of phenolphthalein T.S., and titrate the excess sodium hydroxide at once with 0.1 *N* hydrochloric acid. Perform a blank determination (see *Residual Titrations*, page 883). Each ml. of 0.1 *N* sodium hydroxide is equivalent to 16.54 mg. of $C_2H_3Cl_3O_2$.

Assay for betaine—Dissolve about 200 mg. of Chloral Betaine, accurately weighed, in 50 ml. of glacial acetic acid, add 1.5 to 2 ml. of a 1 in 5000 solution of *p*-naphtholbenzein in glacial acetic acid, and titrate with 0.1 *N* perchloric acid in glacial acetic acid. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 11.72 mg. of $C_5H_{11}NO_2$.

Packaging and storage—Preserve Chloral Betaine in tight containers.

CATEGORY—Sedative.

USUAL DOSE—**870 mg.** to **1.74 g.** 15 to 30 minutes before bedtime.

Chloral Betaine Tablets

Chloral Betaine Tablets contain chloral betaine equivalent to not less than 95.0 percent and not more than 110.0 percent of the labeled amount of $C_2H_3Cl_3O_2$ (chloral hydrate).

Identification—Remove any film coating from Chloral Betaine Tablets by cutting with a sharp knife or by shaking with chloroform for about 1 hour, and triturate the tablet to a fine powder: the infrared absorption spectrum of a potassium bromide dispersion prepared from the powder exhibits maxima only at the same wavelengths as that of NF Chloral Betaine Reference Standard, similarly measured.

Disintegration, page 878—The disintegration time limit for Chloral Betaine Tablets, determined in simulated gastric fluid T.S. without the use of disks, is 15 minutes.

Weight variation, page 901—Chloral Betaine Tablets meet the requirements of the weight variation test for tablets.

Assay—Transfer 10 Chloral Betaine Tablets to a 200-ml. volumetric flask, add 160 ml. of water, and shake mechanically for about 45 minutes or until tablet disintegration is completed. Dilute to volume with water, mix, and filter, discarding the first 20 ml. of filtrate. Transfer an accurately measured volume of the subsequent filtrate, equivalent to about 250 mg. of chloral betaine, to a 125-ml. conical flask, add 20.0 ml. of 0.1 *N* sodium hydroxide, and allow the mixture to stand for 2 minutes. Add 3 drops of phenolphthalein T.S., and titrate the excess sodium hydroxide with 0.1 *N* hydrochloric acid. Perform a blank determination (see *Residual Titrations*, page 883). Each ml. of 0.1 *N* sodium hydroxide is equivalent to 16.54 mg. of $C_2H_3Cl_3O_2$.

Packaging and storage—Preserve Chloral Betaine Tablets in tight, light-resistant containers.

Tablets available—Chloral Betaine Tablets usually available contain chloral betaine equivalent to the following amount of chloral hydrate: 500 mg.

CATEGORY and DOSE—See Chloral Betaine.

Sterile Chloramphenicol for Suspension

Sterile Chloramphenicol for Suspension is a sterile, dry mixture of chloramphenicol and suitable buffers, suspending agents, and preservatives. It contains not less than 85.0 percent of the labeled amount of $C_{11}H_{12}Cl_2N_2O_5$. Sterile Chloramphenicol for Suspension conforms to the regulations of the federal Food and Drug Administration concerning certification of antibiotic drugs.

Description—Sterile Chloramphenicol for Suspension is a white to grayish white or yellowish white, crystalline powder. It is odorless.

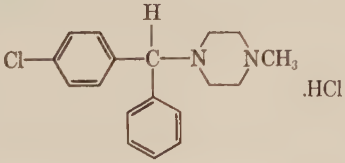
Packaging and storage—Preserve Sterile Chloramphenicol for Suspension in *Containers for Sterile Solids* as described under *Injections*, page 810.

Size available—Sterile Chloramphenicol for Suspension is usually available in the following amount: 1 g.

CATEGORY—Antibacterial; antirickettsial.

USUAL DOSE OF CHLORAMPHENICOL—Intramuscular, **1 g.** every 8 hours.

Chlorcyclizine Hydrochloride



1-(*p*-Chloro-α-phenylbenzyl)-4-methylpiperazine Monohydrochloride

$C_{18}H_{21}ClN_2.HCl$ Mol. wt. 337.30

Chlorcyclizine Hydrochloride contains not less than 98.0 percent and not more than 100.5 percent of $C_{18}H_{21}ClN_2.HCl$, calculated on the dried basis.

Description—Chlorcyclizine Hydrochloride occurs as a white crystalline powder, which is odorless or almost odorless.

Solubility—Chlorcyclizine Hydrochloride is freely soluble in water and in chloroform. It is soluble in alcohol and is practically insoluble in ether and in benzene.

Identification—

A: Dissolve 25 mg. of Chlorcyclizine Hydrochloride in 5 ml. of sulfuric acid: a brilliant yellow color is produced, which disappears upon dilution with 20 ml. of water, leaving a colorless solution.

B: Chlorcyclizine Hydrochloride responds to the tests for *Chloride*, page 808.

Melting range, *Class Ia*, page 815—Chlorcyclizine Hydrochloride melts between 222° and 227°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Chlorcyclizine Hydrochloride, previously dried at 120° for

3 hours, exhibits maxima only at the same wavelengths as that of NF Chlorcyclizine Hydrochloride Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 4000 solution of Chlorcyclizine Hydrochloride in 0.5 *N* sulfuric acid exhibits maxima and minima at the same wavelengths as that of NF Chlorcyclizine Hydrochloride Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorption occurring at about 261 mμ, do not differ by more than 3 percent.

pH, page 824—The pH of a solution of Chlorcyclizine Hydrochloride (1 in 100) is between 4.8 and 5.5.

Loss on drying, page 814—Dry Chlorcyclizine Hydrochloride at 120° for 3 hours: it loses not more than 2 percent of its weight.

Residue on ignition, page 858—Chlorcyclizine Hydrochloride yields not more than 0.2 percent of residue on ignition.

Assay—Dissolve about 500 mg. of Chlorcyclizine Hydrochloride, accurately weighed, in 80 ml. of glacial acetic acid, add 10 ml. of mercuric acetate T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid determining the end-point potentiometrically. Each ml. of 0.1 *N* perchloric acid is equivalent to 16.86 mg. of $C_{18}H_{21}ClN_2.HCl$.

Packaging and storage—Preserve Chlorcyclizine Hydrochloride in tight, light-resistant containers.

CATEGORY—Antihistaminic.

USUAL DOSE—**50 mg.** up to four times a day.

USUAL DOSE RANGE—**25** to **100 mg.**

Chlorcyclizine Hydrochloride Tablets

Chlorcyclizine Hydrochloride Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{18}H_{21}ClN_2.HCl$.

Identification—

A: Extract a quantity of finely powdered Chlorcyclizine Hydrochloride Tablets, equivalent to about 50 mg. of chlorcyclizine hydrochloride, with two 5-ml. portions of chloroform. Filter the combined chloroform solutions, and evaporate to dryness: the residue so obtained responds to *Identification test A* under *Chlorcyclizine Hydrochloride,* page 147.

B: Chlorcyclizine Hydrochloride Tablets meet the requirements under *Identification—Organic Nitrogenous Bases,* page 810.

Disintegration, page 858—The disintegration time limit for Chlorcyclizine Hydrochloride Tablets is 30 minutes.

Content uniformity, *Method I,* page 799—Chlorcyclizine Hydrochloride Tablets meet the requirements of the content uniformity test for Tablets.

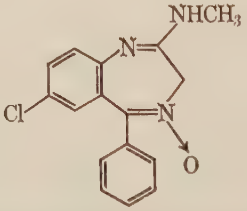
Assay—Proceed with Chlorcyclizine Hydrochloride Tablets as directed under *Salts of Organic Nitrogenous Bases,* page 865, diluting the *Standard Preparation* and the *Assay Preparation* with an equal volume of 0.5 *N* sulfuric acid, and determining the absorbance at 261 mμ. Calculate the quantity, in mg., of $C_{18}H_{21}ClN_2.HCl$ in the portion of the Tablets taken by the formula $0.05C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard Preparation.*

Packaging and storage—Preserve Chlorcyclizine Hydrochloride Tablets in tight, light-resistant containers.

Tablets available—Chlorcyclizine Hydrochloride Tablets usually available contain the following amounts of chlorcyclizine hydrochloride: 25 and 50 mg.

CATEGORY and DOSE—See Chlorcyclizine Hydrochloride.

Chlordiazepoxide*



7-Chloro-2-(methylamino)-5-phenyl-3*H*-1,4-benzodiazepine 4-Oxide

$C_{16}H_{14}ClN_3O$ Mol. wt. 299.76

---

* Patented. See notice, page ii.

Chlordiazepoxide contains not less than 99.0 percent and not more than 101.0 percent of $C_{16}H_{14}ClN_3O$, calculated on the dried basis.

Description—Chlordiazepoxide occurs as a yellow, practically odorless, crystalline powder. It is sensitive to sunlight.

Solubility—Chlordiazepoxide is sparingly soluble in chloroform and in alcohol. It is insoluble in water.

Identification—To about 20 mg. of Chlordiazepoxide, add 5 ml. of hydrochloric acid and 10 ml. of water, and heat to boiling to effect hydrolysis. To the cooled solution add 2 ml. of sodium nitrite solution (1 in 1000), shake, add 1 ml. of ammonium sulfamate solution (1 in 200), then shake for 2 minutes and add 1 ml. of *N*-1-naphthylethylenediamine dihydrochloride solution (1 in 1000): a reddish violet color is produced.

Melting range, page 814—Chlordiazepoxide melts between 240° and 244°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Chlordiazepoxide, previously dried at 105° for 3 hours, exhibits maxima only at the same wavelengths as that of NF Chlordiazepoxide Reference Standard, similarly measured.

Ultraviolet absorption, page 866—[Note: Use low-actinic glassware.] The ultraviolet absorption spectrum of a 1 in 200,000 solution of Chlordiazepoxide in 0.1 *N* alcoholic sulfuric acid exhibits maxima and minima at the same wavelengths as that of NF Chlordiazepoxide Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance occurring at about 245 mμ, do not differ by more than 3 percent.

Loss on drying, page 814—Dry Chlordiazepoxide at 105° for 3 hours: it loses not more than 0.3 percent of its weight.

Residue on ignition, page 858—Chlordiazepoxide yields not more than 0.1 percent of residue on ignition.

Heavy metals, *Method II*, page 806—The heavy metals limit for Chlordiazepoxide is 20 parts per million.

Limit of 7-chloro-1,3-dihydro-5-phenyl-2*H*-1,4-benzodiazepin-2-one 4-oxide and 2-amino-5-chlorobenzophenone—Transfer 50.0 mg. of Chlordiazepoxide to a 10-ml. conical flask, add 2.5 ml. of acetone, and shake. Allow any undissolved particles to settle, and apply 50 μl. of the supernatant solution to a suitable thin-layer chromatographic plate (see page 791) coated with a 0.25-mm. layer of silica gel G. Apply to the same plate 10 μl. of an acetone solution containing 100 mcg. per ml. of NF 7-Chloro-1,3-dihydro-5-phenyl-2*H*-1,4-benzodiazepin-2-one 4-Oxide Reference Standard, and 10 μl. of an acetone solution containing 10 mcg. per ml. of NF 2-Amino-5-chlorobenzophenone Reference Standard. Develop the chromatogram in an unsaturated chamber with ethyl acetate until the solvent front has moved at least 10 cm. from the origin. Remove the plate from the developing chamber, and allow the solvent to evaporate. Locate the spots on the plate by lightly spraying with diluted sulfuric acid, followed by drying at 105° for 15 minutes, and then spraying in succession with sodium nitrite solution (1 in 1000), ammonium sulfamate solution (1 in 200), and *N*-1-naphthylethylenediamine dihydrochloride solution (1 in 1000). Any spots from the sample solution are not greater in size or intensity than the spots, occurring at the respective R_f values, produced by the Reference Standard solutions, corresponding to not more than 0.1 percent of 7-chloro-1,3-dihydro-5-phenyl-2*H*-1,4-benzodiazepin-2-one 4-oxide, and not more than 0.01 percent of 2-amino-5-chlorobenzophenone.

Assay—Dissolve about 800 mg. of Chlordiazepoxide, accurately weighed, in 90 ml. of chloroform, add 3 drops of methyl red T.S., and titrate with 0.1 *N* perchloric acid in dioxane to a pink end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 29.98 mg. of $C_{16}H_{14}ClN_3O$.

Packaging and storage—Preserve Chlordiazepoxide in tight, light-resistant containers.

Category—Tranquilizer (minor).

Usual dose—**5** or **10 mg.** three or four times a day.

Usual dose range—**5** to **25 mg.**

Chlordiazepoxide Tablets

Chlordiazepoxide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{16}H_{14}ClN_3O$.

Identification—A portion of finely powdered Chlordiazepoxide Tablets, equivalent to about 20 mg. of chlordiazepoxide, responds to the *Identification test* under *Chlordiazepoxide*, page 148.

Ultraviolet absorption, page 866—The

solution of chlordiazepoxide employed for measurement of absorbance in the *Assay*, when diluted 1:1 with 0.1 *N* alcoholic sulfuric acid, exhibits maxima at the same wavelengths as the NF Chlordiazepoxide Reference Standard solution prepared for the *Assay*, and similarly diluted, and the ratio A_{245}/A_{311} is between 2.90 and 3.45.

Disintegration, page 878—The disintegration time limit for Chlordiazepoxide Tablets is 30 minutes.

Content uniformity, *Method II*, page 799—[Note: Use low-actinic glassware.] Chlordiazepoxide Tablets meet the requirements of the content uniformity test for tablets, using the following special procedure: Crush one tablet in a suitable container, add 5 ml. of dimethylformamide, and let stand for about 20 to 30 minutes. Dilute this solution quantitatively and stepwise, if necessary, with 0.1 *N* sulfuric acid, filtering prior to final dilution, to provide a solution containing approximately 15 mcg. of chlordiazepoxide per ml. Concomitantly determine the absorbance of this solution and of a solution of NF Chlordiazepoxide Reference Standard, in the same medium at a concentration of about 15 mcg. per ml., in 1-cm. cells, at the maximum at about 309 mμ, with a suitable spectrophotometer, using 0.1 *N* sulfuric acid as the blank. Calculate the quantity, in mg., of $C_{16}H_{14}ClN_3O$ in the tablet by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity of chlordiazepoxide, in mg., in the tablet; D is the exact concentration, in mcg. per ml., of chlordiazepoxide in the sample solution, based upon the labeled quantity per tablet and the extent of dilution; C is the exact concentration, in mcg. per ml., of the Reference Standard solution; A_U is the absorbance of the sample solution; and A_S is the absorbance of the Reference Standard solution.

Limit of 7-chloro-1,3-dihydro-5-phenyl-2*H*-1,4-benzodiazepin-2-one 4-oxide and 2-amino-5-chlorobenzophenone—Transfer an accurately weighed portion of finely powdered Chlordiazepoxide Tablets, equivalent to about 25.0 mg. of chlordiazepoxide, to a 10-ml. conical flask, add 2.5 ml. of acetone, and shake. Allow the excipients to settle, and apply 50 μl. of the supernatant solution to a suitable thin-layer chromatographic plate (see page 791), coated with a 0.25-mm. layer of silica gel G. Apply to the same plate 20 μl. of an acetone solution containing 1 mg. per ml. of NF 7-Chloro-1,3-dihydro-5-phenyl-2*H*-1,4-benzodiazepin-2-one 4-Oxide Reference Standard, and 5 μl. of an acetone solution containing 100 mcg. per ml. of NF 2-Amino-5-chlorobenzophenone Reference Standard. Develop the chromatogram in an unsaturated chamber with ethyl acetate until the solvent front has moved at least 10 cm. from the origin. Remove the plate from the developing chamber, and allow the solvent to evaporate. Locate the spots on the plate by lightly spraying with diluted sulfuric acid, followed by drying at 105° for 15 minutes, and then spraying in succession with sodium nitrite solution (1 in 1000), ammonium sulfamate solution (1 in 200), and *N*-1-naphthylethylenediamine dihydrochloride solution (1 in 1000). Any spots from the sample solution are not greater in size or intensity than the spots, occurring at the respective R_f values, produced by the Reference Standard solutions, corresponding to not more than 4 percent of 7-chloro-1,3-dihydro-5-phenyl-2*H*-1,4-benzodiazepin-2-one 4-oxide, and not more than 0.1 percent of 2-amino-5-chlorobenzophenone.

Assay—[Note: Use low-actinic glassware.] Weigh and finely powder not less than 20 Chlordiazepoxide Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 30 mg. of chlordiazepoxide, to a glass-stoppered centrifuge tube, and add 40 ml. of chloroform. Shake the mixture for 20 minutes in a mechanical shaker, then centrifuge. Transfer the chloroform extract to a 200-ml. volumetric flask. Repeat the extraction procedure three more times with 40-ml. portions of chloroform, combining the extracts in the volumetric flask, and dilute to volume with chloroform. Transfer this solution to a 250-ml. separator, and add 25 ml. of pH 9.7 borate buffer solution. (Prepare the buffer by mixing 30 ml. of 0.1 *N* sodium hydroxide with 70 ml. of a solution made with 12.4 g. of boric acid dissolved in 100 ml. of 1 *N* sodium hydroxide and diluted to 1000 ml. with water.) Shake well, and pass the chloroform layer through a funnel containing a pledget of glass wool layered with anhydrous sodium sulfate. Pipet 10.0 ml. of the filtrate into a 100-ml. volumetric flask, and evaporate to dryness under a stream of nitrogen. Using 0.1 *N* alcoholic sulfuric acid, dissolve the residue, dilute to volume, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Chlordiazepoxide Reference Standard, in the same medium, at a concentration of about 15 mcg. per ml., in 1-cm. cells, at the maximum at about 311 mμ, with a suitable spectrophotometer, using 0.1 *N* alcoholic sulfuric acid as the blank. Calculate the quantity, in mg., of $C_{16}H_{14}ClN_3O$ in the portion of the tablets taken by the formula $2C \times (A_U/A_S)$, in which C is the exact concentration of the Reference Standard solution, in mcg. per ml., A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

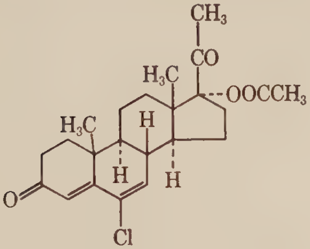
Packaging and storage—Preserve Chlordiazepoxide Tablets in tight, light-resistant containers.

Tablets available—Chlordiazepoxide

Tablets usually available contain the following amounts of chlordiazepoxide: 5, 10, and 25 mg.

Category and Dose—See Chlordiazepoxide.

Chlormadinone Acetate*



6-Chloro-17-hydroxypregna-4,6-diene-3,20-dione Acetate

$C_{23}H_{29}ClO_4$ Mol. wt. 404.94

Chlormadinone Acetate contains not less than 97.0 percent and not more than 102.0 percent of $C_{23}H_{29}ClO_4$, calculated on the dried basis.

Description—Chlormadinone Acetate occurs as an off-white to pale yellow, fluffy, crystalline powder. It is odorless.

Solubility—Chlormadinone Acetate is freely soluble in chloroform, and is slightly soluble in ether, in alcohol and in methanol. It is practically insoluble in water.

Identification—

A: Prepare a solution of Chlormadinone Acetate in chloroform containing 10 mg. per ml. On a suitable thin-layer chromatographic plate (see page 791), coated with a 0.25-mm. layer of silica gel G, spot 10 µl. of this solution and 10 µl. of a chloroform solution of NF Chlormadinone Acetate Reference Standard containing 10 mg. per ml. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of chloroform and ether (9:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Observe first under shortwave ultraviolet light and then under longwave ultraviolet light. Spray the plate with a 1 in 10 solution of phosphomolybdic acid in methanol, and then heat the plate on a steam bath over a thin metal sheet for 5 minutes. The R_f value of the main spot obtained from the sample solution corresponds to that obtained from the Reference Standard solution.

B: To about 50 mg. of Chlormadinone Acetate contained in a test tube, add 2 ml. of alcohol and 2 ml. of dilute sulfuric acid (1 in 3.5), and boil gently for about 1 minute: the odor of ethyl acetate is perceptible.

Melting range, *Class Ia,* page 815—Chlormadinone Acetate melts within a range of 4° between 206° and 214°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Chlormadinone Acetate, previously dried in vacuum at 40° for 16 hours, exhibits maxima only at the same wavelengths as that of NF Chlormadinone Acetate Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 100,000 solution of Chlormadinone Acetate in methanol exhibits maxima and minima at the same wavelengths as that of NF Chlormadinone Acetate Reference Standard, similarly measured.

Specific rotation, page 822—The specific rotation of Chlormadinone Acetate, previously dried in vacuum at 40° for 16 hours, determined in a solution in chloroform containing 200 mg. of Chlormadinone Acetate in each 10 ml., is between 0° and −6°.

X-ray diffraction, page 902—The X-ray diffraction pattern of Chlormadinone Acetate conforms to the following pattern:

Loss on drying, page 814—Dry Chlormadinone Acetate at 105° for 3 hours: it loses not more than 1 percent of its weight.

Foreign steroids and other impurities—

Standard preparation—Prepare as directed under *Steroid Chromatographic Purity,* page 876, using NF Chlormadinone Acetate Reference Standard to prepare a solution in chloroform containing approximately 10 mg. per ml.

Test preparation—Weigh accurately about 50 mg. of Chlormadinone Acetate, previously dried at 105° for 3 hours, dissolve it in a sufficient quantity of chloroform to make 5.0 ml., and mix.

Procedure—Proceed as directed for *Procedure* under *Steroid Chromatographic Purity,* page 876, applying 10 μl. each of the *Test Preparation* and of the *Standard Preparation* to the chromatographic plate and using a solvent system consisting of chloroform and ether (70:30). (Note: Use chloroform, rather than alcohol, to elute the silica gel bands). Determine the absorbances at the maximum at about 284 mμ. Calculate the percentage of chromatographic impurities by the formula $100 - [100 \times 5 \times (C/W) \times (A_U/A_S)]$, in which C is the exact concentration, in mg. per ml., of the *Standard preparation,* and W is the weight, in mg., of Chlormadinone Acetate taken: not more than 3 percent is found.

Assay—Transfer about 80 mg. of Chlormadinone Acetate, accurately weighed, to a 100-ml. volumetric flask, add methanol to volume, and mix. Transfer 1.0 ml. of this solution to a second 100-ml. volumetric flask, dilute to volume with methanol, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Chlormadinone Acetate Reference Standard, in the same medium at a concentration of about 8 mcg. per ml., in 1-cm. cells, at the maximum at about 284 mμ, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg., of $C_{23}H_{29}ClO_4$ in the Chlormadinone Acetate taken by the formula $10C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Chlormadinone Acetate in tight, light-resistant containers.

CATEGORY—Progestin.

USUAL DOSE—See Chlormadinone Acetate and Mestranol Tablets.

Chlormadinone Acetate and Mestranol Tablets

Chlormadinone Acetate and Mestranol Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of $C_{23}H_{29}ClO_4$ (chlormadinone acetate) and of $C_{21}H_{26}O_2$ (mestranol).

Identification—

A: The solution prepared for measurement of absorbance in the *Assay for chlormadinone acetate* exhibits a maximum at 285 ± 3 mμ.

B: The solution prepared for measurement of absorbance in the *Assay for mestranol* exhibits a maximum at 545 ± 3 mμ.

Disintegration, page 878—The disintegration time limit for Chlormadinone Acetate and Mestranol Tablets is 30 minutes.

Content uniformity, *Method II,* page 799

—Chlormadinone Acetate and Mestranol Tablets meet the requirements of the content uniformity test for tablets, using the following special procedure:

Chlormadinone acetate standard preparation—Transfer about 10 mg. of NF Chlormadinone Acetate Reference Standard, accurately weighed, to a 100-ml. volumetric flask, add chloroform to volume, and mix.

Mestranol standard preparation—Transfer about 8 mg. of USP Mestranol Reference Standard, accurately weighed, to a 200-ml. volumetric flask, add chloroform to volume, and mix. Transfer 10.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with chloroform, and mix.

Test preparation—Transfer a tablet to a 60-ml. separator containing 5 ml. of water and 0.05 ml. of sodium hydroxide solution (1 in 2). Carefully pipet 20.0 ml. of chloroform into the separator, stopper the separator with a stopper moistened with water, shake until the tablet has completely disintegrated, and then shake for 3 minutes longer. Allow the layers to separate, and collect the chloroform layer in a 25-ml. glass-stoppered flask containing 3 g. of anhydrous sodium sulfate.

Procedure for chlormadinone acetate—Transfer an accurately measured volume of the *Test preparation*, equivalent to about 200 mcg. of chlormadinone acetate, to a 25-ml. volumetric flask, and transfer 2.0 ml. of the *Chlormadinone acetate standard preparation* to a second 25-ml. volumetric flask. Dilute each flask to volume with chloroform, and mix. Concomitantly determine the absorbances of the solutions in 1-cm. cells, at the maximum at about 285 mμ, with a suitable spectrophotometer, using chloroform as the blank. Calculate the quantity, in mg., of $C_{23}H_{29}ClO_4$ in the tablet by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity of chlormadinone acetate, in mg., in the tablet; D is the exact concentration, in mcg. per ml., of chlormadinone acetate in the final sample solution, based upon the labeled quantity and the extent of dilution; C is the exact concentration, in mcg. per ml., of the diluted *Chlormadinone acetate standard solution;* A_U is the absorbance of the final sample solution; and A_S is the absorbance of the diluted *Chlormadinone acetate standard solution.*

Procedure for mestranol—Transfer an accurately measured volume of the *Test preparation*, equivalent to about 16 mcg. of mestranol, to a 25-ml. volumetric flask, and transfer 4.0 ml. of *Mestranol standard preparation* to a second 25-ml. volumetric flask. Wash down the neck of each flask with 2 ml. of chloroform, and then evaporate the contents of each flask to dryness at room temperature with the aid of a stream of air, without heating. Pipet 0.3 ml. of methanol into each flask, and dissolve the residues completely by rotating the flasks. Immerse the bulb and part of the neck of each flask in a constant-temperature water bath maintained at 25°, and, with constant swirling, add 10.0 ml. of *Color reagent*, prepared as directed in the *Assay for mestranol*, to each flask. Mix, and after 6 ± 1 minutes from the time of addition of the *Color reagent*, determine the absorbance of each solution in a 1-cm. cell, at the maximum at about 545 mμ, with a suitable spectrophotometer, using the *Color reagent* as the blank. Record the absorbance of the solution from the *Mestranol standard preparation* as A_S and that from the *Test preparation* as A_U. Calculate the quantity, in mcg., of $C_{21}H_{26}O_2$ in the tablet by the formula $(T/DV) \times 4C \times (A_U/A_S)$, in which T is the labeled quantity of mestranol, in mcg., in the tablet; D is the exact concentration, in mcg. per ml., of mestranol in the *Test preparation*, based upon the labeled quantity of mestranol per tablet; V is the volume, in ml., of the *Test preparation* taken; and C is the exact concentration, in mcg. per ml., of the *Mestranol standard preparation.*

Assay for chlormadinone acetate—Weigh not less than 20 Chlormadinone Acetate and Mestranol Tablets, and transfer a number of the tablets, equivalent to about 40 mg. of chlormadinone acetate, to a 125-ml. separator containing 30 ml. of water, 0.15 ml. of sodium hydroxide solution (1 in 2), and 40 ml. of chloroform. Shake until complete disintegration is effected. Allow the layers to separate, and drain the chloroform layer through a sintered-glass filter funnel containing 10 g. of anhydrous sodium sulfate, collecting the filtrate in a 200-ml. volumetric flask. Extract with three additional 40-ml. portions of chloroform, passing each extract through the funnel into the flask. Rinse the filter with chloroform, collecting the filtrate in the flask, dilute to volume with chloroform, and mix. Transfer 2.0 ml. of this solution to a 50-ml. volumetric flask, dilute to volume with chloroform, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Chlormadinone Acetate Reference Standard, in the same medium at a concentration of about 8 mcg. per ml., in 1-cm. cells, at the maximum at about 285 mμ, with a suitable spectrophotometer, using chloroform as the blank. Calculate the quantity, in mg., of $C_{23}H_{29}ClO_4$ in the Tablets taken by the formula $5C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Assay for mestranol—

Color reagent—Transfer 30.0 ml. of methanol to a 100-ml. volumetric flask, and place the flask in an ice-water bath maintained below 15°. With constant stirring, slowly and cautiously add sulfuric acid until a volume of about 95 ml. is reached. Allow the solution to return to room temperature, dilute to volume with sulfuric acid, and mix.

Standard preparation—Transfer about 16 mg. of USP Mestranol Reference Standard, accurately weighed, to a 200-ml. volumetric flask, add chloroform to volume, and mix. Transfer 10.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with chloroform, and mix.

Assay preparation—Weigh not less than 20 Chlormadinone Acetate and Mestranol Tablets, and transfer a number of tablets, equivalent to about 1.6 mg. of mestranol, to a 125-ml. separator containing 30 ml. of water, 0.15 ml. of sodium hydroxide solution (1 in 2), and 40 ml. of chloroform. Shake until complete disintegration is effected. Allow the layers to separate, and drain the chloroform layer through a sintered-glass filter funnel containing 10 g. of anhydrous sodium sulfate, collecting the filtrate in a 200-ml. volumetric flask. Extract with three additional 40-ml. portions of chloroform, passing each extract through the funnel into the flask. Rinse the filter with chloroform, collecting the filtrate in the flask, dilute to volume with chloroform, and mix.

Procedure—Transfer 2.0 ml. each of the *Standard preparation* and of the *Assay preparation* into separate 25-ml. volumetric flasks, and wash down the neck of each flask with 2 ml. of chloroform. Carefully evaporate the contents of each flask to dryness at room temperature with the aid of a stream of air, without heating. Pipet 0.3 ml. of methanol into each flask, and dissolve the residues completely by rotating the flasks. Immerse the bulb and part of the neck of each flask in a constant-temperature water bath maintained at 25°, and, with constant stirring, add 10.0 ml. of *Color reagent* to each flask. Mix, and after 6 ± 1 minutes from the time of the addition of the *Color reagent*, determine the absorbance of each solution in a 1-cm. cell, at the maximum at about 545 mμ, with a suitable spectrophotometer, using the *Color reagent* as the blank. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{21}H_{26}O_2$ in the Tablets taken by the formula $0.2C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*.

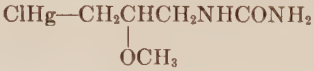
Packaging and storage—Preserve Chlormadinone Acetate and Mestranol Tablets in well-closed containers.

Tablets available—Chlormadinone Acetate and Mestranol Tablets usually available contain the following amount of chlormadinone acetate: 2 mg.; and of mestranol: 80 mcg.

Category—Estrogen-progestin (ovulation control).

Usual dose—Beginning on day 5 of menstrual cycle, 80 mcg. of mestranol daily for 15 days, then 80 mcg. of mestranol and 2 mg. of chlormadinone acetate daily for 5 days.

Chlormerodrin*



$$ClHg{-}CH_2\underset{\displaystyle OCH_3}{CH}CH_2NHCONH_2$$

Chloro(2-methoxy-3-ureidopropyl)mercury

$C_5H_{11}ClHgN_2O_2$ Mol. wt. 367.20

Chlormerodrin contains not less than 98.8 percent and not more than 100.7 percent of $C_5H_{11}ClHgN_2O_2$, calculated on the dried basis.

Description—Chlormerodrin occurs as a white, odorless, bitter powder.

Solubility—Chlormerodrin is sparingly soluble in water, and is slightly soluble in methanol and in absolute alcohol. It is practically insoluble in acetone and in ether.

Identification—Mix 50 mg. of Chlormerodrin with 3 drops of water, dip a clean copper wire in the paste and hold it in the nonluminous portion of the flame of a Bunsen burner: the flame turns green (*presence of chlorine*).

Melting range, page 814—Chlormerodrin melts between 145° and 155°.

Infrared absorption, page 866—The infrared absorption spectrum of a mineral oil dispersion of Chlormerodrin, previously dried at 105° for 5 hours, exhibits maxima only at the same wavelengths as that of NF Chlormerodrin Reference Standard, similarly measured.

Clarity and color of solution—Dissolve

---

* Patented. See notice, page ii.

1 g. of Chlormerodrin in 60 ml. of approximately 0.05 *N* sodium hydroxide: the solution is colorless and exhibits not more than a faint opalescence.

Loss on drying, page 814—Dry Chlormerodrin at 105° for 5 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Chlormerodrin yields not more than 0.3 percent of residue on ignition.

Mercury ions—Suspend 500 mg. of Chlormerodrin in 5 ml. of water, and dissolve as completely as possible by the gradual, and finally dropwise, addition, with stirring, of approximately 14 ml. of 0.1 *N* sodium hydroxide. Transfer the solution to a 25-ml. volumetric flask, dilute to volume with water, mix, filter, and add 4 drops of sodium sulfide T.S. to 5 ml. of the filtrate: not more than a faint coloration of the solution is noticeable within 20 seconds.

Assay—Transfer about 400 mg. of Chlormerodrin, accurately weighed, to a 400-ml. beaker, add 5 ml. of hydrochloric acid and 150 ml. of water, heat on a steam bath for about 5 minutes, and, while still on the steam bath, pass hydrogen sulfide into the solution for about 5 minutes. Transfer the precipitate quantitatively to a tared sintered-glass crucible, wash the precipitate successively with portions of water, alcohol, carbon disulfide, and alcohol, allowing the liquid to run through the filter without suction, and finally wash with ether. Dry the crucible and contents at 105° for 2 hours. The weight of mercuric sulfide so obtained, multiplied by 1.578, represents the weight of $C_5H_{11}ClHgN_2O_2$ in the portion of Chlormerodrin taken.

Packaging and storage—Preserve Chlormerodrin in well-closed containers.

CATEGORY—Diuretic.

USUAL DOSE RANGE—**55** to **110 mg.** daily.

Chlormerodrin Tablets

Chlormerodrin Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_5H_{11}ClHgN_2O_2$.

Identification—

A: A portion of powdered Chlormerodrin Tablets, equivalent to about 50 mg. of chlormerodrin, responds to the *Identification test* under *Chlormerodrin,* page 154.

B: The black precipitate obtained in the *Assay* is insoluble in hot 2 *M* nitric acid.

Disintegration, page 878—The disintegration time limit for Chlormerodrin Tablets is 30 minutes.

Content uniformity, *Method II,* page 799—Chlormerodrin Tablets meet the requirements of the content uniformity test for tablets, using the following special procedure: Quantitatively transfer a finely powdered tablet to a 25-ml. volumetric flask, using about 20 ml. of pH 10.0 borate buffer solution (prepared by dissolving 21.64 g. of boric acid and 235 g. of potassium chloride in 2000 ml. of water, adding 300 ml. of 1 *N* sodium hydroxide, and diluting to 7000 ml. with water) to effect the transfer. Warm on a steam bath for 20 minutes with occasional swirling, and cool. To the flask add 2 ml. of freshly prepared sodium bisulfite solution (1 in 40), dilute to volume with the buffer solution, mix, and filter, discarding the first 10 ml. of filtrate. Transfer a portion of the subsequent filtrate to a polarographic cell, insert the dropping mercury electrode of a suitable polarograph (see page 847), and record the polarogram from -0.1 volt to -0.9 volt, using a saturated calomel electrode as the reference electrode. Determine the height of the diffusion current $[(i_d)_U]$ as the difference between the residual current and the diffusion current plateau. Concomitantly and similarly determine the diffusion current $[(i_d)_S]$ of a solution containing about 366 mcg. of NF Chlormerodrin Reference Standard in each ml. and prepared as directed for the sample solution. Calculate the quantity, in mg., of $C_5H_{11}ClHgN_2O_2$ in the tablet by the formula $(T/D) \times C \times [(i_d)_U/(i_d)_S]$, in which T is the labeled quantity of chlormerodrin, in mg., in the tablet; D is the exact concentration, in mcg. per ml., of the sample solution based upon the labeled quantity per tablet and the extent of dilution, and C is the exact concentration, in mcg. per ml., of the Reference Standard solution.

Assay—Weigh and finely powder not less than 20 Chlormerodrin Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 250 mg. of chlormerodrin, to a 250-ml. volumetric flask, add 15 ml. of hydrochloric acid and 150 ml. of water, shake the mixture in a mechanical shaker for 1 hour, dilute to volume with water, mix, and filter. Transfer an accurately measured portion of the filtrate, equivalent to about 200 mg. of chlormerodrin, to a suitable beaker, and proceed as directed in the *Assay* under *Chlormerodrin,* page 154, beginning with "... heat on a steam bath...." The weight of mercuric sulfide, multiplied by

1.578, represents the weight of $C_5H_{11}ClHgN_2O_2$ in the portion of the Tablets taken.

Packaging and storage—Preserve Chlormerodrin Tablets in well-closed containers.

Tablets available—Chlormerodrin Tablets usually available contain the following amount of chlormerodrin: 18.3 mg.

CATEGORY AND DOSE—See Chlormerodrin.

Chloroform

$CHCl_3$ Mol. wt. 119.38

Chloroform contains not less than 99.0 percent and not more than 99.5 percent of $CHCl_3$, the remainder consisting of alcohol.

Caution: Care should be taken not to vaporize Chloroform in the presence of a flame, because of the production of harmful gases.

Description—Chloroform is a clear, colorless, mobile liquid, having a characteristic, ethereal odor, and a burning, sweet taste. It is not flammable, but its heated vapor burns with a green flame. It boils at about 61°. It is affected by light.

Solubility—Chloroform is slightly soluble in water. It is miscible with alcohol, with ether, with benzene, with solvent hexane, and with fixed and volatile oils.

Specific gravity, page 866—The specific gravity of Chloroform is not less than 1.474 and not more than 1.478, indicating not less than 99.0 percent and not more than 99.5 percent of $CHCl_3$.

Nonvolatile residue—Evaporate 50 ml. of Chloroform in a platinum or porcelain dish on a steam bath, and dry at 105° for 1 hour: the weight of the residue does not exceed 1 mg. (20 parts per million, w/v).

Chloride and free chlorine—Shake 10 ml. of Chloroform with 25 ml. of oxygen- and carbon dioxide-free water, and allow the liquids to separate completely: separate portions of 10 ml. each of the water layer are not affected by a few drops of silver nitrate T.S. (*chloride*), or colored blue by the addition of a few drops each of potassium iodide T.S. and starch T.S. (*free chlorine*).

Readily carbonizable substances—Transfer 40 ml. of Chloroform to a glass-stoppered cylinder previously rinsed with sulfuric acid T.S. and allowed to drain for 10 minutes. Add 5 ml. of sulfuric acid T.S., and shake the mixture vigorously for 5 minutes. Allow the liquids to separate completely: the Chloroform remains colorless and the acid has no more color than Matching Fluid A (see page 856).

Odorous and chlorinated decomposition products—Dilute 2 ml. of the sulfuric acid separated from the Chloroform in the test for *Readily carbonizable substances* with 5 ml. of water: the liquid is colorless and clear, and while hot from the mixing emits but a faint vinous or ether odor (*odorous decomposition products*). When further diluted with 10 ml. of water, it remains clear, and is not affected within 1 minute by the addition of 3 drops of silver nitrate T.S. (*chlorinated decomposition products*).

Acid and phosgene—Into each of two glass-stoppered 50-ml. color-comparison cylinders having an internal diameter of 20 mm., place 10 ml. of water, 2 drops of phenolphthalein T.S., and enough 0.01 *N* sodium hydroxide to produce, after vigorous shaking, pink tints of equal intensity. Into one of the cylinders measure 20.0 ml. of Chloroform, and again shake the mixture well. Add 0.01 *N* sodium hydroxide, dropwise from a buret, shaking the mixture well after each addition, until the pink color is reproduced in an intensity equal to that in the cylinder without the Chloroform. Not more than 0.20 ml. of 0.01 *N* sodium hydroxide is required to produce a pink color which persists for 15 minutes.

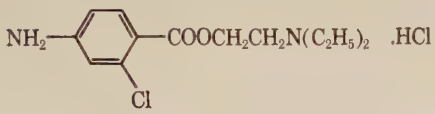
Aldehyde and ketone—Shake 3 ml. of Chloroform with 10 ml. of ammonia-free water in a glass-stoppered cylinder for 5 minutes. After the liquids separate, transfer 5 ml. of the water extract to another glass-stoppered cylinder containing 40 ml. of ammonia-free water, and add 5 ml. of alkaline mercuric-potassium iodide T.S.: no turbidity or precipitate develops within 1 minute.

Foreign odor—Pour 20 ml. of Chloroform, in small portions, upon a piece of clean, odorless filter paper laid flat upon a warmed glass plate, and rock the plate from side to side until the liquid is completely evaporated: no foreign odor becomes perceptible as the last portions of liquid disappear from the paper, and the paper remains odorless.

Packaging and storage—Preserve Chloroform in tight, light-resistant containers, preferably at a temperature not above 30°.

CATEGORY—Solvent.

Chloroprocaine Hydrochloride



2-(Diethylamino)ethyl 4-amino-2-chlorobenzoate Monohydrochloride

$C_{13}H_{19}ClN_2O_2 . HCl$ Mol. wt. 307.22

Chloroprocaine Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of $C_{13}H_{19}ClN_2O_2 . HCl$, calculated on the dried basis.

Description—Chloroprocaine Hydrochloride occurs as a white, crystalline powder. Is odorless and is stable in air. Its solutions are acid to litmus. It exhibits local anesthetic properties when placed on the tongue.

Solubility—Chloroprocaine Hydrochloride is soluble in water and is slightly soluble in alcohol. It is very slightly soluble in chloroform and is practically insoluble in ether.

Identification—Chloroprocaine Hydrochloride responds to the tests for *Chloride*, page 808.

Melting range, page 814—Chloroprocaine Hydrochloride melts between 173° and 176°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Chloroprocaine Hydrochloride, previously dried at 105° for 2 hours, exhibits maxima only at the same wavelengths as that of NF Chloroprocaine Hydrochloride Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 100,000 solution of Chloroprocaine Hydrochloride in pH 4.5 buffer solution (prepared by dissolving 13.61 g. of monobasic potassium phosphate in 750 ml. of water, adjusting the pH to 4.5 ± 0.1 with 0.1 N potassium hydroxide, and diluting to 1000 ml. with water) exhibits maxima and minima at the same wavelengths as that of NF Chloroprocaine Hydrochloride Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance occurring at about 278 mμ, do not differ by more than 3 percent.

Acidity—Dissolve 1 g. of Chloroprocaine Hydrochloride in 25 ml. of water, add 2 drops of methyl red T.S., and titrate with 0.02 N sodium hydroxide: not more than 1.8 ml. is required to produce a yellow color.

Loss on drying, page 814—Dry about 500 mg. of Chloroprocaine Hydrochloride, accurately weighed, at 105° for 2 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Chloroprocaine Hydrochloride yields not more than 0.15 percent of residue on ignition.

4-Amino-2-chlorobenzoic acid—

Standard preparation—Transfer 50.0 mg. of 4-amino-2-chlorobenzoic acid to a 100-ml. volumetric flask, dissolve in water, dilute to volume with water, and mix. Transfer 5.0 ml. of this solution to a second 100-ml. volumetric flask, dilute to volume with water, and mix.

Test preparation—Transfer 100.0 mg. of Chloroprocaine Hydrochloride to a 25-ml. volumetric flask, dissolve in water, dilute to volume with water, and mix.

Procedure—Transfer to separate separators 1.0 ml. each of the *Standard preparation* and of the *Test preparation*. To each separator add 1 ml. of 0.1 N hydrochloric acid, 1 ml. of water, and 2 ml. of sodium nitrite solution (1 in 1000), mix, and allow to stand for 3 minutes. Add 2 ml. of ammonium sulfamate solution (1 in 200), mix, and allow to stand for 2 minutes. Add 5 ml. of N-1-naphthylethylenediamine dihydrochloride solution (1 in 1000), mix, and allow to stand for 10 minutes. Add 7 ml. of chloroform, shake vigorously for 30 seconds, and add rapidly 0.8 ml. of sodium hydroxide solution (35 in 100) with continuous agitation. Shake immediately for 2 minutes, and allow the layers to separate. Remove most of the chloroform, and repeat the extraction with 5-ml. portions of chloroform until the chloroform phase remains colorless. Allow the aqueous layer to stand until clear: the color of the solution from the *Test preparation* is not more intense than that of the solution from the *Standard preparation* (0.625 percent).

Assay—Transfer about 400 mg. of Chloroprocaine Hydrochloride, accurately weighed, to a 200-ml. beaker, add 80 ml. of glacial acetic acid and 2 ml. of acetic anhydride, and heat on a steam bath for 10 minutes. Cool, add 10 ml. of mercuric acetate T.S., and titrate with 0.1 N perchloric acid in glacial acetic acid, determining the end-point potentiometrically. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 N perchloric acid is equivalent to 30.72 mg. of $C_{13}H_{19}ClN_2O_2 . HCl$.

Packaging and storage—Preserve

Chloroprocaine Hydrochloride in well-closed containers.

Category—Local anesthetic.

Usual dose—Infiltration, **100 ml.** of 0.5 percent solution. Peripheral nerve block, **50 ml.** of 1 percent solution.

Usual dose range—Up to **1 g.** as a 0.5 to 3 percent solution.

Chloroprocaine Hydrochloride Injection

Chloroprocaine Hydrochloride Injection is a sterile solution of chloroprocaine hydrochloride in water for injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{13}H_{19}ClN_2O_2.HCl$.

Identification—Chloroprocaine Hydrochloride Injection responds to the *Identification test* under *Chloroprocaine Hydrochloride*, page 157.

pH, page 824—The pH of Chloroprocaine Hydrochloride Injection is between 2.7 and 4.0.

4-Amino-2-chlorobenzoic acid—

Standard preparation—Prepare as directed in the test for *4-Amino-2-chlorobenzoic acid* under *Chloroprocaine Hydrochloride*, page 157.

Test preparation—Transfer to a 25-ml. volumetric flask an accurately measured volume of Chloroprocaine Hydrochloride Injection, equivalent to about 100 mg. of chloroprocaine hydrochloride, dilute to volume with water, and mix.

Procedure—Transfer to a separator 1.6 ml. of the *Standard preparation*, transfer to another separator 1.0 ml. of the *Test preparation*, and continue as directed for *Procedure* in the test for *4-Amino-2-chlorobenzoic acid* under *Chloroprocaine Hydrochloride*, page 157: the color of the solution from the *Test preparation* is not more intense than that from the *Standard preparation* (1 percent).

Other requirements—Chloroprocaine Hydrochloride Injection meets the requirements under *Injections*, page 810.

Assay—

Standard preparation—Transfer to a 125-ml. separator about 50 mg. of NF Chloroprocaine Hydrochloride Reference Standard, accurately weighed, add 20 ml. of water, and mix.

Assay preparation—Transfer to a 125-ml. separator an accurately measured volume of Chloroprocaine Hydrochloride Injection, equivalent to about 50 mg. of chloroprocaine hydrochloride, and dilute to about 20 ml. with water.

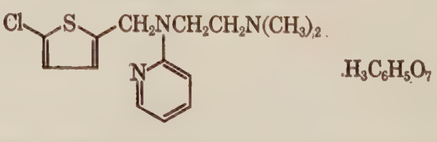
Procedure—To the *Standard preparation* and also to the *Assay preparation* add 5 ml. of ammonia T.S., then treat each as follows: Extract with five 25-ml. portions of chloroform, and filter the combined extracts through about 1 g. of anhydrous sodium sulfate supported on a pledget of glass wool. Collect the filtrate in a 200-ml. volumetric flask, add chloroform to volume, and mix. Transfer 3.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with chloroform, and mix. Concomitantly determine the absorbances of both solutions at the maximum at about 278 mμ, with a suitable spectrophotometer, using chloroform as the blank. Calculate the quantity, in mg., of $C_{13}H_{19}ClN_2O_2.HCl$ in each ml. of the Injection taken by the formula $(W/V) \times (A_U/A_S)$, in which W is the weight, in mg., of NF Chloroprocaine Hydrochloride Reference Standard used in preparing the *Standard preparation*, V is the volume, in ml., of the Injection taken, A_U is the absorbance of the solution from the *Assay preparation*, and A_S is the absorbance of the solution from the *Standard preparation*.

Packaging and storage—Preserve Chloroprocaine Hydrochloride Injection in single-dose or in multiple-dose containers, preferably of Type I glass.

Injections available—Chloroprocaine Hydrochloride Injections usually available contain the following amounts of chloroprocaine hydrochloride: 300 and 600 mg. in 30 ml.

Category and Dose—See Chloroprocaine Hydrochloride.

Chlorothen Citrate



2-[(5-Chloro-2-thenyl)[2-(dimethylamino)ethyl]amino]pyridine Citrate (1:1)

$C_{14}H_{18}ClN_3S.C_6H_8O_7$ Mol. wt. 487.96

Chlorothen Citrate, dried in vacuum over phosphorus pentoxide for 5 hours, contains not less than 98.0 percent and not more than 100.5 percent of $C_{14}H_{18}ClN_3S \cdot C_6H_8O_7$.

Description—Chlorothen Citrate occurs as a white, crystalline powder, usually having a faint odor. Its solutions are acid to litmus.

Solubility—Chlorothen Citrate is sparingly soluble in water. It is slightly soluble in alcohol, and practically insoluble in chloroform, in ether, and in benzene.

Identification—

A: Dissolve 25 mg. of Chlorothen Citrate in 5 ml. of sulfuric acid: a dark red color is produced, which disappears on dilution with 20 ml. of water with formation of a brown precipitate.

B: Dissolve about 500 mg. of Chlorothen Citrate in 5 ml. of hot water, add a slight excess of sodium hydroxide to liberate chlorothen base, and filter: the clear filtrate responds to the tests for *Citrate,* page 808.

Melting range, page 814—Chlorothen Citrate melts between 112° and 116°. On further heating it gradually solidifies and remelts between 125° and 140° with decomposition.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Chlorothen Citrate, previously dried in vacuum over phosphorus pentoxide for 5 hours, exhibits maxima only at the same wavelengths as that of NF Chlorothen Citrate Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 50,000 solution of Chlorothen Citrate in 0.5 *N* sulfuric acid exhibits maxima and minima at the same wavelengths as that of NF Chlorothen Citrate Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorption occurring at about 243 mμ do not differ by more than 2.5 percent.

Loss on drying, page 814—Dry Chlorothen Citrate in vacuum over phosphorus pentoxide for 5 hours: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Chlorothen Citrate yields not more than 0.1 percent of residue on ignition.

Assay—Transfer to a beaker about 600 mg. of Chlorothen Citrate, previously dried in vacuum over phosphorus pentoxide for 5 hours and accurately weighed, and dissolve it in 80 ml. of glacial acetic acid. Titrate with 0.1 *N* perchloric acid in glacial acetic acid, determining the end-point potentiometrically, using suitable electrodes. Each ml. of 0.1 *N* perchloric acid is equivalent to 24.40 mg. of $C_{14}H_{18}ClN_3S \cdot C_6H_8O_7$.

Packaging and storage—Preserve Chlorothen Citrate in tight, light-resistant containers.

CATEGORY—Antihistaminic.

USUAL DOSE—**25 mg.** every 3 or 4 hours, should not exceed 150 mg. in a 24-hour period.

Chlorothen Citrate Tablets

Chlorothen Citrate Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{14}H_{18}ClN_3S \cdot C_6H_8O_7$.

Identification—To a portion of finely powdered Chlorothen Citrate Tablets, equivalent to about 50 mg. of chlorothen citrate, add 5 ml. of water and 3 ml. of ammonia T.S., and extract the liberated base with two 10-ml. portions of ether. Wash the combined ether extracts with 2 ml. of water, and evaporate the ether extracts to dryness. The residue so obtained responds to *Identification test A* under *Chlorothen Citrate,* page 158.

Ultraviolet absorption, page 866—The solution employed for the measurement of ultraviolet absorbance in the *Assay* exhibits an absorbance maximum at 313 ± 1 mμ.

Disintegration, page 878—The disintegration time limit for Chlorothen Citrate Tablets is 30 minutes.

Content uniformity, *Method I,* page 799—Chlorothen Citrate Tablets meet the requirements of the content uniformity test for tablets.

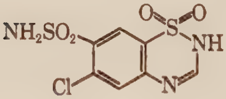
Assay—Weigh and finely powder not less than 20 Chlorothen Citrate Tablets. Weigh accurately a portion of the powder, equivalent to about 40 mg. of chlorothen citrate, and transfer to a 100-ml. volumetric flask. Add 25 ml. of formic acid, shake mechanically for 1 hour, and dilute to volume with water. Centrifuge the mixture and transfer 25.0 ml. of the clear supernatant liquid to a 250-ml. separator. Add 20 ml. of ether, shake carefully, and draw the aqueous phase into a second 250-ml. separator. Wash the ether phase with two 10-ml. portions of water, adding the washings to the second separator, and discard the ether. To the acid solution slowly add sodium hydroxide solution (1 in 4), in portions, until the solution is distinctly alkaline, cool the solution to room temperature, add 50 ml. of ether, shake carefully, and transfer the aqueous phase to a third 250-ml. separator containing 50 ml. of ether. Shake the third separator carefully, and discard the aqueous phase. Wash the ether extracts in the two separators, in succession, with one 20-ml. portion of water, and discard the water. Extract the separate ether phases successively with three 20-ml. portions of 0.5 *N* sulfuric acid, combine the acid extracts in a 100-ml. volumetric flask, dilute with the acid to volume, and mix. Transfer 20.0 ml. of the solution to another 100-ml. volumetric flask, make to volume with 0.5 *N* sulfuric acid, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Chlorothen Citrate Reference Standard, in the same medium, at a concentration of about 20 mcg. per ml., in 1-cm. cells, at the maximum at about 313 mμ with a suitable spectrophotometer, using 0.5 *N* sulfuric acid as the blank. Calculate the quantity, in mg., of $C_{14}H_{18}ClN_3S.C_6H_8O_7$ in the portion of the Tablets taken by the formula $2C \times (A_U/A_S)$, in which C is the exact concentration of the Reference Standard solution, in mcg. per ml., A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Chlorothen Citrate Tablets in tight containers.

Tablets available—Chlorothen Citrate Tablets usually available contain the following amount of chlorothen citrate: 25 mg.

CATEGORY and DOSE—See Chlorothen Citrate.

Chlorothiazide*



6-Chloro-2*H*-1,2,4-benzothiadiazine-7-sulfonamide 1,1-Dioxide

$C_7H_6ClN_3O_4S_2$ Mol. wt. 295.72

Chlorothiazide contains not less than 98.0 percent and not more than 100.5 percent of $C_7H_6ClN_3O_4S_2$, calculated on the dried basis.

Description—Chlorothiazide occurs as a white or practically white, odorless, crystalline powder. It melts at about 355°.

Solubility—Chlorothiazide is very slightly soluble in water. It is freely soluble in dimethylformamide and in dimethyl sulfoxide, and is slightly soluble in methanol and in pyridine. It is practically insoluble in ether, in benzene, and in chloroform.

Identification—Fuse about 100 mg. of Chlorothiazide with a pellet of sodium hydroxide: the ammonia fumes produced turn moistened red litmus paper blue. The fusion mixture responds to the test for *Sulfite*, page 810.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Chlorothiazide, previously dried at 105° for 1 hour, exhibits maxima only at the same wavelengths as that of NF Chlorothiazide Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 100,000 solution of Chlorothiazide in 0.1 *N* sodium hydroxide exhibits maxima and minima at the same wavelengths as that of NF Chlorothiazide Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance occurring at about 292 mμ, do not differ by more than 3 percent.

Loss on drying, page 814—Dry Chlorothiazide at 105° for 1 hour: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Chlorothiazide yields not more than 0.1 percent of residue on ignition.

---

* Patented. See notice, page ii.

Chloride—Dissolve about 1 g. of Chlorothiazide, accurately weighed, in a mixture of 10 ml. of water and 10 ml. of sodium hydroxide solution (1 in 10). Cool in an ice bath, and add 20 ml. of water and 5 ml. of nitric acid. A flocculent, white precipitate is formed. Titrate potentiometrically, using a silver-silver chloride electrode system and 0.05 *N* silver nitrate as the titrant. Each ml. of 0.05 *N* silver nitrate is equivalent to 1.778 mg. of Cl. Not more than 0.05 percent of Cl is found.

Selenium—A *Test Preparation* prepared with 200 mg. of Chlorothiazide meets the requirements of the *Selenium Limit Test*, page 865 (30 parts per million).

Heavy metals, *Method II*, page 806—The heavy metals limit for Chlorothiazide is 10 parts per million.

Diazotizable substances—

Standard preparation—Transfer 20.0 mg. of NF 4-Amino-6-chloro-1,3-benzenedisulfonamide Reference Standard to a 100-ml. volumetric flask, dissolve in acetone, dilute to volume with acetone, and mix. Transfer 4.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with acetone, and mix. Each ml. of the *Standard preparation* contains 8 mcg. of the reagent.

Test preparation—Transfer 80.0 mg. of Chlorothiazide to a 100-ml. volumetric flask, dilute to volume with acetone, and mix.

Procedure—Transfer 1.0 ml. each of the *Standard preparation*, of the *Test preparation*, and of acetone to serve as the blank to separate tubes. To each tube add 9.0 ml. of 1 *N* hydrochloric acid and 0.1 ml. of freshly prepared sodium nitrite solution (1 in 25), mix, and allow to stand for 1 minute. Add 0.8 ml. of ammonium sulfamate solution (1 in 50), mix, allow to stand for 3 minutes, add 0.8 ml. of *N*-1-naphthylethylenediamine dihydrochloride solution in 50 percent alcohol (1 in 50), and mix. After 2 minutes, concomitantly determine the absorbances of the solutions, in 1-cm. cells, at the maximum at about 518 mμ, with a suitable spectrophotometer, using the blank to set the instrument: the absorbance of the solution from the *Test preparation* does not exceed that of the solution from the *Standard preparation*, corresponding to not more than 1 percent of diazotizable substances.

Assay—Dissolve about 500 mg. of Chlorothiazide, accurately weighed, in 80 ml. of dimethylformamide, observing precautions against absorption of atmospheric carbon dioxide. Add 3 drops of a 1 in 100 solution of bromothymol blue in dimethylformamide, and titrate with 0.1 *N* sodium methoxide to a full turquoise-blue endpoint. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* sodium methoxide is equivalent to 29.57 mg. of $C_7H_6ClN_3O_4S_2$.

Packaging and storage—Preserve Chlorothiazide in well-closed containers.

CATEGORY—Diuretic; antihypertensive.

USUAL DOSE—Diuretic, **500 mg.** one or two times a day. Antihypertensive, **250 mg.** three times a day.

USUAL DOSE RANGE—Diuretic, **500 mg.** to **1 g.** Antihypertensive, **250** to **500 mg.**

Chlorothiazide Oral Suspension

Chlorothiazide Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_7H_6ClN_3O_4S_2$.

Identification—The ultraviolet absorption spectrum of the solution of chlorothiazide prepared from Chlorothiazide Oral Suspension as directed in the *Assay* exhibits maxima and minima at the same wavelengths as that of a solution of NF Chlorothiazide Reference Standard, prepared as directed in the *Assay*, similarly measured.

pH, page 824—The pH of Chlorothiazide Oral Suspension is between 3.5 and 4.0.

Assay—Transfer to a 250-ml. volumetric flask an accurately measured volume of Chlorothiazide Oral Suspension, equivalent to about 250 mg. of chlorothiazide, dilute to volume with 0.1 *N* sodium hydroxide, and mix. Transfer 10.0 ml. of this solution to a 100-ml volumetric flask, dilute to volume with 0.1 *N* hydrochloric acid, and mix. Transfer 50.0 ml. of this last solution to a 125-ml. separator, and wash with two 25-ml. portions of chloroform, discarding the washings. Transfer 10.0 ml. of the washed solution to a 100-ml. volumetric flask, dilute to volume with 0.1 *N* sodium hydroxide, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Chlorothiazide Reference Standard, in the same medium at a concentration of about 10 mcg. per ml., in 1-cm. cells, at the maximum at about 292 mμ, with a suitable spectrophotometer, using 0.1 N sodium hydroxide as the blank. Calculate the quantity, in mg., of $C_7H_6ClN_3O_4S_2$ in each ml. of the Suspension taken by the formula $25 \times (C/V) \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, V is the volume, in ml., of the Suspension taken, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Chlorothiazide Oral Suspension in tight containers.

Suspension available—Chlorothiazide Oral Suspension usually available contains the following amount of chlorothiazide: 250 mg. in 5 ml.

Category and Dose—See Chlorothiazide.

Chlorothiazide Tablets

Chlorothiazide Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_7H_6ClN_3O_4S_2$.

Identification—

A: The polarogram (see page 847) of the solution employed for measurement in the *Assay* of Chlorothiazide Tablets exhibits a half-wave potential ($E_{1/2}$) within 1 percent of that of NF Chlorothiazide Reference Standard, similarly measured.

B: Powder 1 Chlorothiazide Tablet, and fuse it with a pellet of sodium hydroxide: the fusion mixture responds to the *Identification test* under *Chlorothiazide*, page 160.

Disintegration, page 878—The disintegration time limit for Chlorothiazide Tablets is 30 minutes.

Weight variation, page 901—Chlorothiazide Tablets meet the requirements of the weight variation test for tablets.

Assay—Weigh and finely powder not less than 20 Chlorothiazide Tablets. Weigh accurately a portion of the powder, equivalent to about 250 mg. of chlorothiazide, and transfer to a 100-ml. volumetric flask. Add 20 ml. of dimethylformamide, shake for 5 minutes, then dilute to volume with water. Pipet 10.0 ml. of the solution into a 100-ml. volumetric flask, and add 50 ml. of 1 M ammonium chloride and 3 ml. of a 1 in 500 solution of alkyl phenoxy polyethoxy ethanol. Dilute to volume with water, and mix. Transfer a portion of this solution to a polarographic cell. De-aerate by bubbling nitrogen through the sample solution for 10 minutes. Insert the dropping mercury electrode of a suitable polarograph, and with a drop-time of 3 to 4 seconds, record the polarogram from -1.00 volt to -1.75 volts, using a saturated calomel electrode as the reference electrode. Determine the height of the diffusion current $[(i_d)_U]$ as the difference between the residual current and the diffusion current plateau. Concomitantly and similarly determine the diffusion current $[(i_d)_S]$ of a solution containing about 250 mcg. of NF Chlorothiazide Reference Standard in each ml. and prepared as directed for the sample solution. Calculate the quantity, in mg., of $C_7H_6ClN_3O_4S_2$ in the portion of the Tablets taken by the formula $C \times [(i_d)_U/(i_d)_S]$, in which C is the exact concentration, in mcg. per ml., of NF Chlorothiazide Reference Standard in the Reference Standard solution.

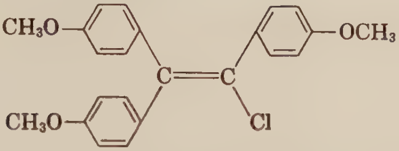
Packaging and storage—Preserve Chlorothiazide Tablets in well-closed containers.

Tablets available—Chlorothiazide Tablets usually available contain the following amounts of chlorothiazide: 250 and 500 mg.

Category and Dose—See Chlorothiazide.

Chlorothiazide, Sodium, for Injection, page 641

Chlorotrianisene



Chlorotris(*p*-methoxyphenyl)ethylene

$C_{23}H_{21}ClO_3$ Mol. wt. 380.88

Chlorotrianisene, dried at 80° for 18 hours, contains not less than 97.0 percent and not more than 103.0 percent of $C_{23}H_{21}ClO_3$.

Description—Chlorotrianisene occurs as small white crystals, or as a crystalline powder. It is odorless, and is stable in air.

Solubility—Chlorotrianisene is very slightly soluble in water. It is slightly soluble in alcohol and in methanol, and is freely soluble in acetone, in benzene, and in chloroform. It is practically insoluble in 2,2,4-trimethylpentane.

Melting range, page 814—Chlorotrianisene melts between 115° and 117°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Chlorotrianisene, previously dried at 80° for 18 hours, exhibits maxima only at the same wavelengths as that of NF Chlorotrianisene Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 100,000 solution of Chlorotrianisene in chloroform exhibits maxima and minima at the same wavelengths as that of NF Chlorotrianisene Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorption occurring at about 310 $m\mu$ do not differ by more than 3 percent.

pH, page 824—The pH of a saturated solution of Chlorotrianisene is between 5.0 and 7.0.

Loss on drying, page 814—Dry Chlorotrianisene at 80° for 18 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Chlorotrianisene yields not more than 1 percent of residue on ignition.

Heavy metals, *Method II*, page 806—The heavy metals limit for Chlorotrianisene is 20 parts per million.

Assay—Transfer to a 100-ml. flask 500 mg. of Chlorotrianisene, previously dried at 80° for 18 hours and accurately weighed, add 15 ml. of dehydrated alcohol, connect the flask to a reflux condenser, and begin heating gently. When the Chlorotrianisene has dissolved and the alcohol is boiling, cautiously add through the condenser about 2 g. of clean sodium, cut in small pieces. Reflux for not less than 1 hour, shaking frequently (there must be a visible excess of sodium present at the end of 1 hour, add more sodium if necessary); then, while the solution is still boiling, cautiously add alcohol to decompose the excess sodium. Continue heating for 15 minutes after the last trace of sodium has disappeared. Rinse the condenser with small portions of water, and transfer the reaction mixture to a 400-ml. beaker, rinsing the flask with about 125 ml. of water. Cool the solution and add 15 ml. of nitric acid and 25.0 ml. of 0.1 *N* silver nitrate, and mix. When the precipitate has coagulated, filter, and wash the filter with water. Add 10 ml. of ferric ammonium sulfate T.S. to the filtrate, and titrate the excess silver nitrate with 0.1 *N* ammonium thiocyanate. Each ml. of 0.1 *N* silver nitrate is equivalent to 38.09 mg. of $C_{23}H_{21}ClO_3$.

Packaging and storage—Preserve Chlorotrianisene in tight containers.

Category—Estrogen.
Usual dose—**24 mg.** daily.
Usual dose range—**12 to 50 mg.**

Chlorotrianisene Capsules

Chlorotrianisene Capsules contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{23}H_{21}ClO_3$.

Identification—The assay sample solution prepared from Chlorotrianisene Capsules and the solution prepared from NF Chlorotrianisene Reference Standard in the *Assay* exhibit similar ultraviolet absorption spectra.

Content uniformity, *Method I*, page 798—Chlorotrianisene Capsules meet the requirements of the content uniformity test for capsules.

Assay—

Chromatographic column—Pack a pledget of glass wool in the base of a chromatographic tube (25 × 300-mm. test tube to which is fused a 5-cm. length of 6 or 8-mm. tubing) with the aid of a tamping rod of stainless steel, aluminum, or glass, at least 31 cm. long and having a terminal disk with a diameter about 1 mm. less than that of the chromatographic tube. To 7.0 g. of purified siliceous earth in a 150-ml. beaker, add 8.0 ml. of nitromethane, and incorporate by kneading thoroughly with a flexible spatula blade until the mixture is fluffy. Transfer to the chromatographic tube in three approximately equal portions, tamping gently to compress the material to a uniform mass.

Assay preparation for hard gelatin capsules—Remove as completely as possible, the contents of not less than 20 Chlorotrianisene Capsules and weigh accurately. Mix the combined contents thoroughly, and transfer an accurately weighed quantity of the powder, equivalent to about 12 mg. of chlorotrianisene, to a 100-ml. volumetric flask. Add 75 ml. of *n*-heptane, shake for 30 minutes, dilute to volume with *n*-heptane, and mix.

Assay preparation for soft capsules—Weigh accurately not less than 10 Chlorotrianisene Capsules in a tared weighing vessel. Transfer the weighed Capsules to another dish. Carefully open the Capsules, without loss of the shell material, and transfer the contents to a 50-ml. beaker. Wash the emptied capsules with several portions of ether, and allow them to dry in a jet of air until the odor of ether is no longer perceptible. Weigh the empty capsules in the original tared weighing vessel: the difference represents the weight of the contents of the capsules. Transfer an accurately weighed portion of the contents of the capsules, equivalent to about 12 mg. of chlorotrianisene, to a 100-ml. volumetric flask, add *n*-heptane to volume, and mix.

Procedure—Transfer 10.0 ml. of the *Assay preparation* to the prepared column. Wash the column with 40 ml. of *n*-heptane, and discard the washings. Elute with 175 ml. of *n*-heptane, collecting the eluate in a 250-ml. conical flask. Evaporate the eluate to dryness, dissolve the residue in chloroform, and transfer to a 100-ml. volumetric flask. Wash the receiver with chloroform, transfer the washings to the volumetric flask, add chloroform to volume, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Chlorotrianisene Reference Standard, in the same medium, at a concentration of about 12 mcg. per ml., in 1-cm. cells, at the maximum absorbance at about 310 mμ, with a suitable spectrophotometer, using chloroform as the blank. Calculate the quantity, in mg., of $C_{23}H_{21}ClO_3$ in the portion of the Capsules taken by the formula $C \times (A_U/A_S)$, in which C is the exact concentration of the Reference Standard solution, in mcg. per ml., A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Chlorotrianisene Capsules in well-closed containers protected from excessive heat, cold, and moisture.

Labeling—The container label indicates the vehicle used in the Chlorotrianisene Capsules.

Capsules available—Chlorotrianisene Capsules usually available contain the following amounts of chlorotrianisene: 12, 25, and 72 mg.

CATEGORY and DOSE—See Chlorotrianisene.

Chlorpheniramine Maleate Injection

Chlorpheniramine Maleate Injection is a sterile solution of chlorpheniramine maleate in water for injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{16}H_{19}ClN_2.C_4H_4O_4$.

Identification—

A: Dilute a volume of Chlorpheniramine Maleate Injection, equivalent to about 50 mg. of chlorpheniramine maleate, with 0.01 *N* hydrochloric acid to 25 ml., and proceed as directed under *Identification—Organic Nitrogenous Bases*, page 810, beginning with "Transfer the liquid to a separator. . . .": the Injection meets the requirements of the test.

B: Evaporate a volume of Chlorpheniramine Maleate Injection, equivalent to about 25 mg. of chlorpheniramine maleate, on a steam bath to dryness, and dry the residue at 105° for 1 hour: it melts between 128° and 135°, page 814.

pH, page 824—The pH of Chlorpheniramine Maleate Injection is between 4.0 and 5.2.

Other requirements—Chlorpheniramine Maleate Injection meets the requirements under *Injections*, page 810.

Assay—Proceed with Chlorpheniramine Maleate Injection as directed under *Salts of Organic Nitrogenous Bases*, page 865, but for the determination of A_S, dissolve about 25 mg. of USP Chlorpheniramine Maleate Reference Standard, accurately weighed, in 20 ml. of 0.1 N sulfuric acid, and treat this solution the same as the portion of Injection being assayed. Concomitantly determine the absorbances of the solutions at the maximum occurring at about 264 mμ, with a suitable spectrophotometer. Calculate the quantity, in mg., of $C_{16}H_{19}ClN_2 . C_4H_4O_4$ in each ml. of the Injection taken by the formula $0.05 \times (C/V) \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of USP Chlorpheniramine Maleate Reference Standard in the *Standard Preparation*, and V is the volume, in ml., of Injection taken.

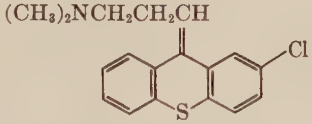
Packaging and storage—Preserve Chlorpheniramine Maleate Injection in single-dose or in multiple-dose containers, preferably of Type I glass, protected from light.

Injections available—Chlorpheniramine Maleate Injection usually available contains the following amounts of chlorpheniramine maleate: 10 mg. in 1 ml.; 100 mg. in 10 ml.; and 200 mg. in 2 ml.

CATEGORY—Antihistaminic.

USUAL DOSE OF CHLORPHENIRAMINE MALEATE—Parenteral, **10** to **20 mg.**

Chlorprothixene*



(E)-2-Chloro-N,N-dimethylthioxanthene-$\Delta^{9,\gamma}$-propylamine

$C_{18}H_{18}ClNS$ Mol. wt. 315.87

Chlorprothixene contains not less than 99.0 percent and not more than 101.0 percent of $C_{18}H_{18}ClNS$, calculated on the dried basis.

Description—Chlorprothixene occurs as a yellow, crystalline powder, having a slight amine-like odor.

Solubility—Chlorprothixene is practically insoluble in water. It is soluble in alcohol and in ether, and is freely soluble in chloroform.

Identification—

A: Dissolve about 10 mg. of Chlorprothixene in 2 ml. of sulfuric acid: the resulting orange solution exhibits a strong yellow fluorescence under ultraviolet light.

B: Dissolve about 10 mg. of Chlorprothixene in 2 ml. of nitric acid: a light red solution forms. Dilute the solution with 5 ml. of water: the solution exhibits a green fluorescence under ultraviolet light.

Melting range, page 814—Chlorprothixene melts between 96.5° and 101.5°.

Infrared absorption, page 866—The infrared absorption spectrum of a 1 in 10 solution of Chlorprothixene, previously dried in vacuum over phosphorus pentoxide at 60° for 4 hours, in carbon disulfide, exhibits maxima only at the same wavelengths as that of NF Chlorprothixene Reference Standard, similarly measured.

Ultraviolet Absorption, page 866—A 1 in 20,000 solution of Chlorprothixene in 0.1 N hydrochloric acid exhibits an absorbance maximum at 324 ± 2 mμ, and its absorptivity at that maximum is within 2 percent of the absorptivity of a solution of NF Chlorprothixene Reference Standard similarly measured. A 1 in 100,000 solution of Chlorprothixene in 0.1 N hydrochloric acid exhibits an absorbance maximum at 267 ± 2 mμ, and its absorptivity at that maximum is within ± 2 percent of the absorptivity of a solution of NF Chlorprothixene Reference Standard similarly measured.

Loss on drying, page 814—Dry Chlorprothixene in vacuum over phosphorus pentoxide at 60° for 4 hours: it loses not more than 0.1 percent of its weight.

Residue on ignition, page 858—Chlorprothixene yields not more than 0.1 percent of residue on ignition.

Heavy metals, *Method II*, page 806—The heavy metals limit for Chlorprothixene is 20 parts per million.

Assay—Dissolve about 800 mg. of chlorprothixene, accurately weighed, in 80 ml. of chloroform, add 3 drops of methanolic methyl red T.S., and titrate with 0.1 N perchloric acid in dioxane. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 31.59 mg. of $C_{18}H_{18}ClNS$.

---

* Patented. See notice, page ii.

Packaging and storage—Preserve Chlorprothixene in tight, light-resistant containers.

Category—Tranquilizer (major).

Usual dose range—Moderate anxiety, **10 mg.** three or four times a day (up to 60 mg. daily); severe neurotic and psychotic states, **25** to **50 mg.** three or four times daily (up to 600 mg. daily).

Chlorprothixene Tablets

Chlorprothixene Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{18}H_{18}ClNS$.

Identification—

A: A portion of finely powdered Chlorprothixene Tablets, equivalent to about 10 mg. of chlorprothixene, responds to *Identification test B* under *Chlorprothixene*, page 165.

B: The ultraviolet absorption spectrum of the solution employed for measurement of absorbance in the *Assay* exhibits maxima and minima at the same wavelengths as that of a 1 in 20,000 solution of NF Chlorprothixene Reference Standard in 0.5 *N* hydrochloric acid, similarly measured.

Disintegration, page 878—The disintegration time limit for Chlorprothixene Tablets is 30 minutes.

Content uniformity, *Method II*, page 799—[Note: Use low-actinic glassware.] Chlorprothixene Tablets meet the requirements of the content uniformity test for tablets, using the following special procedure: Crush one tablet in a suitable container, add 5 ml. of dimethylformamide, and let stand for about 20 to 30 minutes. Dilute this solution quantitatively and stepwise, if necessary, with 0.1 *N* sulfuric acid, filtering prior to final dilution, to provide a solution containing approximately 50 mcg. of chlorprothixene per ml. Concomitantly determine the absorbance of this solution and of a solution of NF Chlorprothixene Reference Standard, in the same medium at a concentration of about 50 mcg. per ml., in 1-cm. cells, at the maximum at about 324 mμ, with a suitable spectrophotometer, using 0.1 *N* sulfuric acid as the blank. Calculate the quantity, in mg., of $C_{18}H_{18}ClNS$ in the tablet by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity of chlorprothixene, in mg., in the tablet; D is the exact concentration, in mcg. per ml., of chlorprothixene in the sample solution, based upon the labeled quantity per tablet and the extent of dilution; C is the exact concentration, in mcg. per ml., of the Reference Standard solution; A_U is the absorbance of the sample solution; and A_S is the absorbance of the Reference Standard solution.

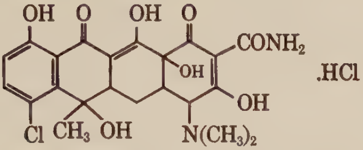
Assay—[Note: Use low-actinic glassware.] Weigh and finely powder not less than 20 Chlorprothixene Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg. of chlorprothixene, to a glass-stoppered 125-ml. conical flask, add 50 ml. of ether, and shake the mixture mechanically for 45 minutes. Filter the suspension through glass wool into a separator, and wash the flask and filter with three 10-ml. portions of ether. Extract the combined filtrate and washings with four 30-ml. portions of 0.5 *N* hydrochloric acid, combining the extracts in a 200-ml. volumetric flask. Dilute the extracts to volume with 0.5 *N* hydrochloric acid, and mix. Transfer 10.0 ml. of this solution to a 50-ml. volumetric flask, dilute to volume with water, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Chlorprothixene Reference Standard, in the same medium, at a concentration of about 50 mcg. per ml., in 1-cm. cells, at the maximum at about 324 mμ, with a suitable spectrophotometer, using water containing 10 ml. of 0.5 *N* hydrochloric acid per 50 ml. as the blank. Calculate the quantity, in mg., of $C_{18}H_{18}ClNS$ in the portion of the Tablets taken by the formula $C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Chlorprothixene Tablets in well-closed, light-resistant containers.

Tablets available—Chlorprothixene Tablets usually available contain the following amounts of chlorprothixene: 10, 25, 50 and 100 mg.

Category and Dose—See Chlorprothixene.

Chlortetracycline Hydrochloride



7-Chlorotetracycline Hydrochloride

7-Chloro-4-(dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,6,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-2-naphthacenecarboxamide Monohydrochloride

$C_{22}H_{23}ClN_2O_8 . HCl$ Mol. wt. 515.35

Chlortetracycline Hydrochloride contains not less than 90.0 percent of $C_{22}H_{23}ClN_2O_8 . HCl$. Chlortetracycline Hydrochloride conforms to the regulations of the federal Food and Drug Administration concerning certification of antibiotic drugs.

Description—Chlortetracycline Hydrochloride occurs as a yellow, crystalline powder. It is odorless and has a bitter taste. It is stable in air but is slowly affected by light. Its 1 in 200 solution has a pH of about 3.

Solubility—Chlortetracycline Hydrochloride is sparingly soluble in water, and is slightly soluble in alcohol. It is soluble in solutions of alkali hydroxides and carbonates. It is practically insoluble in acetone, in chloroform, in dioxane, and in ether.

Packaging and storage—Preserve Chlortetracycline Hydrochloride in tight containers, protected from light.

CATEGORY—Antibacterial; antiprotozoan.

USUAL DOSE—**250 mg.** four times a day.

USUAL DOSE RANGE—**250 to 500 mg.**

Chlortetracycline Hydrochloride Capsules

Chlortetracycline Hydrochloride Capsules contain not less than 85.0 percent of the labeled amount of $C_{22}H_{23}ClN_2O_8 . HCl$. Chlortetracycline Hydrochloride Capsules conform to the regulations of the federal Food and Drug Administration concerning certification of antibiotic drugs.

Packaging and storage—Preserve Chlortetracycline Hydrochloride Capsules in tight, light-resistant containers.

Capsules available—Chlortetracycline Hydrochloride Capsules usually available contain the following amounts of chlortetracycline hydrochloride: 50, 100, and 250 mg.

CATEGORY and DOSE—See Chlortetracycline Hydrochloride.

Chlortetracycline Hydrochloride for Injection

Chlortetracycline Hydrochloride for Injection is a sterile, dry mixture of chlortetracycline hydrochloride with a suitable buffer, the latter usually consisting of an amino acid. It contains not less than 85.0 percent of the labeled amount of $C_{22}H_{23}ClN_2O_8 . HCl$. Chlortetracycline Hydrochloride for Injection conforms to the regulations of the federal Food and Drug Administration concerning certification of antibiotic drugs.

Packaging and storage—Preserve Chlortetracycline Hydrochloride for Injection in single-dose or multiple-dose containers.

Labeling—Chlortetracycline Hydrochloride for Injection complies with the requirements for *Labeling* under *Injections*, page 810. The container label indicates the solvent recommended for preparing a solution for injection.

Size available—Chlortetracycline Hydrochloride for Injection usually available contains the following amount of chlortetracycline hydrochloride: 500 mg.

CATEGORY and DOSE—See Chlortetracycline Hydrochloride.

Ophthalmic Chlortetracycline Hydrochloride

Ophthalmic Chlortetracycline Hydrochloride is a sterile, dry mixture of chlortetracycline hydrochloride with a suitable buffer. It contains not less than 85.0 percent of the labeled amount of $C_{22}H_{23}ClN_2O_8.HCl$. It may contain suitable bacteriostatic agents and diluents. Ophthalmic Chlortetracycline Hydrochloride conforms to the regulations of the federal Food and Drug Administration concerning certification of antibiotic drugs.

Packaging and storage—Preserve Ophthalmic Chlortetracycline Hydrochloride in tight containers.

Size available—Ophthalmic Chlortetracycline Hydrochloride usually available contains the following amount of chlortetracycline hydrochloride: 25 mg. in each vial.

Category—Antibacterial.

Application—Topically 1 or 2 drops of a 0.5 percent solution every 2 hours.

Chymotrypsin

Chymotrypsin is a proteolytic enzyme crystallized from an extract of the pancreas gland of the ox, *Bos taurus* Linné (Fam. *Bovidæ*). When assayed as directed herein, it contains not less than 1000 NF Chymotrypsin Units in each mg., calculated on the dried basis, and not less than 90.0 percent and not more than 110.0 percent of the labeled potency.

Note: Determine the suitability of the substrate and check the adjustment of the spectrophotometer by performing the assay using NF Chymotrypsin Reference Standard. Determine the suitability of the substrate in the limit test for Trypsin by using the appropriate amount of NF Trypsin Crystallized Reference Standard.

Description—Chymotrypsin occurs as a white to yellowish white, odorless, crystalline or amorphous powder.

Solubility test—An amount of Chymotrypsin, equivalent to 100,000 NF Chymotrypsin Units, is soluble in 10 ml. of water or in 10 ml. of saline T.S.

Loss on drying, page 814—Dry Chymotrypsin in a vacuum oven at 60° for 4 hours: it loses not more than 5 percent of its weight.

Residue on ignition, page 858—Chymotrypsin yields not more than 2.5 percent of residue on ignition.

Trypsin—

Chymotrypsin solution—Dissolve 100 mg. of Chymotrypsin in 10.0 ml. of water.

Tris(hydroxymethyl)aminomethane buffer 0.08 M, pH 8.1—Dissolve 294 mg. of calcium chloride in 40 ml. of 0.2 *M* tris(hydroxymethyl)aminomethane, adjust the pH to 8.1 with 1 *N* hydrochloric acid, and dilute to 100 ml. with water.

Substrate solution—Transfer 98.5 mg. of *p*-toluenesulfonyl-L-arginine methyl ester hydrochloride, suitable for assaying trypsin, into a 25-ml. volumetric flask. Add 5 ml. of *0.08 M Tris(hydroxymethyl)aminomethane buffer, pH 8.1,* and swirl until the substrate dissolves. Add 0.25 ml. of methyl red—methylene blue T.S., and dilute to volume with water.

Procedure—By means of a micropipet transfer 50 μl. of the *Chymotrypsin solution* to a depression on a white spot plate. Add 0.2 ml. of the *Substrate solution,* start a stop watch and allow it to run for exactly 3 minutes: no purple color develops within 3 minutes, indicating the presence of no more than 1 percent of trypsin.

Salmonella, page 862—The test for *Salmonella* in Chymotrypsin is negative.

Assay—

Fifteenth molar phosphate buffer, pH 7.0—Dissolve 4.54 g. of monobasic potassium phosphate in sufficient water to make 500 ml. of solution. Dissolve 4.73 g. of anhydrous dibasic sodium phosphate in sufficient water to make 500 ml. of solution. Mix 38.9 ml. of the monobasic potassium phosphate solution with 61.1 ml. of dibasic sodium phosphate solution. If necessary, adjust the pH to 7.0 by the dropwise addition of dibasic sodium phosphate solution.

Substrate solution—Dissolve 23.7 mg. of *N*-acetyl-L-tyrosine ethyl ester, suitable for use in assaying Chymotrypsin, in about 50 ml. of *Fifteenth molar phosphate* *buffer, pH 7.0*, with warming. When cool, dilute to 100 ml. with additional pH 7.0 buffer. (*Substrate solution* may be stored in the frozen state and used after thawing; it is important, however, to freeze immediately after preparation.)

Chymotrypsin solution—Accurately weigh and dissolve a sufficient amount of the sample being assayed in 0.001 *N* hydrochloric acid to produce a solution containing between 12 and 16 NF Chymotrypsin Units per ml. The dilution will be correct if, during the conduct of the assay, there is a change in absorbance of between 0.008 and 0.012 in each 30-second interval.

Procedure—Conduct the assay in a suitable spectrophotometer equipped to maintain a temperature of 25° ± 0.1° in the cell compartment. The temperature in the reaction cell should be determined before and after the measurement of absorbance to assure that the temperature does not change by more than 0.5°. Pipet 0.2 ml. of 0.001 *N* hydrochloric acid and 3.0 ml. of the *Substrate solution* into a 1-cm. cell. Place this cell in the spectrophotometer and adjust the instrument so that the absorbance will read 0.200 at 237 mμ. Pipet 0.2 ml. of *Chymotrypsin solution* containing between 12 and 16 NF Chymotrypsin Units per ml. into another 1-cm. cell, add 3 ml. of the *Substrate solution*, and place the cell in the spectrophotometer. (*This order of addition must be followed.*) At the time the *Substrate solution* is added, start a stop watch and read the absorbance at 30-second intervals for at least 5 minutes. Repeat the procedure on the same dilution at least once. Absolute absorbance values are of less importance than the constancy of the rate of change of absorbance. If the rate of change does not remain constant for at least 3 minutes, repeat the run and, if necessary, use a lower concentration. The duplicate run at the same dilution should match the first run in rate of absorbance change. Determine the average absorbance change per minute, using only the values within the 3-minute portion of the curve where the rate of absorbance change is constant. Plot a curve of absorbance against time. One NF Chymotrypsin Unit is the activity causing a change in absorbance of 0.0075 per minute under the conditions specified in this assay. Calculate the number of NF Chymotrypsin Units per mg. by the formula $(A_2 - A_1)/(T \times W \times 0.0075)$ in which A_1 is the absorbance straight line final reading, A_2 is the absorbance straight line initial reading, T is the elapsed time in minutes between the initial and final readings, and W is the weight, in mg., of Chymotrypsin in the volume of solution used in determining the absorbance.

Packaging and storage—Preserve Chymotrypsin in tight containers and avoid excessive heat.

CATEGORY—Proteolytic.

USUAL DOSE RANGE—Intramuscular, 2500 to 5000 NF Units one to three times a day.

Sterile Chymotrypsin

Sterile Chymotrypsin contains not less than 80.0 percent and not more than 120.0 percent of the labeled potency of chymotrypsin.

Description and other requirements—Sterile Chymotrypsin conforms to the *Description* and meets the other requirements under *Chymotrypsin*, page 168.

Identification—Prepare a *Substrate solution* as directed in the *Identification test* under *Chymotrypsin Injection*, page 170. Reconstitute the contents of one vial of Sterile Chymotrypsin in 1 ml. of saline T.S., transfer 0.2 ml. to a spot plate, and add 0.2 ml. of the *Substrate solution:* a purple color is produced within three minutes (*distinction from trypsin which produces no purple color within three minutes*).

Completeness of solution—Sterile Chymotrypsin dissolves completely in the solvent and in the concentration recommended in the labeling.

Sterility—Sterile Chymotrypsin meets the requirements under *Sterility Tests*, page 874.

Assay—Proceed as directed in the *Assay* under *Chymotrypsin*, page 168, but use the following as the *Chymotrypsin solution:* Dissolve the contents of one vial of Sterile Chymotrypsin in 5.0 ml. of 0.001 *N* hydrochloric acid. Dilute an accurately measured volume (V, in ml.) of this solution, equivalent to about 300 NF Chymotrypsin Units, to 25.0 ml. with 0.001 *N* hydrochloric acid. Calculate the number of NF Chymotrypsin Units per vial by the formula $300 \times (5/V)(A_2 - A_1)/(T \times 2.4 \times 0.0075)$, in which A_1 is the absorbance straight-line final reading, A_2 is the absorbance straight-line initial reading, T is the elapsed time in minutes between the initial and final reading, and 2.4 is the number of NF Chymotrypsin Units present in the sample on which the absorbance was determined.

Packaging and storage—Preserve Sterile Chymotrypsin in single-dose containers, preferably of Type I glass.

Labeling—Sterile Chymotrypsin complies with the requirements for *Labeling* under *Injections,* page 810.

Sizes available—Sterile Chymotrypsin usually available contains the following amount of chymotrypsin: 750 NF Chymotrypsin Units.

CATEGORY—See Chymotrypsin.

APPLICATION—For zonule lysis, 150 to 500 NF Units as a 1:5000 solution.

Chymotrypsin Injection

Chymotrypsin Injection is a sterile solution of Chymotrypsin in water for injection or in aqueous gelatin solution. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled potency.

Identification—Prepare a *Substrate solution* as follows: Transfer 237.0 mg. of *N*-acetyl-L-tyrosine ethyl ester, suitable for use in assaying chymotrypsin, to a 100-ml. volumetric flask, add 2 ml. of alcohol, swirl until solution is effected. Add 20 ml. of *Fifteenth molar phosphate buffer, pH 7.0,* prepared as directed in the *Assay* under *Chymotrypsin,* page 168, add 1 ml. of methyl red-methylene blue T.S., and dilute to volume with water. Mix 0.2 ml. of this solution with 0.05 ml. of Chymotrypsin Injection on a spot plate: a purple color is produced *(distinction from trypsin which produces no purple color within three minutes).*

Other requirements—Chymotrypsin Injection meets the requirements under *Injections,* page 810.

pH, page 824—The pH of Chymotrypsin Injection is between 3.9 and 4.1.

Assay—Dilute an accurately measured volume of Chymotrypsin Injection with 0.001 *N* hydrochloric acid to produce a solution containing between 12 and 16 NF Chymotrypsin Units per ml. Proceed as directed in the *Assay* under *Chymotrypsin,* page 168. Calculate the number of NF Units of Chymotrypsin in each ml. of the Injection taken by the formula $(A_2 - A_1)/(T \times V \times 0.0075)$, in which A_1 is the absorbance straight line final reading, A_2 is the absorbance straight line initial reading, T is the elapsed time in minutes between the initial and final readings, and V is the volume of Injection, taking into account the dilutions employed, present in the 0.2-ml. aliquot used in determining the absorbance.

Packaging and storage—Preserve Chymotrypsin Injection in single-dose or in multiple-dose containers, preferably of Type I glass, in a refrigerator. Avoid freezing.

Injections available—Chymotrypsin Injection usually available contains the following amounts of chymotrypsin: 5000 NF Chymotrypsin Units in 1 ml. and 25,000 Units in 5 ml.

CATEGORY and DOSE—See Chymotrypsin.

Cinnamon

Cinnamon is the dried bark of *Cinnamomum loureirii* Nees (Fam. *Lauraceæ*). Cinnamon contains, in each 100 g., not less than 2.5 ml. of volatile oil.

Unground Cinnamon occurs in quills up to 30 cm. long and 4 cm. in diameter, the bark from 0.5 to 7.0 mm. in thickness, or in broken irregular pieces or in flattened slabs up to 10 mm. in thickness. The outer surface of the bark is light brown to dark purplish brown, often with grayish patches of crustose lichens and numerous bud scars, finely longitudinally wrinkled when from young twigs, otherwise more or less rough from corky patches surrounding the lenticels. The inner surface is reddish brown to dark brown, granular, and slightly striate. The fracture is short. The odor is characteristically aromatic. The taste is sweetish, aromatic, and pungent.

Histology—Sections of Cinnamon show a narrow outer layer of more or less lignified cork cells followed by a cortex of starch-bearing parenchyma with scattered stone cells, mucilage and oil cells, a pericycle containing a nearly continuous zone of stone cells among which are small groups of pericyclic fibers with thickened and slightly lignified walls, and a broad phloem traversed by phloem rays 1 to 3 cells wide, the cells containing either starch or very small acicular crystals of calcium oxalate. The phloem strands consist largely of parenchyma cells among which occur scattered inconspicuous islets of sieve, phloem fibers which are isolated or in groups of 2 to 20, and numerous mucilage and oil cells. The parenchyma cells usually are filled with starch or contain very small acicular crystals of calcium oxalate, the latter mostly localized in the phloem ray cells. The lumina of parenchyma cells, stone cells, and fibers are frequently filled with an amorphous reddish brown substance, which is for the most part insoluble in the ordinary reagents. The bark of the young twigs, as contrasted with older bark, shows an epidermal layer with a thick, yellowish cuticle, fewer stone cells in the pericycle, narrower inner bark, and fewer secretion cells.

Powdered Cinnamon is yellowish brown or reddish brown. It contains numerous single and 2- to 4-compound starch grains, the single grains from 5 to 25 μ in diameter; stone cells irregular in shape, occasionally with one wall much thinner than the other walls, sometimes containing starch; fibers from 300 to 1500 μ in length, with very thick, more or less wavy and slightly lignified walls; parenchyma cells with reddish brown walls; elongated secretion cells containing volatile oil or mucilage; phloem ray cells with minute needles of calcium oxalate; and fragments of somewhat lignified cork.

Foreign organic matter, page 886—The amount of foreign organic matter in Cinnamon does not exceed 2 percent.

Assay—Place about 100 g. of Cinnamon, preferably coarsely comminuted, and accurately weighed, in the flask of the apparatus used for volatile oil determinations and proceed as directed on page 889, using the separator for oils heavier than water.

Packaging and storage—Preserve Cinnamon in well-closed containers, preferably in a cool, dry place.

Category—Flavor.

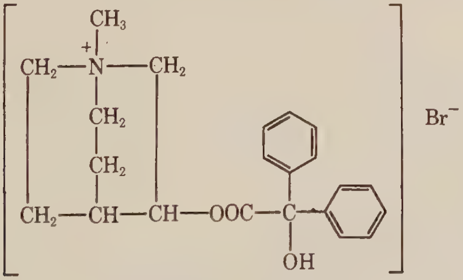
Citrated Caffeine, page 111
Citrated Caffeine Tablets, page 112

Clidinium Bromide*



3-Hydroxy-1-methylquinuclidinium Bromide Benzilate

$C_{22}H_{26}BrNO_3$ Mol. wt. 432.36

Clidinium Bromide contains not less than 99.0 percent and not more than 100.5 percent of $C_{22}H_{26}BrNO_3$, calculated on the dried basis.

---

* Patented. See notice, page ii.

Description—Clidinium Bromide occurs as a white or nearly white, almost odorless, crystalline powder. It is optically inactive.

Solubility—Clidinium Bromide is soluble in water and in alcohol. It is very slightly soluble in ether and in benzene.

Identification—

A: To a cold solution of 250 mg. of Clidinium Bromide in 5 ml. of water in an ice bath add 5 ml. of trinitrophenol T.S. and scratch the side of the tube with a glass rod to induce crystallization. Collect the precipitate on a filter, wash well with cold water, and dry at 105° for 1 hour: the picrate so obtained melts between 184° and 189°, page 814. (*Caution: Picrates may be explosive.*)

B: To a solution of 100 mg. of Clidinium Bromide in 2 ml. of water add a few drops of diluted nitric acid and 1 ml. of silver nitrate T.S.: a yellowish white precipitate is produced.

Melting range, page 814—Clidinium Bromide melts between 240° and 244°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Clidinium Bromide, previously dried at 105° for 3 hours, exhibits maxima only at the same wavelengths as that of NF Clidinium Bromide Reference Standard, similarly measured.

Loss on drying, page 814—Dry Clidinium Bromide at 105° for 3 hours: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Clidinium Bromide yields not more than 0.1 percent of residue on ignition.

Heavy metals, *Method II,* page 806—The heavy metals limit for Clidinium Bromide is 20 parts per million.

Limit of 3-quinuclidinyl benzilate and 3-hydroxy-1-methylquinuclidinium bromide—

Modified Dragendorff reagent—Dissolve 850 mg. of bismuth nitrate in a mixture of 10 ml. of glacial acetic acid and 40 ml. of water. Prepare another solution by dissolving 8 g. of potassium iodide in 20 ml. of water. Mix 5 ml. of each solution, dilute to 50 ml. with dilute sulfuric acid (1 in 10), and mix.

Standard preparation—Dissolve 100.0 mg. of NF Clidinium Bromide Reference Standard in 1.0 ml. of methanol.

Reference preparation A—Dissolve 10.0 mg. of NF 3-Hydroxy-1-methylquinuclidinium Bromide Reference Standard in 1.0 ml. of methanol. Add 50 µl. of this solution to 100.0 mg. of NF Clidinium Bromide Reference Standard dissolved in 1.0 ml. of methanol.

Reference preparation B—Dissolve 3.0 mg. of NF 3-Quinuclidinyl Benzilate Reference Standard in 100.0 ml. of methanol.

Test preparation—Dissolve 100.0 mg. of Clidinium Bromide in 1.0 ml. of methanol.

Solvent mixture—Mix 70 volumes of acetone, 20 volumes of methanol, 4 volumes of water, and 6 volumes of hydrochloric acid.

Chromatographic plates—Use suitable thin-layer chromatographic plates (see page 791) coated with a 0.25-mm. layer of silica gel G. Place the plates in a chromatographic chamber saturated with the *Solvent mixture,* and allow the solvent front to ascend about 15 cm. Remove the plates from the chamber, dry at 105° for 15 minutes, and cool.

Procedure for 3-quinuclidinyl benzilate—Apply 20 µl. each of the *Standard preparation,* of *Reference preparation B,* and of the *Test preparation* to separate points on one plate. Place the plate in an unsaturated chromatographic chamber containing fresh *Solvent mixture,* and allow the solvent front to ascend 10 cm. Remove the plate, dry at 105° for 10 minutes, cool, and spray with potassium iodoplatinate T.S.: clidinium bromide produces a spot at about R_f 0.5 and 3-quinuclidinyl benzilate produces a spot at about R_f 0.8; the *Test preparation* shows no spot of 3-quinuclidinyl benzilate.

Procedure for 3-hydroxy-1-methylquinuclidinium bromide—Apply 20 µl. each of *Reference preparation A* and of the *Test preparation* to separate points on another plate. Place the plate in an unsaturated chromatographic chamber containing fresh *Solvent mixture,* and allow the solvent front to ascend for 10 cm. Remove the plate, dry at 105° for 10 minutes, cool, and spray with *Modified Dragendorff reagent:* 3-hydroxy-1-methylquinuclidinium bromide produces a spot at about R_f 0.4; any spot from the *Test preparation* is not greater in size or intensity than the spot occurring at R_f 0.4 produced by the 3-hydroxy-1-methylquinuclidinium bromide in *Reference preparation A,* corresponding to not more than 0.5 percent.

Assay—Dissolve about 1.2 g. of Clidinium Bromide, accurately weighed, in 80 ml. of glacial acetic acid, warming if necessary to effect solution. Cool, add 15 ml. of mercuric acetate T.S., and titrate with 0.1 *N* perchloric acid in dioxane, determining the end-point potentiometrically. Each ml. of 0.1 *N* perchloric acid is equivalent to 43.24 mg. of $C_{22}H_{26}BrNO_3$.

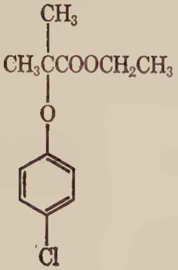
Packaging and storage—Preserve Clidinium Bromide in tight, light-resistant containers.

CATEGORY—Anticholinergic.

USUAL DOSE—**2.5 mg.** three times a day.

USUAL DOSE RANGE—**2.5** to **5 mg.** three or four times a day.

Clofibrate*



Ethyl 2-(*p*-Chlorophenoxy)-2-methylpropionate

$C_{12}H_{15}ClO_3$ Mol. wt. 242.70

Clofibrate contains not less than 97.0 percent and not more than 103.0 percent of $C_{12}H_{15}ClO_3$, calculated on the anhydrous basis.

Description—Clofibrate occurs as a colorless to pale yellow liquid with a characteristic odor.

Solubility—Clofibrate is insoluble in water. It is soluble in acetone, in alcohol, in benzene, and in chloroform.

Infrared absorption, page 866—The infrared absorption spectrum, determined in a 0.1-cm. cell, of a 1 in 10 solution in carbon disulfide of Clofibrate, previously dried over a suitable desiccant, exhibits maxima only at the same wavelengths as that of NF Clofibrate Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 50,000 solution of Clofibrate in methanol exhibits maxima and minima at the same wavelengths as that of NF Clofibrate Reference Standard, similarly measured.

Refractive index, page 858—The refractive index at 20° of Clofibrate is between 1.500 and 1.505.

Water, page 900—Determine the water content of Clofibrate by the titrimetric method: not more than 0.2 percent is found.

Acidity—Mix 10.0 g. of Clofibrate with 100 ml. of neutralized alcohol, add 3 drops of phenolphthalein T.S., and titrate with 0.1 *N* sodium hydroxide: not more than 0.9 ml. is required for neutralization.

Limit of *p*-chlorophenol—

Standard preparation—Dissolve 50.0 mg. of *p*-chlorophenol in 500.0 ml. of 0.1 *N* sodium hydroxide. Dilute 4.0 ml. of this solution to 100.0 ml. with 0.1 *N* sodium hydroxide, and mix.

Test preparation—Transfer 2.0 g. of Clofibrate to a 250-ml. separator, and add 50 ml. of solvent hexane which has been previously washed with two 25-ml. portions of 0.1 *N* sodium hydroxide followed by successive quantities of water until the washings are no longer alkaline to phenolphthalein T.S. Dissolve the sample in the solvent hexane, and extract this solution successively with two 20-ml. portions and one 5-ml. portion of 0.1 *N* sodium hydroxide. Allow the phases to separate completely, and collect the aqueous phases in a 50-ml. volumetric flask, discarding the solvent hexane phase. Dilute the aqueous alkaline solution to volume with 0.1 *N* sodium hydroxide, and mix.

Test preparation blank—Prepare the solution as directed under *Test preparation*, omitting only the sample.

Procedure—Transfer 6.0 ml. of the *Standard preparation* to a 250-ml. separator, and dilute to 20 ml. with 0.1 *N* sodium hydroxide. To a second 250-ml. separator transfer 20.0 ml. of 0.1 *N* sodium hydroxide to serve as the *Standard preparation blank*. To the third and fourth 250-ml. separators transfer 20.0 ml. of the *Test preparation* and of the *Test preparation blank*, respectively. To each separator add 20.0 ml. of a buffer solution prepared by dissolving 24.736 g. of boric acid in sufficient 0.1 *N* sodium hydroxide to make 1000 ml. Add successively 0.1 ml. of 4-aminoantipyrine solution (3 in 100) and 0.2 ml. of potassium ferricyanide solution (1 in 10) to each separator, shaking well after each addition. Allow the mixtures to stand for 3 minutes, add 10 ml. of chloroform to each separator, and shake well. Allow the layers to separate completely, and transfer the chloroform layer from each separator to separate 25-ml. volumetric flasks. Wash the contents remaining in each separator with 2 ml. of chloroform without shaking, and add the chloroform washings to the respective volumetric flasks. Add 5 ml. of chloroform to each separator, and shake well. Allow the layers to separate, and add the chloroform layer from each separator to the contents of the respective volumetric flasks. Finally, wash the contents in each of the separators with 3 ml. of chloroform adding the chloroform washings to the contents in the respective volumetric flasks. Dilute each volumetric flask to volume with chloroform, add about 0.5 g. of anhydrous sodium sulfate, shake, and allow to stand for 5 minutes. Concomitantly determine the absorbances of the solutions in 5-cm. cells, at the maximum at about 455 mμ, with a suitable spectrophotometer, using chloroform as the blank. Record the absorbance of the solution from the *Standard preparation* as A_1, from the *Standard preparation blank* as A_2, from the *Test preparation* as A_3, and from the *Test preparation blank* as A_4. The corrected absorbance of the solution from the *Test preparation* $(A_3 - A_4)$ is not greater than the corrected absorbance of the solution from the *Standard preparation* $(A_1 - A_2)$, corresponding to not more than 30 parts per million of *p*-chlorophenol.

---

* Patented. See notice, page ii.

Assay—

Ion-exchange resin—Allow about 3 g. of a strongly basic polystyrene anion-exchange resin to stand for about 15 minutes, with occasional stirring, in a beaker containing 75 ml. of 1 *N* sodium hydroxide. Wash the resin with water until the washings are neutral to litmus paper, then wash with three 50-ml. portions of methanol.

Ion-exchange column—Place a plug of glass wool in the base of a 1 × 15-cm. ion-exchange tube, and transfer to the tube a sufficient amount of *Ion-exchange resin*, slurried in methanol, to produce a column bed height of from 6 to 8 cm.

Standard preparation—Transfer about 50 mg. of NF Clofibrate Reference Standard, accurately weighed, to a 50-ml. volumetric flask, add methanol to volume, and mix. Transfer 20.0 ml. of the solution to a 100-ml. volumetric flask, dilute to volume with methanol, and mix. Transfer 10.0 ml. of this solution to a second 100-ml. volumetric flask, dilute to volume with methanol, and mix.

Assay preparation—Transfer about 200 mg. of Clofibrate, accurately weighed, to a 100-ml. volumetric flask, add methanol to volume, and mix. Transfer 10.0 ml. of this solution to the *Ion-exchange column*, and collect the eluate in a 100-ml. volumetric flask. Rinse the column with 25 ml. of methanol, collect the rinsings in the volumetric flask, dilute to volume with methanol, and mix. Transfer 5.0 ml. of this solution to a 50-ml. volumetric flask, dilute to volume with methanol, and mix.

Procedure—Concomitantly determine the absorbances of the solutions in 1-cm. cells, at the maximum occurring at about 226 mμ, with a suitable spectrophotometer, using methanol as the blank. Record the absorbance of the *Standard preparation* as A_S and that of the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{12}H_{15}ClO_3$ in the Clofibrate taken by the formula $10C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*.

Packaging and storage—Preserve Clofibrate in tight, light-resistant containers.

CATEGORY—Anticholesterolemic.

USUAL DOSE—**500 mg.** four times daily.

Clofibrate Capsules

Clofibrate Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{12}H_{15}ClO_3$.

Identification—A portion of the contents of Clofibrate Capsules responds to the *Infrared absorption test* under *Clofibrate*, page 173.

Weight variation, page 901—Clofibrate Capsules meet the requirements of the weight variation test for capsules.

Assay—Weigh the contents of not less than 20 Clofibrate Capsules, and determine the average weight per capsule. Mix the combined contents well, and proceed as directed in the *Assay* under *Clofibrate*, page 173. Calculate the quantity, in mg., of $C_{12}H_{15}ClO_3$ in the portion of the Capsules taken, by the formula $10C \times (A_U/A_S)$.

Packaging and storage—Preserve Clofibrate Capsules in well-closed, light-resistant containers.

Capsules available—Clofibrate Capsules usually available contain the following amounts of clofibrate: 250 and 500 mg.

CATEGORY and DOSE—See Clofibrate.

Cobalamin Concentrate

Cobalamin Concentrate consists of the dried, partially purified product resulting from the growth of selected *Streptomyces* cultures or other cobalamin-producing microorganisms. It may contain harmless diluents and stabilizing agents. Cobalamin Concentrate contains, in each g., not less than 500 mcg. of cobalamin.

Description—Cobalamin Concentrate occurs as pink to brown granules or fine powder.

Identification—Ignite 1 g. of Cobalamin Concentrate at a temperature not exceeding 500°. If necessary, nitric acid may be added to destroy the organic matter, but sulfuric acid is not to be used. Dissolve the residue in 5 ml. of hydrochloric acid, transfer the solution to a 25-ml. graduate, add 1 ml. of stannous chloride solution (1 in 10), and dilute to 10 ml. Then add 2.5 ml. of potassium thiocyanate solution (1 in 2) and 12.5 ml. of acetone, and mix well: a bluish green color forms (cobalt).

Loss on drying, page 814—Dry Cobalamin Concentrate at 60° under a pressure of not more than 5 mm. of mercury for 2 hours: it loses not more than 5 percent of its weight.

pH, page 824—The pH of a solution of Cobalamin Concentrate (1 in 200) is between 4.0 and 8.0.

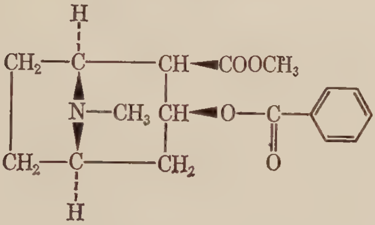
Assay—Proceed as directed under *Cobalamin Assay,* page 793.

Packaging and storage—Preserve Cobalamin Concentrate in tight containers, protected from light.

Labeling—The potency in terms of the number of mcg. of cobalamin in each g. of Cobalamin Concentrate must be stated on the label.

CATEGORY—Vitamin B_{12} supplement.

Cocaine



Methyl 3β-Hydroxy-1αH,5αH-tropane-2β-carboxylate Benzoate (Ester)

$C_{17}H_{21}NO_4$ Mol. wt. 303.36

Cocaine, dried over phosphorus pentoxide for 3 hours, contains not less than 99.0 percent and not more than 101.0 percent of $C_{17}H_{21}NO_4$.

Description—Cocaine occurs as colorless to white crystals, or as a white, crystalline powder. A solution of Cocaine in diluted hydrochloric acid is levorotatory. Its saturated solution is alkaline to litmus.

Solubility—Cocaine is slightly soluble in water, is freely soluble in alcohol, in chloroform, in ether, and is soluble in olive oil. It is sparingly soluble in mineral oil, and is very soluble in warm alcohol.

Identification—

A: Heat about 100 mg. of powdered Cocaine with 1 ml. of sulfuric acid at 100° for 5 minutes, then cautiously mix with 2 ml. of water: the mixture has the aromatic odor of methyl benzoate and, upon cooling, yields crystals of benzoic acid.

B: Dissolve 100 mg. of Cocaine in 0.4 ml. of 1 *N* hydrochloric acid and enough water to make 5 ml., and add 5 drops of a solution of chromium trioxide (1 in 20): a yellow precipitate is produced which redissolves on shaking the mixture. Add 1 ml. of hydrochloric acid: a permanent, orange-colored, crystalline precipitate is formed.

C: Dissolve 10 mg. of Cocaine in 1 ml. of 0.02 *N* hydrochloric acid, and evaporate the solution just to dryness on a steam bath. Dissolve the residue in 2 drops of water, and add 1 ml. of 0.1 *N* potassium permanganate: a violet, crystalline precipitate forms, which appears brownish violet when collected on a filter, and shows characteristic violet-red crystalline aggregates under the low power of a microscope.

Melting range, page 814—Cocaine melts between 96° and 98°.

Loss on drying, page 814—Dry Cocaine over phosphorus pentoxide for 3 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Cocaine yields not more than 0.1 percent of residue on ignition.

Readily carbonizable substances, page 856—Dissolve 500 mg. of Cocaine in 5 ml. of sulfuric acid T.S.: the solution has no more color than Matching Fluid A.

Cinnamyl-cocaine and other reducing substances—Dissolve 300 mg. of finely powdered Cocaine in 1 ml. of 1 *N* hydrochloric acid with the aid of heat, if necessary, and dilute with water to 15 ml. Mix 5 ml. of this solution with 0.3 ml. of 1 *N* sulfuric acid and 0.1 ml. of 0.1 *N* potassium permanganate: the violet color does not disappear entirely within 30 minutes.

Isoatropyl-cocaine—Dilute in a beaker 5 ml. of the solution of Cocaine prepared in the test for *Cinnamyl-cocaine and other reducing substances* with 80 ml. of water, add 0.2 ml. of ammonia T.S., and stir the solution vigorously during 5 minutes, occasionally rubbing the inner wall of the beaker with a stirring rod: a crystalline precipitate of cocaine develops, and the supernatant liquid is clear.

Assay—Dissolve about 600 mg. of Cocaine, previously dried over phosphorus pentoxide for 3 hours and accurately weighed, in 50 ml. of glacial acetic acid, add 1 drop of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 30.34 mg. of $C_{17}H_{21}NO_4$.

Packaging and storage—Preserve Cocaine in well-closed, light-resistant containers.

CATEGORY—Local anesthetic (narcotic).

APPLICATION—Topical to mucous membrane as a 1 percent solution.

Cocaine Hydrochloride Tablets

Cocaine Hydrochloride Tablets contain not less than 91.0 percent and not more than 109.0 percent of the labeled amount of $C_{17}H_{21}NO_4.HCl$.

Identification—

A: Add 5 drops of a solution of chromium trioxide (1 in 20) to 5 ml. of a filtered solution of Cocaine Hydrochloride Tablets, equivalent to cocaine hydrochloride 1 in 50: a yellow precipitate is formed which redissolves when the mixture is shaken. On the addition of 1 ml. of hydrochloric acid, a permanent, yellowish orange, crystalline precipitate is formed.

B: Dissolve a portion of powdered Cocaine Hydrochloride Tablets, equivalent to about 10 mg. of cocaine hydrochloride, in 1 ml. of water, filter, and add 2 ml. of 0.1 *N* potassium permanganate: a red-purple, crystalline precipitate is produced which appears brown when collected on a filter, and shows characteristic, crystalline aggregates under the low power of a microscope.

C: Add silver nitrate T.S., dropwise, to a filtered solution of Cocaine Hydrochloride Tablets, equivalent to cocaine hydrochloride 1 in 20: a white precipitate forms which is insoluble in nitric acid.

Disintegration, page 878—The disintegration time limit for Cocaine Hydrochloride Tablets is 15 minutes.

Content uniformity, *Method II,* page 798—Cocaine Hydrochloride Tablets meet the requirements of the content uniformity test for tablets using the following special procedure: Transfer one tablet to a 100-ml. volumetric flask containing 50 ml. of water, and shake the flask until the tablet is dissolved. Dilute to volume with water, mix, and filter, discarding the first 20 ml. of filtrate. Dilute a portion of the subsequent filtrate, if necessary, with water to provide a solution containing approximately 80 mcg. of cocaine hydrochloride per ml. Concomitantly determine the absorbance of this solution and of a standard solution of USP Cocaine Hydrochloride, in the same medium, at a concentration of about 80 mcg. per ml., in 1-cm. cells, at the maximum at about 275 mμ, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg., of $C_{17}H_{21}NO_4.HCl$ in the tablet by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity, in mg., of cocaine hydrochloride in the tablet; D is the exact concentration, in mcg. per ml., of cocaine hydrochloride in the sample solution, based upon the labeled quantity per tablet and the extent of dilution; C is the exact concentration of the standard solution, in mcg. per ml.; A_U is the absorbance of the sample solution; and A_S is the absorbance of the standard solution.

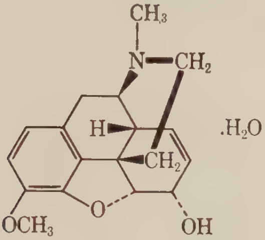
Assay—Weigh and finely powder not less than 20 Cocaine Hydrochloride Tablets. Dissolve an accurately weighed portion of the powder, equivalent to about 60 mg. of cocaine hydrochloride, in 10 ml. of water. Render the solution slightly alkaline with ammonia T.S., and completely extract the cocaine with small successive portions of ether. Evaporate the combined ether extracts to one-half their volume on a steam bath, transfer the remaining liquid to a separator, and wash it with three 5-ml. portions of water. Shake the water washings with a small portion of ether and add the ether washing to the combined ether extracts. Add 10.0 ml. of 0.05 *N* sulfuric acid to the ether solution, agitate the mixture thoroughly, and draw off the acidified water layer into a beaker. Again wash the ether with 2 small portions of water, add the washings to the acid liquid, and titrate the excess acid with 0.02 *N* sodium hydroxide, using methyl red T.S. as the indicator. Each ml. of 0.05 *N* sulfuric acid is equivalent to 16.99 mg. of $C_{17}H_{21}NO_4 . HCl$.

Packaging and storage—Preserve Cocaine Hydrochloride Tablets in well-closed, light-resistant containers.

Tablets available—Cocaine Hydrochloride Tablets usually available contain the following amounts of cocaine hydrochloride: 8 and 15 mg.

CATEGORY—Local anesthetic (narcotic)

Codeine



7,8-Didehydro-4,5α-epoxy-3-methoxy-17-methylmorphinan-6α-ol

$C_{18}H_{21}NO_3 . H_2O$ Mol. wt. 317.39

Codeine, dried at 80° for 4 hours, contains not less than 98.5 percent and not more than 100.5 percent of $C_{18}H_{21}NO_3$.

Description—Codeine occurs as colorless or white crystals, or as a white, crystalline powder. It effloresces slowly in dry air and is affected by light. In acid or alcohol solutions it is levorotatory. A saturated solution of Codeine is alkaline to litmus.

Solubility—Codeine is slightly soluble in water, is freely soluble in alcohol, and is very soluble in chloroform. It is sparingly soluble in ether. When heated in an amount of water insufficient for complete solution, Codeine melts to oily drops which crystallize on cooling.

Identification—

A: Add 0.5 ml. of sulfuric acid, containing 5 mg. of selenious acid in each ml., to 1 mg. of Codeine contained in a porcelain crucible or small dish: a green color is produced, which changes rapidly to blue, then slowly back to green.

B: Dissolve about 10 mg. of Codeine in 5 ml. of sulfuric acid, add a drop of ferric chloride T.S., and warm the mixture: the solution becomes blue, but changes to reddish brown on the addition of 1 drop of nitric acid.

C: To 1 mg. of Codeine contained in a porcelain crucible or small dish add 0.5 ml. of sulfuric acid-formaldehyde T.S.: an intense violet-blue color is produced at once.

D: Add 2 drops of nitric acid to about 2 mg. of Codeine: a light orange color is produced, fading to greenish yellow within one minute (*difference from morphine*).

E: Dissolve about 5 mg. of Codeine in about 5 ml. of diluted sulfuric acid and add several drops of potassium ferricyanide T.S., containing 1 drop of ferric chloride T.S. in each ml.: a light greenish yellow color is produced (*difference from morphine*).

Melting range, page 814—Codeine, rendered anhydrous by drying at 80° for 4 hours, melts, within a range of 2°, between 154° and 158°.

Loss on drying, page 814—Dry Codeine at 80° for 4 hours: it loses not more than 6 percent of its weight.

Residue on ignition, page 858—Codeine yields not more than 0.1 percent of residue on ignition.

Readily carbonizable substances, page 856—Dissolve 10 mg. of Codeine in 5 ml. of sulfuric acid T.S.: the solution has no more color than Matching Fluid S.

Morphine—Dissolve about 50 mg. of potassium ferricyanide in 10 ml. of water, and add 1 drop of ferric chloride T.S. and 1 ml. of a neutral or slightly acid solution of Codeine (1 in 100) made with the aid of sulfuric acid: no blue color is produced immediately.

Assay—Dissolve about 400 mg. of Codeine, previously dried at 80° for 4 hours and accurately weighed, by warming it in 30.0 ml. of 0.1 *N* sulfuric acid. Cool, and add 10 ml. of water. Add 3 drops of methyl red T.S., and titrate the excess acid with 0.1 *N* sodium hydroxide. Each ml. of 0.1 *N* sulfuric acid is equivalent to 29.94 mg. of $C_{18}H_{21}NO_3$.

Packaging and storage—Preserve Codeine in tight, light-resistant containers.

CATEGORY—Analgesic (narcotic); antitussive.

USUAL DOSE—Analgesic, **30 mg.** every four hours; antitussive **5 to 10 mg.** every 4 hours.

USUAL DOSE RANGE—Analgesic, **15 to 60 mg.**

Codeine and Terpin Hydrate Elixir, page 685

Codeine Phosphate, Aspirin, Phenacetin, and Caffeine Tablets

Codeine Phosphate, Aspirin, Phenacetin, and Caffeine Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{18}H_{21}NO_3 . H_3PO_4 . {}^1/_2H_2O$ (codeine phosphate), and not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of $C_9H_8O_4$ (aspirin), of $C_{10}H_{13}NO_2$ (phenacetin), and of $C_8H_{10}N_4O_2$ (caffeine).

Identification—

A: Transfer a quantity of finely powdered Codeine Phosphate, Aspirin, Phenacetin, and Caffeine Tablets, equivalent to about 1 mg. of codeine phosphate, to a test tube, and add a few drops of sulfuric acid containing 5 mg. of selenious acid in each ml.: a green color is produced which rapidly changes to blue (*presence of codeine*).

B: Mix a portion of finely powdered Codeine Phosphate, Aspirin, Phenacetin, and Caffeine Tablets, equivalent to about 10 mg. of codeine phosphate, with 10 ml. of water, and filter: the filtrate, when neutralized with ammonia T.S., responds to the tests for *Phosphate*, page 809.

C: Crush a Codeine Phosphate, Aspirin, Phenacetin, and Caffeine Tablet, and boil it with 5 ml. of diluted sulfuric acid: acetic acid, recognizable by its odor, is evolved. Cool the mixture, and add a few drops of ferric chloride T.S.: a violet to purple color is produced (*presence of aspirin*).

D: Crush a Codeine Phosphate, Aspirin, Phenacetin, and Caffeine Tablet, and boil for a few minutes with 3 ml. of diluted hydrochloric acid. Dilute with 10 ml. of water, cool, filter, and add 1 drop of potassium dichromate T.S. to the filtrate: the mixture slowly develops a ruby-red color (*presence of phenacetin*).

E: Crush a Codeine Phosphate, Aspirin, Phenacetin, and Caffeine Tablet, shake with 5 ml. of water, filter, and to the filtrate add a few drops of tannic acid T.S.: a precipitate is produced which is soluble in an excess of the reagent (*presence of caffeine*).

Disintegration, page 878—The disintegration time limit for Codeine Phosphate, Aspirin, Phenacetin, and Caffeine Tablets is 10 minutes.

Content uniformity, *Method I*, page 799—Codeine Phosphate, Aspirin, Phenacetin, and Caffeine Tablets meet the requirements of the content uniformity test for tablets when tested for codeine phosphate and for caffeine content.

Free salicylic acid—

Ferric chloride-urea reagent—Dissolve by swirling, without the aid of heat, 60 g. of urea in a mixture of 8 ml. of ferric chloride solution (6 in 10) and 42 ml. of 0.05 *N* hydrochloric acid. Adjust the resulting solution to a pH of 3.2, if necessary, by the addition of 6 *N* hydrochloric acid.

Standard preparation—Transfer 75.0 mg. of salicylic acid, previously dried over silica gel for 3 hours and accurately weighed, to a 100-ml. volumetric flask, add chloroform to volume, and mix. Transfer 10.0 ml. of this solution to a second 100-ml. volumetric flask, dilute to volume with chloroform, and mix. Transfer 10.0 ml. of this last solution to a 50-ml. volumetric flask containing 10 ml. of methanol, 2 drops of hydrochloric acid, and 10 ml. of a 1 in 10 solution of glacial acetic acid in ether, dilute to volume with chloroform, and mix.

Test preparation—Pack a pledget of glass wool in the base of a 20 × 2.5-cm. chromatographic tube, and uniformly pack the tube with a mixture of 3 g. of chromatographic siliceous earth and 2 ml. of freshly prepared *Ferric chloride-urea reagent.* Weigh accurately a quantity of finely powdered Codeine Phosphate, Aspirin, Phenacetin, and Caffeine Tablets, equivalent to 100 mg. of aspirin, mix with 10 ml. of chloroform by stirring for 3 minutes, and then transfer to the chromatographic column with the aid of a few ml. of chloroform. Pass 50 ml. of chloroform through the column, rinse the tip of the chromatographic tube with chloroform, and discard the eluate. Prepare as a receiver a 50-ml. volumetric flask containing 10 ml. of methanol and 2 drops of hydrochloric acid, and elute any salicylic acid from the column by passing 10 ml. of a 1 in 10 solution of glacial acetic acid in ether that has been recently saturated with water, followed by 30 ml. of chloroform. Dilute the eluate to volume with chloroform, and mix.

Procedure—Concomitantly determine the absorbances of the solutions in 1-cm. cells, at the maximum at about 306 mμ, with a suitable spectrophotometer, using as the blank a solvent mixture of the same composition as that used for the *Standard preparation:* the absorbance of the *Test preparation* does not exceed that of the *Standard preparation* (0.75 percent, calculated on the labeled aspirin content).

Assay for codeine phosphate—

Internal standard solution—Prepare a

solution in chloroform containing 400 mcg. of USP Propoxyphene Hydrochloride Reference Standard in each ml.

Standard preparation—Transfer about 30 mg. of USP Codeine Phosphate, accurately weighed, to a 125-ml. separator, add 20 ml. of sodium hydroxide T.S., swirl to mix, and continue as directed under *Assay preparation*, beginning with "... and extract the solution with four 25-ml. portions of methylene chloride. ..." Use the final solution as directed in the *Procedure*.

Assay preparation—Weigh and finely powder not less than 20 Codeine Phosphate, Aspirin, Phenacetin, and Caffeine Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 30 mg. of codeine phosphate, to a 125-ml. separator, add 20 ml. of sodium hydroxide T.S., swirl to mix, and extract the solution with four 25-ml. portions of methylene chloride, filtering each extract through anhydrous sodium sulfate into a 150-ml. beaker. Evaporate the combined extracts to a volume of about 5 ml. on a steam bath with the aid of a current of air, and quantitatively transfer the residual liquid to a glass-stoppered 25-ml. conical flask with the aid of 20 ml. of methylene chloride. Evaporate to near dryness on a steam bath, and complete the evaporation to dryness with the aid of a current of air, without heating. Dissolve the residue in 10.0 ml. of *Internal standard solution*, and use the resultant solution as directed in the *Procedure*.

Procedure—Inject a portion of the *Standard preparation* into a suitable gas chromatograph equipped with a flame-ionization detector, and record the chromatogram. Under typical conditions, the instrument contains a 1-meter × 6-mm. (outside diameter) glass column packed with 3 to 5 percent methyl silicone gum on 80 to 100-mesh or 100 to 120-mesh acid-washed, silanized, flux-calcined siliceous earth. The column is maintained at 215°, and the injector port and detector block at 230°; helium is used as the carrier gas at a flow rate of 50 ml. per minute.

Measure the peak height of each component, recording the height of the propoxyphene hydrochloride peak as P_1 and that of the codeine phosphate peak as P_2.

Similarly, inject a portion of the *Assay preparation* into the chromatograph, and record the chromatogram under the same conditions as described for the *Standard preparation*. Measure the peak height of each component, recording the height of the propoxyphene hydrochloride peak as p_1 and that of the codeine phosphate peak as p_2.

Calculate the quantity, in mg., of $C_{18}H_{21}NO_3 . H_3PO_4 . {}^1/_2H_2O$ in the portion of Tablets taken by the formula $10C \times (p_2 \times P_1)/(p_1 \times P_2)$, in which C is the exact equivalent concentration, in mg. per ml., of codeine phosphate in the *Standard preparation*.

Assay for aspirin, phenacetin, and caffeine—

Preparation of chromatographic column—Pack a pledget of fine glass wool in the base of a chromatographic tube (25 × 200-mm. test tube to which is fused a 5-cm. length of 6 or 8-mm. tubing) with the aid of a tamping rod of stainless steel, aluminum, or glass, at least 30 cm. long and having a disk with a diameter about 1 mm. less than that of the chromatographic tube. To 2.0 g. of purified siliceous earth (see page 927) in a glass mortar add 2.0 ml. of approximately 4 *N* sulfuric acid and incorporate by kneading thoroughly with a flexible spatula blade until the mixture is fluffy. Transfer to the column and tamp gently to compress the material to a uniform mass. In like manner, mix intimately 2.0 g. of purified siliceous earth with 2.0 ml. of approximately 1 *N* sodium bicarbonate, transfer to the column, and gently compress with the tamping rod. Wash the column so prepared with one 20-ml. portion of water-washed ether and discard the washings.

Phenacetin standard solution—Transfer to a 100-ml. volumetric flask about 50 mg. of USP Phenacetin Reference Standard, previously dried at 60° for 1 hour and accurately weighed, add chloroform to volume, and mix. Transfer 10.0 ml. of this solution to a second 100-ml. volumetric flask, add isooctane to volume, and mix.

Aspirin standard solution—Transfer to a 100-ml. volumetric flask about 50 mg. of USP Aspirin Reference Standard, previously recrystallized from isopropanol, dried over silica gel for 5 hours, and accurately weighed. Add chloroform to volume, and mix. Transfer 10.0 ml. of this solution to a second 100-ml. volumetric flask, add 1 ml. of glacial acetic acid, dilute to volume with chloroform, and mix. Use within 3.5 hours.

Caffeine standard solution—Transfer to a 100-ml. volumetric flask about 100 mg. of NF Caffeine Reference Standard, previously dried at 80° for 4 hours and accurately weighed, add chloroform to volume, and mix. Transfer 10.0 ml. of this solution to a second 100-ml. volumetric flask, dilute to volume with chloroform, and mix. Transfer 10.0 ml. of this last solution to a third 100-ml. volumetric flask, dilute to volume with chloroform, and mix.

Assay preparation—Weigh and finely powder not less than 20 Codeine Phosphate, Aspirin, Phenacetin, and Caffeine Tablets. Transfer to a 50-ml. volumetric flask an accurately weighed portion of the powder, equivalent to about 50 mg. of aspirin, add 30 ml. of chloroform, and mix thoroughly by shaking. Add 0.1 ml. of glacial acetic acid, dilute to volume with chloroform, and mix.

Procedure—(Use water-washed solvents.) Dilute 5.0 ml. of the *Assay preparation* with 20 ml. of ether and pass the solution into the column without pressure. After all of the solution has passed into the column, complete the elution of the phenacetin from the column with five 5-ml. portions of ether, allowing each portion to pass into the column before the next portion is added, and collecting the total ether eluate in a glass evaporating dish. Immediately after the last portion of ether has passed through the column, rinse the tip of the outlet tube with chloroform, collecting the rinsings in the evaporating dish, remove the dish, and replace it with a 50-ml. volumetric flask to receive the caffeine eluate in the next step. Evaporate the total eluate to dryness on a steam bath in a current of air. Dissolve the residue in 5 ml. of chloroform, transfer to a 50-ml. volumetric flask, dilute to volume with isooctane, and mix.

To elute the caffeine, pass 48 ml. of chloroform through the column, rinse the tip with chloroform, add sufficient chloroform to make 50.0 ml., and mix. Replace the receiver with a 100-ml. volumetric flask, and elute the aspirin with a solution of 0.5 ml. of glacial acetic acid in 5 ml. of chloroform, followed by 90 ml. of a solution of glacial acetic acid in chloroform (1 in 100), dilute to volume with the latter solvent, and mix. The absorbance of the aspirin solution must be determined within 3.5 hours after preparation of the *Assay preparation.*

Determine the absorbance of each solution in 1-cm. cells, with a suitable spectrophotometer, at 285 mμ for the phenacetin solution, at 276 mμ for the caffeine solution, and at 280 and 310 mμ for the aspirin solution, using as a blank the respective solvent employed for each solution. Record the absorbance of each *Standard solution* as A_S and that of the corresponding *Assay solution* as A_U.

Calculation for phenacetin—Calculate the quantity, in mg., of $C_{10}H_{13}NO_2$ per tablet by the formula $0.5C \times (A_U/A_S) \times$ (Av. Wt. per Tablet/Wt. of Sample), in which C is the exact quantity, in mcg., of phenacetin per ml. of the *Phenacetin standard solution.*

Calculation for aspirin—Calculate the quantity, in mg., of $C_9H_8O_4$ per tablet by the formula $C \times [(A_{U280} - 0.2A_{U310})/A_{S280}] \times$ (Av. Wt. per Tablet/Wt. of Sample), in which C is the exact quantity, in mcg., of aspirin per ml. of the *Aspirin standard solution* and A_U and A_S are the absorbances of the sample solution and standard solution, respectively, at the wavelengths indicated by the subscripts.

Calculation for caffeine—Calculate the quantity, in mg., of $C_8H_{10}N_4O_2$ per tablet by the formula $0.5C \times (A_U/A_S) \times$ (Av. Wt. per Tablet/Wt. of Sample), in which C is the exact quantity, in mcg., of caffeine per ml. of the *Caffeine standard solution.*

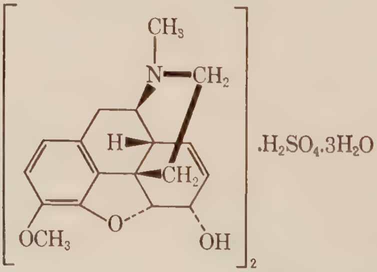
Packaging and storage—Preserve Codeine Phosphate, Aspirin, Phenacetin, and Caffeine Tablets in well-closed containers.

Tablets available—Codeine Phosphate, Aspirin, Phenacetin, and Caffeine Tablets usually available contain the following amounts of codeine phosphate: 8, 15, 30, and 60 mg.; of aspirin: 230 mg.; of phenacetin: 150 mg.; and of caffeine: 30 mg.

CATEGORY—Analgesic (narcotic).

USUAL DOSE OF CODEINE PHOSPHATE—**8** to **60 mg.**; OF ASPIRIN—**600 mg.**; OF PHENACETIN—**300 mg.**; OF CAFFEINE—**200 mg.**

Codeine Sulfate



7,8-Didehydro-4,5α-epoxy-3-methoxy-17-methylmorphinan-6α-ol Sulfate (2:1)

$(C_{18}H_{21}NO_3)_2 . H_2SO_4 . 3H_2O$ Mol. wt. 750.87

Codeine Sulfate, dried at 105° for 3 hours, contains not less than 98.5 percent and not more than 100.5 percent of $(C_{18}H_{21}NO_3)_2 . H_2SO_4$.

Description—Codeine Sulfate occurs as white crystals, usually needle-like, or as a white, crystalline powder. It is affected by light.

Solubility—Codeine Sulfate is soluble in water, and is very slightly soluble in alcohol. It is freely soluble in water at 80°. It is insoluble in chloroform and in ether.

Identification—

A: To 1 mg. of Codeine Sulfate contained in a porcelain crucible or small dish add 0.5 ml. of sulfuric acid-formaldehyde T.S.: an intense violet-blue color is produced at once (*difference from morphine which gives an intense purple color*).

B: To 1 mg. of Codeine Sulfate contained in a porcelain crucible or small dish add 0.5 ml. of sulfuric acid containing in each ml. 5 mg. of selenious acid: a green color is produced at once, which rapidly changes to blue, then slowly to dark olive-green (*difference from morphine which gives at once a blue color, changing to green*).

C: To a solution of 5 mg. of Codeine Sulfate in 5 ml. of sulfuric acid contained in a test tube, add 1 drop of ferric chloride T.S., mix, and heat in boiling water for 2 minutes: a blue color is produced which upon the addition of a drop of nitric acid changes to dark red-brown (*ethylmorphine and morphine give the same color reactions, but hydromorphone and papaverine do not*).

D: Codeine Sulfate responds to the tests for *Sulfate*, page 810.

Specific rotation, page 822—The specific rotation of Codeine Sulfate, calculated on the dried basis, determined in a solution containing the equivalent of 2 g. of Codeine Sulfate in each 100 ml., is between $-112.5°$ and $-115°$.

Acidity—Dissolve 500 mg. of Codeine Sulfate in 15 ml. of water, add 1 drop of methyl red T.S., and titrate with 0.02 *N* sodium hydroxide: not more than 0.3 ml. is required for neutralization.

Loss on drying, page 814—Dry Codeine Sulfate at 105° for 3 hours: it loses not less than 6 percent and not more than 7.5 percent of its weight.

Residue on ignition, page 858—Codeine Sulfate yields not more than 0.1 per cent of residue on ignition.

Readily carbonizable substances, page 856—Dissolve 10 mg. of Codeine Sulfate in 5 ml. of sulfuric acid T.S.: the solution has no more color than Matching Fluid S.

Morphine—Dissolve about 50 mg. of potassium ferricyanide in 10 ml. of water, and add 1 drop of ferric chloride T.S. and 1 ml. of a solution of Codeine Sulfate (1 in 100): no blue color is produced immediately.

Assay—Dissolve about 1.4 g. of Codeine Sulfate, previously dried at 105° for 3 hours and accurately weighed, in 50 ml. of glacial acetic acid, warming if necessary to effect solution. Titrate with 0.1 *N* perchloric acid in glacial acetic acid determining the end-point potentiometrically. Each ml. of 0.1 *N* perchloric acid is equivalent to 69.68 mg. of $(C_{18}H_{21}NO_3)_2.H_2SO_4$.

Packaging and storage—Preserve Codeine Sulfate in tight, light-resistant containers.

CATEGORY—Analgesic (narcotic); antitussive.

USUAL DOSE—Analgesic, **30 mg.** every 4 hours. Antitussive, **5** to **10 mg.** every 4 hours.

USUAL DOSE RANGE—Analgesic, **15** to **60 mg.**

Codeine Sulfate Tablets

Codeine Sulfate Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $(C_{18}H_{21}NO_3)_2.H_2SO_4.3H_2O$.

Identification—

A: Digest a quantity of finely powdered Codeine Sulfate Tablets, equivalent to about 50 mg. of codeine sulfate, with 15 ml. of water and 5 ml. of diluted sulfuric acid for 1 hour. Filter, if necessary, and wash any undissolved residue with a few ml. of water. Render the filtrate alkaline with ammonia T.S., extract with several small portions of chloroform, and evaporate the chloroform solution to dryness on a steam bath. The resulting residue of codeine responds to *Identification tests A, B, and C* under *Codeine Sulfate*, page 180.

B: A filtered solution of Codeine Sulfate Tablets responds to the tests for *Sulfate*, page 810.

Disintegration, page 878—The disintegration time limit for Codeine Sulfate Tablets is 15 minutes.

Content uniformity, *Method II*, page 799—Codeine Sulfate Tablets meet the requirements of the content uniformity test for tablets, using the following special procedure: Quantitatively transfer a finely powdered tablet to a 25-ml. volumetric flask. Add 15 ml. of water, and shake to dissolve. Dilute to volume with water, and filter, discarding the first few ml. of filtrate. Dilute a portion of the subsequent filtrate quantitatively and stepwise, if necessary, with 0.01 *N* sodium hydroxide to provide a solution containing approximately 120 mcg. of codeine sulfate (trihydrate) per ml. Concomitantly determine the absorbance of this solution and of a standard solution of NF Codeine Sulfate, in the same medium, at a concentration of about 120 mcg. per ml., in 1-cm. cells, at the maximum at about 284 mμ, with a suitable spectrophotometer, using water as the blank. Calculate the quantity in mg., of $(C_{18}H_{21}NO_3)_2.H_2SO_4.3H_2O$ in the tablet by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity of codeine sulfate, in mg., in the tablet; D is the exact concentration, in mcg. per ml., of codeine sulfate in the sample solution based upon the labeled quantity per tablet and the extent of dilution; C is the exact concentration of the standard solution, in mcg. per ml., A_U is the absorbance of the tablet extract, and A_S is the absorbance of the standard solution.

Assay—Weigh and finely powder not less than 20 Codeine Sulfate Tablets. Weigh accurately a portion of the powder, equivalent to about 150 mg. of codeine sulfate, and transfer it completely to a 100-ml. volumetric flask. Add sufficient water to make a thin suspension, then add 20 ml. of 0.5 *N* sulfuric acid, shake the mixture occasionally during 2 hours, and allow it to stand overnight. Dilute to volume with water, mix, and filter through a filtering crucible. Transfer to a separator an accurately measured portion of the filtrate, equivalent to not less than 75 mg. of codeine sulfate, render the solution alkaline with ammonia T.S., and completely extract the alkaloid with successive 15-ml. portions of chloroform. Evaporate the combined chloroform solution nearly to dryness on a steam bath, add 25.0 ml. of 0.02 *N* sulfuric acid, and heat gently to dissolve the codeine and expel all of the chloroform. Cool, add 3 drops of methyl red T.S., and titrate the excess acid with 0.02 *N* sodium hydroxide. Each ml. of 0.02 *N* sulfuric acid is equivalent to 7.509 mg. of $(C_{18}H_{21}NO_3)_2.H_2SO_4.3H_2O$.

Packaging and storage—Preserve Codeine Sulfate Tablets in well-closed containers.

Tablets available—Codeine Sulfate Tablets usually available contain the following amounts of codeine sulfate: 15, 30, and 60 mg.

CATEGORY and DOSE—See Codeine Sulfate.

Cod Liver Oil

Cod Liver Oil is the partially destearinated fixed oil obtained from fresh livers of *Gadus morrhua* Linné and other species of the Family *Gadidæ*. Cod Liver Oil contains, in each g., not less than 255 mcg. (850 USP Units) of vitamin A and not less than 2.125 mcg. (85 USP Units) of vitamin D.

Cod Liver Oil may be flavored by the addition of not more than 1 percent of a suitable flavoring substance or a mixture of such substances.

Description—Cod Liver Oil is a thin, oily liquid, having a characteristic, slightly fishy but not a rancid odor, and a fishy taste.

Solubility—Cod Liver Oil is slightly soluble in alcohol. It is freely soluble in ether, in chloroform, in carbon disulfide, and in ethyl acetate.

Identification for vitamin A—To 1 ml. of a chloroform solution of Cod Liver Oil (1 in 40) add 10 ml. of antimony trichloride T.S.: a blue color results immediately.

Specific gravity, page 866—The specific gravity of Cod Liver Oil is not less than 0.918 and not more than 0.927.

Color—When viewed transversely in a tall, cylindrical, standard oil-sample bottle of colorless glass of about 120-ml. capacity, the color of Cod Liver Oil is not more intense than that of a mixture of 11 ml. of cobaltous chloride C.S., 76 ml. of ferric chloride C.S., and 33 ml. of water, in a similar bottle of the same internal diameter.

Nondestearinated cod liver oil—Fill a tall, cylindrical, standard oil-sample bottle of about 120-ml. capacity with Cod Liver Oil at a temperature between 23° and 28°, stopper, and immerse the bottle in a mixture of ice and water for 3 hours: the oil remains clear and does not deposit stearin.

Unsaponifiable matter, page 803—Cod Liver Oil contains not more than 1.3 percent of unsaponifiable matter.

Acid value—Mix 15 ml. of alcohol with 15 ml. of ether, add 5 drops of phenolphthalein T.S., and neutralize with 0.1 *N* sodium hydroxide. Dissolve 2 g. of Cod Liver Oil, accurately weighed, in the mixture, and boil the oil solution gently under a reflux condenser for 10 minutes. Cool, and titrate the mixture with 0.1 *N* sodium hydroxide to the production of a pink color which persists after shaking for 30 seconds: not more than 1 ml. of 0.1 *N* sodium hydroxide is required.

Iodine value, page 804—The iodine value of Cod Liver Oil is not less than 145 and not more than 180.

Saponification value, page 805—The saponification value of Cod Liver Oil is not less than 180 and not more than 192. If carbon dioxide has been used as a preservative, expose the Oil in a shallow dish in a vacuum desiccator for 24 hours before weighing the sample for determination of the saponification value.

Assay for vitamin A—Using an accurately weighed sample of 0.5 to 1 g. of Cod Liver Oil, proceed as directed under *Vitamin A Assay,* page 891.

Assay for vitamin D—Proceed as directed under *Vitamin D Assay, Biological Method,* page 895.

Packaging and storage—Preserve Cod Liver Oil in tight containers. It may be bottled or packaged in containers from which air has been expelled by the production of a vacuum or by an inert gas.

Labeling—The vitamin A potency and vitamin D potency of Cod Liver Oil, when designated on the label, are expressed in United States Pharmacopeia Units per g. of oil. These units may be referred to as USP Units.

CATEGORY—Source of vitamin A and D.

USUAL DOSE—**5 ml.** containing 1170 mcg. (3900 USP Units) of vitamin A and 9.7 mcg. (386 USP Units) of vitamin D.

NOTE: Cod Liver Oil containing more than the minimum NF requirements for both vitamin A and vitamin D may be administered in proportionally smaller doses.

Nondestearinated Cod Liver Oil

Nondestearinated Cod Liver Oil is the entire fixed oil obtained from fresh livers of *Gadus morrhua* Linné and other species of the Family *Gadidæ,* containing not more than 0.5 percent by volume of water and liver tissue. Nondestearinated Cod Liver Oil contains, in each g., not less than 255 mcg. (850 USP Units) of vitamin A and not less than 2.125 mcg. (85 USP Units) of vitamin D.

Description—Nondestearinated Cod Liver Oil is a thin, oily liquid at room temperature, having a characteristic, slightly fishy, but not a rancid, odor and a fishy taste. Nondestearinated Cod Liver Oil congeals or deposits stearin upon chilling.

Solubility—Nondestearinated Cod Liver Oil is slightly soluble in alcohol, and is freely soluble in ether and in chloroform.

Water and sediment, page 805—Nondestearinated Cod Liver Oil contains not more than 0.5 percent by volume of water and sediment.

Iodine value, page 804—The iodine value of Nondestearinated Cod Liver Oil is not less than 128 and not more than 180.

Identification for vitamin A, Color, Unsaponifiable matter, Acid value, and Saponification value—Nondestearinated Cod Liver Oil meets the requirements of the tests for *Identification for vitamin A, Color, Unsaponifiable matter, Acid value,* and *Saponification value* under *Cod Liver Oil,* page 182.

Assays—Proceed as directed in the *Assays* under *Cod Liver Oil,* page 182.

Packaging and storage—Preserve Nondestearinated Cod Liver Oil in tight containers. It may be stored in containers from which the air has been expelled by the production of a vacuum or by an inert gas.

Labeling—The vitamin A potency and vitamin D potency of Nondestearinated Cod Liver Oil, when designated on the label, are expressed in United States Pharmacopeia Units per g. of oil. These units may be referred to as USP Units.

CATEGORY—Pharmaceutic aid (source of cod liver oil).

Colistin Sulfate

Colistin Sulfate is the sulfate salt of an antibacterial substance produced by the growth of *Bacillus polymyxa* var. *colistinus.* It consists primarily of colistin A with small amounts of colistin B. It has a potency of not less than 500 mcg. of colistin base activity per mg. Colistin Sulfate conforms to the regulations of the federal

Food and Drug Administration concerning the certification of antibiotic drugs.

Description—Colistin Sulfate occurs as a white to slightly yellow, odorless, fine powder. A solution of Colistin Sulfate (1 in 100) has a pH between 4.0 and 7.0.

Solubility—Colistin Sulfate is freely soluble in water and slightly soluble in methanol. It is insoluble in acetone and in ether.

Packaging and storage—Preserve Colistin Sulfate in tight containers.

CATEGORY—Antibacterial (intestinal).

USUAL DOSE—**3** to **5 mg. per kg.** of body weight daily in three divided doses.

Colistin Sulfate for Oral Suspension

Colistin Sulfate for Oral Suspension is colistin sulfate admixed with one or more suitable suspending and dispersing agents, colors, flavors, buffers, and preservatives. It contains colistin sulfate equivalent to not less than 90.0 percent and not more than 120.0 percent of the labeled amount of colistin base activity. Colistin Sulfate for Oral Suspension conforms to the regulations of the federal Food and Drug Administration concerning the certification of antibiotic drugs.

Packaging and storage—Preserve Colistin Sulfate for Oral Suspension in tight containers, protected from light.

Size available—Colistin Sulfate for Oral Suspension usually available contains an amount of colistin sulfate equivalent to 300 mg. colistin base activity in a 70-ml. container.

CATEGORY and DOSE—See Colistin Sulfate.

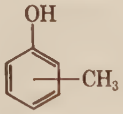
Cresol



C_7H_8O Mol. wt. 108.14

Cresol is a mixture of isomeric cresols obtained from coal tar or from petroleum. It contains not more than 5.0 percent of C_6H_6O (phenol).

Description—Cresol is a colorless, or yellowish to brownish yellow, or pinkish, highly refractive liquid, becoming darker with age and on exposure to light. It has a phenol-like, sometimes empyreumatic odor. A saturated solution of Cresol is neutral or only slightly acid to litmus.

Solubility—Cresol is sparingly soluble in water, usually forming a cloudy solution. Cresol is miscible with alcohol, with ether, and with glycerin, and is dissolved by solutions of fixed alkali hydroxides.

Identification—To a saturated solution of Cresol add a few drops of ferric chloride T.S.: a bluish violet color is produced.

Specific gravity, page 866—The specific gravity of Cresol is not less than 1.030 and not more than 1.038.

Distilling range, *Method II*, page 782—Not less than 90 percent (v/v) of Cresol distils between 195° and 205°.

Hydrocarbons—A solution of 1 ml. of

Cresol in 60 ml. of water shows no more turbidity than that produced in 58 ml. of water by the addition of 1.5 ml. of 0.02 *N* sulfuric acid and 1 ml. of barium chloride T.S., comparison being made after the control mixture has been well shaken and allowed to stand for 5 minutes.

Phenol—

Dilute nitric acid—Blow air through nitric acid until the liquid is colorless, then mix 1 volume with 4 volumes of water.

Standard phenol solution—Dissolve about 1 g. of USP Phenol in about 100 ml. of water, and determine the actual C_6H_6O concentration as follows: Pipet 4.0 ml. of the solution into an iodine flask, add 30.0 ml. of 0.1 *N* bromine, then 5 ml. of hydrochloric acid, and immediately insert the stopper. Shake the flask repeatedly during 30 minutes, allow it to stand for 15 minutes, add quickly 5 ml. of potassium iodide solution (1 in 5), taking precautions against the escape of bromine vapor, and at once stopper the flask. Shake thoroughly, remove the stopper, and rinse it and the neck of the flask with a little water, so that the washings flow into the flask. Add 1 ml. of chloroform, shake the mixture well, and titrate the liberated iodine with 0.1 *N* sodium thiosulfate, adding starch T.S. as the end-point is neared. Perform a blank determination (see *Residual Titrations,* page 883). Each ml. of 0.1 *N* bromine is equivalent to 1.569 mg. of C_6H_6O. Dilute a suitable volume of the solution with water so that each ml. contains 250 mcg. of C_6H_6O.

Procedure—Place about 2.5 g. of Cresol, accurately weighed, in a 250-ml. volumetric flask, add 10 ml. of sodium hydroxide solution (1 in 10), dilute with water to volume, and mix. Pipet 5.0 ml. of this solution into a 200-ml. volumetric flask, add 45 ml. of water and 1 drop of methyl orange T.S., neutralize with *Dilute nitric acid,* added dropwise, then dilute with water to volume, and mix. Pipet 5.0 ml. of the neutralized solution into each of two test tubes, 20 × 180 mm., graduated at the 25-ml. mark, and pipet 5.0 ml. of *Standard phenol solution* into each of two similar test tubes. To the contents of each tube add 5 ml. of Millon's reagent, allowing it to flow down the inner wall of the tube, mix, place the tubes simultaneously in a boiling water bath provided with a rack so that the tubes do not touch the bottom of the bath, and maintain the bath at boiling temperature for exactly 30 minutes. At once remove the tubes from the bath, cool them immediately and thoroughly by placing them in a bath of cold water for at least 10 minutes, add 5 ml. of *Dilute nitric acid* to each tube, and mix.

Add 3 ml. of dilute formaldehyde T.S. (formaldehyde T.S. diluted 1 in 50) to one of each pair of tubes, add water to all tubes to a volume of 25.0 ml., shake thoroughly, and allow to stand for 16 hours, during which time the added formaldehyde will impart a yellow color while the contents of the other 2 tubes acquire an orange-red color.

Pipet 20.0 ml. from each of the two tubes containing the *Standard phenol solution* into 100-ml. volumetric flasks, add 5 ml. of nitric acid, then add water to volume, and mix. Transfer the solutions to burets marked *B1* and *B2*, representing, respectively, the solution not treated and the solution treated with formaldehyde.

Pipet 10.0 ml. of the contents of the tube of formaldehyde-treated Cresol into a 50-ml. color-comparison tube marked *N1* and similarly add 10.0 ml. of the contents not treated with formaldehyde to a similar tube marked *N2*.

Add to tube *N1* the orange-red colored solution from buret *B1*, and add to tube *N2* an equal volume of the yellow-colored solution from buret *B2*, until the colors in tubes *N1* and *N2* match when observed in a colorimeter. Calculate the percentage of phenol by the formula $5V/W$, in which V is the volume, in ml., of *Standard phenol solution* taken from buret *B1*, and W is the weight, in g., of Cresol taken.

Packaging and storage—Preserve Cresol in tight, light-resistant containers.

CATEGORY—Disinfectant.

APPLICATION—1 to 5 percent solution on dishes, utensils, and other inanimate objects.

Saponated Cresol Solution

Saponated Cresol Solution contains, in each 100 ml., not less than 46 ml. and not more than 52 ml. of cresol. It is prepared by the saponification of a mixture of cresol with vegetable oils, or the mixed fatty acids derived therefrom, excluding coconut and palm kernel oils. The vegetable oil may be corn, cottonseed, linseed, or soya bean, or similar oils which have a saponification value, page 805, not greater than 205, and an iodine value, page 804, not less than 100.

Saponated Cresol Solution may be prepared extemporaneously in the following manner:

Cresol	**500 ml.**
The Vegetable Oil	**350 ml.**
Alcohol	**55 ml.**
Potassium Hydroxide	**73 g.**
Purified Water, a sufficient quantity,	
To make	**1000 ml.**

Mix the vegetable oil and the alcohol. Dissolve the potassium hydroxide in 100 ml. of purified water and immediately add this hot solution to the oil while vigorously stirring the mixture with a mechanical stirrer. Continue the stirring until a small portion of the soap dissolves in hot purified water to form a clear solution. Add the cresol to the soap, stir until a clear solution is obtained, and add sufficient purified water to make the Solution measure 1000 ml.

Note: If desired, 58 g. of the potassium hydroxide may be replaced by 37 g. of sodium hydroxide. It is also permissible to replace the alcohol with 20 ml. of oleic acid, in which case the oil should be warmed to 85° before the addition of the solution of the alkali hydroxide, and the mixture heated, if necessary, to complete saponification.

The quantities of potassium hydroxide and sodium hydroxide here directed have been determined upon the basis of the official minimum percentages of strength, namely, 85 percent and 95 percent, respectively. If either or both of the hydroxides used should have a different percentage of strength, corresponding alterations in the quantities should be made.

Characteristics of the liberated fatty acids—Place 50 ml. of Saponated Cresol Solution in a 1000-ml. round-bottom flask, and add 100 ml. of water and 30 ml. of diluted sulfuric acid. Connect the flask with a source of steam and a condenser and distil briskly with steam until 3 ml. of distillate produces not more than a faint opalescence upon the addition of 1 ml. of bromine T.S. Transfer the residual liquid to a separator, cool to room temperature, add 50 ml. of ether, shake well, and allow the layers to separate. Draw off the water layer as completely as possible and wash the ether layer three times with 50-ml. portions of cold water, rejecting the washings. Transfer the ether layer to a small flask containing 15 g. of anhydrous sodium sulfate, shake well, and decant the ether solution through a dry filter into a dry beaker. Carefully evaporate the ether and dry the mixed fatty acids at 105° for 1 hour. The acid value of the fatty acids is not more than 205, using about 1 g. of the fatty acids, accurately weighed, page 804, and the iodine value of the fatty acids is not less than 95, using from 150 to 250 mg. of the fatty acids, accurately weighed, page 804.

Assay—Mix in a 500-ml. distilling flask 50 ml. of Saponated Cresol Solution, accurately measured at 25°, with 150 ml. of kerosene. Add 3 g. of sodium bicarbonate, and distil the mixture, using an upright condenser, at the rate of not more than 2 drops per second, until the distillate comes over strongly yellow, receiving the distillate in a 250- to 300-ml. separator. Draw off the lower water layer, shake the kerosene layer with 10 ml. of sulfuric acid (49 to 51 percent, w/w), allow to stand for 2 hours, then draw off the acid layer completely, and discard it. Add to the kerosene layer 40 ml. of a 15 percent solution of sodium hydroxide, accurately measured at 25°, shake well for 5 minutes, allow to stand until complete separation has taken place, and draw off the sodium hydroxide layer into a graduated cylinder. Shake the kerosene layer again with a fresh portion of 20 ml. of the 15 percent sodium hydroxide solution, accurately measured at 25°, allow the two layers to separate completely, and draw off the sodium hydroxide layer into the graduated cylinder. Adjust the sodium hydroxide solution in the graduated cylinder to a temperature of 25°, and note its volume. The difference between the volume noted and the total volume of sodium hydroxide solution used represents the volume of cresol present in 50 ml. of Saponated Cresol Solution. This difference is not less than 23 ml. and not more than 26 ml.

Transfer the sodium hydroxide solution of the cresol obtained in the assay to a separator, and add sufficient hydrochloric acid to render the solution distinctly acid. Allow the liberated cresol to separate completely, and draw off the lower water layer. Wash the cresol with several successive portions of 20 ml. each of a saturated solution of calcium chloride until the washings are neutral or only slightly acid. Then add to the washed cresol about 5 g. of coarsely granular (about No. 4 mesh) anhydrous calcium chloride, shake gently at frequent intervals during 3 hours, and allow to stand overnight. Decant the clear liquid completely into a graduated 25-ml. cylinder and note its volume. Transfer the dehydrated cresol to a 50- to 60-ml. distilling flask, and distil as directed in *Method II* under *Boiling or Distilling Range or Temperature*, page 782, at the rate of about 1.5 ml. per minute, receiving the distillate in the cylinder in which the cresol was measured. At least 90 percent of the volume of cresol taken distils between 195° and 205°.

Alcohol content, page 772—Saponated Cresol Solution contains not more than 5 percent (v/v) of C_2H_5OH.

Packaging and storage—Preserve Saponated Cresol Solution in tight containers.

CATEGORY—Disinfectant.

Cupric Sulfate

$CuSO_4.5H_2O$ Mol. wt. 249.68

Cupric Sulfate, dried at 250° to constant weight, contains not less than 98.5 percent and not more than 100.5 percent of $CuSO_4$.

Description—Cupric Sulfate occurs as deep blue, triclinic crystals, or as blue, crystalline granules or powder. It has a nauseous, metallic taste, and it effloresces slowly in dry air. Its solutions are acid to litmus.

Solubility—Cupric Sulfate is freely soluble in water and in glycerin. It is very soluble in boiling water and slightly soluble in alcohol.

Identification—A solution of Cupric Sulfate (1 in 10) responds to the tests for *Copper*, page 808, and for *Sulfate*, page 810.

Loss on drying, page 814—Dry Cupric Sulfate at 250° to constant weight: it loses not less than 33 percent and not more than 36.5 percent of its weight.

Alkalies and alkaline earths—Dissolve 2 g. of Cupric Sulfate in 100 ml. of water, add 1 ml. of diluted hydrochloric acid, and pass hydrogen sulfide through the solution until all of the copper is precipitated. Filter the mixture, evaporate 50 ml. of the filtrate to dryness, and ignite: the weight of the residue does not exceed 3 mg. (0.3 percent).

Assay—Weigh accurately about 650 mg. of Cupric Sulfate, previously dried at 250° to constant weight, dissolve it in 50 ml. of water, add 4 ml. of acetic acid and 3 g. of potassium iodide, and titrate the liberated iodine with 0.1 *N* sodium thiosulfate, using starch T.S. as the indicator. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* sodium thiosulfate is equivalent to 15.96 mg. of $CuSO_4$.

Packaging and storage—Preserve Cupric Sulfate in tight containers.

CATEGORY—Antidote (phosphorus).

Cyanocobalamin Co 60 Capsules

Cyanocobalamin Co 60 Capsules contain cyanocobalamin in which a portion of the molecules contain radioactive cobalt (^{60}Co) in the molecular structure. Cyanocobalamin Co 60 Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ^{60}Co as cyanocobalamin expressed in microcuries at the time indicated in the labeling. The activity of each capsule in not less than 97.0 percent and not more than 103.0 percent of the mean radioactivity of the individual capsules of the lot. The cyanocobalamin content is not less than 90.0 percent and not more than 110.0 percent of the labeled amount. The specific activity is not less than 0.5 microcurie per mcg. of cyanocobalamin. Significant quantities of other radionuclides are absent.

Caution—In making dosage calculations, correct for radioactive decay. The radioactive half-life of ^{60}Co *is 5.27 years.*

Description—Cyanocobalamin Co 60 Capsules may contain a small, rectangular solid, or may appear empty.

Radionuclide identification—A solution of 1 or more Cyanocobalamin Co 60 Capsules in water responds to the test for *Radionuclide identification* under *Cyanocobalamin Co 60 Solution*, page 188.

Cyanocobalamin content—Determine the content, in mcg. per Capsule, of cyanocobalamin as directed under *Vitamin B_{12} Activity Assay*, page 892.

Content uniformity—Determine the radioactivity, in counts per minute, of each capsule by measurement in a suitable counting assembly and under identical geometrical conditions. Calculate the mean radioactivity of the individual capsules.

Assay for radioactivity—Determine the radioactivity, in counts per minute, of a calibrated cobalt 60 standard by measurement in a suitable counting assembly, adjusting the concentration of the standard so as to obtain optimum counting accuracy with the particular assembly used. Dissolve 1 or more Cyanocobalamin Co 60 Capsules in water, and adjust the concentration as for the standard. Transfer an accurately measured aliquot to a container identical to that used for the standard, and determine the radioactivity at approximately the same time and under the identical geometrical conditions used for the standard. Correct both determinations for background, and calculate the radioactivity, in microcuries per Capsule, by the formula $SD \times (A/B)$, in which S is the microcurie strength of the standard, D is the dilution factor, and A and B are the radioactivities expressed in counts per minute of the sample and the standard, respectively.

Packaging and storage—Preserve Cyanocobalamin Co 60 Capsules in well-closed containers.

Expiration date—The expiration date of Cyanocobalamin Co 60 Capsules is not later than 6 months after date of calibration.

Labeling—Label Cyanocobalamin Co 60 Capsules to include the following: the name of the Capsules; the name, address, and batch or lot number of the manufacturer; the time and date of calibration; the amount of cyanocobalamin expressed in mcg. per Capsule; the amount of ^{60}Co as cyanocobalamin expressed in microcuries per Capsule at the time and date of calibration; the warning, "Caution—Radioactive Material"; and the statement, "Do not use after 6 months from date of calibration."

Capsules available—Cyanocobalamin Co 60 Capsules are usually available in such sizes as may be requested by the physician.

CATEGORY—Diagnostic aid (pernicious anemia).

USUAL DOSE—**0.5** to **2 mcg.**, containing not more than 1 microcurie.

USUAL DOSE RANGE—The equivalent of 0.5 to 1 microcurie.

Cyanocobalamin Co 60 Solution

Cyanocobalamin Co 60 Solution is a solution suitable for oral administration, containing cyanocobalamin in which a portion of the molecules contain radioactive cobalt ^{60}Co in the molecular structure. Cyanocobalamin Co 60 Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ^{60}Co as cyanocobalamin expressed in microcuries at the time indicated in the labeling. The cyanocobalamin content is not less than 90.0 percent and not more than 110.0 percent of the labeled amount per ml. The amount of cobalt 60 as cyanocobalamin is not more than 1 microcurie per ml. The specific activity is not less than 0.5 microcurie per mcg. of cyanocobalamin. Significant quantities of other radionuclider are abcent. Cyanocobalamin Co 60 Solution contains a suitable bacteriostatic agent.

Caution—In making dosage calculations, correct for radioactive decay. The radioactive half-life of ^{60}Co is 5.27 years.

Description—Cyanocobalamin Co 60 Solution is a clear, colorless to pink solution.

Radionuclide identification—The gamma-ray scintillation spectrum of Cyanocobalamin Co 60 Solution is identical to that of a specimen of cobalt 60 of known purity, which exhibits photoelectric peaks having energies of 1.172 Mev. and 1.332 Mev.

pH, page 824—The pH of Cyanocobalamin Co 60 Solution is between 4.0 and 5.5.

Radiochemical purity—Place 0.01 ml. of a solution, containing 1 mg. of cyanocobalamin per ml., about 45 mm. from one end of a 25 × 300-mm. strip of chromatographic paper (see *Chromatography*, page 786), and allow to dry. To the same area add a measured volume, representing an activity of not less than 20,000 counts per minute, of appropriately diluted Cyanocobalamin Co 60 Solution, and allow to dry. Develop the chromatogram over a period of about 24 hours by descending chromatography, using a freshly prepared homogeneous solution prepared by mixing 1 liter of secondary butyl alcohol, 1 ml. of stronger ammonia water, 20 ml. of sodium cyanide solution (3.5 in 1000), and 300 ml. of water (if phases separate, add 10-ml. increments of secondary butyl alcohol and shake until the mixture becomes homogeneous). Remove the paper strip from the apparatus when the cyanocobalamin spot has moved at least 75 mm. from the point of application. Dry the chromatogram in air, and determine the radioactivity distribution by scanning with a suitable collimated radiation detector, or section the strip into sections not exceeding 65 mm. in width and determine the radioactivity of the individual sections. The radioactivity of the cyanocobalamin band is not less than 95 percent of the total radioactivity. (*Caution:* Cyanocobalamin solutions are sensitive to light. Perform the preparation of strips in diffuse light and the development and drying of strips in the absence of light.)

Cyanocobalamin content—Determine the content, in mcg. per ml., of cyanocobalamin as directed under *Vitamin B_{12} Activity Assay*, page 892.

Assay for radioactivity—Determine the radioactivity, in counts per minute, of a calibrated cobalt 60 standard by measurement in a suitable counting assembly, adjusting the concentration of the standard so as to obtain optimum counting accuracy with the particular assembly used. Transfer an accurately measured aliquot of Cyanocobalamin Co 60 Solution, appropriately diluted, to a container identical to that used for the standard, and determine the radioactivity at approximately the same time and under the identical geometrical conditions used for the standard. Correct both determinations for background, and calculate the radioactivity, in microcuries per ml., by the formula $SD \times (A/B)$, in which S is the microcurie strength of the standard, D is the dilution factor, and A and B are the radioactivities expressed in counts per minute of the sample and the standard, respectively.

Packaging and storage—Preserve Cyanocobalamin Co 60 Solution in single-dose or in multiple-dose containers.

Expiration date—The expiration date of Cyanocobalamin Co 60 Solution is not later than 6 months after date of calibration.

Labeling—Label Cyanocobalamin Co 60 Solution to include the following: the name of the Solution; the name, address, and batch or lot number of the manufacturer; the time and date of calibration; the amount of ^{60}Co as cyanocobalamin expressed as total microcuries and as microcuries per ml. at the time and date of calibration; the amount of cyanocobalamin expressed in mcg. per ml.; the name and quantity of the added preservative; the warning, "Caution—Radioactive Material"; and the statement, "Do not use after 6 months from date of calibration."

CATEGORY and DOSE—See Cyanocobalamin Co 60 Capsules.

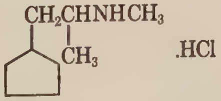
Cyclopentamine Hydrochloride



N,α-Dimethylcyclopentaneethylamine Hydrochloride

$C_9H_{19}N.HCl$ Mol. wt. 177.72

Cyclopentamine Hydrochloride, dried at 80° for 3 hours, contains not less than 98.0 percent and not more than 100.5 percent of $C_9H_{19}N.HCl$.

Description—Cyclopentamine Hydrochloride occurs as a white, crystalline powder, possessing a mild characteristic odor and a bitter taste. The pH of a 1 in 100 solution is about 6.

Solubility—Cyclopentamine Hydrochloride is freely soluble in water and in alcohol. It is sparingly soluble in benzene and is freely soluble in chloroform. It is slightly soluble in ether.

Identification—

A: To 2 ml. of a solution of Cyclopentamine Hydrochloride (1 in 40), add 500 mg. of sodium nitrite and boil gently for about 30 seconds. (A turbidity may develop.) Cool, and add 1.5 ml. of hydrochloric acid dropwise, with additional cooling, if necessary: a yellowish orange, oily material separates. Add more hydrochloric acid dropwise, with agitation, until the oily layer disappears and a white precipitate forms. Decant the supernatant liquid, and add about 5 ml. of water: the precipitate dissolves (*presence of secondary amine*).

B: A solution of Cyclopentamine Hydrochloride (1 in 20) responds to the tests for *Chloride*, page 808.

Melting range, page 814—Cyclopentamine Hydrochloride melts, within a 2° range, between 111° and 117°.

Loss on drying, page 814—Dry Cyclopentamine Hydrochloride at 80° for 3 hours: it loses not more than 0.4 percent of its weight.

Residue on ignition, page 858—Cyclopentamine Hydrochloride yields not more than 0.05 percent of residue on ignition.

Assay—Dissolve about 350 mg. of Cyclopentamine Hydrochloride, previously dried at 80° for 3 hours and accurately weighed, in 50 ml. of glacial acetic acid, and add 1 drop of crystal violet T.S. and 10 ml. of mercuric acetate T.S. Titrate with 0.1 *N* perchloric acid in glacial acetic acid to a blue-green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 17.77 mg. of $C_9H_{19}N.HCl$.

Packaging and storage—Preserve Cyclopentamine Hydrochloride in tight containers.

CATEGORY—Adrenergic (vasoconstrictor).

USUAL DOSE—Intramuscular, **25 mg.** Intravenous, **5** to **10 mg.** Intranasal, 1 or 2 drops of a 0.5 or 1 percent solution every 3 or 4 hours.

Cyclopentamine Hydrochloride Injection

Cyclopentamine Hydrochloride Injection is a sterile solution of cyclopentamine hydrochloride in water for injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_9H_{19}N.HCl$.

Identification—Cyclopentamine Hydrochloride Injection responds to the *Identification tests* under *Cyclopentamine Hydrochloride Solution*, page 190.

Other requirements—Cyclopentamine Hydrochloride Injection meets the requirements under *Injections*, page 810.

Assay—Transfer an accurately measured volume of Cyclopentamine Hydrochloride Injection, equivalent to about 125 mg. of cyclopentamine hydrochloride, to a separator and add water to bring the volume to about 15 ml. Saturate the solution with sodium chloride and add 5 ml. of sodium hydroxide T.S. Extract with 25 ml. of ether, followed by five additional extractions, using 10-ml. portions of ether. Collect the ether extracts in a 250-ml. separator, and wash with 5-ml. portions of water until the water is neutral to litmus. Collect the water washings in a separator and extract with 10 ml. of ether, and then combine with the other ether extracts. Extract with 20.0 ml. of 0.05 *N* sulfuric acid, followed by two 10-ml. portions of water. Combine the extracts in a beaker, and warm on a steam bath to remove the ether. Cool, add 3 drops of methyl red T.S., and titrate with 0.02 *N* sodium hydroxide. Perform a blank determination, and make any necessary correction (see *Residual Titrations*, page 883). Each ml. of 0.02 *N* sulfuric acid is equivalent to 3.554 mg. of $C_9H_{19}N.HCl$.

Packaging and storage—Preserve Cyclopentamine Hydrochloride Injection in single-dose containers, preferably of Type I glass.

Injection available—Cyclopentamine Hydrochloride Injection usually available contains the following amount of cyclopentamine hydrochloride: 25 mg. in 1 ml.

CATEGORY and DOSE—See Cyclopentamine Hydrochloride.

Cyclopentamine Hydrochloride Solution

Cyclopentamine Hydrochloride Solution is cyclopentamine hydrochloride in a suitable isotonic vehicle. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_9H_{19}N.HCl$.

Identification—Transfer to a 125-ml. separator a volume of Cyclopentamine Hydrochloride Solution, equivalent to about 50 mg. of cyclopentamine hydrochloride, add 5 ml. of sodium hydroxide T.S., extract the liberated base with 20 ml. of ether, and evaporate the ether on a steam bath. Dissolve the residue in 2 ml. of water, add 5 drops of diluted hydrochloric acid and about 500 mg. of sodium nitrite, and boil gently for about 30 seconds. (A turbidity may develop.) Proceed as directed in *Identification test A* under *Cyclopentamine Hydrochloride*, page 189, beginning with "Cool, and add 1.5 ml. of hydrochloric acid dropwise. . . ."

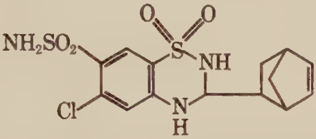
Assay—Proceed with Cyclopentamine Hydrochloride Solution as directed in the *Assay* under *Cyclopentamine Hydrochloride Injection*, page 190.

Packaging and storage—Preserve Cyclopentamine Hydrochloride Solution in tight containers.

Solutions available—Cyclopentamine Hydrochloride Solution usually available contains 0.5 and 1 percent of cyclopentamine hydrochloride.

Category and Dose—See Cyclopentamine Hydrochloride.

Cyclothiazide



6-Chloro-3,4-dihydro-3-(5-norbornen-2-yl)-2*H*-1,2,4-benzothiadiazine-7-sulfonamide 1,1-Dioxide

$C_{14}H_{16}ClN_3O_4S_2$ Mol. wt. 389.88

Cyclothiazide contains not less than 97.0 percent and not more than 101.5 percent of $C_{14}H_{16}ClN_3O_4S_2$, calculated on the anhydrous basis.

Description—Cyclothiazide occurs as a white to nearly white, practically odorless powder.

Solubility—Cyclothiazide is practically insoluble in water and in chloroform, sparingly soluble in alcohol, and freely soluble in acetone and in methanol.

Identification—Transfer 20 mg. of Cyclothiazide to a test tube, and dissolve in 5 ml. of methanol. Add 1 ml. of hydrochloric acid and warm on a steam bath for 5 minutes: the liquid acquires a blue color and a yellow fluorescence.

Melting range, page 814—Cyclothiazide melts within a range of 4° between 217° and 225°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Cyclothiazide, previously dried over a suitable desiccant, exhibits maxima only at the same wavelengths as that of NF Cyclothiazide Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 100,000 solution of Cyclothiazide in methanol exhibits maxima and minima at the same wavelengths as that of NF Cyclothiazide Reference Standard, similarly measured, and the respective absorptivities, calculated on the anhydrous basis, at the point of maximum absorbance occurring at about 271 mμ, do not differ by more than 3 percent.

Water, page 900—Determine the water content of Cyclothiazide by the titrimetric method: not more than 1 percent is found.

Residue on ignition, page 858—Cyclothiazide yields not more than 0.2 percent of residue on ignition.

Selenium—A *Test Preparation* prepared with 200 mg. of Cyclothiazide meets the requirements of the *Selenium Limit Test*, page 865 (30 parts per million).

Assay—Dissolve about 400 mg. of Cyclothiazide, accurately weighed, in 40 ml. of ethylenediamine, add 5 drops of a solution of *o*-nitroaniline in benzene (1 in 100), and titrate with 0.1 *N* sodium methoxide using a magnetic stirrer. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* sodium methoxide is equivalent to 19.49 mg. of $C_{14}H_{16}ClN_3O_4S_2$.

Packaging and storage—Preserve Cyclothiazide in well-closed containers.

Category—Diuretic; antihypertensive.

Usual dose range—Diuretic—Initial, **1 to 2 mg.** daily; maintenance, **1 to 2 mg.** every other day or two or three times a week. Antihypertensive, **2 mg.** one to three times a day.

Cyclothiazide Tablets

Cyclothiazide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{14}H_{16}ClN_3O_4S_2$.

Identification—The solution prepared from Cyclothiazide Tablets as directed in the *Assay* exhibits ultraviolet absorption maxima and minima at the same wavelengths as that of NF Cyclothiazide Reference Standard, similarly measured.

Disintegration, page 878—The disintegration time limit for Cyclothiazide Tablets is 30 minutes.

Content uniformity, *Method II*, page 799—Cyclothiazide Tablets meet the requirements of the content uniformity test for tablets, using the following special procedure: Quantitatively transfer a finely powdered tablet to a 200-ml. volumetric flask, add 100 ml. of methanol, and shake mechanically for 30 minutes. Dilute to volume with methanol, mix, and filter, discarding the first 20 ml. of filtrate. Dilute a portion of the subsequent filtrate quantitatively and stepwise, if necessary, with methanol to provide a solution containing approximately 10 mcg. of cyclothiazide per ml. Concomitantly determine the absorbance of this solution and of a solution of NF Cyclothiazide Reference Standard, in the same medium, at a concentration of about 10 mcg. per ml., in 1-cm. cells, at the maximum at about 271 mμ, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg., of $C_{14}H_{16}ClN_3O_4S_2$ in the tablet by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity, in mg., of cyclothiazide in the tablet; D is the exact concentration, in mcg. per ml., of cyclothiazide in the sample solution, based upon the labeled quantity per tablet and the extent of dilution; C is the exact concentration of the Reference Standard solution, in mcg. per ml.; A_U is the absorbance of the sample solution; and A_S is the absorbance of the Reference Standard solution.

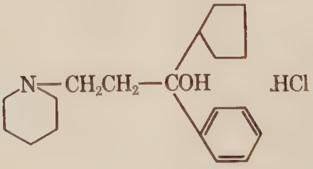
Assay—Weigh and finely powder not less than 20 Cyclothiazide Tablets. Weigh accurately a portion of the powder, equivalent to about 2 mg. of cyclothiazide, and transfer to a separator. Add 5 ml. of water and extract with four 25-ml. portions of a mixture of chloroform and methanol (4:1), filtering each portion through chloroform-washed cotton into a suitable beaker. Evaporate the combined extracts to dryness on a steam bath in a current of air. Transfer the residue quantitatively with the aid of about 100 ml. of methanol to a 200-ml. volumetric flask, dilute to volume with methanol, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Cyclothiazide Reference Standard, in the same medium, at a concentration of about 10 mcg. per ml., in 1-cm. cells, at the maximum at about 271 mμ, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg., of $C_{14}H_{16}ClN_3O_4S_2$ in the portion of Tablets taken by the formula $0.2C \times (A_U/A_S)$, in which C is the exact concentration of the Reference Standard solution, in mcg. per ml., A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Cyclothiazide Tablets in well-closed containers.

Tablets available—Cyclothiazide Tablets usually available contain the following amount of cyclothiazide: 2 mg.

CATEGORY and DOSE—See Cyclothiazide.

Cycrimine Hydrochloride*



α-Cyclopentyl-α-phenyl-1-piperidinepropanol Hydrochloride

$C_{19}H_{29}NO.HCl$ Mol. wt. 323.91

Cycrimine Hydrochloride, dried at 105° for 5 hours, contains not less than 97.0 percent and not more than 100.5 percent of $C_{19}H_{29}NO.HCl$.

---

* Patented. See notice, page ii.

Description—Cycrimine Hydrochloride occurs as a white, odorless solid, possessing a bitter taste.

Solubility—Cycrimine Hydrochloride is slightly soluble in water, and is sparingly soluble in chloroform and in alcohol.

Identification—

A: To 5 ml. of a solution of Cycrimine Hydrochloride (1 in 200) add 2 drops of nitric acid: the solution responds to the test for *Chloride,* page 808, using 1 ml. of silver nitrate T.S.

B: To 40 ml. of a solution of Cycrimine Hydrochloride (1 in 200) add 5 ml. of sodium hydroxide T.S., cool the mixture overnight, filter, wash the precipitate with cold water, and dry in vacuum over phosphorus pentoxide for 5 hours: the cycrimine so obtained melts between 90° and 96°, page 814.

Melting range, *Class Ia,* page 815—Cycrimine Hydrochloride melts with decomposition between 241° and 244°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Cycrimine Hydrochloride, previously dried at 105° for 5 hours, exhibits maxima only at the same wavelengths as that of NF Cycrimine Hydrochloride Reference Standard, similarly measured.

pH, page 824—The pH of a solution of Cycrimine Hydrochloride (1 in 200) is between 5.2 and 5.8.

Loss on drying, page 814—Dry Cycrimine Hydrochloride at 105° for 5 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Cycrimine Hydrochloride yields not more than 0.1 percent of residue on ignition. Retain the residue from a 1-g. sample for the *Heavy metals test.*

Heavy metals, page 806—Dissolve the residue resulting from the *Residue on ignition test* in 23 ml. of water and add 2 ml. of diluted acetic acid: the heavy metals limit for Cycrimine Hydrochloride is 20 parts per million.

Assay—Transfer to a 250-ml. conical flask about 600 mg. of Cycrimine Hydrochloride, previously dried at 105° for 5 hours and accurately weighed, dissolve it in 50 ml. of glacial acetic acid, using heat if necessary, and add 10 ml. of mercuric acetate T.S. Cool the solution to room temperature, add 1 drop of crystal violet T.S., and titrate with 0.1 N perchloric acid in glacial acetic acid to a blue-green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 N perchloric acid is equivalent to 32.39 mg. of $C_{19}H_{29}NO.HCl$.

Packaging and storage—Preserve Cycrimine Hydrochloride in tight containers.

CATEGORY—Anticholinergic.

USUAL DOSE—Initial, **1.25 mg.** three times a day. Maintenance, to be determined by the physician.

USUAL DOSE RANGE—**1.25 to 5 mg.**

Cycrimine Hydrochloride Tablets

Cycrimine Hydrochloride Tablets contain not less than 92.5 percent and not more than 107.5 percent of the labeled amount of $C_{19}H_{29}NO.HCl$.

Identification—Triturate a portion of powdered Cycrimine Hydrochloride Tablets, equivalent to about 300 mg. of cycrimine hydrochloride, with three 25-ml. portions of chloroform, filter through a pledget of cotton, and evaporate the filtrate to dryness on a steam bath. The residue responds to the *Identification tests* under *Cycrimine Hydrochloride,* page 192.

Disintegration, page 878—The disintegration time limit for Cycrimine Hydrochloride Tablets is 30 minutes.

Content uniformity, *Method I,* page 799—Cycrimine Hydrochloride Tablets meet the requirements of the content uniformity test for tablets.

Assay—

Bromocresol purple solution—Dissolve 250 mg. of bromocresol purple in sufficient dilute acetic acid (1 in 50) to make 1000 ml.

Standard preparation—Transfer about 25 mg. of NF Cycrimine Hydrochloride Reference Standard, accurately weighed, to a 100-ml. volumetric flask, add water to volume, and mix. Transfer 10.0 ml. of this solution to a second 100-ml. volumetric flask, dilute to volume with *Bromocresol purple solution,* and mix.

Assay preparation—Weigh and finely powder not less than 20 Cycrimine Hydrochloride Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 2.5 mg. of cycrimine hydrochloride, to a 100-ml. volumetric flask, add 10.0 ml. of water, and mix well. Dilute to volume with *Bromocresol purple solution,* mix thoroughly, and allow the undissolved particles to settle. Use the supernatant liquid as directed in the *Procedure.*

Procedure—Transfer 5.0 ml. each of the *Standard preparation* and of the *Assay preparation* to separate 60-ml. separators. Transfer 0.5 ml. of water and 4.5 ml. of *Bromocresol purple solution* to a third separator to serve as the blank. Extract each solution with 20 ml. of chloroform, and filter each extract, discarding the first

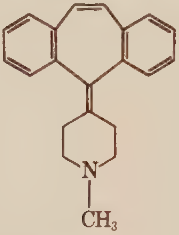
5 ml. of filtrate. Concomitantly determine the absorbance of each subsequent filtrate in 1-cm. cells, at the maximum at about 405 mμ, with a suitable spectrophotometer, using the blank to set the instrument. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{19}H_{29}NO.HCl$ in the portion of Tablets taken by the formula $0.1C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation.*

Packaging and storage—Preserve Cycrimine Hydrochloride Tablets in tight containers.

Tablets available—Cycrimine Hydrochloride Tablets usually available contain the following amounts of cycrimine hydrochloride: 1.25 and 2.5 mg.

CATEGORY and DOSE—See Cycrimine Hydrochloride.

Cyproheptadine Hydrochloride*



$.HCl.1^1/_2H_2O$

4-(5*H*-Dibenzo[*a,d*]cyclohepten-5-ylidene)-1-methylpiperidine Hydrochloride

$C_{21}H_{21}N.HCl.1^1/_2H_2O$ Mol. wt. (anhydrous) 323.87

Cyproheptadine Hydrochloride, dried in vacuum at 100° to constant weight, contains not less than 98.5 percent and not more than 100.5 percent of $C_{21}H_{21}N.HCl$.

Description—Cyproheptadine Hydrochloride occurs as a white to slightly yellow, odorless or practically odorless, crystalline powder.

Solubility—Cyproheptadine Hydrochloride is slightly soluble in water, sparingly soluble in alcohol, and freely soluble in methanol. It is soluble in chloroform and practically insoluble in ether.

Identification—Dissolve 100 mg. of Cyproheptadine Hydrochloride in 10 ml. of methanol. Place 1 drop of the solution on a filter paper, dry, and view under shortwave ultraviolet light: a bright blue fluorescence is observed.

Infrared absorption, page 866—The infrared absorption spectrum of a mineral oil dispersion of Cyproheptadine Hydrochloride exhibits maxima only at the same wavelengths as that of NF Cyproheptadine Hydrochloride Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 62,500 solution of Cyproheptadine Hydrochloride in alcohol exhibits maxima and minima at the same wavelengths as that of NF Cyproheptadine Hydrochloride Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance occurring at about 286 mμ, do not differ by more than 3 percent.

Acidity—Dissolve 1 g. of Cyproheptadine Hydrochloride in 25 ml. of methanol, add 3 drops of methyl red T.S., and titrate with 0.1 *N* sodium hydroxide: not more than 0.15 ml. is required (0.05 percent as HCl).

Loss on drying, page 814—Dry Cyproheptadine Hydrochloride in vacuum at 100° to constant weight, maintaining the pressure between 1 mm. and 5 mm. of mercury: it loses not less than 7 percent and not more than 9 percent of its weight.

Residue on ignition, page 858—Cyproheptadine Hydrochloride yields not more than 0.1 percent of residue on ignition.

Heavy metals, *Method II,* page 806—The heavy metals limit for Cyproheptadine Hydrochloride is 30 parts per million.

Assay—Dissolve about 650 mg. of Cyproheptadine Hydrochloride, previously dried in vacuum at 100° to constant weight and accurately weighed, in 50 ml. of glacial acetic acid, heating to effect solution. Cool, add 10 ml. of mercuric acetate T.S., 0.5 ml. of acetic anhydride, and 1 drop of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 32.39 mg. of $C_{21}H_{21}N.HCl$.

---

* Patented. See notice, page ii.

Packaging and storage—Preserve Cyproheptadine Hydrochloride in well-closed containers.

CATEGORY—Antihistaminic; antipruritic.

USUAL DOSE—4 mg. three or four times a day.

USUAL DOSE RANGE—4 to 20 mg. a day.

Cyproheptadine Hydrochloride Syrup

Cyproheptadine Hydrochloride Syrup contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{21}H_{21}N.HCl$.

Identification—Transfer a volume of Cyproheptadine Hydrochloride Syrup, equivalent to about 20 mg. of cyproheptadine hydrochloride, into a 125-ml. separator, add 20 ml. of sodium bicarbonate solution (1 in 25), and extract with 50 ml. of isooctane. Wash the isooctane extracts with 15 ml. of the sodium bicarbonate solution, and discard the aqueous phase. Filter the isooctane into a 125-ml. conical flask, and evaporate to a few ml. on a steam bath with the aid of a current of air. Complete the evaporation to dryness with the air current at room temperature. Dissolve the residue in 2 ml. of methanol, transfer 3 drops to a filter paper, allow to dry, and view under shortwave ultraviolet light: a bright blue fluorescence is observed.

Reaction—Cyproheptadine Hydrochloride Syrup is acid to litmus.

Assay—Transfer to a 125-ml. separator an accurately measured volume of Cyproheptadine Hydrochloride Syrup, equivalent to about 2 mg. of anhydrous cyproheptadine hydrochloride, add 20 ml. of sodium bicarbonate solution (1 in 100), and extract with two 25-ml. portions of isooctane. Wash the combined isooctane extracts with 15 ml. of the sodium bicarbonate solution, and discard the washing. Extract the isooctane solution with one 50-ml. portion and one 25-ml. portion of 0.1 *N* hydrochloric acid, collecting the aqueous acid extract in a 100-ml. volumetric flask. Dilute to volume with 0.1 *N* hydrochloric acid, and mix. Filter a portion of the solution through dry filter paper, discarding the first 20 ml. of filtrate. Concomitantly determine the absorbance of the subsequent filtrate and of a solution of NF Cyproheptadine Hydrochloride Reference Standard, in 0.1 *N* hydrochloric acid at a concentration of about 20 mcg. of anhydrous cyproheptadine hydrochloride per ml., in 1-cm. cells, with a suitable spectrophotometer, at the maximum at about 286 mμ, using 0.1 *N* hydrochloric acid as the blank. Calculate the quantity, in mg., of $C_{21}H_{21}N.HCl$ in each ml. of the Syrup taken by the formula $0.1 \times (C/V) \times (A_U/A_S)$, in which C is the exact concentration, calculated on the anhydrous basis, of the Reference Standard solution, in mcg. per ml., V is the volume, in ml., of the Syrup taken, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Cyproheptadine Hydrochloride Syrup in tight containers.

Syrup available—Cyproheptadine Hydrochloride Syrup usually available contains the following amount of anhydrous cyproheptadine hydrochloride: 2 mg. in 5 ml.

CATEGORY and DOSE—See Cyproheptadine Hydrochloride.

Cyproheptadine Hydrochloride Tablets

Cyproheptadine Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{21}H_{21}N.HCl$.

Identification—Powder a Cyproheptadine Hydrochloride Tablet, transfer to a suitable flask, add 1 ml. of methanol, stopper, and shake for 10 minutes. Filter, transfer a few drops of filtrate to a new filter paper, dry, and view under shortwave ultraviolet light: a bright blue fluorescence is observed.

Disintegration, page 878—The disintegration time limit for Cyproheptadine Hydrochloride Tablets is 15 minutes.

Content uniformity, *Method I*, page 799—Cyproheptadine Hydrochloride Tablets meet the requirements of the content uniformity test for tablets.

Assay—

Mixed solvent—Prepare a solution by mixing 10 ml. of methanol, 2 drops of hydrochloric acid, and sufficient water-saturated chloroform to make 100 ml.

Standard preparation—Dissolve a suitable quantity of NF Cyproheptadine Hydrochloride Reference Standard, accurately weighed, in the *Mixed solvent*, and prepare, by quantitative and stepwise dilution, a solution containing about 20 mcg. per ml.

Assay preparation—Weigh and finely powder not less than 20 Cyproheptadine Hydrochloride Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 4 mg. of cyproheptadine hydrochloride, to a 100-ml. beaker, add 1 ml. of spectrograde dimethyl sulfoxide (see page 915), and mix thoroughly to wet the powder evenly. Add 1 ml. of sulfamic acid solution (1 in 20), mix, add 3 g. of purified siliceous earth, and mix until a fluffy mixture is obtained.

Chromatographic column—Pack a pledget of fine glass wool in the base of a chromatographic tube (25 × 250-mm. test tube to which is fused a 5-cm. length of 7-mm. tubing) with the aid of a tamping rod about 45 cm. long and having a disk with a diameter of about 1 mm. less than that of the tube. To 2 g. of purified siliceous earth in a 100-ml. beaker add 1 ml. of sulfamic acid solution (1 in 20), and mix until a fluffy mixture is obtained. Transfer the mixture to the column, and tamp gently to compress the material to a uniform mass. Transfer the *Assay preparation* to the column, scrub the beaker with a mixture of 1 g. of the siliceous earth and 3 drops of the sulfamic acid solution, transfer this to the column, tamp as above, and add a pledget of glass wool to the top of the column.

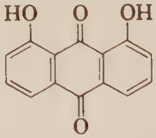
Procedure—Wash the column with 100 ml. of water-saturated ether, and discard the washings. Place under the column, as a receiver, a 200-ml. volumetric flask containing 20 ml. of methanol and 4 drops of hydrochloric acid. Pass through the column 150 ml. of water-saturated chloroform. Mix the eluate, allow to cool to room temperature, dilute to volume with water-saturated chloroform, and mix. Concomitantly determine the absorbance of this solution and of the *Standard preparation*, in 1-cm. cells at the maximum at about 286 mμ, with a suitable spectrophotometer, using the *Mixed solvent* as the blank. Record the absorbance of the *Standard preparation* as A_S, and record the absorbance of the solution from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{21}H_{21}N.HCl$ in the portion of tablets taken by the formula $0.2C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of anhydrous cyproheptadine hydrochloride in the *Standard preparation*.

Packaging and storage—Preserve Cyproheptadine Hydrochloride Tablets in well-closed containers.

Tablets available—Cyproheptadine Hydrochloride Tablets usually available contain the following amount of cyproheptadine hydrochloride: 4 mg.

Category and Dose—See Cyproheptadine Hydrochloride.

Danthron



1,8-Dihydroxyanthraquinone

$C_{14}H_8O_4$ Mol. wt. 240.22

Danthron contains not less than 95.0 percent and not more than 105.0 percent of $C_{14}H_8O_4$.

Description—Danthron occurs as an orange-colored, crystalline powder.

Solubility—Danthron is practically insoluble in water. It is soluble in alcohol, in ether, in benzene, in chloroform, and in solutions of sodium hydroxide.

Identification—

A: Dissolve about 100 mg. of Danthron in 1 ml. of sulfuric acid: a red solution is produced. Dilute the solution with water: a yellow precipitate is formed.

B: Dissolve about 50 mg. of Danthron in 10 ml. of ether, add 5 ml. of ammonia T.S., and shake thoroughly: the water layer is red in color.

Melting range, page 814—Danthron begins to sublime at about 75°, and melts between 190° and 195°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Danthron, previously dried over a suitable desiccant, exhibits maxima only at the same wavelengths as that of NF Danthron Reference Standard, similarly measured.

Ultraviolet absorption, page 866—A 1 in 50,000 solution of Danthron in benzene exhibits maxima and minima at the same wavelengths as that of NF Danthron Reference Standard, similarly measured.

Heavy metals, page 806—To 2 g. of Danthron add 5 ml. of diluted acetic acid and sufficient water to make 50 ml., shake the mixture for about 5 minutes, and filter. Extract the filtrate with four 25-ml. portions of ethylene dichloride to remove the yellow coloring material, and determine the heavy metals content on a 25-ml. portion of the filtrate: the heavy metals limit for Danthron is 50 parts per million.

Mercury—Danthron contains not more than 50 parts per million of mercury when tested according to the *Mercury Limit Test,* page 816.

Assay—Transfer to a 100-ml. volumetric flask about 200 mg. of Danthron, accurately weighed, add benzene to volume, and mix. Transfer 10.0 ml. of this solution to a second 100-ml. volumetric flask, dilute to volume with benzene, and mix. Transfer 10.0 ml. of this solution to a third 100-ml. volumetric flask, dilute to volume with benzene, and mix. Concomitantly determine the absorbance of this solution, and of a solution of NF Danthron Reference Standard, in benzene, at a concentration of about 20 mcg. per ml., in 1-cm. cells, at the maximum at about 432 mμ, with a suitable spectrophotometer, using benzene as the blank. Calculate the quantity, in mg. of $C_{14}H_8O_4$ in the Danthron taken by the formula $10C \times (A_U/A_S)$, in which C is the exact concentration of the Reference Standard solution, in mcg. per ml., A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Danthron in well-closed containers.

Category—Cathartic.
Usual dose—**75 to 150 mg.**

Danthron Tablets

Danthron tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{14}H_8O_4$.

Identification—

A: Finely powder a number of Danthron Tablets, equivalent to about 150 mg. of danthron, and transfer to a glass-stoppered centrifuge tube. Add 25 ml. of ether, shake, and allow to stand, with frequent shaking, for 15 minutes. Transfer 15 ml. of the clear supernatant liquid to a small beaker, and evaporate to dryness under a stream of air. Add 1 ml. of sulfuric acid, and swirl to dissolve the residue: a red solution is produced. Dilute the solution with water: a yellow precipitate is formed.

B: Transfer 5 ml. of the clear supernatant liquid obtained in *Identification test A* to a small glass-stoppered tube, add 3 ml. of ammonia T.S., and shake vigorously: the water layer becomes red in color.

Disintegration, page 878—The disintegration time limit for Danthron Tablets is 30 minutes.

Weight variation, page 901—Danthron Tablets meet the requirements of the weight variation test for tablets.

Assay—Weigh and finely powder not less than 20 Danthron Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 20 mg. of danthron, to a 50-ml. volumetric flask, add about 40 ml. of chloroform, and allow to stand for about 15 minutes with frequent swirling to aid dissolution. Dilute to volume with chloroform, and mix. Transfer a portion of the mixture to a glass-stoppered centrifuge tube, and centrifuge until the solids are separated. Transfer 1.0 ml. of the clear supernatant liquid to a 50-ml. volumetric flask, dilute to volume with alcohol, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Danthron Reference Standard, in the same medium, at a concentration of about 8 mcg. per ml., in 1-cm. cells, at the maximum at about 430 mμ, with a suitable spectrophotometer, using a mixture of chloroform and alcohol (1 in 50) as the blank. Calculate the quantity, in mg., of $C_{14}H_8O_4$ in the portion of the Tablets taken by the formula $2.5C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

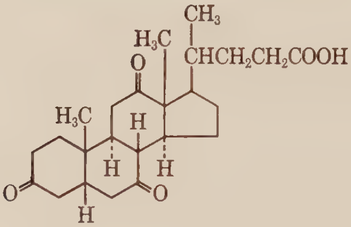
Packaging and storage—Preserve Danthron Tablets in well-closed containers.

Tablets available—Danthron Tablets usually available contain the following amount of danthron: 75 mg.

Category and Dose—See Danthron.

Dehydrocholate, Sodium, Injection, page 645

Dehydrocholic Acid



3,7,12-Trioxo-5β-cholan-24-oic Acid

$C_{24}H_{34}O_5$ Mol. wt. 402.54

Dehydrocholic Acid contains not less than 98.5 percent and not more than 101.0 percent of $C_{24}H_{34}O_5$, calculated on the dried basis. Dehydrocholic Acid for parenteral use melts between 237° and 242°.

Description—Dehydrocholic Acid occurs as a white, fluffy, odorless powder, having a bitter taste.

Solubility—Dehydrocholic Acid is practically insoluble in water and is slightly soluble in ether. It is slightly soluble in alcohol and sparingly soluble in chloroform, the solutions in these solvents usually being slightly turbid. Dehydrocholic Acid is soluble in glacial acetic acid and in solutions of alkali hydroxides and carbonates.

Melting range, *Class Ia,* page 815—Dehydrocholic Acid melts within a range of 3° between 231° and 242°.

Specific rotation, page 822—The specific rotation of Dehydrocholic Acid, calculated on the dried basis, determined in a solution in dioxane containing 200 mg. of Dehydrocholic Acid in each 10 ml., is not less than +29° and not more than +32.5°.

Loss on drying, page 814—Dry Dehydrocholic Acid at 105° for 2 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Dehydrocholic Acid yields not more than 0.3 percent of residue on ignition.

Odor on boiling—Boil 2 g. of Dehydrocholic Acid with 100 ml. of water for 2 minutes: the mixture is odorless.

Barium—Add to the mixture obtained in the test for *Odor on boiling* 2 ml. of hydrochloric acid, and again boil for 2 minutes. Cool, filter, and wash with water until the filtrate measures 100 ml. To 10 ml. of the filtrate add 1 ml. of diluted sulfuric acid: no turbidity is produced.

Heavy metals, *Method II,* page 806—The heavy metals limit for Dehydrocholic Acid is 20 parts per million.

Salmonella, page 862—The test for *Salmonella* in Dehydrocholic Acid is negative.

Assay—Transfer about 500 mg. of Dehydrocholic Acid, accurately weighed, to a 300-ml. conical flask, add 60 ml. of neutralized alcohol, and warm on a steam bath until solution is effected. Cool, add phenolphthalein T.S. and 20 ml. of water, and titrate with 0.1*N* sodium hydroxide, adding 100 ml. of water shortly before the end-point is reached. Each ml. of 0.1 *N* sodium hydroxide is equivalent to 40.25 mg. of $C_{24}H_{34}O_5$.

Packaging and storage—Preserve Dehydrocholic Acid in well-closed containers.

CATEGORY—Choleretic.
USUAL DOSE—**500 mg.** three times a day.
USUAL DOSE RANGE—**250** to **750 mg.**

Dehydrocholic Acid Tablets

Dehydrocholic Acid Tablets contain not less than 94.0 percent and not more than 106.0 percent of the labeled amount of $C_{24}H_{34}O_5$.

Identification—Mix a quantity of finely powdered Dehydrocholic Acid Tablets, equivalent to about 500 mg. of dehydrocholic acid, with 15 ml. of water, and add slowly, with stirring, 2 ml. of sodium carbonate T.S. Filter, and add to the filtrate diluted hydrochloric acid (about 2 ml.), dropwise, until no more precipitate is formed. Filter the precipitate, wash with small portions of cold water until free from chloride, and dry at 105° for 2 hours: the dehydrocholic acid so obtained conforms to the *Melting range* and *Specific rotation* requirements under *Dehydrocholic Acid,* page 198.

Disintegration, page 878—The disintegration time limit for Dehydrocholic Acid Tablets is 30 minutes.

Weight variation, page 901—Dehydrocholic Acid Tablets meet the requirements of the weight variation test for tablets.

Salmonella, page 862—The test for *Salmonella* in Dehydrocholic Acid Tablets is negative.

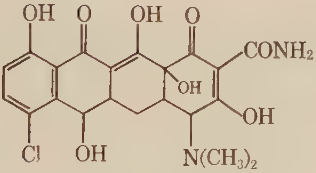
Assay—Weigh and finely powder not less than 20 Dehydrocholic Acid Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 500 mg. of dehydrocholic acid, to a 300-ml. conical flask, add 60 ml. of neutralized alcohol, and warm on a steam bath for 10 minutes. Cool, add phenolphthalein T.S. and 20 ml. of water, and titrate with 0.1 *N* sodium hydroxide, adding 100 ml. of water shortly before the end-point is reached. Each ml. of 0.1 *N* sodium hydroxide is equivalent to 40.25 mg. of $C_{24}H_{34}O_5$.

Packaging and storage—Preserve Dehydrocholic Acid Tablets in well-closed containers.

Tablets available—Dehydrocholic Acid Tablets usually available contain the following amount of dehydrocholic acid: 250 mg.

CATEGORY and DOSE—See Dehydrocholic Acid.

Demeclocycline



7-Chloro-6-demethyltetracycline

7-Chloro-4-(dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,6,10,12,12a-pentahydroxy-1,11-dioxo-2-naphthacenecarboxamide

$C_{21}H_{21}ClN_2O_8$ Mol. wt. 464.86

Demeclocycline contains not less than 97.0 percent of $C_{21}H_{21}ClN_2O_8$, calculated on the anhydrous basis. Demeclocycline conforms to the regulations of the federal Food and Drug Administration concerning certification of antibiotic drugs.

Description—Demeclocycline occurs as a yellow, crystalline powder. It is odorless and has a bitter taste. Its 1 in 100 solution has a pH of about 4.8.

Solubility—Demeclocycline is sparingly soluble in water and is soluble in alcohol. It readily dissolves in diluted hydrochloric acid and in alkaline solutions.

Packaging and storage—Preserve Demeclocycline in tight containers, protected from light.

CATEGORY—Antibacterial.

USUAL DOSE—**600 mg.** daily in 4 divided doses of 150 mg. each or 2 divided doses of 300 mg. each.

USUAL DOSE RANGE—**150** to **900 mg.** a day.

Demeclocycline for Oral Suspension

Demeclocycline for Oral Suspension is a dry mixture of demeclocycline and may contain one or more suitable colors, flavors, buffers, and preservatives. It contains demeclocycline equivalent to not less than 85.0 percent of the labeled amount of $C_{21}H_{21}ClN_2O_8 . HCl$, and conforms to the regulations of the federal Food and Drug Administration concerning certification of antibiotic drugs.

Packaging and storage—Preserve Demeclocycline for Oral Suspension in tight containers, protected from light.

Size available—Demeclocycline for Oral Suspension usually available contains an amount of demeclocycline equivalent to 900 mg. of demeclocycline hydrochloride in a 60-ml. container.

CATEGORY and DOSE—See Demeclocycline.

Demeclocycline Oral Suspension

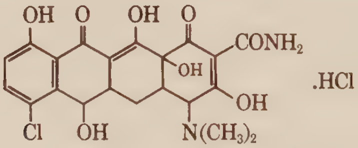
Demeclocycline Oral Suspension contains demeclocycline equivalent to not less than 85.0 percent of the labeled amount of $C_{21}H_{21}ClN_2O_8.HCl$. Demeclocycline Oral Suspension conforms to the regulations of the federal Food and Drug Administration concerning certification of antibiotic drugs.

Packaging and storage—Preserve Demeclocycline Oral Suspension in tight containers, protected from light.

Suspension available—Demeclocycline Oral Suspension usually available contains an amount of demeclocycline equivalent to 75 mg. of demeclocycline hydrochloride in each 5 ml.

CATEGORY and DOSE—See Demeclocycline.

Demeclocycline Hydrochloride*



7-Chloro-6-demethyltetracycline Hydrochloride

7-Chloro-4-(dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,6,10,12,12a-pentahydroxy-1,11-dioxo-2-naphthacenecarboxamide Monohydrochloride

$C_{21}H_{21}ClN_2O_8.HCl$ Mol. wt. 501.32

Demeclocycline Hydrochloride contains not less than 90.0 percent of $C_{21}H_{21}ClN_2O_8.HCl$. Demeclocycline Hydrochloride conforms to the regulations of the federal Food and Drug Administration concerning certification of antibiotic drugs.

Description—Demeclocycline Hydrochloride occurs as a yellow, crystalline powder. It is odorless and has a bitter taste. The pH of a 1 in 100 solution is about 2.5.

Solubility—Demeclocycline Hydrochloride is sparingly soluble in water and is slightly soluble in alcohol. It is sparingly soluble in solutions of alkali hydroxides and carbonates. It is practically insoluble in acetone and in chloroform.

Packaging and storage—Preserve Demeclocycline Hydrochloride in tight containers, protected from light.

CATEGORY—Antibacterial.

USUAL DOSE—**600 mg.** daily in 4 divided doses of 150 mg. each or 2 divided doses of 300 mg. each.

USUAL DOSE RANGE—**150** to **900 mg.** per day.

Demeclocycline Hydrochloride Capsules

Demeclocycline Hydrochloride Capsules contain not less than 85.0 percent of the labeled amount of $C_{21}H_{21}ClN_2O_8.HCl$. Demeclocycline Hydrochloride Capsules conform to the regulations of the federal Food and Drug Administration concerning certification of antibiotic drugs.

---

* Patented. See notice, page ii.

Packaging and storage—Preserve Demeclocycline Hydrochloride Capsules in tight, light-resistant containers.

Capsules available—Demeclocycline Hydrochloride Capsules usually available contain the following amounts of demeclocycline hydrochloride: 75 and 150 mg.

CATEGORY and DOSE—See Demeclocycline Hydrochloride.

Demeclocycline Hydrochloride Tablets

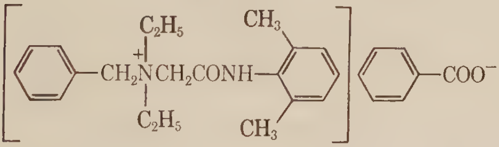
Demeclocycline Hydrochloride Tablets contain not less than 90.0 percent of the labeled amount of $C_{21}H_{21}ClN_2O_8.HCl$. Demeclocycline Hydrochloride Tablets conform to the regulations of the federal Food and Drug Administration concerning certification of antibiotic drugs.

Packaging and storage—Preserve Demeclocycline Hydrochloride Tablets in tight containers.

Tablets available—Demeclocycline Hydrochloride Tablets usually available contain the following amounts of demeclocycline hydrochloride: 75, 150, and 300 mg.

CATEGORY and DOSE—See Demeclocycline Hydrochloride.

Denatonium Benzoate



Benzyldiethyl[(2,6-xylylcarbamoyl)methyl]ammonium Benzoate

$C_{28}H_{34}N_2O_3$ Mol. wt. 446.59

Denatonium Benzoate, dried at 105° for 2 hours, contains not less than 99.5 percent and not more than 101.0 percent of $C_{28}H_{34}N_2O_3$.

Description—Denatonium Benzoate occurs as a white, odorless, crystalline powder. It has an intensely bitter taste.

Solubility—Denatonium Benzoate is soluble in water, freely soluble in alcohol and in chloroform, sparingly soluble in acetone, and practically insoluble in ether.

Identification—

A: Dissolve about 150 mg. of Denatonium Benzoate in 10 ml. of water and add 15 ml. of trinitrophenol T.S.: a yellow precipitate is formed.

B: Dissolve about 100 mg. of Denatonium Benzoate in 10 ml. of water, and add 20 ml. of diluted sulfuric acid and 15 ml. of ammonium reineckate T.S. Mix, filter through a sintered-glass crucible using gentle suction, and wash thoroughly with water. Remove as much water as possible with suction, and then dry in an oven at 105° for 1 hour. The denatonium reineckate so obtained melts at about 170°, page 814.

Melting range, *Class Ia,* page 815—

Denatonium Benzoate melts between 166° and 170°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Denatonium Benzoate, previously dried at 105° for 2 hours, exhibits maxima only at the same wavelengths as that of NF Denatonium Benzoate Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 10,000 solution of Denatonium Benzoate in water exhibits maxima and minima at the same wavelengths as that of NF Denatonium Benzoate Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorption occurring at about 263 mμ, do not differ by more than 3 percent.

pH, page 824—The pH of a solution of Denatonium Benzoate (1 in 10) is between 7.0 and 8.0.

Loss on drying, page 814—Dry Denatonium Benzoate at 105° for 2 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Denatonium Benzoate yields not more than 0.1 percent of residue on ignition.

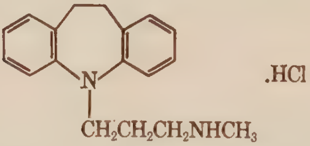
Chloride, page 784—Dissolve 350 mg. of Denatonium Benzoate in 9 ml. of water, add 1 ml. of nitric acid, and filter. A 1-ml. portion of the filtrate shows no more chloride than corresponds to 0.1 ml. of 0.02 *N* hydrochloric acid (0.2 percent).

Assay—Dissolve about 900 mg. of Denatonium Benzoate, previously dried at 105° for 2 hours and accurately weighed, in 50 ml. of glacial acetic acid, add 1 drop of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 44.66 mg. of $C_{28}H_{34}N_2O_3$.

Packaging and storage—Preserve Denatonium Benzoate in tight containers.

CATEGORY—Alcohol denaturant.

Desipramine Hydrochloride*



10,11-Dihydro-5-[3-(methylamino) propyl]-5*H*-dibenz[*b,f*]azepine Monohydrochloride

$C_{18}H_{22}N_2 . HCl$ Mol. wt. 302.85

Desipramine Hydrochloride, dried at 105° for 2 hours, contains not less than 98.0 percent and not more than 102.0 percent of $C_{18}H_{22}N_2 . HCl$.

Description—Desipramine Hydrochloride occurs as a white to off-white crystalline powder.

Solubility—Desipramine Hydrochloride is soluble in water and in alcohol. It is freely soluble in methanol and in chloroform, and is insoluble in ether.

Identification—

A: Add about 5 mg. of Desipramine Hydrochloride to 2 ml. of nitric acid on a spot plate: an intense blue color is produced.

B: A solution of Desipramine Hydrochloride in alcohol (1 in 20) responds to the tests for *Chloride*, page 808.

Melting range, *Class Ia,* page 815—Desipramine Hydrochloride melts within a range of 5° between 208° and 218°.

Infrared absorption, page 866—The infrared absorption spectrum of a mineral oil dispersion of Desipramine Hydrochloride, previously dried at 105° for 2 hours, exhibits maxima only at the same wavelengths as that of NF Desipramine Hydrochloride Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 3 in 100,000 solution of Desipramine Hydrochloride in 0.1 *N* hydrochloric acid exhibits maxima and minima at the same wavelengths as that of NF Desipramine Hydrochloride Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance occurring at about 251 mμ, do not differ by more than 2 percent.

---

* Patent pending. See notice, page ii.

Loss on drying, page 814—Dry Desipramine Hydrochloride in vacuum at 105° for 2 hours: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Desipramine Hydrochloride yields not more than 0.1 percent of residue on ignition. Retain the residue for the *Heavy metals test.*

Heavy metals, page 806—To the residue obtained in the test for *Residue on ignition* add 1 ml. of hydrochloric acid and 0.5 ml. of nitric acid, and evaporate on a steam bath to dryness. Add 2 ml. of diluted acetic acid, digest on a steam bath for 5 minutes, filter if necessary, and wash the residue with sufficient water to make 25 ml.: the heavy metals limit for Desipramine Hydrochloride is 10 parts per million.

Iminodibenzyl—

Standard preparation—Transfer 12.5 mg. of NF Iminodibenzyl Reference Standard to a 25-ml. volumetric flask, dissolve in alcohol, dilute to volume with alcohol, and mix. Transfer 10.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with alcohol, and mix. Transfer 1.0 ml. of this solution to a low-actinic 25-ml. volumetric flask, add 10 ml. of hydrochloric acid-alcohol (1:1), and mix.

Test preparation—Transfer 50.0 mg. of Desipramine Hydrochloride to a low-actinic 25-ml. volumetric flask, add 10 ml. of hydrochloric acid-alcohol (1:1), and mix.

Procedure—To each flask and to a third flask containing 10 ml. of hydrochloric acid-alcohol (1:1) to serve as the blank, add slowly 5 ml. of a 0.4 percent (v/v) solution of furfuraldehyde in alcohol, mix, then add 5 ml. of hydrochloric acid, and allow the flasks to stand for 3 hours in a constant-temperature bath at 25°. Dilute each flask to volume with hydrochloric acid-alcohol (1:1), and mix. Concomitantly determine the absorbances of the solutions, in 1-cm. cells, at the maximum at about 565 mμ, with a suitable spectrophotometer, using the blank to set the instrument: the absorbance of the solution from the *Test preparation* is not greater than that from the *Standard preparation* (0.1 percent).

Assay—Dissolve about 300 mg. of Desipramine Hydrochloride, previously dried at 105° for 2 hours and accurately weighed, in 100 ml. of glacial acetic acid, add 10 ml. of mercuric acetate T.S., and titrate potentiometrically with 0.1 *N* perchloric acid in glacial acetic acid using glass and calomel electrodes. Each ml. of 0.1 *N* perchloric acid is equivalent to 30.29 mg. of $C_{18}H_{22}N_2.HCl$.

Packaging and storage—Preserve Desipramine Hydrochloride in tight containers.

CATEGORY—Antidepressant.

USUAL DOSE—**150 mg.** per day in divided doses.

USUAL DOSE RANGE—**50** to **200 mg.** per day.

Desipramine Hydrochloride Capsules

Desipramine Hydrochloride Capsules contain not less than 92.0 percent and not more than 108.0 percent of the labeled amount of $C_{18}H_{22}N_2.HCl$.

Identification—Mix the contents of Desipramine Hydrochloride Capsules, equivalent to about 125 mg. of desipramine hydrochloride, with 10 ml. of chloroform, stir for 5 minutes, and filter. Evaporate the chloroform on a steam bath to a volume of about 4 ml., add ether until the solution becomes turbid, then heat slightly on the steam bath to remove the turbidity, and cool: the crystals of desipramine hydrochloride so obtained, when filtered and dried at 100° for 30 minutes, respond to the *Identification tests* and meet the requirements for *Melting range* under *Desipramine Hydrochloride,* page 202.

Content uniformity, *Method II*, page 798—Desipramine Hydrochloride Capsules meet the requirements of the content uniformity test for capsules, using the following special procedure: Quantitatively transfer the contents of a capsule and the capsule shell to a 100-ml. volumetric flask with the aid of 70 ml. of 30 percent alcohol, and shake for 30 minutes using a mechanical shaker that provides vigorous agitation. Dilute to volume with 30 percent alcohol, mix, and filter, discarding the first 20 ml. of filtrate. Dilute a portion of the subsequent filtrate quantitatively and stepwise with 30 percent alcohol to provide a solution containing approximately 25 mcg. of desipramine hydrochloride per ml. Concomitantly determine the absorbance of this solution and of a solution of NF Desipramine Hydrochloride Reference Standard, in the same medium, at a concentration of about 25 mcg. per ml., in 1-cm. cells, at the maximum at about 251 mμ, with a suitable spectrophotometer, using 30 percent alcohol as the blank. Calculate the quantity, in mg., of $C_{18}H_{22}N_2.HCl$ in the capsule by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity, in mg., of desipramine hydrochloride in the capsules; D is the exact concentration, in mcg. per ml., of desipramine hydrochloride in the sample solution based upon the labeled quantity per capsule and the extent of dilution; C is the exact concentration, in mcg. per ml., of the Reference Standard solution; A_U is the absorbance of the sample solution; and A_S is the absorbance of the Reference Standard solution.

Assay—Transfer as completely as possible the contents of not less than 20 Desipramine Hydrochloride Capsules to a tared weighing bottle, and weigh. Transfer an accurately weighed quantity of the powder, equivalent to about 250 mg. of desipramine hydrochloride, to a 250-ml. volumetric flask, add about 100 ml. of hydrochloric acid solution (4 in 100), and shake mechanically for 1 hour. Dilute to volume with hydrochloric acid solution (4 in 100), mix, and filter, discarding the first 20 ml. of filtrate. Transfer 5.0 ml. of the subsequent filtrate to a separator, add 60 ml. of sodium hydroxide T.S., and extract with four 20-ml. portions of ether, shaking each portion for 2 minutes and collecting the extracts in a second separator. Extract the combined ether extracts with four 30-ml. portions of hydrochloric acid solution (4 in 100), combine the acid extracts in a 200-ml. volumetric flask, dilute to volume with hydrochloric acid solution (4 in 100), and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Desipramine Hydrochloride Reference Standard, in the same medium, at a concentration of about 25 mcg. per ml., in 1-cm. cells, at the maximum at about 251 mμ, with a suitable spectrophotometer, using hydrochloric acid solution (4 in 100) as the blank. Calculate the quantity, in mg., of $C_{18}H_{22}N_2.HCl$ in the portion of the Capsules taken by the formula $10C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Desipramine Hydrochloride Capsules in tight containers.

Capsules available—Desipramine Hydrochloride Capsules usually available contain the following amount of desipramine hydrochloride: 25 mg.

CATEGORY and DOSE—See Desipramine Hydrochloride.

Desipramine Hydrochloride Tablets

Desipramine Hydrochloride Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{18}H_{22}N_2.HCl$.

Identification—Finely powder a number of Desipramine Hydrochloride Tablets, equivalent to about 350 mg. of desipramine hydrochloride, and triturate the powder with 15 ml. of chloroform. Filter the chloroform extract through paper into a wide-mouth test tube, and evaporate the filtrate to about 3 ml. Carefully add ether until the liquid becomes turbid, heat to produce a clear solution, then cool, and allow to stand. Collect the crystals, wash with ether, and dry at 80° in vacuum for 30 minutes: the desipramine hydrochloride so obtained responds to the *Identification tests* and meets the requirements for *Melting range* under *Desipramine Hydrochloride*, page 202.

Disintegration, page 878—The disintegration time limit for Desipramine Hydrochloride Tablets is 30 minutes.

Content uniformity, *Method II*, page 799—Desipramine Hydrochloride Tablets meet the requirements of the content uniformity test for tablets, using the following special procedure: Quantitatively transfer a finely powdered tablet to a 100-ml. volumetric flask, add 50 ml. of 0.1 *N* hydrochloric acid, and shake mechanically for 15 minutes. Dilute to volume with 0.1 *N* hydrochloric acid, mix, and filter, discarding the first 20 ml. of filtrate. Dilute a portion of the subsequent filtrate quantitatively and stepwise with 0.1 *N* hydrochloric acid to provide a solution containing approximately 25 mcg. of desipramine hydrochloride per ml. Concomitantly determine the absorbance of this solution and of a solution of NF Desipramine Hydrochloride Reference Standard, in the same medium, at a concentration of about 25 mcg. per ml., in 1-cm. cells, at the maximum at about 251 mμ, with a suitable spectrophotometer, using 0.1 *N* hydrochloric acid as the blank. Calculate the quantity, in mg., of $C_{18}H_{22}N_2.HCl$ in the tablet by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity in mg., of desipramine hydrochloride in the tablet; D is the exact concentration, in mcg. per ml., of desipramine hydrochloride in the sample solution, based upon the labeled quantity per tablet and the extent of dilution; C is the exact concentration, in mcg. per ml., of the Reference Standard solution; A_U is the absorbance of the sample solution; and A_S is the absorbance of the Reference Standard solution.

Assay—Weigh and finely powder not less than 20 Desipramine Hydrochloride Tablets. Weigh accurately a portion of the powder, equivalent to about 100 mg. of Desipramine Hydrochloride, and transfer with the aid of 60 ml. of 0.1 *N* hydrochloric acid to a 100-ml. volumetric flask. Shake for 30 minutes, add 0.1 *N* hydrochloric acid to volume, mix, and filter, rejecting the first 10 ml. of filtrate. Transfer 15.0 ml. of the subsequent filtrate to a separator, add 10 g. of anhydrous potassium carbonate, mix to dissolve, and extract with one 40-ml. portion of ether followed by three successive extractions with 25-ml. portions of ether. Add 2 ml. of 0.1 *N* hydrochloric acid to the combined ether extracts, and evaporate the ether under vacuum in a water bath at about 45°. Transfer the residue with the aid of 0.1 *N* hydrochloric acid to a 500-ml. volumetric flask, add 0.1 *N* hydrochloric acid to volume, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Desipramine Hydrochloride Reference Standard, in the same medium at a concentration of about 30 mcg. per ml., at the maximum at about 251 mμ, in 1-cm. cells, with a suitable spectrophotometer, using 0.1 *N* hydrochloric acid as the blank. Calculate the quantity, in mg., of $C_{18}H_{22}N_2.HCl$, in the portion of Tablets taken by the formula $3.333C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Desipramine Hydrochloride Tablets in tight containers.

Tablets available—Desipramine Hydrochloride Tablets usually available contain the following amounts of desipramine hydrochloride: 25 and 50 mg.

Category and Dose—See Desipramine Hydrochloride.

Desoxycorticosterone Acetate Pellets

Desoxycorticosterone Acetate Pellets are sterile pellets composed of desoxycorticosterone acetate in compressed form, without the presence of any binder, diluent, or excipient. They contain not less than 97.0 percent and not more than 103.0 percent of $C_{23}H_{32}O_4$.

Solubility in alcohol—A solution of 25 mg. of powdered Desoxycorticosterone Acetate Pellets in 1 ml. of alcohol is clear and practically free from insoluble residue.

Melting range, *Class Ia,* page 815—Desoxycorticosterone Acetate Pellets melt between 155° and 161°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Desoxycorticosterone Acetate Pellets exhibits maxima only at the same wavelengths as that of USP Desoxycorticosterone Acetate Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 100,000 solution of Desoxycorticosterone Acetate Pellets in alcohol exhibits maxima and minima at the same wavelengths as that of USP Desoxycorticosterone Acetate Reference Standard, similarly measured, and the respective absorptivities at the point of maximum absorption, occurring at about 240 mμ, do not differ by more than 3 percent.

Specific rotation, page 822—The specific rotation of Desoxycorticosterone Acetate Pellets, determined in a solution in dioxane containing 100 mg. of desoxycorticosterone acetate in each 10 ml., is not less than +168° and not more than +176°.

Sterility—Desoxycorticosterone Acetate Pellets meet the requirements under *Sterility Tests,* page 874.

Weight variation—Weigh 5 Desoxycorticosterone Acetate Pellets singly, and calculate the average weight. The average weight is not less than 95 percent and not more than 105 percent of the labeled weight of $C_{23}H_{32}O_4$, and each pellet weighs not less than 90 percent and not more than 110 percent of the labeled weight of $C_{23}H_{32}O_4$.

Assay—

Standard preparation—Prepare as directed for the *Standard preparation* under *Steroid Assay,* page 876, using USP Desoxycorticosterone Acetate Reference Standard.

Assay preparation—Weigh and finely powder not less than 10 Desoxycorticosterone Acetate Pellets. Weigh accurately about 100 mg. of the powder, dissolve it in sufficient alcohol to make 200.0 ml., and mix. Pipet 5.0 ml. of this solution into a 250-ml. volumetric flask, add alcohol to volume, and mix. Pipet 20.0 ml. of this solution into a glass-stoppered, 50-ml. conical flask.

Procedure—Proceed as directed for *Procedure* under *Steroid Assay,* page 876. Calculate the quantity in mg. of $C_{23}H_{32}O_4$ in the portion of the Pellets taken by the formula $10C \times (A_U/A_S)$.

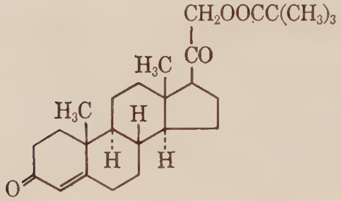
Packaging and storage—Preserve Desoxycorticosterone Acetate Pellets in tight containers suitable for maintaining sterile contents, holding one Pellet each.

Pellets available—Desoxycorticosterone Acetate Pellets usually available contain the following amounts of desoxycorticosterone acetate: 75 and 125 mg.

CATEGORY—Mineralcorticoid.

USUAL DOSE—Implantation, **75 mg.** per mg. of daily intramuscular dose.

Desoxycorticosterone Pivalate*



21-Hydroxypregn-4-ene-3,20-dione Pivalate

$C_{26}H_{38}O_4$ Mol. wt. 414.59

Desoxycorticosterone Pivalate contains not less than 97.0 percent and not more than 103.0 percent of $C_{26}H_{38}O_4$, calculated on the dried basis.

Description—Desoxycorticosterone Pivalate occurs as a white, or creamy white, crystalline powder. It is odorless and is stable in air.

Solubility—Desoxycorticosterone Pivalate is practically insoluble in water. It is slightly soluble in alcohol, in methanol, in ether, and in vegetable oils. It is sparingly soluble in acetone, and soluble in dioxane.

Identification—Dissolve about 5 mg. of Desoxycorticosterone Pivalate in 2 ml. of sulfuric acid: the solution is yellowish, with a greenish fluorescence. Dilute the solution with 2 ml. of water: the color changes to a dark red-blue, and on further dilution with 2 ml. of water it is discharged.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Desoxycorticosterone Pivalate, previously dried at 105° for 2 hours, exhibits maxima only at the same wavelengths as that of NF Desoxycorticosterone Pivalate Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 50,000 solution of Desoxycorticosterone Pivalate in methanol exhibits maxima and minima at the same wavelengths as that of NF Desoxycorticosterone Pivalate Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance occurring at about 241 mμ, do not differ by more than 3 percent.

Melting range, *Class Ia,* page 815—Desoxycorticosterone Pivalate melts between 200° and 206°.

Specific rotation, page 822—The specific rotation of Desoxycorticosterone Pivalate, calculated on the dried basis, determined in a solution in dioxane containing 100 mg. of Desoxycorticosterone Pivalate in each 10 ml., is between +153° and +161°.

Loss on drying, page 814—Dry Desoxycorticosterone Pivalate at 105° for 2 hours: it loses not more than 0.5 percent of its weight.

Foreign steroids and other impurities—

Standard preparation—Prepare as directed under *Steroid Chromatographic Purity,* page 876, using NF Desoxycorticosterone Pivalate Reference Standard to prepare a solution containing approximately 4 mg. per ml.

Test preparation—Weigh accurately about 40 mg. of Desoxycorticosterone Pivalate, previously dried at 105° for 2 hours, dissolve it in a sufficient quantity of a mixture of equal volumes of alcohol and chloroform to make 10.0 ml., and mix.

Procedure—Proceed as directed for *Procedure* under *Steroid Chromatographic Purity,* page 876, using a solvent system consisting of benzene and ethyl acetate (4:3), and determining the absorbance at the maximum at about 240 mμ. Calculate the percentage of chromatographic impurities by the formula $100 - [100 \times 10 \times (C/W) \times (A_U/A_S)]$, in which C is the exact concentration, in mg. per ml., of the *Standard preparation*, and W is the weight, in mg., of Desoxycorticosterone Pivalate taken: not more than 3 percent is found.

---

* Patented. See notice, page ii.

Assay—

Standard preparation—Prepare as directed for *Standard preparation* under *Steroid Assay*, page 876, using NF Desoxycorticosterone Pivalate Reference Standard.

Assay preparation—Weigh accurately about 100 mg. of Desoxycorticosterone Pivalate, dissolve it in sufficient alcohol to make 200.0 ml., and mix. Pipet 5.0 ml. of this solution into a 250-ml. volumetric flask, add alcohol to volume, and mix. Pipet 20.0 ml. of this solution into a glass-stoppered 50-ml. conical flask.

Procedure—Proceed as directed for *Procedure* under *Steroid Assay*, page 876. Calculate the quantity, in mg., of $C_{26}H_{38}O_4$ in the portion of Desoxycorticosterone Pivalate taken by the formula $10C \times (A_U/A_S)$.

Packaging and storage—Preserve Desoxycorticosterone Pivalate in well-closed, light-resistant containers.

CATEGORY—Mineralcorticoid.

USUAL DOSE RANGE—Intramuscular, **50** to **100 mg.**, repeated in not less than 30 days.

Sterile Desoxycorticosterone Pivalate Suspension

Sterile Desoxycorticosterone Pivalate Suspension is a sterile suspension of desoxycorticosterone pivalate in an aqueous medium. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{26}H_{38}O_4$.

Identification—Centrifuge a portion of Sterile Desoxycorticosterone Pivalate Suspension, decant the supernatant liquid, wash the residue by stirring with several successive portions of water, centrifuging and decanting each time, and finally dry the residue at 105°: the desoxycorticosterone pivalate so obtained melts between 198° and 204° as determined by the method for *Class Ia*, page 815, and responds to the *Identification test* under *Desoxycorticosterone Pivalate*, page 206.

pH, page 824—The pH of Sterile Desoxycorticosterone Pivalate Suspension is between 5.0 and 7.0.

Other requirements—Sterile Desoxycorticosterone Pivalate Suspension meets the requirements under *Injections*, page 810.

Assay—Transfer to a 50-ml. volumetric flask an accurately measured volume of Sterile Desoxycorticosterone Pivalate Suspension, equivalent to about 50 mg. of desoxycorticosterone pivalate, add water to volume, and mix. Place about 3 mm. of glass wool in the bottom of a chromatographic tube, about 200 mm. long and about 25 mm. in internal diameter, and cover with a well-packed mixture of 2 g. of purified siliceous earth and 1 ml. of water. Pipet 5.0 ml. of the diluted suspension into a beaker containing 8 g. of purified siliceous earth, mix, and add to the prepared chromatographic tube, packing uniformly. Rinse the beaker with a mixture of 1 g. of purified siliceous earth and 0.5 ml. of water, add to the tube, and cover with a 2-mm. layer of glass wool. Pour 120 ml. of water-saturated chloroform, in divided portions, onto the column, collecting about 98 ml. of eluate in a 100-ml. volumetric flask, dilute to volume with chloroform, and mix. Pipet 5.0 ml. of this solution into a glass-stoppered, 50-ml. flask, evaporate the solution to dryness on a steam bath, and dissolve the residue in 25.0 ml. of methanol. Concomitantly determine the absorbance of this solution and of a solution of NF Desoxycorticosterone Pivalate Reference Standard, in the same medium, at a concentration of about 10 mcg. per ml., in 1-cm. cells, at the maximum at about 241 mμ, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg., of $C_{26}H_{38}O_4$ in each ml. of the Suspension taken by the formula $5 \times (C/V) \times (A_U/A_S)$, in which C is the exact concentration of the standard solution, in mcg. per ml., V is the volume, in ml., of the Suspension taken, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Sterile Desoxycorticosterone Pivalate Suspension in single-dose or in multiple-dose containers, preferably of Type I glass, protected from light.

Suspension available—Sterile Desoxycorticosterone Pivalate Suspension usually available contains the following amount of desoxycorticosterone pivalate: 100 mg. in 4 ml.

CATEGORY and DOSE—See Desoxycorticosterone Pivalate.

Dexamethasone Aerosol

Dexamethasone Aerosol is dexamethasone in a suitable lotion base mixed with fluorocarbon propellants in a pressurized container. Dexamethasone Aerosol delivers not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{22}H_{29}FO_5$.

Identification—Evaporate on a steam bath just to dryness 5 ml. of the *Assay preparation* obtained as directed in the *Assay*, and dissolve the residue in 1 ml. of chloroform. On a suitable thin-layer chromatographic plate (see page 791), coated with a 0.25-mm. layer of silica gel G, spot 100 µl. of this solution and 10 µl. of a chloroform solution of USP Dexamethasone Reference Standard containing 500 mcg. per ml. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of chloroform and diethylamine (2:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by lightly spraying with dilute sulfuric acid (1 in 2) and heating on a hot plate or under a heat lamp until spots appear: the R_f value of the main spot obtained from the sample solution corresponds to that obtained from the Reference Standard solution.

Delivery rate—

Standard preparation—Prepare as directed under *Steroid Assay*, page 876, using USP Dexamethasone Reference Standard.

Test preparation—Allow the Dexamethasone Aerosol container to equilibrate at 25°. Shake gently and invert, immersing the valve in about 75 ml. of alcohol contained in a 400-ml. beaker. Actuate the valve by pushing against the bottom of the beaker, and allow to spray for 10 seconds, accurately timed. Transfer the alcohol solution to a 100-ml. volumetric flask, dilute to volume with alcohol, and mix. Transfer 20.0 ml. of this solution to a 50-ml. glass-stoppered flask.

Procedure—Proceed as directed under *Steroid Assay*, page 876, except allow to stand in the dark for 45 minutes. Calculate the quantity, in mg., of $C_{22}H_{29}FO_5$ delivered per second by the formula $0.01C \times (A_U/A_S)$. Dexamethasone is delivered at a rate of not less than 0.060 mg. and not more than 0.090 mg. per second.

Other requirements—Dexamethasone Aerosol meets the requirements for *Leak Testing* and *Pressure Testing* under *Aerosols*, page 770.

Assay—

Standard preparation—Prepare as directed under *Steroid Assay*, page 876, using USP Dexamethasone Reference Standard.

Assay preparation—Shake the Dexamethasone Aerosol container gently and invert, immersing the valve in about 75 ml. of alcohol contained in a 400-ml. beaker. Actuate the valve by pushing against the bottom of the beaker. Remove the container at 15-second intervals, shake gently, and allow the container to warm to room temperature. Continue spraying until the container is exhausted. Transfer the alcohol solution to a 100-ml. volumetric flask, dilute to volume with alcohol, and mix. Dilute an accurately measured volume of this solution, equivalent to about 1 mg. of dexamethasone, to 100.0 ml. with alcohol, and mix. Transfer 20.0 ml. of this solution to a 50-ml. glass-stoppered flask.

Procedure—Proceed as directed under *Steroid Assay*, page 876, except allow to stand in the dark for 45 minutes. Calculate the quantity, in mg., of $C_{22}H_{29}FO_5$ per container by the formula $10 \times (C/V) \times (A_U/A_S)$, in which V is the volume, in ml., of sample solution taken for the second dilution.

Packaging and storage—Preserve Dexamethasone Aerosol in pressurized containers, and protect from excessive heat.

Aerosols available—Dexamethasone Aerosol usually available contains the following amounts of dexamethasone: 10 mg. per 90-g. container; 3.3 mg. per 30-g. container.

CATEGORY—Glucocorticoid.

FOR EXTERNAL USE—Spray affected area for 1 to 2 seconds two or three times a day.

Dexamethasone Elixir

Dexamethasone Elixir contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{22}H_{29}FO_5$.

Identification—Evaporate 50 ml. of the *Assay preparation* from the *Assay* on a steam bath just to dryness, and dissolve the residue in 1 ml. of chloroform. On a suitable thin-layer chromatographic plate (see page 791), coated with a 0.25-mm.

layer of silica gel G, spot 10 µl. of this solution and 10 µl. of a chloroform solution of USP Dexamethasone Reference Standard containing 500 mcg. per ml. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of chloroform and diethylamine (2:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by lightly spraying with dilute sulfuric acid (1 in 2) and heating on a hot plate or under a lamp until spots appear. The R_f value of the main spot obtained from the sample solution corresponds to that obtained from the Reference Standard solution.

Assay—

Standard preparation—Prepare as directed under *Steroid Assay*, page 876, using USP Dexamethasone Reference Standard.

Assay preparation—Transfer an accurately measured volume of Dexamethasone Elixir, equivalent to about 1 mg. of dexamethasone, to a separator, and add water to make about 15 ml. Extract the dexamethasone completely, using four 20-ml. portions of chloroform, filtering each portion through chloroform-washed cotton into a 100-ml. volumetric flask, add chloroform to volume, and mix. Pipet 20.0 ml. of the solution into a glass-stoppered, 50-ml. conical flask, evaporate the chloroform on a steam bath just to dryness, cool, and dissolve the residue in 20.0 ml. of alcohol.

Procedure—Proceed as directed under *Steroid Assay*, page 876, except allow to stand in the dark for 45 minutes. Calculate the quantity, in mg. per ml., of $C_{22}H_{29}FO_5$ in the Elixir by the formula $0.1 \times (C/V) \times (A_U/A_S)$, in which V is the volume, in ml., of the Elixir taken.

Alcohol content, page 772—Dexamethasone Elixir contains from 3.8 to 5.7 percent (v/v) of C_2H_5OH.

Packaging and storage—Preserve Dexamethasone Elixir in tight containers.

Elixir available—Dexamethasone Elixir usually available contains the following amount of dexamethasone: 500 mcg. in 5 ml.

Category—Glucocorticoid.

Usual dose of dexamethasone—**750 mcg.** two to four times a day.

Usual dose range of dexamethasone—**500 mcg.** to **6 mg.** daily.

Dexamethasone Sodium Phosphate Cream

Dexamethasone Sodium Phosphate Cream contains an amount of $C_{22}H_{28}FNa_2O_8P$ (dexamethasone sodium phosphate) equivalent to not less than 90.0 percent and not more than 115.0 percent of the labeled amount of $C_{22}H_{30}FO_8P$ (dexamethasone phosphate).

Identification—

A: Heat 1 ml. of the *Assay preparation* prepared as directed in the *Assay*, with 5 ml. of phenylhydrazine reagent (prepared as described under *Assay*) at 70° for 2 hours: a yellow color develops.

B: Place 5 ml. of the *Assay preparation* prepared as directed in the *Assay*, in a 50-ml. glass-stoppered tube. Incubate at 37° for 45 minutes with 5 ml. of alkaline phosphatase solution, prepared by dissolving 50 mg. of alkaline phosphatase in 50 ml. of a buffer solution (pH = 9.0) made by dissolving 3.1 g. of boric acid, 203 mg. of magnesium chloride, and 860 mg. of sodium hydroxide in sufficient water to make 1000 ml. After the incubation add 25 ml. of methylene chloride, and shake for two minutes. Evaporate 15 ml. of the methylene chloride extract to dryness, dissolve the residue in 1 ml. of methylene chloride, and apply 5 µl. of the solution to a thin-layer chromatography plate coated with a 0.25-mm. layer of silica gel G. Apply to the same plate 5 µl. of a methylene chloride solution containing 300 mcg. per ml. of USP Dexamethasone Reference Standard. Develop the chromatogram in a tank completely lined with a strip of filter paper 18 cm. wide, the developing solvent consisting of a mixture of chloroform, acetone, and water (50:50:1). When the solvent front has ascended 15 cm. from the starting line, remove the plate from the tank, allow it to dry, and spray it with sulfuric acid solution (1 in 2). Heat at 105° until brown or black spots appear. The R_f value of the main spot obtained from the sample solution corresponds to that obtained from the Reference Standard solution.

Weight variation, page 901—Dexamethasone Sodium Phosphate Cream meets the requirements of the weight variation test for creams.

Assay—

Standard preparation—Transfer about 120 mg. of USP Dexamethasone Sodium Phosphate Reference Standard, equivalent to about 100 mg. of dexamethasone phosphate, accurately weighed, to a 100-ml. volumetric flask, dissolve in water, dilute to volume with water, and mix. Transfer 10.0 ml. of the solution to a 100-ml. volumetric flask, dilute to volume with water, and mix.

Assay preparation—Transfer an accurately weighed portion of Dexamethasone Sodium Phosphate Cream, equivalent to about 1 mg. of dexamethasone phosphate, to a small separator containing about 7 ml. of sodium chloride solution (1 in 10). Add 25 ml. of methylene chloride, agitate to disperse the cream, allow the methylene chloride phase to separate, and discard it. Repeat the extraction with 25 ml. of methylene chloride, again discarding the methylene chloride extract. Transfer the aqueous phase to a 10-ml. volumetric flask, rinse the separator with 2 ml. of water, adding the rinsings to the flask, dilute to volume with water, and mix.

Procedure—Pipet 2.0 ml. each of the *Standard preparation*, the *Assay preparation*, and water into separate glass-stoppered tubes. Add to each tube 5.0 ml. of freshly prepared phenylhydrazine reagent, consisting of 40 ml. of water, 60 ml. of sulfuric acid, 50 ml. of isopropyl alcohol, and 65 mg. of phenylhydrazine hydrochloride. Stopper loosely and place in a water bath at 60° for 2 hours, and cool. Concomitantly determine the absorbances of the solutions in 1-cm. cells, at 410 mμ, with a suitable spectrophotometer, using the reagent blank to set the instrument. Record the absorbance of the solution from the *Standard Preparation* as A_S and that from the *Assay Preparation* as A_U. Calculate the quantity, in mg., of $C_{22}H_{30}FO_8P$ in the portion of the Cream taken by the formula $0.01C \times 0.9148 \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of USP Dexamethasone Sodium Phosphate Reference Standard in the *Standard preparation*, calculated on the water-free and alcohol-free basis, and 0.9148 is the factor for converting dexamethasone sodium phosphate to dexamethasone phosphate.

Packaging and storage—Preserve Dexamethasone Sodium Phosphate Cream in collapsible tubes, or in tight containers.

Cream available—Dexamethasone Sodium Phosphate Cream usually available contains 0.1 percent of dexamethasone phosphate.

CATEGORY—Glucocorticoid.

APPLICATION—Topically as a 0.1 percent cream to the affected area two or three times a day.

Dexamethasone Sodium Phosphate Ophthalmic Ointment

Dexamethasone Sodium Phosphate Ophthalmic Ointment contains an amount of $C_{22}H_{28}FNa_2O_8P$ (dexamethasone sodium phosphate) equivalent to not less than 90.0 percent and not more than 115.0 percent of the labeled amount of $C_{22}H_{30}FO_8P$ (dexamethasone phosphate).

Identification—

A: Heat 1 ml. of the *Assay preparation*, prepared as directed in the *Assay*, with 5 ml. of phenylhydrazine reagent (prepared as described under *Assay*) at 70° for 2 hours: a yellow color develops.

B: Place 5 ml. of the *Assay preparation*, prepared as directed in the *Assay*, in a 50-ml. glass-stoppered tube. Incubate at 37° for 45 minutes with 5 ml. of alkaline phosphatase solution, prepared by dissolving 50 mg. of alkaline phosphatase in 50 ml. of a buffer solution (pH = 9.0) made by dissolving 3.1 g. of boric acid, 203 mg. of magnesium chloride, and 860 mg. of sodium hydroxide in sufficient water to make 1000 ml. After the incubation add 25 ml. of methylene chloride, and shake for 2 minutes. Evaporate 15 ml. of the methylene chloride extract to dryness, dissolve the residue in 1 ml. of methylene chloride, and apply 5 μl. of the solution to a thin-layer chromatographic plate coated with a 0.25-mm. layer of silica gel G. Apply to the same plate 5 μl. of a methylene chloride solution containing 300 mcg. per ml. of USP Dexamethasone Reference Standard. Develop the chromatogram in a tank completely lined with a strip of filter paper 18 cm. wide, the developing solvent consisting of a mixture of chloroform, acetone, and water (50:50:1). When the solvent front has ascended 15 cm. from the starting line, remove the plate from the tank, allow it to dry, and spray it with sulfuric acid solution (1 in 2). Heat at 105° until brown or black spots appear. The R_f value of the main spot from the sample solution corresponds to that obtained from the Reference Standard solution.

Weight variation, page 901—Dexamethasone Sodium Phosphate Ophthalmic Ointment meets the requirements of the weight variation test for ointments.

Metal particles—Dexamethasone Sodium Phosphate Ophthalmic Ointment meets the requirements of the test for *Metal Particles—Ophthalmic Ointments*, page 816.

Assay—

Standard preparation—Transfer about 120 mg. of USP Dexamethasone Sodium Phosphate Reference Standard, equivalent to about 100 mg. of dexamethasone phosphate, accurately weighed, to a 100-ml. volumetric flask, dissolve in water, dilute to volume with water, and mix. Transfer 10.0 ml. of the solution to a 100-ml. volumetric flask, dilute to volume with water, and mix.

Assay preparation—Transfer an accurately weighed portion of Dexamethasone Sodium Phosphate Ophthalmic Ointment, equivalent to about 1 mg. of dexamethasone phosphate, to a 125-ml. separator, add 25 ml. of methylene chloride to dissolve the Ointment, then add 10.0 ml. of water, and shake to extract the dexamethasone salt. Discard the methylene chloride, and again extract the aqueous layer with 25 ml. of methylene chloride, again discarding the methylene chloride.

Procedure—Pipet 2.0 ml. each of the *Standard preparation*, the *Assay preparation*, and water into separate glass-stoppered tubes. Add to each tube 5.0 ml. of freshly prepared phenylhydrazine reagent, consisting of 40 ml. of water, 60 ml. of sulfuric acid, 50 ml. of isopropyl alcohol, and 65 mg. of phenylhydrazine hydrochloride. Stopper loosely and place in a water bath at 60° for 2 hours, and cool. Concomitantly determine the absorbances of the solutions in 1-cm. cells, at 410 mμ, with a suitable spectrophotometer, using the reagent blank to set the instrument Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{22}H_{30}FO_8P$ in the portion of Ointment taken by the formula $0.01C \times 0.9148 \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of USP Dexamethasone Sodium Phosphate Reference Standard in the *Standard preparation*, calculated on the water-free and alcohol-free basis, and 0.9148 is the factor for converting dexamethasone sodium phosphate to dexamethasone phosphate.

Packaging and storage—Preserve Dexamethasone Sodium Phosphate Ophthalmic Ointment in collapsible ophthalmic ointment tubes.

Ointment available—Dexamethasone Sodium Phosphate Ophthalmic Ointment usually available contains 0.05 percent of dexamethasone phosphate.

CATEGORY—Glucocorticoid.

APPLICATION—Topically as a 0.05 percent ointment to the eye or ear one to three times a day.

Dexamethasone Sodium Phosphate Ophthalmic Solution

Dexamethasone Sodium Phosphate Ophthalmic Solution is a sterile solution of dexamethasone sodium phosphate in water. It contains an amount of $C_{22}H_{28}FNa_2O_8P$ (dexamethasone sodium phosphate) equivalent to not less than 90.0 percent and not more than 115.0 percent of the labeled amount of $C_{22}H_{30}FO_8P$ (dexamethasone phosphate).

Identification—

A: Heat 1 ml. of the solution from the *Assay preparation* with 5 ml. of phenylhydrazine reagent (prepared as described under *Assay*) at 70° for 2 hours: a yellow color develops.

B: Place 5 ml. of the solution from the *Assay preparation* in a 50-ml. glass-stoppered tube. Incubate at 37° for 45 minutes with 5 ml. of alkaline phosphatase solution, prepared by dissolving 50 mg. of alkaline phosphatase in 50 ml. of a buffer solution (pH = 9.0) made by dissolving 3.1 g. of boric acid, 203 mg. of magnesium chloride, and 860 mg. of sodium hydroxide in sufficient water to make 1000 ml. After the incubation add 25 ml. of methylene chloride, and shake for two minutes. Evaporate 15 ml. of the methylene chloride extract to dryness, dissolve the residue in 1 ml. of methylene chloride, and apply 5 μl. of the solution to a thin-layer chromatography plate coated with a 0.25-mm. layer of silica gel G. Apply to the same plate 5 μl. of a methylene chloride solution containing 300 mcg. per ml. of USP Dexamethasone Reference Standard. Develop the chromatogram in a tank completely lined with a strip of filter paper 18 cm. wide, the developing solvent consisting of a mixture of chloroform, acetone, and water (50:50:1). When the solvent front has ascended 15 cm. from the starting line, remove the plate from the tank, allow it to dry, and spray it with sulfuric acid solution (1 in 2). Heat at 105° until brown or black spots appear. The R_f value of the main spot obtained from the sample solution corresponds to that obtained from the Reference Standard solution.

pH, page 824—The pH of Dexamethasone Sodium Phosphate Ophthalmic Solution is between 7.2 and 7.8.

Sterility—Dexamethasone Sodium Phosphate Ophthalmic Solution meets the requirements under *Sterility Tests*, page 874.

Assay—

Standard preparation—Transfer about 120 mg. of USP Dexamethasone Sodium Phosphate Reference Standard, equivalent to about 100 mg. of dexamethasone phosphate, accurately weighed, to a 100-ml. volumetric flask, dissolve in water, dilute to volume with water, and mix. Transfer 10.0 ml. of the solution to a 100-ml. volumetric flask, dilute to volume with water, and mix.

Assay preparation—Transfer an accurately measured volume of Dexamethasone Sodium Phosphate Ophthalmic Solution, equivalent to about 5 mg. of dexamethasone phosphate, to a 125-ml. separator containing about 25 ml. of water. Extract with two 25-ml. portions of methylene chloride, discarding the methylene chloride each time. Quantitatively transfer the aqueous phase to a 50-ml. volumetric flask, dilute to volume with water, and mix.

Procedure—Pipet 2.0 ml. each of the *Standard preparation*, the *Assay preparation*, and water into separate glass-stoppered tubes. Add to each tube 5.0 ml. of freshly prepared phenylhydrazine reagent, consisting of 40 ml. of water, 60 ml. of sulfuric acid, 50 ml. of isopropyl alcohol, and 65 mg. of phenylhydrazine hydrochloride. Stopper loosely and place in a water bath at 60° for 2 hours, and cool. Concomitantly determine the absorbances of the solutions in 1-cm. cells, at 410 mμ with a suitable spectrophotometer, using the reagent blank to set the instrument. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{22}H_{30}FO_8P$ in each ml. of the Solution taken by the formula $0.05 \times 0.9148 \times (C/V) \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of USP Dexamethasone Sodium Phosphate Reference Standard in the *Standard preparation*, calculated on the water-free and alcohol-free basis, 0.9148 is the factor for converting dexamethasone sodium phosphate to dexamethasone phosphate, and V is the volume, in ml., of the Solution taken.

Packaging and storage—Preserve Dexamethasone Sodium Phosphate Ophthalmic Solution in tightly closed, light-resistant containers.

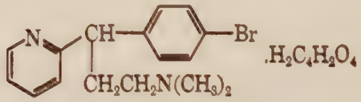
Solution available—Dexamethasone Sodium Phosphate Ophthalmic Solution usually available contains 0.1 percent of dexamethasone phosphate.

CATEGORY—Glucocorticoid.

APPLICATION—Topically as a 0.1 percent solution, 1 or 2 drops one to three times a day to the eye; 3 or 4 drops one to three times a day to the ear.

Dexamethasone Sodium Phosphate and Neomycin Sulfate Cream, page 473

Dexbrompheniramine Maleate*



(+)-2-[*p*-Bromo-α-[2-(dimethylamino)ethyl]benzyl]pyridine Maleate (1:1)

$C_{16}H_{19}BrN_2 . C_4H_4O_4$ Mol. wt. 435.32

Dexbrompheniramine Maleate, dried at 65° for 4 hours, contains not less than 98.0 percent and not more than 102.0 percent of $C_{16}H_{19}BrN_2 . C_4H_4O_4$.

Description—Dexbrompheniramine Maleate occurs as a white, odorless, crystalline powder. The pH of a 1 in 100 solution is about 5.

Solubility—Dexbrompheniramine Maleate is freely soluble in water, and is soluble in alcohol and in chloroform.

Identification—Dissolve about 500 mg. of Dexbrompheniramine Maleate in 5 ml. of water, add 2 ml. of stronger ammonia water, extract with three 5-ml. portions of chloroform, and discard the extracts. Evaporate the water solution to dryness, add several drops of diluted sulfuric acid to the residue, and then add 5 ml. of water, and extract the solution with four 25-ml. portions of ether. Filter the ether extracts through anhydrous sodium sulfate, previously moistened with ether, evaporate the filtrate to dryness in a current of air, and dry the residue at 105° for 1 hour: the maleic acid so obtained melts between 128° and 133°, page 814.

Melting range, *Class Ia*, page 815—Dexbrompheniramine Maleate melts between 103° and 113°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Dexbrompheniramine Maleate, previously dried at 65°

---

* Patented. See notice, page ii.

for 4 hours, exhibits maxima only at the same wavelengths as that of NF Dexbrompheniramine Maleate Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 30,000 solution of Dexbrompheniramine Maleate in methanol exhibits maxima and minima at the same wavelengths as that of NF Dexbrompheniramine Maleate Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis at the point of maximum absorbance occurring at about 261 mμ, do not differ by more than 3 percent.

Specific rotation, page 822—The specific rotation of Dexbrompheniramine Maleate, calculated on the dried basis, determined in a solution in dimethylformamide, containing 500 mg. of Dexbrompheniramine Maleate in each 10 ml., is between +33.0° and +38.5°

Loss on drying, page 814—Dry Dexbrompheniramine Maleate at 65° for 4 hours: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Dexbrompheniramine Maleate yields not more than 0.15 percent of residue on ignition.

Assay—Dissolve about 400 mg. of Dexbrompheniramine Maleate, previously dried at 65° for 4 hours and accurately weighed, in 50 ml. of glacial acetic acid, add 1 drop of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 21.77 mg. of $C_{16}H_{19}BrN_2 . C_4H_4O_4$.

Packaging and storage—Preserve Dexbrompheniramine Maleate in tight, light-resistant containers.

CATEGORY—Antihistaminic.
USUAL DOSE—**2 mg.** four times a day.
USUAL DOSE RANGE—**2** to **12 mg.** a day

Dexbrompheniramine Maleate Tablets

Dexbrompheniramine Maleate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{16}H_{19}BrN_2 . C_4H_4O_4$.

Identification—

A: Dexbrompheniramine Maleate Tablets meet the requirements under *Identification—Organic Nitrogenous Bases,* page 810.

B: Suspend completely a quantity of finely powdered Dexbrompheniramine Maleate Tablets, equivalent to 100 mg. of dexbrompheniramine maleate, in 100 ml. of 0.5 *N* hydrochloric acid. Adjust to pH 11 with stronger ammonia water, and extract with six 100-ml. portions of solvent hexane. Filter each extract through a pledget of glass wool, and evaporate the combined extracts on a steam bath just to the point where hexane vapors are no longer perceptible. Transfer the oily residue, with the aid of three 3-ml. portions of dimethylformamide, to a suitable glass-stoppered graduated cylinder, dilute to 10.0 ml. with dimethylformamide, and mix: the specific rotation of the dexbrompheniramine maleate in the Tablet powder taken is about +36°, page 822.

Disintegration, page 878—The disintegration time limit for Dexbrompheniramine Maleate Tablets is 30 minutes.

Content uniformity, *Method I,* page 799—Dexbrompheniramine Maleate Tablets meet the requirements of the content uniformity test for tablets.

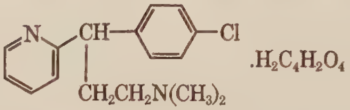
Assay—Weigh and finely powder not less than 20 Dexbrompheniramine Maleate Tablets. Weigh accurately a portion of the powder, equivalent to about 4 mg. of dexbrompheniramine maleate, mix well with 50 ml. of water for 10 minutes, adjust to pH 11 with sodium hydroxide solution (1 in 10), and cool to room temperature. Extract the mixture with two 75-ml. portions of solvent hexane. Extract the combined solvent hexane extracts with three 50-ml. portions of 0.1 *N* hydrochloric acid, combining the acid extracts in a 200-ml. volumetric flask. Dilute the acid extracts to volume with 0.1 *N* hydrochloric acid, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Dexbrompheniramine Maleate Reference Standard, in the same medium at a concentration of about 20 mcg. per ml., in 1-cm. cells, at the maximum at about 264 mμ, with a suitable spectrophotometer using 0.1 *N* hydrochloric acid as the blank. Calculate the quantity, in mg., of $C_{16}H_{19}BrN_2 . C_4H_4O_4$ in the portion of the Tablets taken by the formula $0.2C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Dexbrompheniramine Maleate Tablets in tight, light-resistant containers.

Tablets available—Dexbrompheniramine Maleate Tablets usually available contain the following amount of dexbrompheniramine maleate: 2 mg.

CATEGORY and DOSE—See Dexbrompheniramine Maleate.

Dexchlorpheniramine Maleate*



(+)-2-[*p*-Chloro-*α*-[2-(dimethylamino)ethyl]benzyl]pyridine Maleate (1:1)

$C_{16}H_{19}ClN_2 . C_4H_4O_4$ Mol. wt. 390.87

Dexchlorpheniramine Maleate, dried at 65° for 4 hours, contains not less than 99.0 percent and not more than 100.5 percent of $C_{16}H_{19}ClN_2 . C_4H_4O_4$.

Description—Dexchlorpheniramine Maleate occurs as a white, odorless, crystalline powder.

Solubility—Dexchlorpheniramine Maleate is freely soluble in water. It is soluble in alcohol and in chloroform, and is slightly soluble in benzene and in ether.

Identification—Dissolve about 500 mg. of Dexchlorpheniramine Maleate in 5 ml. of water, add 2 ml. of stronger ammonia water, and extract the mixture with three 5-ml. portions of chloroform. Evaporate the water solution to dryness, add several drops of diluted sulfuric acid to the residue, then add 5 ml. of water, and extract the solution with four 25-ml. portions of ether. Evaporate the ether in a current of warm air: the residue of maleic acid so obtained melts between 128° and 133°, page 814.

Melting range, page 814—Dexchlorpheniramine Maleate melts between 110° and 115°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Dexchlorpheniramine Maleate, previously dried at 65° for 4 hours, exhibits maxima only at the same wavelengths as that of NF Dexchlorpheniramine Maleate Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 25,000 solution of Dexchlorpheniramine Maleate in water exhibits maxima and minima at the same wavelengths as that of NF Dexchlorpheniramine Maleate Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance, occurring at about 261 mμ, do not differ by more than 3 percent.

Specific rotation, page 822—The specific rotation of Dexchlorpheniramine Maleate, calculated on the dried basis, determined in a solution in dimethylformamide, containing 500 mg. of Dexchlorpheniramine Maleate in each 10 ml., is between +39.5° and +43°.

pH, page 824—The pH of a solution of Dexchlorpheniramine Maleate (1 in 100) is between 4.0 and 5.0.

Loss on drying, page 814—Dry Dexchlorpheniramine Maleate at 65° for 4 hours: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Dexchlorpheniramine Maleate yields not more than 0.15 percent of residue on ignition.

Assay—Dissolve about 400 mg. of Dexchlorpheniramine Maleate, previously dried at 65° for 4 hours and accurately weighed, in 50 ml. of glacial acetic acid, add 1 drop of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid, to a green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 19.54 mg. of $C_{16}H_{19}ClN_2 . C_4H_4O_4$.

Packaging and storage—Preserve Dexchlorpheniramine Maleate in tight, light-resistant containers.

CATEGORY—Antihistaminic.

USUAL DOSE—**2 mg.** three or four times a day.

USUAL DOSE RANGE—**1** to **2 mg.**

* Patented. See notice, page ii.

Dexchlorpheniramine Maleate Syrup

Dexchlorpheniramine Maleate Syrup contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{16}H_{19}ClN_2 . C_4H_4O_4$.

Identification—

A: Evaporate the remaining extract from the *Assay* to a small volume on a steam bath, then transfer it to a smaller, more suitable, vessel and evaporate just to the point where hexane vapors are no longer perceptible. Transfer the oily residue, with the aid of four 3-ml. portions of dimethylformamide, to a suitable glass-stoppered graduated cylinder, dilute to 15.0 ml. with dimethylformamide, and mix: the optical rotation of this solution in a 100-mm. tube, after correcting for the blank, is between +0.06° and +0.11° (*distinction from chlorpheniramine maleate*).

B: To a volume of Dexchlorpheniramine Maleate Syrup, equivalent to about 8 mg. of dexchlorpheniramine maleate, add sodium hydroxide solution (1 in 10) to produce a pH of about 11, cool the mixture, and extract with two 40-ml. portions of solvent hexane. Wash the combined extracts with 10 ml. of water, discard the water, and evaporate the hexane solution on a steam bath to dryness. Dissolve the residue in 5 ml. of alcohol, add 5 ml. of a saturated solution of picric acid in alcohol, heat on a steam bath for 5 minutes, and cool to room temperature. Filter the resulting yellow, crystalline precipitate on a sintered-glass crucible, wash with several portions of cold water followed by a small portion of cold alcohol, and dry the precipitate at 105° for 1 hour: the picrate so obtained melts between 196° and 204°, page 814. (*Caution: picrates may be explosive.*)

Assay—Transfer an accurately measured volume of Dexchlorpheniramine Maleate Syrup, equivalent to about 40 mg. of dexchlorpheniramine maleate, to a 250-ml. separator, add sodium hydroxide solution (1 in 10) to pH 11, and allow to cool to room temperature. Extract with five 50-ml. portions of solvent hexane. Collect the extracts in a 500-ml. separator and wash with two 10-ml. portions of water. Combine the water washes and extract them with two 20-ml. portions of solvent hexane, combining these extracts with the bulk of the water-washed extracts. Filter the combined hexane extracts through a solvent hexane-washed cotton pledget into a 500-ml. volumetric flask, dilute to volume with solvent hexane, and mix. Transfer 50.0 ml. of this solution to a 100-ml. beaker, and evaporate just to dryness on a steam bath. (Retain the remaining extract for *Identification test A.*) Dissolve the residue in 0.1 *N* hydrochloric acid and quantitatively transfer the solution, with the aid of 0.1 *N* hydrochloric acid, to a 100-ml. volumetric flask. Dilute to volume with 0.1 *N* hydrochloric acid, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Dexchlorpheniramine Maleate Reference Standard, in the same medium, at a concentration of about 40 mcg. per ml. in 1-cm. cells, at the maximum at about 265 mμ, with a suitable spectrophotometer, using 0.1 *N* hydrochloric acid as the blank. Calculate the quantity, in mg., of $C_{16}H_{19}ClN_2 . C_4H_4O_4$ in each ml. of the Syrup taken by the formula $(C/V) \times (A_U/A_S)$, in which C is the exact concentration of the Reference Standard solution, in mcg. per ml., V is the volume, in ml., of the Syrup taken, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Dexchlorpheniramine Maleate Syrup in well-closed, light-resistant containers.

Syrup available—Dexchlorpheniramine Maleate Syrup usually available contains the following amount of dexchlorpheniramine maleate: 2 mg. in 5 ml.

CATEGORY and DOSE—See Dexchlorpheniramine Maleate.

Dexchlorpheniramine Maleate Tablets

Dexchlorpheniramine Maleate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{16}H_{19}ClN_2 . C_4H_4O_4$.

Identification—

A: Dexchlorpheniramine Maleate Tablets meet the requirements under *Identification—Organic Nitrogenous Bases,* page 810.

B: Suspend completely a quantity of finely powdered Dexchlorpheniramine Maleate Tablets, equivalent to 150 mg. of dexchlorpheniramine maleate, in 100 ml. of diluted acetic acid, filter through a sintered-glass funnel into a suitable vessel, adjust the filtrate to pH 11 with sodium hydroxide solution (1 in 10), and extract the solution with six 100-ml. portions of solvent hexane. Concentrate the combined extracts to a small volume on a steam bath, transfer to a smaller, more suitable, vessel, and evaporate just to the point where hexane vapors are no longer perceptible. Transfer the oily residue, with the aid of four 3-ml. portions of dimethylformamide, to a suitable glass-stoppered graduated cylinder, dilute to 15.0 ml. with dimethylformamide, and mix: the optical rotation of this solution in a 100-mm. tube, after correcting for the blank, is between +0.24° and +0.35°.

Disintegration, page 878—The disintegration time limit for Dexchlorpheniramine Maleate Tablets is 15 minutes.

Content uniformity, *Method I,* page 799—Dexchlorpheniramine Maleate Tablets meet the requirements of the content uniformity test for tablets.

Assay—Weigh and finely powder not less than 20 Dexchlorpheniramine Maleate Tablets. Weigh accurately a portion of the powder, equivalent to about 8 mg. of dexchlorpheniramine maleate, mix well with 50 ml. of water for 10 minutes, adjust to pH 11 with sodium hydroxide solution (1 in 10), and cool to room temperature. Extract the solution with two 75-ml. portions of solvent hexane. Extract the combined solvent hexane extracts with three 50-ml. portions of 0.1 *N* hydrochloric acid, combining the acid extracts in a 200-ml. volumetric flask. Dilute to volume with 0.1 *N* hydrochloric acid, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Dexchlorpheniramine Maleate Reference Standard, in the same medium, at a concentration of about 40 mcg. per ml. in 1-cm. cells, at the maximum at about 265 mμ, with a suitable spectrophotometer using 0.1 *N* hydrochloric acid as the blank. Calculate the quantity, in mg., of $C_{16}H_{19}ClN_2.C_4H_4O_4$ in the portion of the Tablets taken by the formula $0.2C \times (A_U/A_S)$, in which C is the exact concentration of the Reference Standard solution, in mcg. per ml., A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Dexchlorpheniramine Maleate Tablets in tight, light-resistant containers.

Tablets available—Dexchlorpheniramine Maleate Tablets usually available contain the following amount of dexchlorpheniramine maleate: 2 mg.

CATEGORY and DOSE—See Dexchlorpheniramine Maleate.

Dextriferron Injection

Dextriferron Injection is a sterile, colloidal solution prepared from a complex of ferric hydroxide with partially hydrolyzed dextrin in water for injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of Fe (iron).

Description—Dextriferron Injection is a clear, dark brown liquid.

Identification—

A: To 1 ml. of Dextriferron Injection add 5 ml. of water and 1 ml. of stronger ammonia water: no precipitate is formed.

B: To 2 ml. of Dextriferron Injection add 10 ml. of 1 *M* sulfuric acid and 40 ml. of water. To 10 ml. of this solution add 1 ml. of potassium ferrocyanide T.S.: a dark blue precipitate is produced.

Specific gravity, page 866—The specific gravity of Dextriferron Injection is between 1.062 and 1.072 at 20°.

Viscosity, page 889—The viscosity of Dextriferron Injection is between 2.30 and 2.60 centipoises determined with the Ostwald-type viscosimeter at 20°.

Pyrogen—Dextriferron Injection meets the requirements of the *Pyrogen Test*, page 851, the test dose being 2 ml. per kg., with an injection rate of 2 ml. per minute.

pH, page 824—The pH of Dextriferron Injection is between 7.3 and 7.9.

Other requirements—Dextriferron Injection meets the requirements under *Injections*, page 810.

Nonvolatile residue—Accurately weigh the contents of one ampul of Dextriferron Injection in a platinum dish or crucible which has been previously dried and weighed. Evaporate on a steam bath to dryness, complete the drying in an oven at 105° for 15 hours, cool, and weigh: not less than 12 percent and not more than 16 percent of residue remains.

Assay for iron—

Standard preparation—Transfer to a 300-ml. Kjeldahl flask an accurately weighed portion of ferrous ammonium sulfate, equivalent to 100.0 mg. of iron (Fe), and proceed as directed under *Assay preparation*, beginning with "Add 10 ml. of nitric acid. . . . "

Assay preparation—Transfer an accurately weighed portion of Dextriferron Injection, equivalent to about 100 mg. of iron, to a 300-ml. Kjeldahl flask. Add 10 ml. of nitric acid, 10 ml. of sulfuric acid, and a few glass beads, and boil the solution gently until fumes of sulfur trioxide appear. Cool, add 3 ml. of nitric acid, and heat gently again until fumes of sulfur trioxide appear. Continue the addition of nitric acid, followed by gentle boiling, until the solution is clear and light yellow or green in color, then boil for an additional 30 minutes. Cool, cautiously add 100 ml. of water, and boil gently until solution is complete. Cool, transfer the solution to a 500-ml. volumetric flask, rinse the Kjeldahl flask with several small portions of water, dilute to volume with water, and mix. Pipet 5.0 ml. of the solution to a second 500-ml. volumetric flask, add 100 ml. of water and 1 g. of ascorbic acid, dilute to volume with water, and mix.

Procedure—Pipet 5.0-ml. portions of both the *Standard preparation* and the *Assay preparation* into clean, dry test tubes, and to each add 3.0 ml. of a solution of 2,2′-bipyridine in acetic acid (1 in 1500 ml. of dilute acetic acid [3.2 ml. of glacial acetic acid in 100 ml.]), mix, and allow to stand for 15 minutes. Concomitantly determine the absorbances of the *Assay preparation* and the *Standard preparation* at the wavelength of maximum absorbance at about 510 mμ, with a suitable spectrophotometer, using a mixture of 5 ml. of water and 3.0 ml. of 2,2′-bipyridine solution as the blank. Calculate the quantity, in mg., of Fe in the portion of the Injection taken by the formula 100 × (sp. gr./W) × (A_U/A_S), in which W is the weight, in g., of the Injection taken, sp. gr. is the value determined under *Specific gravity*, and A_U and A_S are the absorbances of the *Assay preparation* and *Standard preparation*, respectively.

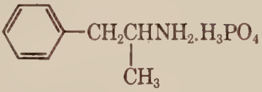
Packaging and storage—Preserve Dextriferron Injection in single-dose containers, preferably of Type I glass.

Injection available—Dextriferron Injection usually available contains the equivalent of 20 mg. of iron per ml. in 5-ml. containers.

Category—Source of iron.

Usual dose—Intravenous, initial trial dose of **1.5 ml.** (equivalent to 30 mg. of iron), then increase dose in increments of **1** to **1.5 ml.** (equivalent to 20 to 30 mg. of iron) per day until a daily dose of **5 ml.** (equivalent to 100 mg. of iron) is reached.

Dextroamphetamine Phosphate



(+)-α-Methylphenethylamine Phosphate (1:1)

$C_9H_{13}N . H_3PO_4$ Mol. wt. 233.21

Dextroamphetamine Phosphate, dried at 105° for 2 hours, contains not less than 98.5 percent and not more than 100.5 percent of $C_9H_{13}N . H_3PO_4$.

Description—Dextroamphetamine Phosphate occurs as a white, odorless, crystalline powder. It has a bitter taste.

Solubility—Dextroamphetamine Phosphate is soluble in water. It is slightly soluble in alcohol and is practically insoluble in benzene, in chloroform, and in ether.

Identification—

A: A solution of Dextroamphetamine Phosphate (1 in 20) responds to the tests for *Phosphate*, page 809.

B: To about 100 mg. of Dextroamphetamine Phosphate contained in a flask, add 5 ml. of water and 2 ml. of sodium hydroxide solution (2 in 5), then add benzoyl chloride, about 0.5 ml. at a time, shaking well after each addition, until no more precipitate forms upon further addition of the reagent. Collect the precipitate on a filter, wash it with about 15 ml. of cold water, and recrystallize it twice from diluted alcohol. The crystals of the benzoyl derivative of amphetamine so obtained, after drying at 80° for 2 hours, melt between 155° and 160°, page 814.

Specific rotation, page 822—The specific rotation of Dextroamphetamine Phosphate, previously dried at 105° for 2 hours, determined in a water solution containing 4 g. of Dextroamphetamine Phosphate in each 100 ml., is not less than +15° and not more than +19°.

pH, page 824—The pH of a solution of Dextroamphetamine Phosphate (1 in 20) is between 4.0 and 5.0.

Loss on drying, page 814—Dry Dextroamphetamine Phosphate at 105° for 2 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Transfer about 1 g. of Dextroamphetamine Phosphate, accurately weighed, to a tared platinum crucible. Ignite carefully, using a low flame, until the sample is free of carbon, and then ignite strongly until no noticeable residue remains. Cool the crucible in a desiccator and weigh. Dextroamphetamine Phosphate yields not more than 0.1 percent of residue on ignition.

Heavy metals, page 806—Dissolve 1 g. of Dextroamphetamine Phosphate in sufficient water to make 20 ml., and add 5 ml. of 0.1 *N* hydrochloric acid: the heavy metals limit for Dextroamphetamine Phosphate is 30 parts per million.

Assay—

Standard preparation—Prepare as directed under *Amphetamine Assay*, page 776.

Assay preparation—Dissolve about 150 mg. of Dextroamphetamine Phosphate, previously dried at 105° for 2 hours and accurately weighed, in 25 ml. of hydrochloric acid solution (1 in 100) in a 50-ml. volumetric flask, dilute to volume with the solvent, and mix. Pipet 2.0 ml. of the solution into a 100-ml. beaker containing 3 g. of purified siliceous earth, and mix until a fluffy mixture is obtained.

Procedure—Proceed as directed under *Amphetamine Assay,* page 776. Calculate the quantity, in mg., of $C_9H_{13}N.H_3PO_4$ in the portion of Dextroamphetamine Phosphate taken by the formula $0.25C \times 1.266 \times [(A_{U257} - A_{U280})/(A_{S257} - A_{S280})]$, in which C is the exact concentration of USP Dextroamphetamine Sulfate Reference Standard, in mcg. per ml., in the *Standard preparation,* and 1.266 is the factor converting dextroamphetamine sulfate to dextroamphetamine phosphate.

Packaging and storage—Preserve Dextroamphetamine Phosphate in well-closed containers.

Category—Central stimulant.
Usual dose—**5 mg.** every 4 to 6 hours.
Usual dose range—**5** to **10 mg.**

Dextroamphetamine Phosphate Tablets

Dextroamphetamine Phosphate Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_9H_{13}N.H_3PO_4$.

Identification—

A: Macerate a quantity of powdered Dextroamphetamine Phosphate Tablets, equivalent to 50 mg. of dextroamphetamine phosphate, with 5 ml. of water for 15 minutes, and filter into a small flask. To the filtrate add 1 ml. of sodium hydroxide solution (2 in 5), then add benzoyl chloride, about 0.5 ml. at a time, shaking well after each addition, until no more precipitate forms upon further addition of the reagent. Filter the precipitate, wash it with about 15 ml. of cold water and recrystallize it twice from diluted alcohol. The benzoyl derivative so obtained, after drying at 80° for 2 hours, melts between 155° and 160°, page 814.

B: Transfer the *Sample Solution,* prepared for the determination of absorbance in the *Assay,* to a separator, make it strongly alkaline with sodium hydroxide T.S., and extract with two 15-ml. portions of chloroform. Add to the chloroform extract 5 ml. of 0.1 N sulfuric acid, shake well, and heat gently until the chloroform is expelled: the remaining solution is dextrorotatory.

Disintegration, page 878—The disintegration time limit for Dextroamphetamine Phosphate Tablets is 15 minutes.

Content uniformity, *Method I,* page 799—Dextroamphetamine Phosphate Tablets meet the requirements of the content uniformity test for tablets.

Assay—

Standard preparation—Prepare as directed under *Amphetamine Assay,* page 776.

Assay preparation—Weigh and finely powder not less than 20 Dextroamphetamine Phosphate Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 6 mg. of dextroamphetamine phosphate, to a 100-ml. beaker, add 2 ml. of hydrochloric acid solution (1 in 100), swirl gently to wet the powder thoroughly, warm on a steam bath for 1 minute, with occasional gentle swirling, and cool. Add 3 g. of purified siliceous earth, and mix until a fluffy mixture is obtained.

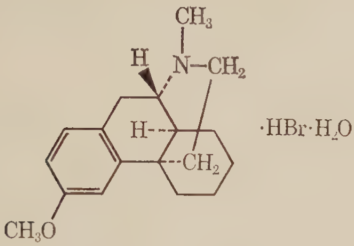
Procedure—Proceed as directed under *Amphetamine Assay,* page 776. Calculate the quantity, in mg., of $C_9H_{13}N.H_3PO_4$ in the portion of the Tablets taken by the formula $0.01C \times 1.266 \times [(A_{U257} - A_{U280})/(A_{S257} - A_{S280})]$, in which C is the exact concentration, in mcg per ml., of USP Dextroamphetamine Sulfate Reference Standard in the *Standard preparation,* and 1.266 is the factor converting dextroamphetamine sulfate to dextroamphetamine phosphate.

Packaging and storage—Preserve Dextroamphetamine Phosphate Tablets in well-closed containers.

Tablets available—Dextroamphetamine Phosphate Tablets usually available contain the following amount of dextroamphetamine phosphate: 5 mg.

Category and Dose—See Dextroamphetamine Phosphate.

Dextromethorphan Hydrobromide*



(+)-3-Methoxy-17-methyl-9α,13α,14α-morphinan Hydrobromide

$C_{18}H_{25}NO.HBr.H_2O$ Mol. wt. 370.33

Dextromethorphan Hydrobromide contains not less than 98.0 percent and not more than 100.5 percent of $C_{18}H_{25}NO.HBr$, calculated on the anhydrous basis.

Description—Dextromethorphan Hydrobromide occurs as practically white crystals, or as a crystalline powder, having a faint odor. It melts at about 126° with decomposition.

Solubility—Dextromethorphan Hydrobromide is sparingly soluble in water. It is freely soluble in alcohol and in chloroform, and is insoluble in ether.

Identification—

A: A solution of Dextromethorphan Hydrobromide (1 in 100) responds to the test for *Bromide*, page 808.

B: To 1 ml. of a solution of ammonium molybdate in sulfuric acid (1 in 100) add about 1 mg. of Dextromethorphan Hydrobromide, and mix: a greenish yellow color develops.

C: Dissolve about 50 mg. of Dextromethorphan Hydrobromide in 2 ml. of diluted sulfuric acid, and add 1 ml. of a freshly prepared solution of mercuric nitrate (dissolve 700 mg. of mercuric nitrate in 4 ml. of water, add 100 mg. of sodium nitrite, mix, and filter): no red color is produced immediately, but after heating, a yellow to red color develops in about 15 minutes.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Dextromethorphan Hydrobromide, previously dried over a suitable desiccant, exhibits maxima only at the same wavelengths as that of NF Dextromethorphan Hydrobromide Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 10,000 solution of Dextromethorphan Hydrobromide exhibits maxima and minima at the same wavelengths as that of NF Dextromethorphan Hydrobromide Reference Standard, similarly measured.

Specific rotation, page 822—The specific rotation of Dextromethorphan Hydrobromide, determined in a solution containing 200 mg. of Dextromethorphan Hydrobromide in each 10 ml. (warming if necessary to obtain complete solution), is between +26° and +28°.

pH, page 824—The pH of a solution of Dextromethorphan Hydrobromide (1 in 100) is between 5.2 and 6.5.

Water, page 900—Determine the water content of Dextromethorphan Hydrobromide by the titrimetric method: not less than 4 percent and not more than 5.5 percent is found.

Residue on ignition, page 858—Dextromethorphan Hydrobromide yields not more than 0.1 percent of residue on ignition.

Dimethylaniline—Transfer to a 25-ml. volumetric flask about 500 mg. of Dextromethorphan Hydrobromide, add 20 ml. of water, and dissolve by warming on a steam bath. Cool, then add 2 ml. of diluted acetic acid and 1 ml. of a solution of sodium nitrite (1 in 100), dilute to volume with water, and mix. This solution shows no more color than corresponds to a solution, similarly prepared, containing 5 mcg. of dimethylaniline in 25 ml. (10 parts per million).

Phenolic compounds—To about 5 mg. of Dextromethorphan Hydrobromide add 1 drop of diluted hydrochloric acid, 1 ml. of water, and 2 drops of ferric chloride T.S. Mix, add 2 drops of potassium ferricyanide T.S., and observe after 2 minutes: no blue-green color develops.

Assay—Dissolve about 700 mg. of Dextromethorphan Hydrobromide, accurately weighed, in a mixture of 50 ml. of glacial acetic acid and 10 ml. of mercuric acetate T.S., warming slightly if necessary to effect solution, add 1 drop of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a blue-green endpoint. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 35.23 mg. of $C_{18}H_{25}NO.HBr$.

Packaging and storage—Preserve Dextromethorphan Hydrobromide in tight containers.

CATEGORY—Antitussive.

USUAL DOSE RANGE—**15** to **30 mg.** one to four times a day.

---

* Patented. See notice, page ii.

Dextromethorphan Hydrobromide Syrup

Dextromethorphan Hydrobromide Syrup contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{18}H_{25}NO.HBr.H_2O$.

Identification—

A: Transfer about 50 ml. of Dextromethorphan Hydrobromide Syrup to a 250-ml. separator, add 20 ml. of water, 5 ml. of a solution of sodium hydroxide (1 in 10), and 40 ml. of solvent hexane, and shake thoroughly. Remove the solvent hexane layer, and filter it through anhydrous sodium sulfate into a 150-ml. beaker. Repeat the solvent hexane extraction, using two 40-ml. portions, and collecting the extracts in the beaker after filtering. Evaporate the combined extracts to dryness at 50° under nitrogen, then dissolve and dilute the residue in 10 ml. of chloroform: the solution is dextrorotatory. Retain the chloroform solution for *Identification test B*.

B: Evaporate the chloroform solution from *Identification test A* to dryness on a steam bath, dissolve the residue in 2 ml. of diluted sulfuric acid, and proceed as directed in *Identification test C* under *Dextromethorphan Hydrobromide*, page 219.

Reaction—Dextromethorphan Hydrobromide Syrup is acid to litmus.

Assay—Transfer to a 125-ml. separator an accurately measured volume of Dextromethorphan Hydrobromide Syrup, equivalent to about 15 mg. of dextromethorphan hydrobromide, add 20 ml. of water and 3 ml. of 1 N hydrochloric acid, and extract with four 25-ml. portions of solvent hexane, adding a small amount of isopropyl alcohol if an emulsion forms, and discard the solvent hexane extracts. Add 10 ml. of stronger ammonia water to the water layer, and extract the liberated base with three 25-ml. portions of solvent hexane, collecting the extracts in a separator. Wash the combined extracts with two 10-ml. portions of water. Extract the solvent hexane with four 20-ml. portions of 0.1 N hydrochloric acid, collecting the latter in a 100-ml. volumetric flask. Dilute to volume with 0.1 N hydrochloric acid, and mix. Transfer 15.0 ml. of this solution to a 25-ml. volumetric flask, dilute to volume with 0.1 N hydrochloric acid, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Dextromethorphan Hydrobromide Reference Standard in the same medium, at a concentration of about 100 mcg. per ml., in 1-cm. cells, at the maximum at about 278 mμ, with a suitable spectrophotometer, using 0.1 N hydrochloric acid as the blank. Calculate the quantity, in mg., of $C_{18}H_{25}NO.HBr.H_2O$, in each ml. of the Syrup taken by the formula $0.167 \times C/V \times (A_U/A_S)$, in which C is the exact concentration of the standard solution, in mcg. per ml., V is the volume, in ml., of the Syrup taken, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Dextromethorphan Hydrobromide Syrup in tight, light-resistant containers.

Syrup available—Dextromethorphan Hydrobromide Syrup usually available contains the following amount of dextromethorphan hydrobromide: 15 mg. in 5 ml.

Category and Dose—See Dextromethorphan Hydrobromide.

Dextromethorphan Hydrobromide and Terpin Hydrate Elixir, page 686

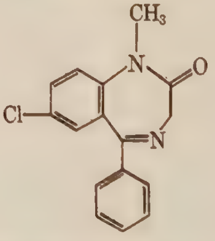
Diazepam*



7-Chloro-1,3-dihydro-1-methyl-5-phenyl-2H-1,4-benzodiazepin-2-one

$C_{16}H_{13}ClN_2O$ Mol. wt. 284.75

---

* Patented. See notice, page ii.

Diazepam contains not less than 98.5 percent and not more than 101.0 percent of $C_{16}H_{13}ClN_2O$, calculated on the dried basis.

Description—Diazepam occurs as an off-white to yellow, practically odorless, crystalline powder.

Solubility—Diazepam is slightly soluble in water and is soluble in alcohol. It is freely soluble in chloroform.

Identification—

A: Prepare a solution of Diazepam in acetone containing 50 mg. per ml. On a suitable thin-layer chromatographic plate (see page 791), coated with a 0.25-mm. layer of silica gel G, spot 10 μl. of this solution and 10 μl. of an acetone solution of NF Diazepam Reference Standard containing 50 mg. per ml. Allow the spots to dry, and develop the chromatogram in an unsaturated chamber with a solvent system consisting of ethyl acetate and *n*-heptane (1:1), not saturating the chamber during development, until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by lightly spraying with potassium iodoplatinate T.S. The R_f value of the main (purple) spot obtained from the sample solution corresponds to that obtained from the Reference Standard solution.

B: Dissolve about 5 mg. of Diazepam in 2 ml. of sulfuric acid: the solution shows a green fluorescence under long-wave ultraviolet light.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Diazepam, previously dried in vacuum over phosphorus pentoxide to constant weight, exhibits maxima only at the same wavelengths as that of NF Diazepam Reference Standard, similarly measured.

Ultraviolet absorption, page 866—[NOTE: Use low-actinic glassware.] A 1 in 25,000 solution of Diazepam in 0.1 *N* alcoholic sulfuric acid exhibits an absorbance maximum at 368 ± 2 mμ, and its absorptivity at that maximum is within 2 percent of the absorptivity of a solution of NF Diazepam Reference Standard, similarly measured. A 15 in 50 dilution of the 1 in 25,000 solution in 0.1 *N* alcoholic sulfuric acid exhibits a maximum at 285 ± 2 mμ, and its absorptivity at that maximum is within 3 percent of the absorptivity of a solution of NF Diazepam Reference Standard, similarly measured.

Melting range, page 814—Diazepam melts between 131° and 135°.

Loss on drying, page 814—Dry Diazepam in vacuum over phosphorus pentoxide at 60° to constant weight: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Diazepam yields not more than 0.1 percent of residue on ignition.

Heavy metals, *Method II*, page 806—The heavy metals limit for Diazepam is 20 parts per million.

Assay—Dissolve about 800 mg. of Diazepam, accurately weighed, in 75 ml. of acetic anhydride in a 250-ml. conical flask. Add 5 drops of Nile blue hydrochloride in glacial acetic acid (1 in 100), and titrate the solution with 0.1 *N* perchloric acid in glacial acetic acid to a blue-green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 28.48 mg. of $C_{16}H_{13}ClN_2O$.

Packaging and storage—Preserve Diazepam in tight, light-resistant containers.

CATEGORY—Tranquilizer (minor).

USUAL DOSE RANGE—Oral, **2** to **10 mg.** two to four times a day. Intramuscular or intravenous, **2** to **10 mg.,** repeated in 3 to 4 hours, if necessary, but no more than 30 mg. should be given in an 8-hour period.

Diazepam Injection

Diazepam Injection is a sterile solution of diazepam in water for injection or other suitable medium. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{16}H_{13}ClN_2O$.

Identification—

A: The solution prepared for measurement of absorbance in the *Assay* exhibits a maximum at 368 ± 2 mμ. A 15 in 50 ml. dilution of this solution in 0.1 *N* alcoholic sulfuric acid exhibits a maximum at 285 ± 2 mμ.

B: Using 30 μl. of Diazepam Injection as the sample solution and 10 μl. of a solution of NF Diazepam Reference Standard in acetone containing 15 mg. per ml. as the standard solution, and ethyl acetate as the solvent, proceed as directed for *Identification Test A* under *Diazepam*, page 220.

pH, page 824—The pH of Diazepam Injection is between 6.2 and 6.9.

Other requirements—Diazepam Injection meets the requirements under *Injections*, page 810.

Assay—Transfer to a suitable separator an accurately measured volume of

Diazepam Injection, equivalent to about 10 mg. of diazepam. Add 20 ml. of pH 7 buffer solution (prepared by mixing 104.5 ml. of 0.2 *M* dibasic sodium phosphate and 85.5 ml. of 0.2 *M* monobasic potassium phosphate in a 1000-ml. volumetric flask, diluting to volume with water, and adjusting the pH, if necessary, to 7.0), and extract with four 20-ml. portions of chloroform, passing each extract through about 5 g. of anhydrous sodium sulfate and combining the extracts in a 100-ml. volumetric flask. Add chloroform to volume, and mix. Pipet 10.0 ml. of this solution into a 25-ml. volumetric flask, evaporate the chloroform under nitrogen, add 0.1 *N* alcoholic sulfuric acid to volume, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Diazepam Reference Standard in 0.1 *N* alcoholic sulfuric acid at a concentration of about 40 mcg. per ml., in 1-cm. cells, at the maximum at about 368 mμ, with a suitable spectrophotometer, using 0.1 *N* alcoholic sulfuric acid as the blank. Calculate the quantity, in mg., of $C_{16}H_{13}ClN_2O$ in each ml. of the Injection taken by the formula $0.25 \times (C/V) \times (A_U/A_S)$, in which *C* is the exact concentration, in mcg. per ml., of the Reference Standard solution, and *V* is the volume, in ml., of the Injection taken, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Diazepam Injection in single-dose or multiple-dose containers, preferably of Type I glass, protected from light.

Injection available—Diazepam Injection usually available contains the following amount of diazepam: 10 mg. in 2 ml.

CATEGORY and DOSE—See Diazepam.

Diazepam Tablets

Diazepam Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{16}H_{13}ClN_2O$.

Identification—

A: The solution prepared for measurement of absorbance in the *Assay* exhibits maxima at 368 ± 2 mμ and at 285 ± 2 mμ.

B: Shake a portion of finely powdered Diazepam Tablets, equivalent to about 10 mg. of diazepam, with 10 ml. of acetone, filter, evaporate the filtrate to dryness under nitrogen, and dissolve the residue in 2 ml. of sulfuric acid: the solution shows a green fluorescence under long-wave ultraviolet light.

Disintegration, page 878—The disintegration time limit for Diazepam Tablets is 30 minutes.

Content uniformity, *Method II,* page 799—[NOTE: Use low-actinic glassware.] Diazepam Tablets meet the requirements of the content uniformity test for tablets, using the following special procedure: Place one tablet in an appropriate container and add 5 ml. of water. Let stand for about 20 to 30 minutes to allow the tablet to disintegrate, then add 5 ml. of methanol, and mix. Dilute this solution quantitatively and stepwise, if necessary, with 0.1 *N* alcoholic sulfuric acid to provide a solution containing approximately 10 mcg. of diazepam per ml., and filter. Concomitantly determine the absorbance of this solution and of a solution of NF Diazepam Reference Standard, in the same medium at a concentration of about 10 mcg. per ml., in 1-cm. cells, at the maximum at about 285 mμ, with a suitable spectrophotometer, using 0.1 *N* alcoholic sulfuric acid as the blank. Calculate the quantity, in mg., of $C_{16}H_{13}ClN_2O$ in the tablet by the formula $(T/D) \times C \times (A_U/A_S)$, in which *T* is the labeled quantity of diazepam, in mg., in the tablet; *D* is the exact concentration, in mcg. per ml., of diazepam in the sample solution, based upon the labeled quantity per tablet and the extent of dilution; *C* is the exact concentration, in mcg. per ml., of the Reference Standard solution; A_U is the absorbance of the sample solution; and A_S is the absorbance of the Reference Standard solution.

Assay—[*Note:* Use low-actinic glassware.] Weigh and finely powder not less than 20 Diazepam Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 4 mg. of diazepam, to a glass-stoppered centrifuge tube, and add 40 ml. of chloroform. Shake the mixture mechanically for 20 minutes, and then centrifuge. Transfer the chloroform extract to a 100-ml. volumetric flask. Repeat the extraction procedure with a 30-ml. portion of chloroform, then with a 20-ml. portion of chloroform, combining the extracts in the volumetric flask, and dilute to volume with chloroform. Transfer this solution to a 250-ml. separator, and add 40 ml. of pH 9.7 borate buffer solution (prepared by mixing 30 ml. of 0.1 *N* sodium hydroxide with 70 ml. of a solution made with 12.4 g. of boric acid dissolved in 100 ml. of 1 *N* sodium hydroxide and diluted to 1000 ml. with water). Shake well, and pass the chloroform layer through a funnel containing a pledget of glass wool layered with 1 g. of anhydrous sodium sulfate.

Pipet 10.0 ml. of the filtrate into a 50-ml. volumetric flask, and evaporate to dryness under a stream of nitrogen. Using 0.1 *N* alcoholic sulfuric acid, dissolve the residue, then dilute to volume, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Diazepam Reference Standard, in the same medium, at a concentration of about 8 mcg. per ml., in 1-cm. cells, at the maximum at about 285 mμ, with a suitable spectrophotometer, using 0.1 *N* alcoholic sulfuric acid as the blank. Calculate the quantity, in mg., of $C_{16}H_{13}ClN_2O$ in the portion of the Tablets taken, by the formula $0.5C \times (A_U/A_S)$, in which C is the exact concentration of the Reference Standard solution, in mcg. per ml., A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

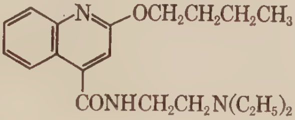
Packaging and storage—Preserve Diazepam Tablets in tight, light-resistant containers.

Tablets available—Diazepam Tablets usually available contain the following amounts of diazepam: 2, 5, and 10 mg.

CATEGORY and DOSE—See Diazepam.

Dibasic Calcium Phosphate, page 125

Dibucaine



2-Butoxy-*N*-[2-(diethylamino)ethyl]cinchoninamide

$C_{20}H_{29}N_3O_2$ Mol. wt. 343.47

Dibucaine contains not less than 97.0 percent and not more than 100.5 percent of $C_{20}H_{29}N_3O_2$, calculated on the dried basis.

Description—Dibucaine occurs as a colorless or almost colorless powder. It is odorless, is somewhat hygroscopic, and darkens on exposure to light.

Solubility—Dibucaine is soluble in 1 *N* hydrochloric acid and in ether. It is slightly soluble in water.

Melting range, page 814—Dibucaine, previously dried over phosphorus pentoxide overnight, melts between 62° and 65°.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 100,000 solution of Dibucaine in 1 *N* hydrochloric acid exhibits maxima and minima at the same wavelengths as that of USP Dibucaine Hydrochloride Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis in terms of the base, at the point of maximum absorbance occurring at about 247 mμ, do not differ by more than 3 percent.

Loss on drying, page 814—Dry Dibucaine over phosphorus pentoxide overnight: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—The residue on ignition from 250 mg. of Dibucaine is negligible.

Assay—Dissolve about 300 mg. of Dibucaine, accurately weighed, in 50 ml. of glacial acetic acid, warming slightly if necessary to effect solution. Add 1 drop of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 17.17 mg. of $C_{20}H_{29}N_3O_2$.

Packaging and storage—Preserve Dibucaine in tight, light-resistant containers.

CATEGORY—Local anesthetic.

APPLICATION—Topically as a 0.5 percent cream or a 1 percent ointment several times a day.

Dibucaine Cream

Dibucaine Cream contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{20}H_{29}N_3O_2$ in a suitable cream base.

Identification—The ultraviolet absorption spectrum of the solution employed for the measurement of absorbance in the *Assay* exhibits maxima and minima at the same wavelengths as that of the solution of USP Dibucaine Hydrochloride Reference Standard prepared as directed in the *Assay*.

Weight variation, page 901—Dibucaine Cream meets the requirements of the weight variation test for creams.

Assay—Accurately weigh a portion of Dibucaine Cream, equivalent to about 10 mg. of dibucaine, into a glass-stoppered 125-ml. conical flask. Add 25 ml. of 1 *N* hydrochloric acid, heat on a steam bath to melt the sample, and then shake vigorously. Cool under running water and filter through paper by decanting into a separator, retaining as much as possible of the congealed portion from the sample in the flask. Repeat the extraction with two additional 25-ml. portions of 1 *N* hydrochloric acid, filtering each portion into the separator. Slowly add 10 ml. of 10 *N* sodium hydroxide, cool, and extract the alkaline solution with three 25-ml. portions of ether, combining the ether extracts in another separator. Extract the ether solution with three 25-ml. portions of 1 *N* hydrochloric acid, filtering the extracts into a 100-ml. volumetric flask. Rinse the filter paper with 10 ml. of 1 *N* hydrochloric acid, dilute to volume with 1 *N* hydrochloric acid, and mix. Transfer 10.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with 1 *N* hydrochloric acid, and mix. Concomitantly determine the absorbance of this solution and of a solution of USP Dibucaine Hydrochloride Reference Standard, in the same medium at a concentration of about 10 mcg. per ml., in 1-cm. cells, at a maximum of about 247 mμ, with a suitable spectrophotometer, using 1 *N* hydrochloric acid as the blank. Calculate the quantity, in mg., of $C_{20}H_{29}N_3O_2$ in the portion of Cream taken by the formula $C \times 0.9040 \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, 0.9040 is the factor converting dibucaine hydrochloride to dibucaine, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Dibucaine Cream in collapsible tubes or in tight containers.

Cream available—Dibucaine Cream usually available contains 0.5 percent of dibucaine.

Category and Application—See Dibucaine.

Dibucaine Ointment

Dibucaine Ointment contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{20}H_{29}N_3O_2$ in a suitable ointment base.

Identification—The ultraviolet absorption spectrum of the solution employed for the measurement of absorbance in the *Assay* exhibits maxima and minima only at the same wavelengths as that of the solution of USP Dibucaine Hydrochloride Reference Standard prepared as directed in the *Assay*.

Weight variation, page 901—Dibucaine Ointment meets the requirements of the weight variation test for ointments.

Assay—Weigh accurately a portion of Dibucaine Ointment, equivalent to about 10 mg. of dibucaine, transfer to a separator containing 50 ml. of ether, and mix to dissolve. Extract successively with three 25-ml. portions and one 10-ml. portion of 1 *N* hydrochloric acid, filtering the extracts into another separator. Continue as directed in the *Assay* under *Dibucaine Cream*, page 223, beginning with "Slowly add 10 ml. of 10 *N* sodium hydroxide. . . ." Calculate the quantity, in mg., of $C_{20}H_{29}N_3O_2$ in the portion of Ointment taken by the formula $C \times 0.9040 \times (A_U/A_S)$.

Packaging and storage—Preserve Dibucaine Ointment in collapsible tubes or in tight containers.

Ointment available—Dibucaine Ointment usually available contains 1 percent of dibucaine.

Category and Application—See Dibucaine.

Dichlorodifluoromethane

CCl_2F_2

CCl_2F_2 Mol. wt. 120.91

Description — Dichlorodifluoromethane occurs as a clear, colorless gas having a faint, ethereal odor. Its vapor pressure at 25° is about 4883 mm. of mercury (80 psig).

Identification—The infrared absorption spectrum of Dichlorodifluoromethane, determined in a 10-cm. cell with sodium chloride windows, at atmospheric pressure, exhibits maxima, among others, at the following wavelengths, in μ: 4.33 (*m*), 4.46 (*m*), 4.56 (*m*), 6.29 (*m*), 7.25 (*m*), 8.05 (*s*), 8.63 (*s*), 9.1 (*vs*), 10.7 (*vs*), 10.8 (*vs*), 11.2 (*m*), 11.3 (*m*), 13.1 (*w*), and 13.9 (*w*). The stronger maxima are best obtained at pressures less than 10 mm. of mercury.

Boiling temperature—Determine the boiling temperature of Dichlorodifluoromethane by the special procedure, page 782: it boils at approximately −30°.

Water—Determine the water content of Dichlorodifluoromethane by the special procedure, page 900: not more than 10 parts per million is found.

High-boiling residues—Determine the content of high-boiling residues in Dichlorodifluoromethane by the special procedure, page 772: not more than 0.01 percent is found.

Inorganic chlorides—Place 5 ml. of dehydrated methanol in a test tube, add 3 drops of a saturated solution of silver nitrate in dehydrated methanol, shake, and add 7 g. of Dichlorodifluoromethane: no opalescence or turbidity is produced.

Packaging and storage—Preserve Dichlorodifluoromethane in tight cylinders, in a cool place.

CATEGORY—Aerosol propellant.

Dichlorotetrafluoroethane

$CClF_2$-$CClF_2$

1,2-Dichlorotetrafluoroethane

$C_2Cl_2F_4$ Mol. wt. 170.92

Description—Dichlorotetrafluoroethane occurs as a clear, colorless gas having a faint, ethereal odor. Its vapor pressure at 25° is about 1621 mm. of mercury (17 psig). It usually contains from 6 to 10 percent of its isomer, CCl_2F-CF_3.

Identification—The infrared absorption spectrum of Dichlorotetrafluoroethane, determined in a 10-cm. cell with sodium chloride windows, at atmospheric pressure, exhibits maxima, among others, at the following wavelengths, in μ: 4.34 (*s*), 4.48 (*m*), 5.28 (*m*), 5.95 (*m*), 7.36 (*s*), 9.5 (*vs*), 10.9 (*vs*), 11.8 (*vs*), 13.6 (*s*), and 14.8 (*s*). The stronger maxima are best obtained at pressures less than 10 mm. of mercury.

Boiling temperature—Determine the boiling temperature of Dichlorotetrafluoroethane by the special procedure, page 772: it boils at approximately 4°.

Water—Determine the water content of Dichlorotetrafluoroethane by the special procedure, page 772: not more than 10 parts per million is found.

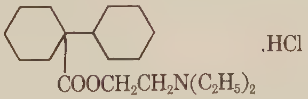
High-boiling residues—Determine the content of high-boiling residues in Dichlorotetrafluoroethane by the special procedure, page 772: not more than 0.01 percent is found.

Inorganic chlorides—Place 5 ml. of dehydrated methanol in a test tube, add 3 drops of a saturated solution of silver nitrate in dehydrated methanol, shake, and add 7 g. of Dichlorotetrafluoroethane: no opalescence or turbidity is produced.

Packaging and storage—Preserve Dichlorotetrafluoroethane in tight cylinders, in a cool place.

CATEGORY—Aerosol propellant.

Dicyclomine Hydrochloride



2-(Diethylamino)ethyl [Bicyclohexyl]-1-carboxylate Hydrochloride

$C_{19}H_{35}NO_2 \cdot HCl$ Mol. wt. 345.96

Dicyclomine Hydrochloride contains not less than 99.0 percent and not more than 102.0 percent of $C_{19}H_{35}NO_2 \cdot HCl$, calculated on the dried basis.

Description—Dicyclomine Hydrochloride occurs as a fine, white, crystalline powder. It is practically odorless and has a very bitter taste.

Solubility—Dicyclomine Hydrochloride is soluble in water, freely soluble in alcohol and in chloroform, and very slightly soluble in ether.

Melting range, page 814—Dicyclomine Hydrochloride melts between 169° and 174°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Dicyclomine Hydrochloride, previously dried at 105° for 4 hours, exhibits maxima only at the same wavelengths as that of NF Dicyclomine Hydrochloride Reference Standard, similarly measured.

Loss on drying, page 814—Dry Dicyclomine Hydrochloride at 105° for 4 hours: it loses not more than 1 percent of its weight.

pH, page 824—The pH of a solution of Dicyclomine Hydrochloride (1 in 100) is between 5.0 and 5.5.

Readily carbonizable substances, page 856—Dissolve 500 mg. of Dicyclomine Hydrochloride in 5 ml. of sulfuric acid T.S.: the solution has no more color than Matching Fluid D.

Assay—Dissolve about 600 mg. of Dicyclomine Hydrochloride, accurately weighed, in 70 ml. of glacial acetic acid, add 10 ml. of mercuric acetate T.S. and 1 drop of crystal violet T.S., and titrate with 0.1 N perchloric acid in glacial acetic acid to a blue end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 N perchloric acid is equivalent to 34.60 mg. of $C_{19}H_{35}NO_2.HCl$.

Packaging and storage—Preserve Dicyclomine Hydrochloride in well-closed containers.

CATEGORY—Anticholinergic.

USUAL DOSE RANGE—**10** to **20 mg.** three or four times a day.

Dicyclomine Hydrochloride Capsules

Dicyclomine Hydrochloride Capsules contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{19}H_{35}NO_2.HCl$.

Identification—

A: Mix a quantity of the contents of Dicyclomine Hydrochloride Capsules, equivalent to about 10 mg. of dicyclomine hydrochloride, with 5 ml. of water, and 2 ml. of diluted nitric acid, filter, and to the filtrate add 2 ml. of silver nitrate T.S.: a white precipitate is produced.

B: Mix gently in a cylinder 3 ml. of sodium lauryl sulfate solution (1 in 1000) with 10 ml. of chloroform and 0.2 ml. of methylene blue T.S., and allow the layers to separate. Transfer to the cylinder a quantity of the contents of Dicyclomine Hydrochloride Capsules, equivalent to about 20 mg. of dicyclomine hydrochloride, dissolved in 5 ml. of water, mix gently, allow the phases to separate and allow to stand for 30 minutes: the blue color migrates from the chloroform phase to the aqueous phase.

Content uniformity, *Method I,* page 798—Dicyclomine Hydrochloride Capsules meet the requirements of the content uniformity test for capsules.

Assay—

Sodium lauryl sulfate, 0.004 M—Dissolve 1.15 g. of sodium lauryl sulfate in about 500 ml. of water, dilute to 1000.0 ml. with water, and mix. Determine the molarity of the solution as follows: transfer to a glass-stoppered cylinder 10.0 ml. of a 0.004 M solution of NF Dicyclomine Hydrochloride Reference Standard (1.384 mg. of $C_{19}H_{35}NO_2.HCl$ per ml.), add 5 ml. of diluted sulfuric acid, 20 ml. of chloroform, and 1 ml. of alcoholic methyl yellow solution (1 in 10,000), and titrate with the sodium lauryl sulfate solution, with frequent shaking, until the chloroform layer acquires a permanent orange-pink color. Calculate the molarity, and restandardize before each use.

Procedure—Transfer as completely as possible the contents of not less than 20 Dicyclomine Hydrochloride Capsules to a suitable tared container, determine the average content weight per capsule, and mix the combined contents thoroughly. Transfer an accurately weighed portion, equivalent to about 20 mg. of dicyclomine hydrochloride, to a 100-ml. glass-stoppered cylinder, and add 20 ml. of water, 5 ml. of diluted sulfuric acid, 20 ml. of chloroform, and 1 ml. of alcoholic methyl yellow solution (1 in 10,000). Stopper the cylinder, shake until the chloroform phase develops a bright yellow color, and titrate with 0.004 M sodium lauryl sulfate, shaking thoroughly after each addition, until the chloroform develops the first orange-pink color. Each ml. of 0.004 M sodium lauryl sulfate is equivalent to 1.384 mg. of $C_{19}H_{35}NO_2.HCl$.

Packaging and storage—Preserve Dicyclomine Hydrochloride Capsules in tight containers.

Capsules available—Dicyclomine Hydrochloride Capsules usually available contain the following amount of dicyclomine hydrochloride: 10 mg.

CATEGORY and DOSE—See Dicyclomine Hydrochloride.

Dicyclomine Hydrochloride Syrup

Dicyclomine Hydrochloride Syrup contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{19}H_{35}NO_2.HCl$.

Identification—

A: To a volume of Dicyclomine Hydrochloride Syrup, equivalent to about 10 mg. of dicyclomine hydrochloride, add 0.2 ml. of diluted nitric acid and 2 ml. of silver nitrate T.S.: a white precipitate is produced.

B: Mix gently in a cylinder 3 ml. of sodium lauryl sulfate solution (1 in 1000) with 10 ml. of chloroform and 0.2 ml. of methylene blue T.S. Allow the phases to separate, then add a volume of Dicyclomine Hydrochloride Syrup, equivalent to about 20 mg. of dicyclomine hydrochloride, mix gently, allow the phases to separate, and allow to stand for 30 minutes: the blue color migrates from the chloroform phase to the aqueous phase.

Assay—

Sodium lauryl sulfate, 0.004 M—Prepare as directed in the *Assay* under *Dicyclomine Hydrochloride Capsules*, page 226.

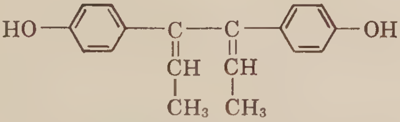
Procedure—Transfer an accurately measured volume of Dicyclomine Hydrochloride Syrup, equivalent to about 20 mg. of dicyclomine hydrochloride, to a 100-ml. glass-stoppered cylinder, add 5 ml. of diluted sulfuric acid and 2 ml. of 0.1 *N* potassium permanganate solution, and mix. When the solution becomes colorless, add 20 ml. of water, 20 ml. of chloroform, and 1 ml. of alcoholic methyl yellow solution (1 in 10,000). Stopper the cylinder, shake until the chloroform phase develops a bright yellow color, and then titrate with 0.004 *M* sodium lauryl sulfate, shaking thoroughly after each addition, until the chloroform develops the first orange-pink color. Each ml. of 0.004 *M* sodium lauryl sulfate is equivalent to 1.384 mg. of $C_{19}H_{35}NO_2.HCl$.

Packaging and storage—Preserve Dicyclomine Hydrochloride Syrup in tight containers.

Syrup available—Dicyclomine Hydrochloride Syrup usually available contains the following amount of dicyclomine hydrochloride: 10 mg. in 5 ml.

CATEGORY and DOSE—See Dicyclomine Hydrochloride.

Dienestrol



4,4′-(Diethylideneethylene)diphenol

$C_{18}H_{18}O_2$ Mol. wt. 266.34

Dienestrol contains not less than 98.0 percent and not more than 100.5 percent of $C_{18}H_{18}O_2$, calculated on the dried basis.

Description—Dienestrol occurs as colorless or white, or practically white, needle-like crystals or as a white, or practically white, crystalline powder. It is odorless.

Solubility—Dienestrol is practically insoluble in water. It is soluble in alcohol, in acetone, in ether, in methanol, in propylene glycol, and in solutions of alkali hydroxides. It is slightly soluble in chloroform, and in fatty oils.

Identification—

A: The diacetate obtained in the *Assay* melts between 118° and 125°, page 814.

B: To a solution of about 10 mg. of Dienestrol in 0.5 ml. of alcohol add 1 ml. of hydrochloric acid and about 50 mg. of vanillin: a blue color is produced immediately, and it persists on dilution with water but disappears on the addition of alkali (*diethylstilbestrol* produces no color).

Melting range, *Class Ia*, page 815—Dienestrol melts within a range of 3° between 227° and 234°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Dienestrol, previously dried at 105° for 2 hours, exhibits maxima only at the same wavelengths as that of NF Dienestrol Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 20,000 solution of Dienestrol in alcohol exhibits maxima and minima at the same wavelengths as that of NF Dienestrol

Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance, occurring at about 228 mμ, do not differ by more than 3 percent.

Loss on drying, page 814—Dry Dienestrol at 105° for 2 hours: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Dienestrol yields not more than 0.15 percent of residue on ignition.

Assay—Weigh accurately about 500 mg. of Dienestrol, add 2 ml. of acetic anhydride and 4 ml. of pyridine, and reflux for 15 minutes. Cool, add 50 ml. of water, shake vigorously, and allow to stand in a stoppered flask in a refrigerator overnight. Collect the precipitate on a tared filter crucible, wash it with water until the odor of pyridine is no longer perceptible, and dry in vacuum at room temperature for 5 hours. The weight of the diacetate so obtained, multiplied by 0.7601, represents its equivalent of $C_{18}H_{18}O_2$.

Packaging and storage—Preserve Dienestrol in tight, light-resistant containers.

CATEGORY—Estrogen.

USUAL DOSE—**500 mcg.** daily.

USUAL DOSE RANGE—**100 mcg.** to **1.5 mg.**

APPLICATION—Vaginal, **5 g.** of a 0.01 percent cream once or twice a day for 7 to 14 days, then once every 48 hours for 7 to 14 days.

Dienestrol Cream

Dienestrol Cream is dienestrol in a suitable water-miscible base. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{18}H_{18}O_2$.

Identification—The polarogram of the *Assay preparation* employed for measurement in the *Assay* exhibits a half-wave potential ($E_{1/2}$) within 1 percent of that of the *Standard preparation,* similarly measured.

Weight variation, page 901—Dienestrol Cream meets the requirements of the weight variation test for creams.

Assay—

pH 6.5 Phosphate buffer—Dissolve 315.2 mg. of monobasic potassium phosphate in 20 ml. of water, add 12.0 ml. of 0.1 *N* sodium hydroxide, dilute to 100.0 ml. with water, and mix. Adjust the pH to 6.5 with 0.1 *N* hydrochloric acid.

Electrolyte solution—Transfer 5.4 g. of ammonium chloride and 45 ml. of stronger ammonia water to a 100-ml. volumetric flask, dilute to volume with water, and mix.

Chromatographic column—Pack a pledget of glass wool in the base of a 20 × 1.5-cm. (outside diameter) chromatographic tube. Nearly fill the tube with a 1:1 mixture of ether and *n*-hexane, and then slowly pour into the tube a slurry of 5 g. of chromatographic silica gel (60/80 mesh) in 10 ml. of ether–*n*-hexane mixture. Open the stopcock, allow the silica gel to settle by gravity, and tamp into a uniform column bed. Allow at least 5 ml. head of solvent mixture to remain on the column until ready for use, and then allow the meniscus to descend to the top of the bed.

Standard preparation—Dissolve in methanol a suitable quantity of NF Dienestrol Reference Standard, accurately weighed, and then dilute, quantitatively and stepwise with methanol to obtain a solution of known concentration, containing about 50 mcg. per ml. Pipet 2.0 ml. of this solution into a glass-stoppered test tube, and evaporate to dryness under reduced pressure. Continue as directed under *Assay preparation,* beginning with "Dissolve the residue in 5.0 ml. of dilute acetic acid (8 in 10). . . ."

Assay preparation—Transfer to a 30-ml. glass-stoppered test tube an accurately weighed quantity, in duplicate, of Dienestrol Cream, equivalent to about 100 mcg. of dienestrol. Add 5.0 ml. of *pH 6.5 Phosphate buffer* and 15 ml. of ether, and shake for 2 minutes. Transfer the ether layer to a second glass-stoppered test tube. Extract the aqueous layer with two 10-ml. portions of ether, adding the extracts to the second tube. Evaporate the combined ether extracts to dryness under reduced pressure, add 10 ml. of dehydrated alcohol,† stopper loosely, and heat in a water bath maintained at 80° until a clear solution forms. Add 1.3 g. of urea, and continue heating, with shaking, until dissolved. Allow to stand at room temperature for about 2 hours, add 5 ml. of a 1:1 mixture of ether and *n*-hexane, and then chill in a refrigerator (4°) for 30 minutes. Immediately centrifuge, and decant the supernatant liquid into a 30-ml. glass-stoppered test tube. Wash the precipitate with two 5-ml. portions of a 1:1 mixture of ether and *n*-hexane, centrifuging after each washing. Combine all of the washings,† and evaporate under reduced pressure to a volume of about 1 ml. Quantitatively transfer this residual mixture to the chromatographic column, with the aid of about 5 ml. of the ether-*n*-hexane mixture, and open the stopcock on the column, allowing the sample to enter the column bed. Wash the sides of the column with the ether–*n*-hexane mixture, and elute the column with 75 ml. of this solvent, collecting the eluate in a 150-ml. beaker. Evaporate the residue to dryness in small portions in a glass-stoppered test tube under reduced pressure.

---

† At this point the procedure may be stopped overnight.

Dissolve the residue in 5.0 ml. of dilute acetic acid (8 in 10), prepared by diluting 80 ml. of glacial acetic acid to 100 ml. with water, and carefully pipet 4.0 ml. of this solution into a 25-ml. volumetric flask. To the flask add 3 drops of sulfuric acid and 5 drops of a freshly prepared saturated solution of sodium nitrite, allow the reaction to proceed for 30 minutes, and then immerse the flask in an ice bath. Add 20 ml. of *Electrolyte solution*, allow the fuming to subside, then remove the flask from the ice bath, dilute to volume with *Electrolyte solution*, and mix. Allow this solution to stand for at least 30 minutes but not longer than 2 hours before using as directed in the *Procedure*.

Procedure—Filter a portion of the *Assay preparation* through a pledget of cotton into a polarographic cell, and deaerate by bubbling nitrogen through the solution for at least 10 minutes. Insert the dropping electrode of a suitable polarograph, and record the polarogram from -0.25 volt to -1.25 volts. Determine the height of the diffusion current $[(i_d)_U]$ between -0.45 volt and -0.95 volt, *versus* a saturated calomel reference electrode, and correct for solution blank. Concomitantly and similarly determine the diffusion current $[(i_d)_S]$ of the *Standard preparation*. Calculate the quantity, in mcg., of $C_{18}H_{18}O_2$ in the portion of Cream taken by the formula $31.25C \times [(i_d)_U/(i_d)_S]$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*.

Packaging and storage—Preserve Dienestrol Cream in tight containers.

Cream available—Dienestrol Cream usually available contains 0.01 percent of dienestrol.

CATEGORY and APPLICATION—See Dienestrol.

Dienestrol Tablets

Dienestrol Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{18}H_{18}O_2$.

Identification—

A: Pulverize a suitable number of Dienestrol Tablets, and extract the powder with several portions of ether. Allow the ether to evaporate, and dry the residue at about 80° for 1 hour: the residue so obtained responds to *Identification test B* under *Dienestrol*, page 227, and after recrystallization from alcohol melts between 227° and 234°, page 814.

B: The polarogram of the *Assay preparation* employed for measurement in the *Assay* exhibits a half-wave potential ($E_{1/2}$) within 1 percent of that of the *Standard preparation* similarly measured.

Disintegration, page 878—The disintegration time limit for Dienestrol Tablets is 30 minutes.

Content uniformity, *Method I*, page 799—Dienestrol Tablets meet the requirements of the content uniformity test for tablets.

Assay—

Buffer solution—Transfer 1.5 g. of potassium hydroxide to a 100-ml. volumetric flask, add 10 ml. of water to dissolve, add 80 ml. of glacial acetic acid, dilute to volume, and mix.

Electrolyte solution—Transfer 5.4 g. of ammonium chloride and 45 ml. of stronger ammonia water to a 100-ml. volumetric flask, dilute to volume, and mix.

Standard preparation—Dissolve a suitable quantity, accurately weighed, of NF Dienestrol Reference Standard in methanol, and then dilute, quantitatively and stepwise, with methanol to obtain a solution of known concentration, containing about 50 mcg. per ml. Pipet 2.0 ml. of this solution into a glass-stoppered test tube, and evaporate to dryness under reduced pressure. Continue as directed under *Assay preparation*, beginning with "Dissolve the residue in 5.0 ml. of *Buffer solution*. . . ."

Assay preparation—Pack a pledget of fine glass wool in the base of a 20 × 1.5 cm. (outside diameter) chromatographic tube. Intimately mix 500 mg. of acid-washed chromatographic siliceous earth with 1.0 ml. of 1 *N* tribasic sodium phosphate, transfer the mixture to the tube, and pack gently with a tamping rod.

Weigh and finely powder not less than 20 Dienestrol Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mcg. of dienestrol, to a 50-ml. beaker, add 1.0 ml. of 1 *N* tribasic sodium phosphate and 1 g. of acid-washed chromatographic siliceous earth, and mix until the mixture is fluffy. Transfer the mixture quantitatively to the column, and pack gently to a uniform mass with a tamping rod. Place a pledget of glass wool on the top of the column. Wash the column with 80 ml. of *n*-hexane, and discard the eluate. Elute the dienestrol from the column with 150 ml. of water-washed chloroform, and evaporate the eluate to dryness on a steam bath with the aid of a current of air. Dissolve the residue in 5.0 ml. of *Buffer solution*, and carefully pipet 4.0 ml. of this solution into a 25-ml. volumetric flask. To the flask add 3 drops of sulfuric acid and 5 drops of a freshly prepared saturated solution of sodium nitrite, allow the reaction to proceed for 30 minutes, and then immerse the flask in an ice bath. Add 20 ml. of *Electrolyte solution*, allow the fuming to subside, then remove the flask from the ice bath, dilute to volume with *Electrolyte solution*, and mix. Allow this solution to stand for at least 30 minutes but not longer than 2 hours before using as directed in the *Procedure*.

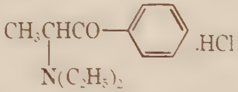
Procedure—Filter a portion of the *Assay preparation* through a pledget of cotton into a polarographic cell, and de-aerate by bubbling nitrogen through the solution for at least 10 minutes. Insert the dropping electrode of a suitable polarograph, and record the polarogram from −0.25 volt to −1.25 volts. Determine the height of the diffusion current $[(i_d)_U]$ between −0.45 volt and −0.95 volt, *versus* a saturated calomel reference electrode, and correct for solution blank. Concomitantly and similarly determine the diffusion current $[(i_d)_S]$ of the *Standard preparation*. Calculate the quantity, in mcg., of $C_{18}H_{18}O_2$ in the portion of Tablets taken by the formula $31.25C \times [(i_d)_U/(i_d)_S]$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*.

Packaging and storage—Preserve Dienestrol Tablets in well-closed containers.

Tablets available—Dienestrol Tablets usually available contain the following amounts of dienestrol: 100 mcg. and 500 mcg.

Category and Dose—See Dienestrol.

Diethylpropion Hydrochloride*



2-(Diethylamino)propiophenone Hydrochloride

$C_{13}H_{19}NO.HCl$ Mol. wt. 241.76

Diethylpropion Hydrochloride contains not less than 97.0 percent and not more than 103.0 percent of $C_{13}H_{19}NO.HCl$, calculated on the anhydrous basis.

Description—Diethylpropion Hydrochloride occurs as a white to off-white, fine crystalline powder. It has a slight characteristic odor. It melts at about 175° with decomposition.

Solubility—Diethylpropion Hydrochloride is freely soluble in water, in chloroform, and in alcohol. It is practically insoluble in ether.

Identification—

A: A solution of Diethylpropion Hydrochloride (1 in 100) responds to the tests for *Chloride*, page 808.

B: Dissolve about 25 mg. of Diethylpropion Hydrochloride in 2 ml. of a solution containing 2 g. of citric acid (monohydrate) in 100 ml. of acetic anhydride and heat for about 15 minutes on a steam bath: a red to purple color develops.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Diethylpropion Hydrochloride, previously dried over a suitable desiccant, exhibits maxima only at the same wavelengths as that of NF Diethylpropion Hydrochloride Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 100,000 solution of Diethylpropion Hydrochloride in 0.1 *N* hydrochloric acid exhibits maxima and minima at the same wavelengths as that of NF Diethylpropion Hydrochloride Reference Standard, similarly measured, and the respective absorptivities, calculated on the anhydrous basis, at the point of maximum absorbance occurring at about 253 $m\mu$, do not differ by more than 3 percent.

Water, page 900—Determine the water content of Diethylpropion Hydrochloride by the titrimetric method: not more than 1 percent is found.

Secondary amines—Dissolve about 5 mg. of Diethylpropion Hydrochloride in a few drops of water on a spot plate. Add, in succession, 1 drop of sodium carbonate solution (1 in 5), 2 drops of acetaldehyde T.S., and 1 drop of sodium nitroferricyanide solution (1 in 100): a reddish color may develop within 3 to 5 minutes, but no dark blue color appears.

Free bromine—One drop of a 1 in 10 solution of Diethylpropion Hydrochloride produces no discoloration when placed upon starch iodide paper.

---

* Patented. See notice, page ii.

Hydrobromic acid and bromide—To 10 ml. of a solution of Diethylpropion Hydrochloride (1 in 10) add 2 drops of diluted hydrochloric acid, 0.5 ml. of chloroform, 0.5 ml. of freshly prepared Chloramine-T solution (1 in 10), and shake vigorously: no yellow or brown-red color is formed in the chloroform layer.

Assay—Transfer about 250 mg. of Diethylpropion Hydrochloride, accurately weighed, to a 500-ml. volumetric flask, dilute to volume with 0.1 *N* hydrochloric acid, and mix. Pipet 5.0 ml. of this solution into a 250-ml. volumetric flask, dilute to volume with 0.1 *N* hydrochloric acid, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Diethylpropion Hydrochloride Reference Standard, in the same medium at a concentration of about 10 mcg. per ml., in 1-cm. cells, at the maximum at about 253 mμ, with a suitable spectrophotometer, using 0.1 *N* hydrochloric acid as the blank. Calculate the quantity, in mg., of $C_{13}H_{19}NO.HCl$ in the Diethylpropion Hydrochloride taken by the formula $25C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Diethylpropion Hydrochloride in well-closed containers, protected from light.

CATEGORY—Anorexic.

USUAL DOSE—**25 mg.** three times a day.

Diethylpropion Hydrochloride Tablets

Diethylpropion Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{13}H_{19}NO.HCl$.

Identification—

A: A portion of finely powdered Diethylpropion Hydrochloride Tablets, equivalent to about 25 mg. of diethylpropion hydrochloride, responds to *Identification test B* under *Diethylpropion Hydrochloride,* page 230.

B: The ultraviolet absorption spectrum of the solution prepared from Diethylpropion Hydrochloride Tablets for measurement of absorption in the *Assay* exhibits maxima and minima at the same wavelengths as that of the Reference Standard solution, similarly measured.

Disintegration, page 878—The disintegration time limit for Diethylpropion Hydrochloride Tablets is 30 minutes.

Content uniformity, *Method II,* page 799—Diethylpropion Hydrochloride Tablets meet the requirements of the content uniformity test for tablets, using the following special procedure: Quantitatively transfer a finely powdered tablet to a 100-ml. volumetric flask containing about 65 ml. of 0.1 *N* hydrochloric acid. Shake frequently during a 10-minute period, dilute to volume with 0.1 *N* hydrochloric acid, and mix. Allow the insoluble material to settle, and filter, discarding the first 20 ml. of filtrate. Dilute a portion of the subsequent filtrate, quantitatively and stepwise, if necessary, with 0.1 *N* hydrochloric acid, to provide a solution containing approximately 10 mcg. of diethylpropion hydrochloride per ml. Concomitantly determine the absorbance of this solution and of a solution of NF Diethylpropion Hydrochloride Reference Standard, in the same medium, at a concentration of about 10 mcg. per ml., in 1-cm. cells, at the maximum at about 253 mμ, with a suitable spectrophotometer, using 0.1 *N* hydrochloric acid as the blank. Calculate the quantity, in mg., of $C_{13}H_{19}NO.HCl$, in the tablet by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity, in mg., of diethylpropion hydrochloride in the tablet; D is the exact concentration, in mcg. per ml., of diethylpropion hydrochloride in the sample solution, based upon the labeled quantity per tablet and the extent of dilution; C is the exact concentration, in mcg. per ml., of the Reference Standard solution; A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

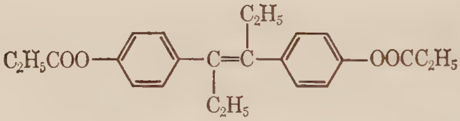
Assay—Weigh and finely powder not less than 20 Diethylpropion Hydrochloride Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 10 mg. of diethylpropion hydrochloride, to a 25-ml. glass-stoppered cylinder containing about 25 ml. of 0.1 *N* hydrochloric acid. Shake at intervals over a 10-minute period. Filter this solution through a suitable wetted filter paper into a 125-ml. separator, and wash the cylinder and filter paper with three 10-ml. portions of 0.1 *N* hydrochloric acid, adding the washes to the separator. Add 5 ml. of sodium hydroxide solution (1 in 10) to the separator, mix, and extract with three 50-ml. portions of chloroform. Extract the combined chloroform extracts with three 50-ml. portions of 0.1 *N* hydrochloric acid, collecting the extracts in a 250-ml. volumetric flask. Dilute to volume with 0.1 *N* hydrochloric acid, and mix. Pipet 25.0 ml. of this solution into a 100-ml. volumetric flask, dilute to volume with 0.1 *N* hydrochloric acid, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Diethylpropion Hydrochloride Reference Standard, in 0.1 *N* hydrochloric acid at a concentration of about 10 mcg. per ml., in 1-cm. cells, at the maximum at about 253 mμ, with a suitable spectrophotometer, using 0.1 *N* hydrochloric acid as the blank. Calculate the quantity, in mg., of $C_{13}H_{19}NO.HCl$ in the portion of the Tablets taken by the formula $C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Diethylpropion Hydrochloride Tablets in well-closed containers.

Tablets available—Diethylpropion Hydrochloride Tablets usually available contain the following amount of diethylpropion hydrochloride: 25 mg.

CATEGORY and DOSE—See Diethylpropion Hydrochloride.

Diethylstilbestrol Dipropionate



(*E*)-α,α'-Diethyl-4,4′-stilbenediol Dipropionate

$C_{24}H_{28}O_4$ Mol. wt. 380.49

Diethylstilbestrol Dipropionate contains not less than 98.0 percent and not more than 100.5 percent of $C_{24}H_{28}O_4$, calculated on the dried basis.

Description—Diethylstilbestrol Dipropionate occurs as a white, odorless, tasteless, crystalline powder. A suspension of Diethylstilbestrol Dipropionate in diluted alcohol (1 in 100) is neutral to litmus paper.

Solubility—Diethylstilbestrol Dipropionate is very slightly soluble in water and in dilute mineral acids. It is insoluble in solutions of alkali hydroxides. It is soluble in vegetable oils, and is freely soluble in acetone, in benzene, in chloroform, in ether, in hot ethanol, and in hot methanol.

Identification—

A: Dissolve about 10 mg. of Diethylstilbestrol Dipropionate in 2 ml. of sulfuric acid: an orange color is produced which disappears on dilution with water.

B: Add 1 ml. of a solution of antimony pentachloride in dry, alcohol-free chloroform (1 in 2) to 5 ml. of a dilute solution of Diethylstilbestrol Dipropionate in the same solvent: a red-colored solution is produced.

C: The diethylstilbestrol obtained in the *Assay* melts between 168° and 172°, page 814.

Melting range, page 814—Diethylstilbestrol Dipropionate melts between 105° and 107°.

Loss on drying, page 814—Dry Diethylstilbestrol Dipropionate to constant weight at 80° in vacuum: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Diethylstilbestrol Dipropionate yields not more than 0.05 percent of residue on ignition.

Assay—Dissolve about 300 mg. of Diethylstilbestrol Dipropionate, accurately weighed, in 10 ml. of a solution of potassium hydroxide in methanol (15 in 100), and reflux the solution for 30 minutes. Cool, dilute with 100 ml. of water, transfer the solution to a separator, and acidify it with diluted hydrochloric acid. Extract the mixture with three 20-ml. portions and two 10-ml. portions of ether, and wash the combined ether extracts with three 5-ml. portions of sodium bicarbonate solution (1 in 20) and one 5-ml. portion of water. Filter the washed ether extracts through an ether-washed pledget of cotton into a tared beaker, rinse the separator with two 5-ml. portions of ether, and pass the rinsings through the cotton, collecting the ether in the beaker. Evaporate the ether in a current of warm air, and dry the residue at 80° to constant weight. The weight of diethylstilbestrol so obtained, multiplied by 1.418, represents the weight of $C_{24}H_{28}O_4$ in the sample taken.

Packaging and storage—Preserve Diethylstilbestrol Dipropionate in tight containers.

CATEGORY—Estrogen.

USUAL DOSE RANGE—**100 mcg.** to **1 mg.** per day.

Diethylstilbestrol Dipropionate Tablets

Diethylstilbestrol Dipropionate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{24}H_{28}O_4$.

Identification—The solution prepared from Diethylstilbestrol Dipropionate Tablets for measurement of absorbance in the *Assay* exhibits a maximum at about 520 mμ.

Disintegration, page 878—The disintegration time limit for Diethylstilbestrol Dipropionate Tablets is 30 minutes.

Content uniformity, *Method I*, page 799—Diethylstilbestrol Dipropionate Tablets meet the requirements of the content uniformity test for tablets.

Assay—

Vanadyl sulfate solution—Dissolve about 100 mg. of vanadyl sulfate in 20 ml. of sulfuric acid in a 200-ml. volumetric flask, cautiously add glacial acetic acid to volume, and mix.

Standard preparation—Dissolve 80 mg. of USP Diethylstilbestrol Reference Standard, accurately weighed, in sufficient diluted alcohol to make 100.0 ml., and mix. Transfer 10.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with diluted alcohol, and mix.

Assay preparation—Weigh and finely powder not less than 50 Diethylstilbestrol Dipropionate Tablets. Transfer to a 50-ml. volumetric flask an accurately weighed portion of the powder, equivalent to about 14 mg. of diethylstilbestrol dipropionate, add 25 ml. of solvent hexane, and shake mechanically for 15 minutes. Dilute to volume with solvent hexane, mix, and centrifuge a portion of the mixture. Transfer to a 50-ml. conical flask 10.0 ml. of the clear, supernatant liquid, add 10 ml. of a solution of potassium hydroxide in alcohol (1 in 100), and evaporate the solvent hexane on a steam bath in a current of warm air. Reflux for 1 hour, cool, then transfer the solution to a 250-ml. separator, with the aid of 100 ml. of water. Acidify the solution to litmus with diluted hydrochloric acid, and extract with three 20-ml. portions and two 10-ml. portions of ether. Wash the combined ether extracts with three 5-ml. portions of sodium bicarbonate solution (1 in 20) and finally with 5 ml. of water. Filter the washed ether extracts through ether-washed cotton into a 250-ml. beaker, and evaporate the ether on a steam bath in a current of warm air. Dissolve the residue in diluted alcohol, transfer the solution to a 25-ml. volumetric flask, dilute to volume with diluted alcohol, and mix.

Procedure—Transfer 2.0 ml. each of the *Standard preparation* and of the *Assay preparation* to separate test tubes fitted with glass stoppers and marked at the 5-ml. level. For a blank, place in a similar tube 2 ml. of diluted alcohol. Cautiously evaporate the liquids to dryness on a steam bath. Add to each test tube 5.0 ml. of the *Vanadyl sulfate solution*, stopper loosely, and heat on a steam bath for 1 hour. Cool, shake well, allow to stand for 5 minutes, add water, if necessary, to the 5-ml. level, and mix. Concomitantly determine the absorbance of each solution in 1-cm. cells, at 520 mμ, with a suitable spectrophotometer, setting the instrument at zero absorbance with the blank. Record the absorbance from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{24}H_{28}O_4$ in the portion of the Tablets taken by the formula $0.125C \times 1.418 \times (A_U/A_S)$, in which C is the exact quantity, in mcg., of USP Diethylstilbestrol Reference Standard per ml. of the *Standard preparation*, and 1.418 is the factor converting diethylstilbestrol to diethylstilbestrol dipropionate.

Packaging and storage—Preserve Diethylstilbestrol Dipropionate Tablets in tight containers.

Tablets available—Diethylstilbestrol Dipropionate Tablets usually available contain the following amounts of diethylstilbestrol dipropionate: 500 mcg., 1 mg., and 5 mg.

CATEGORY and DOSE—See Diethylstilbestrol Dipropionate.

Digitalis Capsules

Digitalis Capsules contain an amount of powdered digitalis equivalent to not less than 85.0 percent and not more than 120.0 percent of the labeled potency.

Weight variation, page 901—Digitalis Capsules meet the requirements of the weight variation test for capsules.

Salmonella, page 862—The test for *Salmonella* in Digitalis Capsules is negative.

Assay—

Standard preparation—Weigh the contents of one container of USP Digitalis Reference Standard to the nearest mg., either in the original container or in a weighing bottle, and transfer to a dry, hard-glass, glass-stoppered container of at least 50-ml. capacity. Complete the weighing within 5 minutes after opening the ampul. Add sufficient menstruum consisting of 4 parts of alcohol, by volume, and 1 part of water, by volume, so that the total volume of menstruum added corresponds to 10 ml. for each g. of powder. Insert the stopper, the upper third of which is greased lightly with petrolatum. Shake the mixture for 24 hours ± 2 hours at 25° ± 5° by mechanical means which continuously brings the solid material into fresh contact with the liquid phase. Immediately thereafter, centrifuge the mixture, decant into a dry, hard-glass bottle having a tight closure, and preserve under refrigeration until used. Use within 30 days.

Assay preparation—

CAPSULES OF DRY POWDERED DIGITALIS—Empty the contents of not less than 20 Digitalis Capsules into a hard-glass, glass-stoppered container of at least 50-ml. capacity. Add a menstruum consisting of 4 parts of alcohol, by volume, and 1 part of water, by volume, so that the total volume of menstruum corresponds to 1 ml. for each expected USP Digitalis Unit. Insert the stopper, the upper third of which is greased lightly with petrolatum. Shake the mixture for 24 hours ± 2 hours at 25° ± 5° by mechanical means which continuously brings the solid material into fresh contact with the liquid phase. Immediately thereafter transfer to a centrifuge tube, centrifuge, and decant into a dry, hard-glass bottle having a tight closure. Preserve under refrigeration until used. Use within 30 days.

CAPSULES OF DIGITALIS SUSPENDED IN WATER-IMMISCIBLE MEDIA (OIL, FAT, WAX, ETC.)—Cut not less than 20 Digitalis Capsules into halves in a dry, shallow glass container. Transfer the contents, together with the capsules, quantitatively, with the aid of a sufficient amount of solvent hexane to a dry, hard-glass, glass-stoppered container of suitable capacity. Add solvent hexane to make a volume approximately 3 times the volume occupied by the capsule fragments and the contents of the capsules. Shake vigorously and centrifuge. Decant and discard the solvent hexane extract. Repeat the solvent hexane extraction twice. Place the extraction container with its contents, with the stopper removed, in an oven at 60° for 8 hours. Remove it from the oven, allow it to cool, and add menstruum consisting of 4 parts of alcohol, by volume, and 1 part of water, by volume, so that the total volume of menstruum corresponds to 1 ml. for each expected USP Digitalis Unit. Insert the stopper, the upper third of which is greased lightly with petrolatum. Shake the mixture for 24 hours ± 2 hours at 25° ± 5° by mechanical means which continuously brings the solid material into fresh contact with the liquid phase. Immediately thereafter transfer to a centrifuge tube, centrifuge the mixture, and decant into a dry, hard-glass bottle having a tight closure. Preserve under refrigeration until used. Use within 30 days.

The pigeons—Employ adult pigeons free from gross evidence of disease or emaciation, and of such weight that the heaviest weighs less than twice the weight of the lightest. Divide the pigeons into groups as nearly alike as practicable with respect to breed and weight so that the average weight of the group assigned by random choice to the *Standard preparation* shall not differ by more than 30% from the average weight of the group assigned to the preparation to be assayed. Withhold food but not water during the period 16 to 28 hours prior to use. Preparatory to injection, lightly anesthetize the pigeon with ether and immobilize it; expose an alar vein and cannulate with a suitable metal or glass cannula. Maintain the anesthesia during cannulation and throughout the subsequent injection period at such a level that pain is absent, the pupillary and corneal reflexes are present, and the voluntary musculature is not relaxed beyond permitting the pigeon to make some voluntary movement occasionally.

Preparation of the test dilutions—Dilute the *Standard preparation* and the preparation to be assayed (*Assay preparation*) with isotonic sodium chloride solution in such a way that the estimated fatal dose of each preparation will be 15 ml. per kg. of pigeon. Make test dilutions the day they are to be used.

Injection of the test dilutions—Arrange to inject the appropriate test dilution by suitable means such as a small-bore buret calibrated to 0.05 ml. Start the injection after insuring the absence of air bubbles from the injection apparatus, by infusing, within a few seconds, a volume of the test dilution equivalent to 1 ml. per kg. of body weight of the pigeon. Repeat this dose at 5-minute intervals thereafter until the pigeon dies of cardiac arrest.

Use a total of not less than 6 pigeons for the *Standard preparation* and not less than 6 pigeons for the preparation to be assayed. If the average number of doses for any given dilution required to produce death is less than 13 or greater than 19, or if the larger exceeds the smaller in the same assay by more than 4 doses, regard these data as preliminary. Use them as a guide, and repeat with a fresh, higher, or lower dilution. Complete the assay within a period of 30 days.

Calculation of the potency—For the group of pigeons injected with the *Standard preparation* find the average of the number of doses of test dilution which were injected and designate it $\bar{y}_S$; similarly find the average of the number of doses of the preparation to be assayed and designate it $\bar{y}_U$. The value of the ratio,

$$\frac{\bar{y}_S \times \text{No. of ml. of } \textit{Standard preparation} \text{ in 100 ml. of test dilution}}{\bar{y}_U \times \text{No. of ml. of preparation to be assayed in 100 ml. of test dilution}}$$

is the potency in USP Digitalis Units per ml.

For the group of pigeons injected with the *Standard preparation* find the range of the number of doses of the test dilution which were injected by subtracting the smallest from the largest number and designate it R_S; similarly find the range for the preparation to be assayed and designate it R_U. Determine the value of g corresponding to the number of pigeons used respectively on the *Standard preparation* (g_S) and the preparation to be assayed (g_U) from the following table:

Number of pigeons:	6	7	8	9	10
Value of *g*:	.026	.019	.015	.013	.011

Number of pigeons:	11	12	13	14
Value of *g*:	.0090	.0078	.0069	.0062

Using these values and those obtained in the calculation of the potency, calculate the standard error of the assay in terms of USP Digitalis Units per ml. by the following formula:

$$\text{standard error of the assay} = \text{Potency}\sqrt{g_S\left(\frac{R_S}{\bar{y}_S}\right)^2 + g_U\left(\frac{R_U}{\bar{y}_U}\right)^2}$$

If the standard error exceeds 0.08 USP Digitalis Unit per ml., repeat the assay or use more pigeons on either the *Standard preparation* or the preparation to be assayed or both until the standard error falls within the limit of 0.08 USP Digitalis Unit per ml.

Packaging and storage—Preserve Digitalis Capsules in well-closed containers.

Capsules available—Digitalis Capsules usually available contain the following amounts of digitalis: 60 and 100 mg.

Category—Cardiotonic.

Usual dose of powdered digitalis—Initial, **1.5 g.** divided over 24 to 48 hours. Maintenance, **100 mg.** daily.

Digitoxin Injection

Digitoxin Injection is a sterile solution of digitoxin in 5 to 50 percent (v/v) of alcohol, and may contain glycerin or other suitable solubilizing agents. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{41}H_{64}O_{13}$.

Identification—

A: Evaporate 100 ml. of the chromatographic eluate obtained in the *Assay* on a steam bath, with the aid of a current of air, to dryness. Dissolve the residue in 2 ml. of a solution prepared by mixing 0.3 ml. of ferric chloride T.S. and 50 ml. of glacial acetic acid, and underlay with 2 ml. of sulfuric acid: at the zone of contact of the two liquids a brown color, which gradually changes to light green, then to blue, is produced, and finally the entire acetic acid layer acquires a blue color.

B: Transfer 20 ml. of the chromatographic eluate obtained in the *Assay* to a small flask, and evaporate on a steam bath, with the aid of a current of air, to dryness. Add 2 ml. of a freshly prepared 1 in 100 solution of *m*-dinitrobenzene in alcohol, and allow to stand for 10 minutes with frequent shaking. Add 2 ml. of a 1 in 200 solution of tetramethylammonium hydroxide in alcohol, and mix: a red-violet color develops slowly and then fades.

Other requirements—Digitoxin Injection meets the requirements under *Injections*, page 810.

Assay—

Adsorbent—Boil a mixture of 150 g. of chromatographic siliceous earth and 1000 ml. of diluted hydrochloric acid for 10 minutes. Cool, filter by suction, wash thoroughly with water until the last washing is neutral to methyl orange T.S., dry at 105° overnight, and ignite at 500° for 2 hours.

Benzene-chloroform mixture (mobile solvent)—Mix 300 ml. of benzene and 100 ml. of chloroform.

Chromatographic tube—Insert a small pledget of glass wool at the juncture of the tube and the stem of a chromatographic tube which is about 200 mm. long and about 25 mm. in internal diameter, and place a plug of purified cotton above the juncture. Arrange a long-stemmed, glass-stoppered, 500-ml. separator to serve as a reservoir for maintaining a constant level of liquid in the tube.

Chromatographic column—Mix about 2 g. of the *Adsorbent* with 1 ml. of water in a 100-ml. beaker until the mixture appears fluffy and uniformly moistened, and transfer to the chromatographic tube, pressing down lightly with a packing rod to a thickness of 15 to 20 mm. Mix uniformly about 3 g. of *Adsorbent* with a mixture of 2 ml. of formamide and 1 ml. of water, and transfer to the chromatographic tube. Introduce a pledget of purified cotton, and press it down lightly and evenly, sweeping the wall of the tube with it.

Standard preparation—Dissolve in alcohol 20.0 mg. of USP Digitoxin Reference Standard, previously dried in vacuum at 100° for 2 hours, dilute with alcohol to 50.0 ml., and mix. Pipet 5.0 ml. of the solution into a 50-ml. volumetric flask, dilute to volume with alcohol, and mix.

Assay preparation—Transfer an accurately measured volume of Digitoxin Injection, equivalent to about 2 mg. of digitoxin, to a separator containing 40 ml. of water and 1 ml. of diluted sulfuric acid. Extract with four 25-ml. portions of chloroform, washing the chloroform extracts in succession in a second separator containing 10 ml. of water. Filter the washed chloroform extract through chloroform-washed cotton, into a 250-ml. beaker, and evaporate on a steam bath, with the aid of a current of air, to dryness. Add 4 ml. of formamide, and warm on the steam bath for 20 minutes, stirring frequently. Cool, add 4 ml. of water and about 8 g. of *Adsorbent*, and mix until the mass appears uniform and does not adhere to the beaker.

Procedure—Transfer the *Assay preparation* in portions through a powder funnel to a prepared *Chromatographic column*, sweeping particles adhering to the beaker or funnel into the tube with a rubber-tipped rod. Scrub the beaker and stirring rod with about 500 mg. of *Adsorbent*, and add it to the tube through the funnel. Repeat the scrubbing with two additional 500-mg. portions of *Adsorbent*. Place a pledget of purified cotton in the tube, and press it down on the column with a packing rod, sweeping the wall of the tube with it so that the over-all height of the column is between 120 and 150 mm. Elute the digitoxin with the *Benzene-chloroform mixture*. Collect nearly 250 ml. of eluate, at a rate not exceeding 4 ml. per minute. Wash the stem of the tube with a stream of chloroform, dilute to 250.0 ml. with chloroform, and mix.

Pipet 25.0 ml. of the eluate mixture and 5.0 ml. of the *Standard preparation* into separate 50-ml. conical flasks, and evaporate on a steam bath, with the aid of a current of air, to dryness. Moisten each residue with about 0.5 ml. of alcohol, and again evaporate to dryness. Cool, pipet 5.0 ml. of alcohol into each flask, stopper, and allow to stand for 15 minutes at 25 ± 3°, with occasional shaking to effect solution. Pipet 5.0 ml. of alcohol into a similar flask, to serve as a blank, and treat all three flasks as follows:

Add 3.0 ml. of alkaline picrate T.S., and mix by swirling, maintaining the temperature at 25 ± 3°. Protect the mixture from intense light. After 16 minutes determine the absorbances of the solutions, in 1-cm. cells, at 495 mμ, with a suitable spectrophotometer, using the blank to set the instrument.

Calculate the quantity, in mg., of $C_{41}H_{64}O_{13}$ in each ml. of the Injection taken by the formula $(2/V) \times (A_U/A_S)$, in which V is the volume, in ml., of the Injection taken, A_U is the absorbance of the solution from the *Assay preparation*, and A_S is that from the *Standard preparation*.

Alcohol content, page 772—Digitoxin Injection contains not less than 90 percent and not more than 110 percent (v/v) of the labeled percent of C_2H_5OH.

Packaging and storage—Preserve Digitoxin Injection in single-dose or multiple-dose containers, preferably in Type I glass, protected from light.

Injections available—Digitoxin Injection usually available contains the following amounts of digitoxin: 100 and 200 mcg. in 1 ml.

CATEGORY—Cardiotonic.

USUAL DOSE RANGE OF DIGITOXIN—Intravenous—Initial, **500 mcg.** to **1.2 mg.**; maintenance, **100** to **200 mcg.**

Dihydroxyaluminum Aminoacetate

$NH_2CH_2COOAl(OH)_2 . xH_2O$

(Glycinato)dihydroxyaluminum

$C_2H_6AlNO_4 . xH_2O$ Mol. wt. (anhydrous) 135.05

Dihydroxyaluminum Aminoacetate yields not less than 35.5 percent and not more than 38.5 percent of Al_2O_3 (aluminum oxide), calculated on the dried basis. Dihydroxyaluminum Aminoacetate may contain small amounts of aluminum oxide and of aminoacetic acid.

Description—Dihydroxyaluminum Aminoacetate occurs as a white, odorless powder. It has a faintly sweet taste.

Solubility—Dihydroxyaluminum Aminoacetate is insoluble in water and in organic solvents. It dissolves in dilute mineral acids and in solutions of fixed alkalies.

Identification—Suspend 1 g. of Dihydroxyaluminum Aminoacetate in 25 ml. of water, add hydrochloric acid, dropwise, until a clear solution is formed, and divide it into two equal parts for the following tests.

A: One portion of the solution responds to the tests for *Aluminum*, page 807.

B: To the other portion of the solution, add 1 drop of liquefied phenol and 5 ml. of sodium hypochlorite T.S.: a blue color is produced.

pH, page 824—The pH of a suspension of 1 g. of finely powdered Dihydroxyaluminum Aminoacetate in 25 ml. of water is between 6.5 and 7.5.

Loss on drying, page 814—Dry Dihydroxyaluminum Aminoacetate to constant weight at 130°: it loses not more than 14.5 percent of its weight.

Acid-consuming capacity—Transfer 250.0 mg. of finely powdered Dihydroxyaluminum Aminoacetate to a flask containing 50.0 ml. of 0.1 *N* hydrochloric acid, and allow the mixture to stand for 10 minutes with occasional agitation. Titrate the excess hydrochloric acid with 0.1 *N* sodium hydroxide, using bromophenol blue T.S. as the indicator: 1 g. of Dihydroxyaluminum Aminoacetate consumes not less than 140 ml. of 0.1 *N* hydrochloric acid.

Acid-neutralizing capacity—Transfer 200.0 mg. of finely powdered Dihydroxyaluminum Aminoacetate to a flask containing 25 ml. of 0.1 *N* hydrochloric acid and shake the mixture vigorously for 5 minutes. At the end of 10 minutes the pH of the mixture is above 3.0.

Mercury—Dissolve completely 1 g. of Dihydroxyaluminum Aminoacetate in 10 ml. of diluted hydrochloric acid, and shake the solution formed with 10 ml. of a solution of dithizone in carbon tetrachloride (1 in 500): no orange color develops in the carbon tetrachloride layer.

Isopropyl alcohol—Transfer about 5 g. of Dihydroxyaluminum Aminoacetate to a flask provided with a reflux condenser, add 100 ml. of approximately 0.1 *N* potassium permanganate and 10 ml. of sulfuric acid. Reflux the mixture for 30 minutes, distil, and collect 10 ml. of the distillate. To 1 ml. of the distillate add 5 drops of sodium nitroferricyanide T.S. and 2 ml. of sodium hydroxide T.S., and then add a slight excess of acetic acid: no red color is produced.

Nitrogen—Determine the nitrogen content of Dihydroxyaluminum Aminoacetate, as directed under *Nitrogen Determination, Method II*, page 821, using about 100 mg., previously dried at 130° to constant weight and accurately weighed. Each ml. of 0.1 *N* sulfuric acid is equivalent to 1.401 mg. of nitrogen. The amount of nitrogen found is not less than 9.9 percent and not more than 10.6 percent.

Assay—Transfer about 2.5 g. of Dihydroxyaluminum Aminoacetate, accurately weighed, to a 150-ml. beaker, add 15 ml. of hydrochloric acid, and warm if necessary to completely dissolve the sample. Transfer the solution quantitatively, with the aid of water, to a 500-ml. volumetric flask, dilute to volume with water, and mix. Pipet 20.0 ml. of this solution into a 250-ml. beaker, and add, in the order named and with continuous stirring, 25.0 ml. of 0.05 *M* disodium ethylenediaminetetraacetate and 20 ml. of acetic acid-ammonium acetate buffer T.S., then heat the solution near the boiling point for 5 minutes. Cool, and add 50 ml. of alcohol, and 2 ml. of dithizone T.S. Titrate with 0.05 *M* zinc sulfate until the color changes from green-violet to rose-pink. Perform a blank determination, substituting 20 ml. of water for the sample solution, and make any necessary correction. Each ml. of 0.05 *M* disodium ethylenediaminetetraacetate is equivalent to 2.549 mg. of Al_2O_3.

Packaging and storage—Preserve Dihydroxyaluminum Aminoacetate in well-closed containers.

CATEGORY—Antacid.

USUAL DOSE—**500 mg.** to **1 g.** four times a day.

USUAL DOSE RANGE—**500 mg.** to **2 g.**

Dihydroxyaluminum Aminoacetate Magma

Dihydroxyaluminum Aminoacetate Magma is a suspension which yields an amount of Al_2O_3 (aluminum oxide) equivalent to not less than 28.5 percent and not more than 35.0 percent of the labeled amount of $C_2H_6AlNO_4$.

Description—Dihydroxyaluminum Aminoacetate Magma is a white, viscous suspension, from which small amounts of water may separate on standing.

Identification—Dilute a volume of Dihydroxyaluminum Aminoacetate Magma, equivalent to 1 g. of dihydroxyaluminum aminoacetate, to 25 ml. with water, add hydrochloric acid, dropwise, until a solution results, and then filter: the filtered solution responds to the *Identification tests* under *Dihydroxyaluminum Aminoacetate,* page 236.

pH, page 824—The pH of a dilution of Dihydroxyaluminum Aminoacetate Magma in water, equivalent to 1 g. of dihydroxyaluminum aminoacetate in 25 ml., is between 6.5 and 7.5.

Acid-consuming capacity—Transfer a volume of Dihydroxyaluminum Aminoacetate Magma, equivalent to about 250 mg. of dihydroxyaluminum aminoacetate, to a 125-ml. glass-stoppered conical flask containing 50.0 ml. of 0.1 *N* hydrochloric acid, and proceed as directed in the test for *Acid-consuming capacity* under *Dihydroxyaluminum Aminoacetate,* page 236, beginning with "... allow the mixture to stand for 10 minutes ...." The amount of 0.1 *N* hydrochloric acid consumed is not less than 125 ml. and not more than 175 ml. for each g. of dihydroxyaluminum aminoacetate present in the sample used for the test.

Acid-neutralizing capacity—Transfer an amount of Dihydroxyaluminum Aminoacetate Magma, equivalent to 200 mg. of dihydroxyaluminum aminoacetate, to a 125-ml. glass-stoppered conical flask containing 25 ml. of 0.1 *N* hydrochloric acid, stopper the flask, shake vigorously during 5 minutes, and allow the mixture to stand for 10 minutes: the pH of the mixture is above 3.0.

Assay—(Shake the container mechanically for 1 hour before removing the sample.) Weigh accurately in a tared beaker a quantity of Dihydroxyaluminum Aminoacetate Magma, equivalent to about 2.5 g. of dihydroxyaluminum aminoacetate, add 15 ml. of hydrochloric acid, and boil gently for about 5 minutes. Cool and transfer the solution quantitatively, with the aid of water, to a 500-ml. volumetric flask, dilute to volume with water, mix, and filter, if necessary, to obtain a clear solution. Proceed as directed in the *Assay* under *Dihydroxyaluminum Aminoacetate,* page 236, beginning with "Pipet 20.0 ml. of this solution ...."

Packaging and storage—Preserve Dihydroxyaluminum Aminoacetate Magma in tight containers and protect it from freezing.

CATEGORY and DOSE—See Dihydroxyaluminum Aminoacetate.

Dihydroxyaluminum Aminoacetate Tablets

Dihydroxyaluminum Aminoacetate Tablets yield an amount of Al_2O_3 (aluminum oxide) equivalent to not less than 28.5 percent and not more than 35.0 percent of the labeled amount of $C_2H_6AlNO_4$.

Identification—Weigh and finely powder not less than 20 Dihydroxyaluminum Aminoacetate Tablets. Suspend a portion of the powder, equivalent to about 1 g. of dihydroxyaluminum aminoacetate, in 25 ml. of water, add hydrochloric acid, dropwise, until all the dihydroxyaluminum aminoacetate is dissolved, and filter. The solution responds to the *Identification tests* under *Dihydroxyaluminum Aminoacetate,* page 236. Retain the remaining portion of the powder for the following tests as indicated.

pH, page 824—The pH of a suspension of an accurately weighed quantity of the powder, retained in the *Identification test,* equivalent to 1 g. of dihydroxyaluminum aminoacetate in 25 ml. of water is between 6.5 and 7.5.

Acid-consuming capacity—Proceed with Dihydroxyaluminum Aminoacetate Tablets as directed in the test for *Acid-consuming capacity* under *Dihydroxyaluminum Aminoacetate,* page 236, using an amount of the powder, retained in the *Identification test,* equivalent to 250 mg. of dihydroxyaluminum aminoacetate.

Acid-neutralizing capacity—Dihydroxyaluminum Aminoacetate Tablets meet the requirements of the test for *Acid-neutralizing capacity* under *Dihydroxyaluminum Aminoacetate,* page 236, using an amount of the powder, retained in the *Identification test,* equivalent to 200 mg. of dihydroxyaluminum aminoacetate.

Disintegration, page 878—The disintegration time limit for Dihydroxyaluminum Aminoacetate Tablets is 30 minutes.

Weight variation, page 901—Dihydroxyaluminum Aminoacetate Tablets meet the requirements of the weight variation test for tablets.

Assay—Transfer to a flask an accurately weighed portion of the powder, retained in the *Identification test,* equivalent to about 2.5 g. of dihydroxyaluminum aminoacetate, add 15 ml. of hydrochloric acid and 10 ml. of water, and boil gently for about 5 minutes. Cool and transfer the solution quantitatively, with the aid of water, to a 500-ml. volumetric flask, dilute to volume with water, mix, and filter to obtain a clear solution. Proceed as directed in the *Assay* under *Dihydroxyaluminum Aminoacetate,* page 236, beginning with "Pipet 20.0 ml. of this solution. . . ."

Packaging and storage—Preserve Dihydroxyaluminum Aminoacetate Tablets in well-closed containers.

Tablets available—Dihydroxyaluminum Aminoacetate Tablets usually available contain the following amount of dihydroxyaluminum aminoacetate: 500 mg.

CATEGORY and DOSE—See Dihydroxyaluminum Aminoacetate.

Dihydroxyaluminum Sodium Carbonate*

$(HO)_2AlOCO_2Na . xH_2O$

Aluminum Sodium Carbonate Hydroxide

$CH_2AlNaO_5 . xH_2O$ Mol. wt. (anhyd.) 144.00

Dihydroxyaluminum Sodium Carbonate, dried to constant weight at 130°, contains the equivalent of not less than 34.8 percent and not more than 38.2 percent of Al_2O_3 (aluminum oxide), and the equivalent of not less than 28.5 percent and not more than 31.5 percent of CO_2 (carbon dioxide).

Description—Dihydroxyaluminum Sodium Carbonate occurs as a fine, white, odorless powder.

Solubility—Dihydroxyaluminum Sodium Carbonate is practically insoluble in water and in organic solvents. It dissolves in dilute mineral acids with the evolution of carbon dioxide.

Identification—A 1 in 20 suspension of Dihydroxyaluminum Sodium Carbonate in diluted hydrochloric acid responds to the tests for *Aluminum*, page 807, and for *Sodium*, page 810.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Dihydroxyaluminum Sodium Carbonate, previously dried to constant weight at 130°, exhibits maxima only at the same wavelengths as that of NF Dihydroxyaluminum Sodium Carbonate Reference Standard, similarly measured.

pH, page 824—The pH of a 1 in 25 suspension of Dihydroxyaluminum Sodium Carbonate in water is between 9.9 and 10.2.

Acid-consuming capacity—Mix about 250 mg. of Dihydroxyaluminum Sodium Carbonate, accurately weighed, with 100.0 ml. of 0.1 *N* hydrochloric acid, and stir with a magnetic stirrer until the sample is completely dissolved. Using a suitable electrode system, titrate the excess acid with 0.1 *N* sodium hydroxide to a pH of 3.8: the volume of 0.1 *N* acid consumed is not less than 230 ml. for each g. of Dihydroxyaluminum Sodium Carbonate.

Acid-neutralizing capacity—Mix 200.0 mg. of Dihydroxyaluminum Sodium Carbonate with 25.0 ml. of 0.1 *N* hydrochloric acid, and allow to stand for exactly 10 minutes: the pH is not less than 3.0.

Prolonged neutralization—Mix 1.000 g. of Dihydroxyaluminum Sodium Carbonate with 25.0 ml. of 0.1 *N* hydrochloric acid, stir with a magnetic stirrer for 1 minute, and then record the pH. Continue adding 0.1 *N* hydrochloric acid at the rate of 1 ml. per minute, preferably with an automatic buret, for a period of 2 hours: the final pH is not less than 3.0.

Loss on drying, page 814—Dry Dihydroxyaluminum Sodium Carbonate to constant weight at 130°: it loses not more than 14 percent of its weight.

Isopropyl alcohol—

Standard isopropyl alcohol solution and *Factor determination*—Dilute about 500 mg. of isopropyl alcohol, accurately weighed, to 500.0 ml. with water, calculate the weight, in mg., of isopropyl alcohol per ml. of the solution, and record this value as W. Transfer 5.0 ml. of this solution to a 500-ml. iodine flask, add 50 ml. of dilute sulfuric acid (1 in 2) and 5.0 ml. of 0.07 *N* potassium dichromate, and heat in a boiling water bath for 15 minutes with the flask loosely stoppered. Remove the flask from the water bath, cool slightly, add 225 ml. of water, 5 ml. of phosphoric acid, 10.0 ml. of 0.05 *N* ferrous ammonium sulfate, and 10 drops of diphenylamine T.S., and titrate with 0.07 *N* potassium dichromate to a permanent purple color. Calculate the factor, F, by the formula $W/[(V_1 \times N_1) - (10 \times N_2)]$, in which V_1 is the total volume, in ml., and N_1 is the exact normality, respectively, of the potassium dichromate solution, and N_2 is the exact normality of the ferrous ammonium sulfate solution.

Procedure—Transfer about 500 mg. of Dihydroxyaluminum Sodium Carbonate, accurately weighed, to a 500-ml. iodine flask, slowly add 10 ml. of dilute sulfuric acid (1 in 2), swirl to dissolve, and then add 5.0 ml. of 0.07 *N* potassium dichromate. Heat in a boiling water bath for 15 minutes with the flask loosely stoppered, remove the flask from the water bath, and cool slightly. Add 225 ml. of water, 5 ml.

---

* Patented. See notice, page ii.

of phosphoric acid, 10.0 ml. of 0.05 *N* ferrous ammonium sulfate, and 10 drops of diphenylamine T.S., and titrate with 0.07 *N* potassium dichromate to a permanent purple color. Calculate the percent of isopropyl alcohol in the sample taken by the formula $F \times [(V_1 \times N_1) - (10 \times N_2)]$: not more than 1 percent is found.

Mercury—Dissolve 1 g. of Dihydroxyaluminum Sodium Carbonate, accurately weighed, in 10 ml. of 3 *N* sulfuric acid contained in a glass-stoppered flask, add 5 ml. of a 1 in 100,000 solution of dithizone in carbon tetrachloride, and shake vigorously for 1 minute: no orange or yellow color develops within 2 minutes.

Assay for aluminum oxide—Transfer about 200 mg. of Dihydroxyaluminum Sodium Carbonate, previously dried at 130° to constant weight and accurately weighed, to a 250-ml. beaker, add 10 ml. of diluted nitric acid, cover the beaker, and boil for 1 minute. Add 25.0 ml. of 0.1 *M* disodium ethylenediaminetetraacetate, again boil for 1 minute and cool, then add 10 ml. of acetic acid–ammonium acetate buffer T.S., 50 ml. of acetone, and 2 ml. of dithizone T.S. Using a pH meter, adjust the pH to 4.5 by the addition of stronger ammonia T.S., and titrate with 0.05 *M* zinc nitrate, maintaining the pH at 4.5 by the addition of stronger ammonia T.S. as necessary, to an orange-pink color. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *M* disodium ethylenediaminetetraacetate is equivalent to 5.098 mg. of Al_2O_3.

Assay for carbon dioxide—

Apparatus—Assemble an apparatus consisting of a 250-ml. conical flask to which is attached, by way of a connecting tube, a separator. Attach a condenser to the flask, then to the condenser attach, by way of connecting tubes, a train of 3 absorption bulbs. Partly fill the first bulb with sulfuric acid; fill the second bulb with porous, granular anhydrous calcium sulfate; fill the third bulb three-fourths full with 20-mesh indicating carbon dioxide absorbent and the remaining one-fourth with the porous, granular anhydrous calcium sulfate. Connect the end of this train to a vacuum line.

Procedure—Transfer about 800 mg. of Dihydroxyaluminum Sodium Carbonate, previously dried at 130° to constant weight, accurately weighed, to the 250-ml. conical flask, add 50 ml. of water and 1 boiling chip, and assemble the apparatus. Position the separator so that its stem extends below the level of water in the flask. Close the stopcock of the separator, to it add 25 ml. of dilute hydrochloric acid (1 in 4), and then stopper the funnel with a small tube filled with 20-mesh indicating carbon dioxide absorbent. Weigh accurately the second bulb in the absorption train, and then connect the bulb back into the system. Open the stopcock of the separator (Caution: Do not close the stopcock during the remainder of the procedure), and apply and maintain a gentle vacuum. When the initial evolution of carbon dioxide gas has ceased, heat the contents of the flask to boiling to expel the dissolved carbon dioxide, and boil gently for 5 minutes. Remove the heat, and allow air to be drawn slowly through the system for 30 minutes. Remove the second absorption bulb, weigh accurately: the difference between the initial and final weighings of the bulb represents the weight of CO_2 in the sample taken.

Packaging and storage—Preserve Dihydroxyaluminum Sodium Carbonate in tight containers.

CATEGORY—Antacid.

USUAL DOSE RANGE—**300** to **600 mg.** as required.

Dihydroxyaluminum Sodium Carbonate Tablets

Dihydroxyaluminum Sodium Carbonate Tablets contain an amount of Al_2O_3 (aluminum oxide) equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of CH_2AlNaO_5.

Identification—A 1 in 10 suspension of powdered Dihydroxyaluminum Sodium Carbonate Tablets in diluted hydrochloric acid responds to the tests for *Aluminum*, page 807, and for *Sodium*, page 810.

Weight variation, page 901—Dihydroxyaluminum Sodium Carbonate Tablets meet the requirements of the weight variation test for tablets.

Acid-consuming capacity—Dissolve 1 Dihydroxyaluminum Sodium Carbonate Tablet in 100.0 ml. of 0.1 *N* hydrochloric acid, stirring vigorously for 15 to 20 minutes. Titrate the excess acid with 0.1 *N* sodium hydroxide to a pH of 3.8: the volume of 0.1 *N* acid consumed is not less than 75 ml.

Assay for aluminum oxide—Weigh and finely powder not less than 20 Dihydroxyaluminum Sodium Carbonate Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 200 mg. of dihydroxyaluminum sodium carbonate, to a 250-ml. beaker and continue as directed in the *Assay for aluminum oxide* under *Dihydroxyaluminum Sodium Carbonate*, page 239, beginning with "... add 10 ml. of diluted nitric acid ..." Each ml. of 0.1 *M* disodium ethylenediaminetetraacetate is equivalent to 5.098 mg. of Al_2O_3, corresponding to 14.40 mg. of CH_2AlNaO_5.

Packaging and storage—Preserve Dihydroxyaluminum Sodium Carbonate Tablets in well-closed containers.

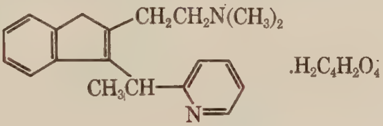
Tablets available—Dihydroxyaluminum Sodium Carbonate Tablets usually available are chewable tablets and contain the following amount of dihydroxyaluminum sodium carbonate (anhydrous): 300 mg.

Labeling—Label Dihydroxyaluminum Sodium Carbonate Tablets to indicate that they are to be chewed before swallowing.

CATEGORY and DOSE—See Dihydroxyaluminum Sodium Carbonate.

Diluted Acetic Acid, page 19
Diluted Erythrityl Tetranitrate, page 273
Diluted Hydrochloric Acid, page 350
Diluted Pentaerythritol Tetranitrate, page 526
Diluted Phosphoric Acid, page 552
Diluted Sodium Hypochlorite Solution, page 648

Dimethindene Maleate*



2-[1-[2-[2-(Dimethylamino)ethyl]inden-3-yl]ethyl]pyridine Maleate (1:1)

$C_{20}H_{24}N_2 . C_4H_4O_4$ Mol. wt. 408.50

Dimethindene Maleate contains not less than 98.0 percent and not more than 102.0 percent of $C_{20}H_{24}N_2 . C_4H_4O_4$, calculated on the dried basis.

Description—Dimethindene Maleate occurs as a white, crystalline powder having a characteristic odor. It melts with decomposition at about 161°.

Solubility—Dimethindene Maleate is sparingly soluble in water. It is soluble in chloroform, freely soluble in methanol, and insoluble in ether.

Identification—Dissolve about 5 mg. of Dimethindene Maleate in 10 ml. of alcohol in a glass-stoppered test tube, add 1 ml. of benzaldehyde and 1 ml. of tetramethylammonium hydroxide T.S., and heat on a steam bath about 30 minutes: a yellow color develops.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Dimethindene Maleate, previously dried in vacuum at 60° for 4 hours, exhibits maxima only at the same wavelengths as that of NF Dimethindene Maleate Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 100,000 solution of Dimethindene Maleate in 0.1 *N* sulfuric acid exhibits maxima and minima at the same wavelengths as that of NF Dimethindene Maleate Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance occurring at about 258 mμ, do not differ by more than 3 percent.

Loss on drying, page 814—Dry Dimethindene Maleate in vacuum at 60° for 4 hours: it loses not more than 0.1 percent of its weight.

Residue on ignition, page 858—Dimethindene Maleate yields not more than 0.1 percent of residue on ignition.

Assay—Dissolve about 400 mg. of Dimethindene Maleate, accurately weighed, in 100 ml. of glacial acetic acid, add 3 drops of a 1 in 1000 solution of *p*-naphtholbenzein in glacial acetic acid, and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 20.42 mg. of $C_{20}H_{24}N_2 . C_4H_4O_4$.

---

* Patented. See notice, page ii.

Packaging and storage—Preserve Dimethindene Maleate in tight, light-resistant containers.

Category—Antihistaminic.

Usual dose range—**1** to **2 mg.** one to three times a day.

Dimethindene Maleate Syrup

Dimethindene Maleate Syrup contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{20}H_{24}N_2 . C_4H_4O_4$.

Identification—

A: The ultraviolet absorption spectrum of the *Assay preparation*, prepared as directed in the *Assay*, exhibits maxima and minima at the same wavelengths as that of the *Standard preparation*, prepared as directed in the *Assay*.

B: Transfer to a centrifuge tube a volume of Dimethindene Maleate Syrup, equivalent to about 2 mg. of dimethindene maleate, add an equal volume of sodium hydroxide T.S., and extract with two 10-ml. portions of chloroform. Filter the chloroform extracts through a pledget of glass wool, previously rinsed with chloroform, into a beaker, and evaporate the chloroform to dryness on a steam bath. Dissolve the residue in 10 ml. of alcohol, add 1 ml. of tetramethylammonium hydroxide T.S. and 0.5 ml. of benzaldehyde, and heat on a steam bath in a stoppered test tube for about 30 minutes: a yellow color develops.

Assay—

Standard preparation—Weigh accurately 20 mg. of NF Dimethindene Maleate Reference Standard, dissolve in water to make 100.0 ml., and mix. Transfer 10.0 ml. of this solution to a separator, and continue as directed under *Assay preparation*, beginning with "Add about 5 ml. of sodium hydroxide T.S. . . ." Use the resulting solution as directed in *Procedure*.

Assay preparation—Transfer an accurately measured volume of Dimethindene Maleate Syrup, equivalent to about 2 mg. of dimethindene maleate, to a separator. Add about 5 ml. of sodium hydroxide T.S., mix, and extract with three 20-ml. portions of chloroform, shaking each portion for at least 2 minutes. Filter the chloroform extracts through a pledget of glass wool washed with chloroform into a 100-ml. volumetric flask, add chloroform to volume, and mix.

Procedure—Concomitantly determine the absorbances of the solutions in 1-cm. cells, at the maximum at about 263 mμ, with a suitable spectrophotometer, using chloroform as the blank. Record the absorbance of the *Standard preparation* as A_S and that of the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{20}H_{24}N_2 . C_4H_4O_4$ in the portion of Syrup taken by the formula $0.1C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*.

Packaging and storage—Preserve Dimethindene Maleate Syrup in well-closed, light-resistant containers, preferably at a temperature not exceeding 30°.

Syrup available—Dimethindene Maleate Syrup usually available contains the following amount of dimethindene maleate: 1 mg. in 5 ml.

Category and Dose—See Dimethindene Maleate.

Dimethindene Maleate Tablets

Dimethindene Maleate Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{20}H_{24}N_2 . C_4H_4O_4$.

Identification—

A: Transfer an amount of powdered Dimethindene Maleate Tablets, equivalent to about 1.5 mg. of dimethindene maleate, to a centrifuge tube, add about 10 ml. of sodium hydroxide T.S., and mix. Extract the mixture with 10 ml. of chloroform. Filter the extract through a pledget of glass wool previously washed with chloroform into a 100-ml. volumetric flask, add chloroform to volume, and mix. The ultraviolet absorption spectrum of this solution exhibits maxima and minima at the same wavelengths as that of NF Dimethindene Maleate Reference Standard treated in the same manner as the sample.

B: Transfer an amount of powdered Dimethindene Maleate Tablets, equivalent to about 2 mg. of dimethindene maleate, to a centrifuge tube, add 10 ml. of sodium hydroxide T.S., and mix. Extract the solution with two 10-ml. portions of chloroform, and continue as directed in *Identification test B* under *Dimethindene Maleate Syrup*, beginning with "Filter the chloroform extracts. . . ."

Disintegration, page 878—The disintegration time limit for Dimethindene Maleate Tablets is 30 minutes.

Content uniformity, *Method II*, page 799—Dimethindene Maleate Tablets meet the requirements of the content uniformity test for tablets, using the following special procedure: Transfer one tablet to a 100-ml. volumetric flask, and add about 50 ml. of 0.1 *N* sulfuric acid. Shake mechanically for about 10 minutes, and dilute to volume with 0.1 *N* sulfuric acid. Mix well and filter, discarding the first 20 ml. of filtrate. Dilute an accurately measured volume of the subsequent filtrate quantitatively and stepwise, if necessary, with 0.1 *N* sulfuric acid to provide a solution containing approximately 10 mcg. of dimethindene maleate per ml. Concomitantly determine the absorbance of this solution and of a solution of NF Dimethindene Maleate Reference Standard, in the same medium, at a concentration of about 10 mcg. per ml., in 1-cm. cells, at the maximum at about 258 mμ, with a suitable spectrophotometer, using 0.1 *N* sulfuric acid as the blank. Calculate the quantity, in mg., of $C_{20}H_{24}N_2 . C_4H_4O_4$ in the tablet by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity, in mg., of dimethindene maleate in the tablet; D is the exact concentration, in mcg. per ml., of dimethindene maleate in the sample solution, based upon the labeled quantity per tablet and the extent of dilution; C is the exact concentration, in mcg. per ml., of the Reference Standard solution; A_U is the absorbance of the sample solution; and A_S is the absorbance of the Reference Standard solution.

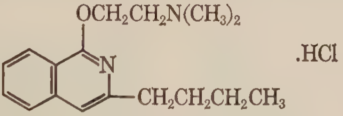
Assay—Weigh and finely powder not less than 20 Dimethindene Maleate Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 5 mg. of dimethindene maleate, to a 125-ml. separator, suspend the powder in 15 ml. of chloroform, and extract with four 10-ml. portions of 0.1 *N* sulfuric acid. Filter the extracts through a pledget of glass wool washed with 0.1 *N* sulfuric acid into a 50-ml. volumetric flask. Wash the filter with an additional 5 ml. of 0.1 *N* sulfuric acid, and add to the combined extracts. Dilute to volume with 0.1 *N* sulfuric acid, and mix. Transfer 10.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with 0.1 *N* sulfuric acid, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Dimethindene Maleate Reference Standard, in the same medium at a concentration of about 10 mcg. per ml., in 1-cm. cells, at the maximum at about 258 mμ, with a suitable spectrophotometer, using 0.1 *N* sulfuric acid as the blank. Calculate the quantity, in mg., of $C_{20}H_{24}N_2 . C_4H_4O_4$ in the portion of Tablets taken by the formula $0.5C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Dimethindene Maleate Tablets in well-closed, light-resistant containers.

Tablets available—Dimethindene Maleate Tablets usually available contain the following amount of dimethindene maleate: 1 mg.

CATEGORY and DOSE—See Dimethindene Maleate.

Dimethisoquin Hydrochloride



3-Butyl-1-[2-(dimethylamino)ethoxy]isoquinoline Monohydrochloride

$C_{17}H_{24}N_2O . HCl$ Mol. wt. 308.85

Dimethisoquin Hydrochloride, dried at 105° for 2 hours, contains not less than 98.0 percent and not more than 101.0 percent of $C_{17}H_{24}N_2O . HCl$.

Description—Dimethisoquin Hydrochloride occurs as a white to off-white, odorless, crystalline powder.

Solubility—Dimethisoquin Hydrochloride is freely soluble in water, in chloroform, and in alcohol. It is very slightly soluble in ether.

Identification—

A: A solution of Dimethisoquin Hydrochloride (1 in 100) responds to the tests for *Chloride*, page 808.

B: To 10 ml. of a solution of Dimethisoquin Hydrochloride add several drops of ammonium reineckate T.S.: a pink precipitate forms.

Melting range, page 814—Dimethisoquin Hydrochloride melts between 144° and 148°.

Infrared absorption, page 866—The infrared absorption spectrum of a mineral oil dispersion of Dimethisoquin Hydrochloride, previously dried at 105° for 2 hours, exhibits maxima only at the same wavelengths as that of NF Dimethisoquin Hydrochloride Reference Standard, similarly measured.

Ultraviolet absorption, page 866—A 1 in 20,000 solution of Dimethisoquin Hydrochloride in isopropyl alcohol exhibits absorbance maxima at 328 ± 2 mμ, 316 ± 2 mμ, and 285 ± 2 mμ, and the ratio A_{316}/A_{328} is between 1.05 and 1.12.

pH, page 824—The pH of a solution of Dimethisoquin Hydrochloride (1 in 100) is between 3.5 and 5.5.

Loss on drying, page 814—Dry Dimethisoquin Hydrochloride at 105° for 2 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Dimethisoquin Hydrochloride yields not more than 0.05 percent of residue on ignition.

Assay—Transfer about 100 mg. of Dimethisoquin Hydrochloride, previously dried at 105° for 2 hours and accurately weighed, to a 100-ml. volumetric flask, add isopropyl alcohol to volume, and mix. Pipet 5.0 ml. of this solution into a second 100-ml. volumetric flask, dilute to volume with isopropyl alcohol, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Dimethisoquin Hydrochloride Reference Standard in isopropyl alcohol, at a concentration of about 50 mcg. per ml., in 1-cm. cells, at 360 mμ and at the maximum at about 328 mμ, with a suitable spectrophotometer, using isopropyl alcohol as the blank. Calculate the quantity, in mg., of $C_{17}H_{24}N_2O.HCl$ in the Dimethisoquin Hydrochloride taken by the formula $2C \times (A_{U328} - A_{U360})/(A_{S328} - A_{S360})$, in which C is the exact concentration of the Reference Standard solution, in mcg. per ml., A_{U328} and A_{U360} are the absorbances of the sample solution at 328 mμ and 360 mμ, respectively, and A_{S328} and A_{S360} are the absorbances of the Reference Standard solution at 328 mμ and 360 mμ, respectively.

Packaging and storage—Preserve Dimethisoquin Hydrochloride in well-closed, light-resistant containers.

CATEGORY—Local anesthetic.

APPLICATION—Topically to the skin as a 0.5 percent ointment or lotion two to four times a day.

Dimethisoquin Hydrochloride Lotion

Dimethisoquin Hydrochloride Lotion contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of $C_{17}H_{24}N_2O.HCl$.

Identification—The solution from the *Assay* meets the requirement for *Ultraviolet absorption* under *Dimethisoquin Hydrochloride,* page 243.

Assay—Transfer an accurately weighed portion of Dimethisoquin Hydrochloride Lotion, equivalent to about 10 mg. of dimethisoquin hydrochloride, to a 200-ml. volumetric flask. Add about 100 ml. of isopropyl alcohol, shake, then dilute to volume with isopropyl alcohol, and mix. Filter a portion of the mixture, discarding the first 25 to 50 ml. of the filtrate. Concomitantly determine the absorbance of this solution and of a solution of NF Dimethisoquin Hydrochloride Reference Standard in isopropyl alcohol, at a concentration of about 50 mcg. per ml., in 1-cm. cells, at 360 mμ and at the maximum at about 328 mμ, with a suitable spectrophotometer, using isopropyl alcohol as the blank. Calculate the quantity, in mg., of $C_{17}H_{24}N_2O.HCl$ in the portion of the Lotion taken by the formula $0.2C \times (A_{U328} - A_{U360})/(A_{S328} - A_{S360})$, in which C is the exact concentration of the Reference Standard solution, in mcg. per ml., A_{U328} and A_{U360} are the absorbances of the sample solution at 328 mμ and 360 mμ, respectively, and A_{S328} and A_{S360} are the absorbances of the Reference Standard solution at 328 mμ and 360 mμ, respectively.

Packaging and storage—Preserve Dimethisoquin Hydrochloride Lotion in tight, light-resistant containers.

Lotion available—Dimethisoquin Hydrochloride Lotion usually available contains 0.5 percent of dimethisoquin hydrochloride.

CATEGORY and APPLICATION—See Dimethisoquin Hydrochloride.

Dimethisoquin Hydrochloride Ointment

Dimethisoquin Hydrochloride Ointment contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{17}H_{24}N_2O.HCl$.

Identification—The solution from the *Assay* meets the requirement for *Ultraviolet absorption* under *Dimethisoquin Hydrochloride*, page 243.

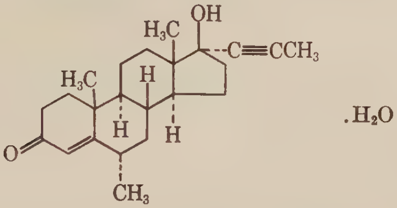
Assay—Transfer an accurately weighed portion of Dimethisoquin Hydrochloride Ointment, equivalent to about 10 mg. of dimethisoquin hydrochloride, to a 200-ml. volumetric flask, and proceed as directed in the *Assay* under *Dimethisoquin Hydrochloride Lotion*, page 244, beginning with "Add about 100 ml. of isopropyl alcohol. . . ." Calculate the quantity, in mg., of $C_{17}H_{24}N_2O.HCl$ in the portion of the Ointment taken by the formula $0.2C \times (A_{U328} - A_{U360})/(A_{S328} - A_{S360})$, in which C is the exact concentration of the Reference Standard solution, in mcg. per ml., A_{U328} and A_{U360} are the absorbances of the sample solution at 328 mμ and 360 mμ, respectively, and A_{S328} and A_{S360} are the absorbances of the Reference Standard solution at 328 mμ and 360 mμ, respectively.

Packaging and storage—Preserve Dimethisoquin Hydrochloride Ointment in tight, light-resistant containers.

Ointment available—Dimethisoquin Hydrochloride Ointment usually available contains 0.5 per cent of dimethisoquin hydrochloride.

CATEGORY and APPLICATION—See Dimethisoquin Hydrochloride.

Dimethisterone*



17β-Hydroxy-6α-methyl-17-(1-propynyl)androst-4-en-3-one

$C_{23}H_{32}O_2.H_2O$ Mol. wt. 358.52

Dimethisterone contains not less than 97.0 percent and not more than 103.0 percent of $C_{23}H_{32}O_2.H_2O$.

Description—Dimethisterone occurs as a white crystalline powder. It is odorless and tasteless. When tested by the method for *Class Ia*, page 815, it melts at about 110° with decomposition.

Solubility—Dimethisterone is soluble in alcohol and is slightly soluble in acetone and in chloroform. It is practically insoluble in water.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Dimethisterone, previously dried over silica gel for 4 hours, exhibits maxima only at the same wavelengths as that of NF Dimethisterone Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 100,000 solution of Dimethisterone in alcohol exhibits maxima and minima at the same wavelengths as that of NF Dimethisterone Reference Standard, similarly measured.

Specific rotation, page 822—The specific rotation of Dimethisterone, calculated on the anhydrous basis, determined in a solution in chloroform containing 200 mg. of Dimethisterone in each 10 ml., is between +16.5° and +21.5° at 20°.

Water, page 900—Determine the water content of Dimethisterone by the titrimetric method: not less than 4.8 percent and not more than 5.7 percent is found.

Residue on ignition, page 858—Dimethisterone yields not more than 0.1 percent of residue on ignition.

Foreign steroids and other impurities—

Standard preparation—Prepare as directed under *Steroid Chromatographic Purity*, page 876, using NF Dimethisterone Reference Standard, previously dried over silica gel for 4 hours.

Test preparation—Weigh accurately about 80 mg. of Dimethisterone, previously dried over silica gel for 4 hours, dissolve it in a sufficient quantity of a mixture of equal volumes of alcohol and chloroform to make 10.0 ml., and mix.

Procedure—Proceed as directed for *Procedure* under *Steroid Chromatographic Purity*, page 876, using a solvent system consisting of benzene and ethyl acetate (4:3), and determining the absorbance at the maximum at about 242 mμ. Calculate the percentage of chromatographic impurities by the formula $100 - [100 \times 10 \times (C/W) \times (A_U/A_S)]$, in which C is the exact concentration, in mg. per ml., of the *Standard preparation*, and W is the weight, in mg., of Dimethisterone taken: not more than 3 percent is found.

---

* Patented. See notice, page ii.

Assay—Transfer about 50 mg. of Dimethisterone, accurately weighed, to a 50-ml. volumetric flask, add dehydrated alcohol to volume, and mix. Transfer 10.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with dehydrated alcohol, and mix. Transfer to a second 100-ml. volumetric flask 10.0 ml. of this last solution, dilute to volume with dehydrated alcohol, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Dimethisterone Reference Standard, previously dried over silica gel for 4 hours, in the same medium, at a concentration of about 10 mcg. per ml., in 1-cm. cells, at the maximum at about 242 mμ, with a suitable spectrophotometer, using dehydrated alcohol as the blank. Calculate the quantity, in mg., of $C_{23}H_{32}O_2.H_2O$ in the Dimethisterone taken by the formula $5C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

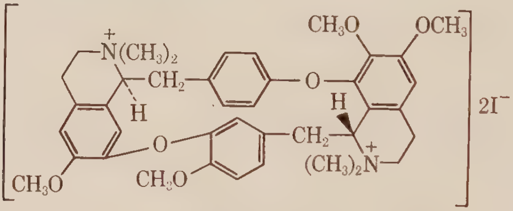
Packaging and storage—Preserve Dimethisterone in tight containers, and avoid excessive heat.

CATEGORY—Progestin.

USUAL DOSE—See Ethinyl Estradiol and Dimethisterone Tablets.

Dimethisterone and Ethinyl Estradiol Tablets, page 293

Dimethyl Tubocurarine Iodide



(+)-*O,O′*-Dimethyltubocurarine Diiodide

$C_{40}H_{48}I_2N_2O_6$ Mol. wt. 906.65

Dimethyl Tubocurarine Iodide, dried in vacuum at 75° for 8 hours, contains not less than 95.0 percent and not more than 105.0 percent of $C_{40}H_{48}I_2N_2O_6$.

Description—Dimethyl Tubocurarine Iodide occurs as an odorless, white or pale yellow crystalline powder.

Solubility—Dimethyl Tubocurarine Iodide is slightly soluble in water, in diluted hydrochloric acid, and in dilute solutions of sodium hydroxide. It is very slightly soluble in alcohol, and practically insoluble in benzene, in chloroform, and in ether.

Identification—

A: Dimethyl Tubocurarine Iodide decomposes with the evolution of gas when heated to about 257°.

B: Dissolve 50 mg. of Dimethyl Tubocurarine Iodide in 30 ml. of water. To 5 ml. of the solution add several drops of nitric acid and 1 ml. of silver nitrate T.S.: a curdy, yellow precipitate forms which is insoluble in ammonia T.S.

C: To another 5-ml. portion of the solution prepared under *Identification test B*, add 1 ml. of ammonium reineckate solution (1 in 25): a pink precipitate forms.

D: To another 5-ml. portion of the solution prepared under *Identification test B*, add about 2 ml. of a saturated solution of picric acid: a yellow precipitate forms.

Loss on drying, page 814—Dry Dimethyl Tubocurarine Iodide in vacuum at 75° for 8 hours: it loses not more than 7 percent of its weight.

Specific rotation, page 822—The specific rotation of Dimethyl Tubocurarine Iodide, calculated on the dried basis, determined in a solution in water containing 25 mg. of Dimethyl Tubocurarine Iodide in each 10 ml., is between +148° and +158°.

Tubocurarine chloride—Dissolve 10 mg. of Dimethyl Tubocurarine Iodide in 6 ml. of water. Add 3 ml. of Folin-Ciocalteu phenol T.S., previously diluted (1 in 4) with water, and adjust the volume to 25 ml. with water. Add 2 ml. of a solution of sodium carbonate (1 in 5) and heat the mixture for 3 minutes in a boiling water bath: the solution is colorless or very faintly blue.

Assay—Weigh accurately about 100 mg. of Dimethyl Tubocurarine Iodide, previously dried in vacuum at 75° for 8 hours, dissolve it in sufficient water to make 100.0 ml., and mix. Transfer 5.0 ml. of this solution to a 100-ml. volumetric flask, add 0.1 ml. of hydrochloric acid, dilute to volume with water, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Dimethyl Tubocurarine Iodide Reference Standard, in the same medium at a concentration of about 50 mcg. per ml., in 1-cm. cells, at the maximum at about 280 mμ, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg., of $C_{40}H_{48}I_2N_2O_6$ in the Dimethyl Tubocurarine Iodide taken by the formula $2C \times (A_U/A_S)$, in which C is the exact concentration, in mcg., per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Dimethyl Tubocurarine Iodide in tight containers.

Category—Skeletal muscle relaxant.

Usual dose range—Intravenous, initial, **1.5** to **8 mg.** given over a 60-second period. Maintenance, **500 mcg.** to **1 mg.** every 25 to 90 minutes.

Dimethyl Tubocurarine Iodide Injection

Dimethyl Tubocurarine Iodide Injection is a sterile solution of dimethyl tubocurarine iodide in isotonic sodium chloride solution. Each ml. exhibits a potency, in terms of mg. of NF Dimethyl Tubocurarine Iodide Reference Standard, equivalent to not less than 93.0 percent and not more than 107.0 percent of the potency stated on the label.

Identification—Evaporate an amount of Dimethyl Tubocurarine Iodide Injection, equivalent to about 5 mg. of dimethyl tubocurarine iodide, to dryness on a steam bath. Add 5 ml. of water and again evaporate to dryness. Repeat the process with another 5 ml. of water. Dissolve the residue in 10 ml. of water. The solution responds to *Identification tests B, C,* and *D* under *Dimethyl Tubocurarine Iodide,* page 246.

Other requirements—Dimethyl Tubocurarine Iodide Injection meets the requirements under *Injections,* page 810.

Assay—

Standard solution—Dissolve NF Dimethyl Tubocurarine Iodide Reference Standard in sufficient water to make a solution having a final concentration of 50.0 mcg. per ml. Preserve in a cold place in a tight container, and use it within 90 days after preparation.

The rabbits—Use healthy rabbits which have been maintained without loss of weight for at least 1 week on a uniform, unrestricted diet and which weigh between 1.5 and 4.0 kg., except that in any one assay the weight of the heaviest rabbit shall be not more than twice that of the lightest rabbit. If the rabbits have not been used for this assay within the previous 7 days, condition them by the injection of one head-drop dose of the *Standard solution* in accordance with directions given below, on at least two different days during the preceding week. Use the animals daily if desired, but do not use them more than once each day.

Procedure—Divide the rabbits into two equal groups of at least eight each. Suitably restrain them in a prone position with the head free, taking precautions to prevent struggling. Place the *Standard solution* in a small-bore buret joined with flexible tubing to a hypodermic needle inserted in a marginal ear vein, and inject a 0.1-ml. dose of the solution every 15 seconds into each rabbit of the first group until head-drop occurs. Replace any rabbit which struggles vigorously during the injection. Consider that head-drop is complete if the rabbit, in response to a light tap on the back, is incapable of raising its head when it has fallen forward or of righting its head when laid on one cheek by the operator. Record the number of doses injected. In a similar manner, inject each rabbit of the second group with Dimethyl Tubocurarine Iodide Injection diluted with water to give approximately the same concentration as the *Standard solution.* Record the number of doses injected.

Repeat the procedure on the following day but inject the *Standard solution* into the group which previously received the Injection and vice versa.

Calculation of the potency—For each rabbit which received both the *Standard solution* and the Dimethyl Tubocurarine Iodide Injection, divide the number of doses injected of the *Standard solution* by the number of doses injected of the Injection. Find the logarithm of each quotient so obtained and calculate the average (L) of these logarithms. The potency expressed in mg. of dimethyl tubocurarine iodide (as represented by

NF Dimethyl Tubocurarine Iodide Reference Standard) per ml., is given by the formula:

$$\text{Potency} = \frac{0.05 \times \text{antilog } L}{\text{Volume of Injection in each ml. of diluted Injection}}$$

For the group of rabbits which first received the *Standard solution* subtract the smallest value of the logarithm from the largest value, thus obtaining R_1, the range. In a similar manner, obtain the value R_2, the range in the logarithms for the group which received the Injection first, and calculate the standard error of the assay by the following formula:

$$\text{Standard error of the Assay} = c \times \text{potency} \times (R_1 + R_2)$$

in which c has a value determined by N, the total number of rabbits which received both the *Standard solution* and the Injection, as follows:

N	14	16	18	20
c	.114	.101	.091	.084
N	22	24	26	28
c	.077	.072	.068	.064

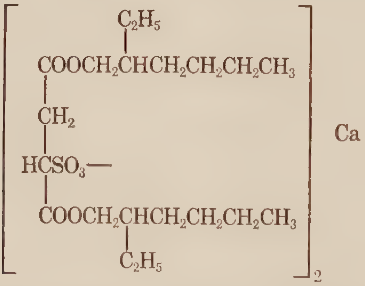
If the standard error exceeds 2.5 percent of the labeled potency, repeat the assay or use more rabbits until the standard error of the combined result is not more than 2.5 percent.

Packaging and storage—Preserve Dimethyl Tubocurarine Iodide Injection in single-dose or multiple-dose containers, preferably of Type I glass. Phenol, 0.5 percent, or some other suitable bacteriostatic substance, must be added to the Injection in multiple-dose containers.

Injections available—Dimethyl Tubocurarine Iodide Injection usually available contains the following amounts of dimethyl tubocurarine iodide: 5 mg. in 10 ml., 10 mg. in 10 ml., 40 mg. in 20 ml., and 50 mg. in 50 ml.

CATEGORY and DOSE—See Dimethyl Tubocurarine Iodide.

Dioctyl Calcium Sulfosuccinate*



Bis(2-ethylhexyl) *S*-Calcium Sulfosuccinate

$C_{40}H_{74}CaO_{14}S_2$ Mol. wt. 883.24

Dioctyl Calcium Sulfosuccinate contains not less than 91.0 percent and not more than 100.5 percent of $C_{40}H_{74}CaO_{14}S_2$, calculated on the dried basis.

Description—Dioctyl Calcium Sulfosuccinate occurs as a white, gelatinous solid having the characteristic odor of octyl alcohol. It is free of the odor of other solvents.

Solubility—Dioctyl Calcium Sulfosuccinate is slightly soluble in water. It is freely soluble in alcohol and glycerin, and is very soluble in polyethylene glycol 400 and in corn oil.

Clarity of solution—Dissolve 25 g. of Dioctyl Calcium Sulfosuccinate in 94 ml. of alcohol: the solution does not develop a haze within 24 hours.

Loss on drying, page 814—Dry Dioctyl Calcium Sulfosuccinate at 105° for 2 hours: it loses not more than 5 percent of its weight.

Residue on ignition, page 858—Dioctyl Calcium Sulfosuccinate yields not less than 14.0 percent and not more than 16.0 percent of residue on ignition, calculated on the anhydrous basis.

Arsenic—A *Test preparation* prepared with 5 g. of Dioctyl Calcium Sulfosuccinate, as directed for organic compounds, meets the requirements of the *Arsenic Test,* page 777 (2 parts per million As).

Heavy metals, page 806—Transfer

---

* Patented. See notice, page ii.

2.0 g. of Dioctyl Calcium Sulfosuccinate to a platinum crucible, and ignite until free from carbon. Cool, moisten the residue obtained with 1 ml. of hydrochloric acid, and evaporate to dryness on a steam bath. Add 2 ml. of diluted acetic acid, digest on a steam bath for 5 minutes, filter into one of a pair of matched 50-ml. color-comparison tubes, and wash the residue with sufficient water to make 25 ml.: the heavy metals limit for Dioctyl Calcium Sulfosuccinate is 10 parts per million.

Assay—

Assay preparation—Transfer 3.000 g. of Dioctyl Calcium Sulfosuccinate to a 400-ml. beaker. Add 50 ml. of hot water, and stir until a paste is formed. Add two additional 50-ml. portions of hot water, and stir until the sample is completely dissolved. [Note—Dioctyl Calcium Sulfosuccinate dissolves slowly in water, and solution must be complete at this point.] Cool the solution to room temperature, transfer it quantitatively, with the aid of water, to a 1000-ml. volumetric flask, dilute to volume with water, and mix.

Tetra-n-butylammonium iodide solution—Transfer 1.250 g. of tetra-*n*-butylammonium iodide to a 500-ml. volumetric flask, dilute to volume with water, and mix.

Salt solution—Transfer 100 g. of anhydrous sodium sulfate and 10 g. of sodium carbonate to a 400-ml. beaker, and add sufficient water to dissolve the two salts. Transfer the solution to a 1000-ml. volumetric flask, dilute to volume, and mix.

Procedure—Pipet 25.0 ml. of *Tetra-n-butylammonium iodide solution* into a 250-ml. conical flask. Transfer 50 ml. of the *Salt solution*, 25 ml. of chloroform, and 0.4 ml. of bromophenol blue T.S. to the flask. Stopper, and shake vigorously for 20 to 30 seconds or until all of the blue color goes into the lower chloroform layer. Titrate the solution with the *Assay preparation*, until about 1 ml. from the end-point, and shake the stoppered flask vigorously for about 2 minutes. Continue the titration in 2-drop increments, shaking the stoppered flask vigorously for about 10 seconds after each addition, and then allow the flask to stand about 10 seconds or until the chloroform layer has separated. Continue the titration until the blue color is completely absent in the chloroform layer. Calculate the percent of Dioctyl Calcium Sulfosuccinate by the formula $2490/V$, in which V is the number of ml. of the *Assay preparation* required to reach the end-point, and 2490 is a factor derived by the expression $[1.250 \times (25/500) \times (883.24/2 \times 369.4) \times 100] / [3.000/1000]$.

Packaging and storage—Preserve Dioctyl Calcium Sulfosuccinate in well-closed containers.

Category—Wetting agent; nonlaxative fecal matter softener.

Usual dose—**240 mg.**

Dioctyl Calcium Sulfosuccinate Capsules

Dioctyl Calcium Sulfosuccinate Capsules contain not less than 85.0 percent and not more than 115.0 percent of the labeled amount of $C_{40}H_{74}CaO_{14}S_2$.

Identification—Ash the contents of one Dioctyl Calcium Sulfosuccinate Capsule, dissolve the residue in 10 ml. of 1 *N* hydrochloric acid, and filter: the filtrate responds to the tests for *Calcium*, page 808.

Weight variation, page 901—Dioctyl Calcium Sulfosuccinate Capsules meet the requirements of the weight variation test for capsules, using chloroform as the solvent in the procedure for *Soft capsules*.

Assay—

Tetra-n-butylammonium iodide solution and *Salt solution*—Prepare as directed in the *Assay* under *Dioctyl Calcium Sulfosuccinate*, page 248.

Assay preparation—Cut in half 10 Dioctyl Calcium Sulfosuccinate Capsules, and transfer the capsule halves to a 100-ml. beaker. Rinse the cutting tool with chloroform, collecting the washings in the beaker. To the beaker add about 40 ml. of chloroform, stir for about 30 minutes, and decant the chloroform into a 100-ml. volumetric flask. Rinse the capsule shells and the beaker with several small portions of chloroform, adding the rinsings to the flask. Dilute to volume with chloroform, and mix.

Procedure—Transfer an accurately measured volume of the *Assay preparation*, equivalent to about 50 mg. of dioctyl calcium sulfosuccinate, to a 250-ml. glass-stoppered conical flask. Add chloroform, if necessary, to make 10 ml., and then add to the flask 50 ml. of *Salt solution* and 0.2 ml. of bromophenol blue T.S. Mix, and titrate with *Tetra-n-butylammonium iodide solution* until about 1 ml. from the end-point, and shake the stoppered flask vigorously for about 2 minutes. Continue the titration in 2-drop increments, shaking vigorously for about 10 seconds after each addition, and then allow the flask to stand about 10 seconds or until the chloroform layer has separated. Continue the titration until the chloroform layer assumes a blue color. Each ml. of *Tetra-n-butylammonium iodide solution* is equivalent to 2.989 mg. of $C_{40}H_{74}CaO_{14}S_2$.

Packaging and storage—Preserve Dioctyl Calcium Sulfosuccinate Capsules in tight containers, and store in a cool, dry place.

Capsules available—Dioctyl Calcium Sulfosuccinate Capsules usually available contain the following amounts of dioctyl calcium sulfosuccinate: 50 and 240 mg.

CATEGORY and DOSE—See Dioctyl Calcium Sulfosuccinate.

Dioctyl Sodium Sulfosuccinate Solution*

Dioctyl Sodium Sulfosuccinate Solution contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{20}H_{37}NaO_7S$.

Description—Dioctyl Sodium Sulfosuccinate Solution is a clear liquid having a bitter taste and a faint, characteristic odor. It is colorless unless a color has been added.

Identification—Evaporate to dryness on a steam bath a volume of Dioctyl Sodium Sulfosuccinate Solution equivalent to about 50 mg. of dioctyl sodium sulfosuccinate. Dry the residue at 105° for 30 minutes, cool, and dissolve the residue in 10 ml. of chloroform. The infrared absorption spectrum of this solution exhibits maxima at the same wavelengths as that of USP Dioctyl Sodium Sulfosuccinate Reference Standard, similarly measured.

pH, page 824—The pH of Dioctyl Sodium Sulfosuccinate Solution is between 5.8 and 6.9.

Assay—

Assay preparation—Transfer an accurately measured volume of Dioctyl Sodium Sulfosuccinate Solution, equivalent to about 300 mg. of dioctyl sodium sulfosuccinate, to a 100 ml. volumetric flask, dilute to volume with water, and mix.

Tetra-n-butylammonium iodide solution—Transfer 1.250 g. of tetra-*n*-butylammonium iodide to a 500-ml. volumetric flask. Dilute to volume with water, and mix.

Salt solution—Transfer 100 g. of anhydrous sodium sulfate and 10 g. of sodium carbonate to a 1000-ml. volumetric flask, add sufficient water to dissolve the two salts, dilute to volume with water, and mix.

Procedure—Pipet 25.0 ml. of *Tetra-n-butylammonium iodide solution* into a 250-ml. conical flask. Transfer 50.0 ml. of the *Salt solution*, 25 ml. of chloroform, and 0.4 ml. of bromophenol blue T.S. to the flask. Stopper and shake vigorously for 20 to 30 seconds or until all of the blue color goes into the lower chloroform layer. Titrate the *Tetra-n-butylammonium iodide solution* with the *Assay preparation*, using a 50-ml. buret, until about 1 ml. from the end-point, and shake the stoppered flask vigorously for about 2 minutes. Continue the titration in 2-drop increments, shaking the stoppered flask vigorously for about 10 seconds after each addition, and then allow the flask to stand about 10 seconds or until the chloroform layer has separated. Continue the titration until the blue color is completely absent in the chloroform layer. Calculate the quantity, in mg., of $C_{20}H_{37}NaO_7S$ in each ml. of the Solution taken by the formula $7522/vV$, in which v is the volume, in ml., of the Solution taken, V is the volume, in ml., of the *Assay preparation* required to reach the end-point, and 7522 is a factor derived by the expression $[1250 \times (26/500) \times (444.6/369.4) \times 100]$.

Packaging and storage—Preserve Dioctyl Sodium Sulfosuccinate Solution in tight containers.

Solution available—Dioctyl Sodium Sulfosuccinate Solution usually available contains the following amount of dioctyl sodium sulfosuccinate: 10 mg. in 1 ml.

CATEGORY—Fecal matter softener.

USUAL DOSE RANGE OF DIOCTYL SODIUM SULFOSUCCINATE—**50 to 200 mg.**

---

* Patented. See notice, page ii.

Dioctyl Sodium Sulfosuccinate Syrup

Dioctyl Sodium Sulfosuccinate Syrup contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{20}H_{37}NaO_7S$.

Identification—

Tetra-n-butylammonium iodide solution and *Salt solution*—Prepare as directed in the *Assay* under *Dioctyl Sodium Sulfosuccinate Solution*, page 250.

Procedure—Place 100 ml. of *Salt solution* and 50 ml. of chloroform in a 250-ml. glass-stoppered cylinder, add 6 drops of bromophenol blue T.S. and 0.7 ml. of *Tetra-n-butylammonium iodide solution*, and mix for 10 seconds. The blue indicator is transferred to the chloroform layer. Slowly add a volume of Dioctyl Sodium Sulfosuccinate Syrup, equivalent to about 40 mg. of dioctyl sodium sulfosuccinate, to the cylinder, and then shake for 30 seconds: the indicator migrates to the aqueous layer, giving it a violet color.

pH, page 824—The pH of Dioctyl Sodium Sulfosuccinate Syrup is between 5.5 and 6.5.

Assay—

Standard preparation—Transfer about 100 mg. of USP Dioctyl Sodium Sulfosuccinate Reference Standard, previously dried at 105° for 2 hours and accurately weighed, to a 100-ml. volumetric flask, dissolve in 2.5 ml. of alcohol, dilute to volume with water, and mix. Transfer 10.0 ml. of this solution to a 1000-ml. volumetric flask, dilute to volume with water, and mix.

Assay preparation—Transfer an accurately measured volume of Dioctyl Sodium Sulfosuccinate Syrup, equivalent to about 100 mg. of dioctyl sodium sulfosuccinate, to a 1000-ml. volumetric flask, allowing the pipet to drain for 15 minutes. Dilute to volume with water, and mix. Transfer 10.0 ml. of the solution to a 100-ml. volumetric flask, dilute to volume with water, and mix.

Procedure—Transfer 20.0 ml. each of the *Standard preparation* and of the *Assay preparation* to separate separators, and transfer 20 ml. of water to a third separator to serve as the blank. To each separator add 5 drops of hydrochloric acid, mix by swirling, add 1.0 ml. of methylene blue solution (1 in 1000), and mix by swirling. To each separator add 20.0 ml. of chloroform, and shake vigorously for 5 minutes. Wash each chloroform solution, in clean separators, with 20 ml. of water, shaking vigorously for 60 seconds. Discard the washings, and filter each chloroform solution through cotton into a 100-ml. volumetric flask, washing each separator with two 10-ml. portions of chloroform and filtering the washings into each flask. Dilute each flask to volume with chloroform, and mix. Concomitantly determine the absorbance of the solutions, in 1-cm. cells, at the maximum at about 650 mμ, with a suitable spectrophotometer, using the blank to set the instrument. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{20}H_{37}NaO_7S$ in each ml. of the Syrup taken by the formula $10 \times (C/V) \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*, and V is the volume, in ml., of the Syrup taken.

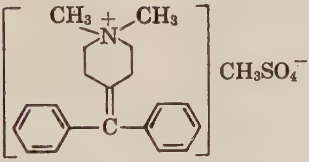
Packaging and storage—Preserve Dioctyl Sodium Sulfosuccinate Syrup in tight, light-resistant containers.

Syrup available—Dioctyl Sodium Sulfosuccinate Syrup usually available contains the following amount of dioctyl sodium sulfosuccinate: 20 mg. in 5 ml.

Category—Fecal matter softener.

Usual dose of dioctyl sodium sulfosuccinate—**50** to **200 mg.**

Diphemanil Methylsulfate*



4-(Diphenylmethylene)-1,1-dimethylpiperidinium Methyl Sulfate

$C_{21}H_{27}NO_4S$ Mol. wt. 389.52

Diphemanil Methylsulfate contains not less than 97.0 percent and not more than 103.0 percent of $C_{21}H_{27}NO_4S$, calculated on the dried basis.

Description—Diphemanil Methylsulfate occurs as a white or nearly white, crystalline solid, possessing a bitter taste, and a faint characteristic odor. It is stable to heat and to light, and is somewhat hygroscopic.

Solubility—Diphemanil Methylsulfate is sparingly soluble in water, in alcohol, and in chloroform.

Identification—Prepare a solution of Diphemanil Methylsulfate in methanol containing 1 mg. per ml. On a line parallel to and not more than 2 cm. from the edge of a suitable thin-layer chromatographic plate (see page 791), coated with a 0.25-mm. layer of chromatographic silica gel mixture, spot 10 µl. of this solution and 10 µl. of a methanol solution of NF Diphemanil Methylsulfate Reference Standard containing 1 mg. per ml. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of hydrochloric acid and methoxyethanol (1:100) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by examination under shortwave ultraviolet light: the R_f value of the main spot obtained from the sample corresponds to that obtained with the Reference Standard.

---

* Patented. See notice, page ii.

Melting range, page 814—Diphemanil Methylsulfate melts between 189° and 196°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Diphemanil Methylsulfate, previously dried at 105° for 4 hours, exhibits maxima only at the same wavelengths as that of NF Diphemanil Methylsulfate Reference Standard, similarly measured.

pH, page 824—The pH of a solution of Diphemanil Methylsulfate (1 in 100) is between 4.0 and 6.0.

Loss on drying, page 814—Dry Diphemanil Methylsulfate at 105° for 4 hours: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Diphemanil Methylsulfate yields not more than 0.1 percent of residue on ignition. Retain the residue from a 1-g. sample for the *Heavy metals test.*

Heavy metals, page 806—Dissolve the residue resulting from the *Residue on ignition test* in 23 ml. of water and add 2 ml. of diluted acetic acid: the heavy metals limit for Diphemanil Methylsulfate is 20 parts per million.

Assay—

Buffer solution—Dissolve 9.23 g. of Na_2HPO_4 in 800 ml. of water, adjust to pH 4 with saturated citric acid solution, dilute to 1000.0 ml. with water, and mix.

Standard preparation—Dissolve about 50 mg. of NF Diphemanil Methylsulfate Reference Standard, accurately weighed, in sufficient water to make 500.0 ml., and mix.

Assay preparation—Dissolve about 50 mg. of Diphemanil Methylsulfate, accurately weighed, in sufficient water to make 500.0 ml., and mix.

Procedure—Treat the standard and the sample solutions and the blank similarly and concurrently. Transfer 10.0 ml. each of the *Standard preparation* and the *Assay preparation* and of *Buffer solution* to separate 250-ml. separators, add to each 40 ml. of *Buffer solution*, 10 ml. of a solution of bromophenol blue in chloroform (1 in 1000), and 60 ml. of chloroform. Shake the separators vigorously for 2 minutes, let stand for 15 minutes, then withdraw the chloroform layers through chloroform-washed cotton into 100-ml. volumetric flasks. Repeat the extraction with 20 ml. of chloroform, adding the filtered chloroform extracts to the respective volumetric flasks, dilute to volume with chloroform, and mix. Without delay, concomitantly determine the absorbance of the solutions in 1-cm. cells, at the maximum at about 412 mµ with a suitable spectrophotometer, using the blank to set the instrument. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{21}H_{27}NO_4S$ in the portion of Diphemanil Methylsulfate taken by the formula $0.5C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation.*

Packaging and storage—Preserve Diphemanil Methylsulfate in tight containers.

CATEGORY—Anticholinergic.

USUAL DOSE—Oral, **100 mg.** every 4 to 6 hours. Intramuscular and subcutaneous, **25 mg.** four times a day.

USUAL DOSE RANGE—Oral, **50** to **200 mg.**

Diphemanil Methylsulfate Injection

Diphemanil Methylsulfate Injection is a sterile solution of diphemanil methylsulfate in a suitable aqueous vehicle. It contains not less than 92.5 percent and not more than 107.5 percent of the labeled amount of $C_{21}H_{27}NO_4S$.

Identification—Dilute Diphemanil Methylsulfate Injection with methanol to obtain a solution containing about 1 mg. per ml. Proceed as directed in the *Identification test* under *Diphemanil Methylsulfate*, page 251, beginning with "On a line parallel to . . . ."

pH, page 824—The pH of Diphemanil Methylsulfate Injection is between 3.0 and 5.0.

Other requirements—Diphemanil Methylsulfate Injection meets the requirements under *Injections*, page 810.

Assay—

Buffer solution—Prepare as directed in the *Assay* under *Diphemanil Methylsulfate*, page 251.

Standard preparation—Prepare as directed in the *Assay* under *Diphemanil Methylsulfate*, page 251.

Assay preparation—Transfer an accurately measured volume of Diphemanil Methylsulfate Injection, equivalent to about 50 mg. of diphemanil methylsulfate, to a 500-ml. volumetric flask, add water to volume, and mix.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Diphemanil Methylsulfate*, page 251. Calculate the quantity, in mg., of $C_{21}H_{27}NO_4S$ in each ml. of the Injection taken by the formula $0.5 \times (C/V) \times (A_U/A_S)$, in which C is the exact concentration of the *Standard preparation*, in mcg. per ml., V is the volume, in ml., of the Injection taken, A_U is the absorbance of the solution from the *Sample preparation*, and A_S is the absorbance of the solution from the *Standard preparation*.

Packaging and storage—Preserve Diphemanil Methylsulfate Injection in single-dose or multiple-dose containers, preferably of Type I glass.

Injections available—Diphemanil Methylsulfate Injection usually available contains the following amounts of diphemanil methylsulfate: 25 mg. in 1 ml., and 250 mg. in 10 ml.

CATEGORY and DOSE—See Diphemanil Methylsulfate.

Diphemanil Methylsulfate Tablets

Diphemanil Methylsulfate Tablets contain not less than 92.5 percent and not more than 107.5 percent of the labeled amount of $C_{21}H_{27}NO_4S$.

Identification—Shake a quantity of finely powdered Diphemanil Methylsulfate Tablets, equivalent to about 25 mg. of diphemanil methylsulfate, with 25 ml. of methanol for 15 minutes, and filter. Proceed as directed in the *Identification test* under *Diphemanil Methylsulfate*, page 251, beginning with "On a line parallel to . . . ."

Disintegration, page 878—The disintegration time limit for Diphemanil Methylsulfate Tablets is 10 minutes.

Weight variation, page 901—Diphemanil Methylsulfate Tablets meet the requirements of the weight variation test for tablets.

Assay—

Buffer solution—Prepare as directed in the *Assay* under *Diphemanil Methylsulfate*, page 251.

Standard preparation—Prepare as directed in the *Assay* under *Diphemanil Methylsulfate*, page 251.

Assay preparation—Weigh and finely powder not less than 10 Diphemanil Methylsulfate Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg. of diphemanil methylsulfate, in a 500-ml. volumetric flask, add 150 ml. of water, shake mechanically for 15 minutes, add water to volume, mix, and filter through a dry filter, discarding the first 25 ml. of filtrate.

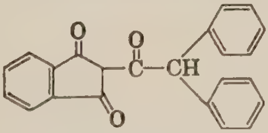
Procedure—Proceed as directed for *Procedure* in the *Assay* under *Diphemanil Methylsulfate*, page 251. Calculate the quantity, in mg., of $C_{21}H_{27}NO_4S$ in the portion of the Tablets taken by the formula $0.5\,C \times (A_U/A_S)$, in which C is the exact concentration of the *Standard preparation*, in mcg. per ml., A_U is the absorbance of the solution from the *Assay preparation*, and A_S is the absorbance of the solution from the *Standard preparation*.

Packaging and storage—Preserve Diphemanil Methylsulfate Tablets in tight containers.

Tablets available—Diphemanil Methylsulfate Tablets usually available contain the following amount of diphemanil methylsulfate: 100 mg.

CATEGORY and DOSE—See Diphemanil Methylsulfate.

Diphenadione*



2-(Diphenylacetyl)-1,3-indandione

$C_{23}H_{16}O_3$ Mol. wt. 340.38

---

* Patented. See notice, page ii.

Diphenadione contains not less than 98.0 percent and not more than 100.5 percent of $C_{23}H_{16}O_3$, calculated on the dried basis.

Description—Diphenadione occurs as yellow crystals or as a yellow, crystalline powder. It is odorless.

Solubility—Diphenadione is practically insoluble in water. It is soluble in benzene, in ether, and in glacial acetic acid. It is slightly soluble in acetone and in alcohol.

Identification—

A: To a saturated solution of Diphenadione in 0.01 *N* sodium hydroxide add an equal volume of 10 *N* sodium hydroxide: a yellow precipitate is formed.

B: Dissolve 50 mg. of Diphenadione in 1.5 ml. of alcohol and add 1 drop of ferric chloride T.S.: a brick-red suspension is formed.

Melting range, page 814—Diphenadione melts between 144° and 150°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Diphenadione, previously dried at 105° for 4 hours, exhibits maxima only at the same wavelengths as that of NF Diphenadione Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 200,000 solution of Diphenadione in a mixture of one volume of 0.1 *N* sulfuric acid and 19 volumes of alcohol exhibits maxima and minima at the same wavelengths as that of NF Diphenadione Reference Standard, similarly measured.

Loss on drying, page 814—Dry Diphenadione at 105° for 4 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Diphenadione yields not more than 0.1 percent of residue on ignition.

Assay—Transfer to a 100-ml. volumetric flask about 50 mg. of Diphenadione, accurately weighed, add a mixture of one volume of 0.1 *N* sulfuric acid and 19 volumes of alcohol to volume, and mix. Transfer 10.0 ml. of this solution to a second 100-ml. volumetric flask, dilute to volume with the alcoholic sulfuric acid, and mix. Transfer to a third 100-ml. volumetric flask 10.0 ml. of this last solution, dilute to volume with the alcoholic sulfuric acid, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Diphenadione Reference Standard, in the same medium, at a concentration of about 5 mcg. per ml., in 1-cm. cells, at the maximum at about 289 mμ, with a suitable spectrophotometer, using the alcoholic sulfuric acid as the blank. Calculate the quantity, in mg., of $C_{23}H_{16}O_3$ in the Diphenadione taken by the formula $10C \times (A_U/A_S)$, in which C is the exact concentration of the Reference Standard solution, in mcg. per ml., A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Diphenadione in tight, light-resistant containers.

CATEGORY—Anticoagulant.

USUAL DOSE—Initial, **20** to **30 mg.** the first day, **10** to **15 mg.** the second day. Maintenance, **2.5** to **5 mg.** daily.

USUAL DOSE RANGE—**2.5** to **30 mg.**

Diphenadione Tablets

Diphenadione Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{23}H_{16}O_3$.

Identification—Digest with 50 ml. of benzene for 15 minutes an amount of powdered Diphenadione Tablets, equivalent to about 20 mg. of diphenadione. Filter the mixture and evaporate the filtrate to dryness on a steam bath: the diphenadione thus obtained meets the requirement for *Infrared absorption* under *Diphenadione*, page 253.

Disintegration, page 878—The disintegration time limit for Diphenadione Tablets is 30 minutes.

Content uniformity, *Method I*, page 799—Diphenadione Tablets meet the requirements of the content uniformity test for tablets.

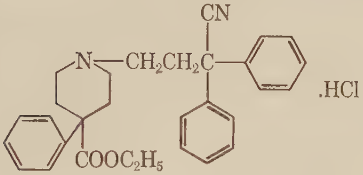
Assay—Weigh and finely powder not less than 10 Diphenadione Tablets. Weigh accurately a portion of the powder equivalent to about 5 mg. of diphenadione, and transfer completely, with the aid of 15 ml. of water, to a separator. Extract the diphenadione completely, using four 20-ml. portions of chloroform, filtering each portion through chloroform-washed cotton into a 100-ml. volumetric flask. Add chloroform to volume, and mix. Pipet 10.0 ml. of this solution into a 100-ml. volumetric flask and evaporate the chloroform on a steam bath just to dryness. Dissolve the residue in 25 ml. of 0.005 *N* sulfuric acid in alcohol, warming on a steam bath to ensure complete solution of the diphenadione, and cool to room temperature. Add alcoholic sulfuric acid to volume, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Diphenadione Reference Standard, in the same medium, at a concentration of about 5 mcg. per ml., in 1-cm. cells, at the maximum at about 289 mμ, with a suitable spectrophotometer, using the alcoholic sulfuric acid as the blank. Calculate the quantity, in mg., of $C_{23}H_{16}O_3$ in the portion of the Tablets taken by the formula $C \times (A_U/A_S)$, in which C is the exact concentration of the Reference Standard solution, in mcg. per ml., A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Diphenadione Tablets in tight containers.

Tablets available—Diphenadione Tablets usually available contain the following amount of diphenadione: 5 mg.

CATEGORY and DOSE—See Diphenadione.

Diphenoxylate Hydrochloride*



Ethyl 1-(3-Cyano-3,3-diphenylpropyl)-4-phenylisonipecotate Hydrochloride

$C_{30}H_{32}N_2O_2 . HCl$ Mol. wt. 489.06

Diphenoxylate Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of $C_{30}H_{32}N_2O_2 . HCl$, calculated on the dried basis.

Description—Diphenoxylate Hydrochloride occurs as a white, odorless, crystalline powder. A saturated solution has a pH of about 3.3.

Solubility—Diphenoxylate Hydrochloride is slightly soluble in water and in isopropanol, soluble in methanol, sparingly soluble in alcohol and acetone, and freely soluble in chloroform. It is practically insoluble in ether and in solvent hexane.

Identification—A solution of Diphenoxylate Hydrochloride (1 in 100) responds to the tests for *Chloride*, page 808.

Melting range, page 814—Diphenoxylate Hydrochloride melts between 220° and 226°.

Infrared absorption, page 866—The infrared absorption spectrum of a 1 in 10 solution of Diphenoxylate Hydrochloride in chloroform, determined in a 0.2-mm. cell, exhibits maxima at the following wavelengths, stated in μ: 3.24 (*sh*), 3.33 (*s*), 4.30 (*vs bd*), 5.76 (*v s*), 6.23 (*m*), 6.28 (*sh*), 6.64 (*s*), 6.76 (*sh*), 6.85 (*s*), 6.96 (*sh*), 7.08 (*m*), 7.22 (*m*), 7.61 (*m bd*), 8.48 (*m*), 8.60 (*w*), 8.73 (*s*), 8.93 (*w bd*), 9.12 (*sh*), 9.24 (*m*), 9.54 (*sh*), 9.77 (*m*), 9.98 (*m bd*), 10.17 (*m*), 10.54 (*w bd*), 10.90 (*m bd*), 11.30 (*v w bd*), 11.60 (*m bd*), 11.96 (*w bd*).

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 2000 solution of Diphenoxylate Hydrochloride in 0.01 N methanolic hydrochloric acid exhibits maxima at 252 ± 2 mμ, 257 ± 2 mμ, and at 264 ± 2 mμ. The ratio A_{257}/A_{252} is 1.2 ± 0.1.

Loss on drying, page 814—Dry Diphenoxylate Hydrochloride at 105° for 2 hours: it loses not more than 0.5 percent of its weight.

Assay—Dissolve about 300 mg. of Diphenoxylate Hydrochloride, accurately weighed, in 75 ml. of glacial acetic acid, add 4 ml. of mercuric acetate T.S., and titrate with 0.1 N perchloric acid in glacial acetic acid, determining the end-point potentiometrically. Each ml. of 0.1 N perchloric acid is equivalent to 48.91 mg. of $C_{30}H_{32}N_2O_2 . HCl$.

Packaging and storage—Preserve Diphenoxylate Hydrochloride in well-closed containers.

CATEGORY—Antidiarrheal (narcotic).

USUAL DOSE—**5 mg.** four times a day.

USUAL DOSE RANGE—**5** to **40 mg.** per day.

---

* Patented. See notice, page ii.

Diphenoxylate Hydrochloride and Atropine Sulfate Solution

Diphenoxylate Hydrochloride and Atropine Sulfate Solution contains not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{30}H_{32}N_2O_2 . HCl$ (diphenoxylate hydrochloride), and not less than 80.0 percent and not more than 120.0 percent of the labeled amount of $(C_{17}H_{23}NO_3)_2 . H_2SO_4 . H_2O$ (atropine sulfate).

Identification—Transfer a volume of Diphenoxylate Hydrochloride and Atropine Sulfate Solution, equivalent to about 100 mg. of diphenoxylate hydrochloride, to a separator, add 1 ml. of diluted hydrochloric acid and sufficient water to make about 100 ml., and continue as directed for *Identification test A* under *Diphenoxylate Hydrochloride and Atropine Sulfate Tablets*, page 257.

pH, page 824—The pH of Diphenoxylate Hydrochloride and Atropine Sulfate Solution diluted with an equal volume of water is between 3.0 and 3.7.

Assay for diphenoxylate hydrochloride—Transfer an accurately measured volume of Diphenoxylate Hydrochloride and Atropine Sulfate Solution, equivalent to about 100 mg. of diphenoxylate hydrochloride, to a separator, add 4 ml. of diluted hydrochloric acid, and extract with six 30-ml. portions of chloroform. Wash the combined chloroform extracts with 25 ml. of water, and discard the washing. Transfer the chloroform to a beaker, and evaporate nearly to dryness. Add 100 ml. of glacial acetic acid and 4 ml. of mercuric acetate T.S. to the beaker, and titrate with 0.05 *N* perchloric acid in dioxane, determining the end-point potentiometrically. Each ml. of 0.05 *N* perchloric acid is equivalent to 24.45 mg. of $C_{30}H_{32}N_2O_2 . HCl$.

Assay for atropine sulfate—

p-Dimethylaminobenzaldehyde solution—Just prior to use, dissolve 1 g. of *p*-dimethylaminobenzaldehyde in 6 ml. of a cooled mixture of 88 volumes of sulfuric acid and 12 volumes of water.

Standard stock solution—Transfer about 50 mg. of USP Atropine Sulfate Reference Standard, accurately weighed, to a 200-ml. volumetric flask, add 0.1 *N* sulfuric acid to volume, and mix.

Diluted standard preparation—Transfer 2.0 ml. of the *Standard stock solution* to a 250-ml. separator, and continue as directed under *Assay preparation*, beginning with "... and add water to make about 150 ml."

Assay preparation—Transfer an accurately measured volume of Diphenoxylate Hydrochloride and Atropine Sulfate Solution, equivalent to about 500 mcg. of atropine sulfate, to a 250-ml. separator, and add water to make about 150 ml. Make the solution alkaline with ammonia T.S., and extract with six 30-ml. portions of chloroform. Wash the combined chloroform extracts with 25 ml. of water, and discard the washing. Extract the washed chloroform with two 25-ml. portions of 0.1 *N* sulfuric acid, discard the chloroform, and wash the combined acid extracts with 10 ml. of chloroform, discarding the washing. Make the solution alkaline with ammonia T.S., and extract with five 25-ml. portions of chloroform, discarding the aqueous phase. Wash the combined chloroform extracts with 20 ml. of water, and discard the washing. Transfer the chloroform to a 150-ml. beaker, and evaporate to a volume of about 2 ml. Transfer the residual liquid with the aid of chloroform to a 10-ml. volumetric flask, dilute to volume with chloroform, and mix.

Procedure—Transfer 2.0 ml. each of the *Diluted Standard preparation*, the *Assay preparation*, and of chloroform to serve as the blank to separate 250-mm. test tubes, to each tube add a small boiling stone, and evaporate to dryness in a boiling water bath. Dry at 80° for 30 minutes. To each tube add exactly 0.5 ml. of the *p-Dimethylaminobenzaldehyde solution*, and allow to stand, with intermittent rotation of each tube for 2 minutes. Immerse the tubes in a water bath at 70°, and heat for 6 minutes, mixing each tube intermittently without removal from the water bath. Cool in cold water for 3 minutes, then carefully add 5.0 ml. of acetic anhydride to each tube, mix, and allow to stand for 15 minutes. Concomitantly determine the absorbances of the solutions in 1-cm. cells, at the maximum at about 515 mμ, with a suitable spectrophotometer, using the blank to set the instrument. Record the absorbance of the solution from the *Diluted standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mcg., of $(C_{17}H_{23}NO_3)_2 . H_2SO_4 . H_2O$ in each ml. of the Solution taken by the formula $10 \times (C/V) \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Diluted standard preparation*, and V is the volume, in ml., of the Solution taken.

Packaging and storage—Preserve Diphenoxylate Hydrochloride and Atropine Sulfate Solution in tight, light-resistant containers.

Solution available—Diphenoxylate Hydrochloride and Atropine Sulfate Solution usually available contains the following amount of diphenoxylate hydrochloride: 2.5 mg. in 5 ml.; and of atropine sulfate: 25 mcg. in 5 ml.

CATEGORY and DOSE—See Diphenoxylate Hydrochloride.

Diphenoxylate Hydrochloride and Atropine Sulfate Tablets

Diphenoxylate Hydrochloride and Atropine Sulfate Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{30}H_{32}N_2O_2 . HCl$ (diphenoxylate hydrochloride), and not less than 80.0 percent and not more than 120.0 percent of the labeled amount of $(C_{17}H_{23}NO_3)_2 . H_2SO_4 . H_2O$ (atropine sulfate).

Identification—Transfer an amount of finely powdered Diphenoxylate Hydrochloride and Atropine Sulfate Tablets, equivalent to about 100 mg. of diphenoxylate hydrochloride, to a separator, add 100 ml. of water and 1 ml. of diluted hydrochloric acid, and extract with five 25-ml. portions of a 9:1 mixture of chloroform and isopropanol. After each extraction transfer the bottom chloroform layer to a second separator, filtering each portion through a sintered-glass filter. Wash the combined chloroform solutions with two 25-ml. portions of water, discard the washings, and evaporate the chloroform to dryness on a steam bath. To the residue add 10 ml. of ether previously saturated with hydrochloric acid, carefully evaporate to dryness, then add a second portion of the acid-saturated ether, and again evaporate to dryness. Slurry the residue with *n*-hexane, allow the solids to settle, and carefully decant off the supernatant liquid. Dry the solids at 105° for 1 hour: the diphenoxylate hydrochloride so obtained responds to the *Infrared absorption test* under *Diphenoxylate Hydrochloride*, page 255, and the ultraviolet absorption spectrum of a 1 in 2000 solution of the residue in 0.01 *N* methanolic hydrochloric acid exhibits maxima at the same wavelengths as that of NF Diphenoxylate Hydrochloride, similarly measured.

Disintegration, page 878—The disintegration time limit for Diphenoxylate Hydrochloride and Atropine Sulfate Tablets is 15 minutes.

Content uniformity, *Method II*, page 799—Diphenoxylate Hydrochloride and Atropine Sulfate Tablets meet the requirements of the content uniformity test for tablets, when tested for diphenoxylate content using the following special procedure: Place a tablet in a 50-ml. glass-stoppered centrifuge tube, add an accurately measured volume of methanol to produce a concentration of about 250 mcg. of diphenoxylate hydrochloride per ml., and crush the tablet with a glass rod. Mix by shaking vigorously, and then centrifuge at 2000 r.p.m. for 10 minutes. Concomitantly determine the absorbance of the supernatant liquid and of a standard solution of NF Diphenoxylate Hydrochloride, in the same medium, at a concentration of about 250 mcg. per ml., in 1-cm. cells, at the maximum at about 257 mμ, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg., of $C_{30}H_{32}N_2O_2 . HCl$ in the tablet by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity, in mg., of diphenoxylate hydrochloride per tablet; D is the exact concentration, in mcg. per ml., of diphenoxylate hydrochloride in the sample solution, based upon the labeled quantity per tablet and the extent of dilution; C is the exact concentration of the standard solution, in mcg. per ml.; A_U is the absorbance of the sample solution; and A_S is the absorbance of the standard solution.

Assay for diphenoxylate hydrochloride—Weigh and finely powder not less than 60 Diphenoxylate Hydrochloride and Atropine Sulfate Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 150 mg. of diphenoxylate hydrochloride, to a 250-ml. separator, add 100 ml. of water and 1 ml. of diluted hydrochloric acid, and extract with five 25-ml. portions of a 9:1 mixture of chloroform and isopropanol, shaking each portion for at least 2 minutes. After each extraction transfer the bottom chloroform layer to a second separator, filtering each portion through a sintered-glass filter. Rinse the filter with a few ml. of chloroform, add the rinsings to the chloroform solution, and extract the combined chloroform solutions with two 25-ml. portions of water. Discard the washings, and evaporate the chloroform in a beaker on a steam bath to a volume of about 5 ml. Add 5 ml. of mercuric acetate T.S. and 100 ml. of glacial acetic acid, and titrate with 0.05 *N* perchloric acid in dioxane, determining the end-point potentiometrically. Each ml. of 0.05 *N* perchloric acid is equivalent to 24.45 mg. of $C_{30}H_{32}N_2O_2 . HCl$.

Assay for atropine sulfate—

p-Dimethylaminobenzaldehyde solution and *Standard stock solution*—Prepare as directed in the *Assay for atropine sulfate* under *Diphenoxylate Hydrochloride and Atropine Sulfate Solution*, page 256.

Diluted standard preparation—Transfer 5.0 ml. of *Standard stock solution* to a 100-ml. volumetric flask, dilute to volume with 0.1 *N* sulfuric acid, mix, and continue as directed under *Assay preparation*, beginning with "To the flask add 2 ml. of chloroform, and mix by inversion and shaking."

Assay preparation—Weigh and finely powder not less than 50 Diphenoxylate Hydrochloride and Atropine Sulfate Tablets. Transfer a portion of the powder, equivalent to about 1.25 mg. of atropine sulfate, to a 100-ml. volumetric flask, add 40 ml. of 0.1 *N* sulfuric acid, shake vigorously for 3 minutes, dilute to volume with 0.1 *N* sulfuric acid, and mix. To the flask add 2 ml. of chloroform, and mix by inversion and shaking. Pour the entire contents of the flask, without rinsing, into a 250-ml. centrifuge cup, cover with a rubber cap, and centrifuge at 1600 r.p.m. for 10 minutes. Carefully decant the aqueous solution into a 250-ml. beaker, retaining the chloroform in the centrifuge cup. Filter the aqueous solution, discarding the first 10 ml. of filtrate. Transfer 40.0 ml. of the subsequent filtrate to a 250-ml. separator, and extract with two 25-ml. portions of a 9:1 mixture of chloroform and isopropanol, combining the extracts in another separator. Do not discard the aqueous phase. Wash the combined extracts with 10 ml. of 0.1 *N* sulfuric acid, add the washing to the original aqueous phase, and then discard the chloroform. Make the combined aqueous solution alkaline with ammonia T.S., and then extract the alkaline solution with five 20-ml. portions of the chloroform-isopropanol 9:1 mixture. Wash the combined extracts with 20 ml. of water, and discard the washing. Extract the chloroform solution with one 40-ml. portion and one 25-ml. portion of 0.1 *N* sulfuric acid, combine the acid extracts in a separate separator, and then discard the chloroform phase. Make the acid extracts alkaline with ammonia T.S., and then extract with five 20-ml. portions of chloroform. Wash the combined chloroform extracts with 20 ml. of water, discard the washing, and then transfer the chloroform layer to a 250-ml. beaker. Evaporate the solution to dryness on a hot plate with the aid of a stream of air, and dissolve the residue in sufficient chloroform to make 10.0 ml.

Procedure—Proceed as directed for *Procedure* in the *Assay for atropine sulfate* under *Diphenoxylate Hydrochloride and Atropine Sulfate Solution,* page 256. Calculate the quantity, in mg., of $(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot H_2O$ in the portion of Tablets taken by the formula $0.025C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation.*

Packaging and storage—Preserve Diphenoxylate Hydrochloride and Atropine Sulfate Tablets in well-closed, light-resistant containers.

Tablets available—Diphenoxylate Hydrochloride and Atropine Sulfate Tablets usually available contain the following amount of diphenoxylate hydrochloride: 2.5 mg.; and of atropine sulfate: 25 mcg.

CATEGORY and DOSE—See Diphenoxylate Hydrochloride.

Diphenylhydantoin Oral Suspension

Diphenylhydantoin Oral Suspension is diphenylhydantoin suspended in a suitable medium. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{15}H_{12}N_2O_2$.

Identification—

A: Shake a volume of Diphenylhydantoin Oral Suspension, equivalent to about 100 mg. of diphenylhydantoin, with 50 ml. of a 1 in 2 mixture of ether and chloroform in a separator, evaporate the extract to dryness, and dry at 105° in vacuum for 4 hours: the diphenylhydantoin so obtained melts between 292° and 299°, with some decomposition, page 814.

B: Dissolve 100 mg. of the residue obtained in *Identification test A* in 100 ml. of chloroform, with slight warming if necessary. To 5 ml. of this solution add 0.2 ml. of a freshly prepared 1 in 100 solution of cobaltous acetate in methanol and 1 ml. of a freshly prepared 1 in 20 solution of isopropylamine in methanol, and mix: a violet to red-violet color is produced.

Assay—Measure accurately a volume of Diphenylhydantoin Oral Suspension, equivalent to between 125 mg. and 200 mg. of diphenylhydantoin, and transfer to a separator. Add 15 ml. of water, mix, and extract with 80-ml. of a 1 in 2 mixture of ether and chloroform, collecting the extract in a 500-ml. separator. Complete the extraction with successive 40-ml. portions of the ether-chloroform mixture until a small portion of the extract does not leave a residue when evaporated in a watch glass. Wash the combined extracts with two 10-ml. portions of sodium bicarbonate solution (1 in 50), discard the wash solution, and then filter the extract through cotton previously moistened with the extraction mixture. Evaporate the filtered extract on a steam bath with the aid of a current of air, dry the residue at 105° in vacuum for 2 hours, and cool. Dissolve in 50 ml. of dimethylformamide, add 3 drops of a saturated solution of azo-violet in benzene, and titrate with 0.1 *N* sodium methoxide to a blue end-point.

Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* sodium methoxide is equivalent to 25.23 mg. of $C_{15}H_{12}N_2O_2$.

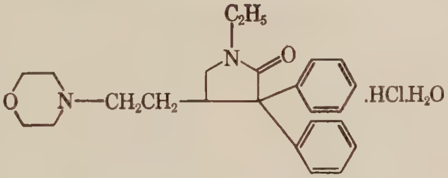
Packaging and storage—Preserve Diphenylhydantoin Oral Suspension in tight containers. Avoid freezing.

Suspensions available—Diphenylhydantoin Oral Suspension usually available contains the following amounts of diphenylhydantoin: 6, 20, and 25 mg. in 1 ml.

CATEGORY—Anticonvulsant.

USUAL DOSE OF DIPHENYLHYDANTOIN—**100 mg.** up to four times a day.

Doxapram Hydrochloride*



1-Ethyl-4-(2-morpholinoethyl)-3,3-diphenyl-2-pyrrolidinone Monohydrochloride

$C_{24}H_{30}N_2O_2 . HCl . H_2O$ Mol. wt. 433.00

Doxapram Hydrochloride, dried at 105° for 2 hours, contains not less than 98.0 percent and not more than 100.5 percent of $C_{24}H_{30}N_2O_2 . HCl$.

Description—Doxapram Hydrochloride occurs as a white to off-white, odorless, crystalline powder.

Solubility—Doxapram Hydrochloride is soluble in water and sparingly soluble in alcohol. It is soluble in chloroform and practically insoluble in ether.

Melting range, page 814—Doxapram Hydrochloride melts within a range of 2° between 217° and 221°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Doxapram Hydrochloride, previously dried at 105° for 2 hours, exhibits maxima only at the same wavelengths as that of NF Doxapram Hydrochloride Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 2500 solution of Doxapram Hydrochloride in water exhibits maxima and minima at the same wavelengths as that of NF Doxapram Hydrochloride Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance occurring at about 258 mμ, do not differ by more than 3 percent.

pH, page 824—The pH of a solution of Doxapram Hydrochloride (1 in 100) is between 3.5 and 5.0.

Loss on drying, page 814—Dry Doxapram Hydrochloride at 105° for 2 hours: it loses not less than 3 percent and not more than 4.5 percent of its weight.

Residue on ignition, page 858—Doxapram Hydrochloride yields not more than 0.3 percent of residue on ignition.

Arsenic—A *Test Preparation* prepared with 2 g. of Doxapram Hydrochloride, as directed for organic compounds, meets the requirements of the *Arsenic Test,* page 777 (5 parts per million As).

Heavy metals, *Method II,* page 806—The heavy metals limit for Doxapram Hydrochloride is 20 parts per million.

Assay—Dissolve about 800 mg. of Doxapram Hydrochloride, previously dried for 2 hours at 105° and accurately weighed, in 50 ml. of glacial acetic acid, add 1 drop of crystal violet T.S. and 10 ml. of mercuric acetate T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a blue-green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 41.50 mg. of $C_{24}H_{30}N_2O_2 \cdot HCl$.

Packaging and storage—Preserve Doxapram Hydrochloride in tight containers.

CATEGORY—Respiratory stimulant.

USUAL DOSE RANGE—Intravenous, **500 mcg.** to **1 mg. per kg.** of body weight given as a single injection or **1.5** to **2.0 mg. per kg.** of body weight given as injections of **500 mcg.** to **1.0 mg. per kg.** of body weight at 5-minute intervals.

---

* Patented. See notice, page ii.

Doxapram Hydrochloride Injection

Doxapram Hydrochloride Injection is a sterile solution of doxapram hydrochloride in water for injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{24}H_{30}N_2O_2 . HCl$.

Identification—The ultraviolet absorption spectrum of the solution prepared from Doxapram Hydrochloride Injection for measurement of absorbance in the *Assay* exhibits ultraviolet absorption maxima and minima at the same wavelengths as that of NF Doxapram Hydrochloride Reference Standard, similarly measured.

pH, page 824—The pH of Doxapram Hydrochloride Injection is between 3.5 and 5.0.

Other requirements—Doxapram Hydrochloride Injection meets the requirements under *Injections,* page 810.

Assay—Transfer an accurately measured volume of Doxapram Hydrochloride Injection, equivalent to about 100 mg. of doxapram hydrochloride, to a 250-ml. volumetric flask, dilute to volume with water, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Doxapram Hydrochloride Reference Standard, in the same medium, at a concentration of about 400 mcg. per ml., in 1-cm. cells, at the maximum at about 258 mμ, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg., of $C_{24}H_{30}N_2O_2.HCl$ in each ml. of the Injection taken by the formula $0.25 \times (C/V) \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, V is the volume, in ml., of the Injection taken, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

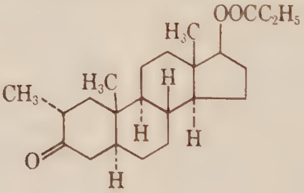
Packaging and storage—Preserve Doxapram Hydrochloride Injection in single-dose or in multiple-dose containers, preferably of Type I glass.

Injection available—Doxapram Hydrochloride Injection usually available contains the following amount of doxapram hydrochloride: 400 mg. in 20 ml.

CATEGORY and DOSE—See Doxapram Hydrochloride.

Dried Sodium Phosphate, page 655
Dried Yeast, page 764
Dried Yeast Tablets, page 765

Dromostanolone Propionate*



17β-Hydroxy-2α-methyl-5α-androstan-3-one Propionate

$C_{23}H_{36}O_3$ Mol. wt. 360.54

Dromostanolone Propionate contains not less than 95.0 percent and not more than 102.0 percent of $C_{23}H_{36}O_3$, calculated on the dried basis.

Description—Dromostanolone Propionate occurs as a white to creamy white, crystalline powder. It is odorless or has a faint odor.

Solubility—Dromostanolone Propionate is practically insoluble in water. It is soluble in chloroform, in ether, and in methanol.

Identification—Prepare a solution of Dromostanolone Propionate in chloroform containing 10 mg. per ml. On a suitable thin-layer chromatographic plate (see page 791), coated with a 0.25-mm. layer of chromatographic silica gel mixture, spot

---

* Patented. See notice, page ii.

10 µl. of this solution and 10 µl. of a chloroform solution of NF Dromostanolone Propionate Reference Standard containing 10 mg. per ml. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of chloroform and ethyl acetate (9:1) until the solvent front has moved to within about 2.5 cm. from the top of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots by lightly spraying with a 1 in 100 solution of vanillin in 50 percent phosphoric acid, and heating at 105° for 15 minutes. Observe the plate under longwave ultraviolet light: the R_f value of the main spot obtained from the sample corresponds to that obtained from the Reference Standard solution.

Melting range, page 814—Dromostanolone Propionate melts within a range of 4° between 127° and 133°.

Infrared absorption, page 866—The infrared absorption spectrum of a mineral oil dispersion of Dromostanolone Propionate, previously dried in vacuum at 40° for 16 hours, exhibits maxima only at the same wavelengths as that of NF Dromostanolone Propionate Reference Standard, similarly measured.

Specific rotation, page 822—The specific rotation of Dromostanolone Propionate, previously dried in vacuum at 40° for 16 hours, determined in a solution in chloroform containing 200 mg. of dromostanolone propionate in each 10 ml., is between +22° and +28°.

Loss on drying, page 814—Dry Dromostanolone Propionate in vacuum at 40° for 16 hours: it loses not more than 1 percent of its weight.

Assay—Transfer about 25 mg. of Dromostanolone Propionate, accurately weighed, to a 10-ml. volumetric flask, add chloroform to volume, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Dromostanolone Propionate Reference Standard, in the same medium, at a concentration of about 2.5 mg. per ml., in 1-mm. cells, at the maximum at about 5.9 µ, with a suitable infrared spectrophotometer, using chloroform as the blank. Calculate the quantity, in mg., of $C_{23}H_{36}O_3$ in the Dromostanolone Propionate taken by the formula $10C \times (A_U/A_S)$, in which C is the exact concentration of the Reference Standard solution, in mg. per ml., A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Dromostanolone Propionate in tight containers, protected from light.

CATEGORY—Antineoplastic.

USUAL DOSE—Intramuscular, **100 mg.** three times a week.

Dromostanolone Propionate Injection

Dromostanolone Propionate Injection is a sterile solution of dromostanolone propionate in a suitable oil. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{23}H_{36}O_3$. It contains phenol as a preservative.

Identification—The infrared absorption spectrum of the *Assay preparation*, prepared as directed in the *Assay*, exhibits maxima and minima at the same wavelengths as that of the *Standard preparation*, prepared as directed in the *Assay*.

Other requirements—Dromostanolone Propionate Injection meets the requirements under *Injections*, page 810.

Assay—

Adsorbent—Pack a pledget of glass wool in the stem of a suitable funnel, fill the funnel to within 2.5 cm. of the top with 60 to 100-mesh chromatographic magnesium silicate, and wash thoroughly with hot hydrochloric acid until the last washing is colorless. Wash with water until free from chloride, then wash with methanol, and finally with a mixture of equal volumes of benzene and carbon tetrachloride. Spread in a thin layer, and dry at 100° for 6 hours.

Chromatographic column—Pack a pledget of glass wool in the base of a 1.2 × 30-cm. chromatographic tube equipped with a stopcock. To the tube add a slurry prepared by mixing 4 g. of *Adsorbent* with a mixture of equal volumes of benzene and carbon tetrachloride, taking precautions to avoid the formation of air pockets or channels. Wash down the sides of the tube with the benzene-carbon tetrachloride mixture, allow the adsorbent to settle, and tap the tube gently and uniformly. Insert a pledget of glass wool in the top of the tube. (*Caution:* Do not allow the top of the adsorbent to become dry during the preparation of the column.)

Standard preparation—Dissolve about 12.5 mg. of NF Dromostanolone Propionate Reference Standard, accurately weighed, in 80 percent methanol in a 25-ml. volumetric flask. Dilute to volume with 80 percent methanol, and mix. Continue as directed under *Assay preparation*, beginning with "Transfer 10.0 ml. of this solution to a 25-ml. conical flask. . . ."

Assay preparation—Transfer an accurately measured volume of Dromostanolone Propionate Injection, equivalent to about 50 mg. of dromostanolone propionate, to a 50-ml. centrifuge tube, add 20 ml. of 80 percent methanol, and shake for 5 minutes. Centrifuge for 3 minutes at 1500 r.p.m., then carefully decant into a 100-ml. volumetric flask. Extract the oil phase with three additional 20-ml. portions of 80 percent methanol, decanting into the volumetric flask. Dilute the solution in the flask to volume with 80 percent methanol, and mix. Transfer 10.0 ml. of this solution to a 25-ml. conical flask, and evaporate to dryness using mild heat and a stream of air. Toward the end of the evaporation add several small portions of dehydrated methanol to facilitate evaporation of the residual water. Dissolve the residue in about 6 ml. of a mixture of equal volumes of benzene and carbon tetrachloride, and add this solution to the top of the chromatographic column, washing the flask with two 2-ml. portions of the same mixture and adding the washings to the column. Just as the solution disappears into the plug, add to the column 40 ml. of the benzene-carbon tetrachloride mixture to wash the column, and discard the eluate. Elute the dromostanolone propionate by adding to the column a mixture of alcohol and chloroform (1:20), and collect 25.0 ml. of eluate. Evaporate to dryness using mild heat and a stream of air, and dissolve the residue in 2.0 ml. of chloroform.

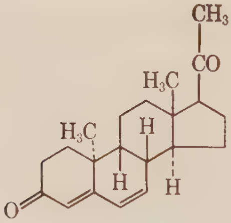
Procedure—Concomitantly determine the absorbances of the solutions in 1-mm. cells, at the maximum at about 5.9 μ, with a suitable infrared spectrophotometer, using chloroform as the blank. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{23}H_{36}O_3$ in each ml. of the Injection taken by the formula $20 \times C/V \times (A_U/A_S)$, in which C is the exact concentration, in mg. per ml., of the *Standard preparation*, and V is the volume, in ml., of the Injection taken.

Packaging and storage—Preserve Dromostanolone Propionate Injection in single-dose or in multiple-dose containers of Type II or Type III glass, protected from light.

Injections available—Dromostanolone Propionate Injection usually available contains the following amounts of dromostanolone propionate: 50 mg. in 1 ml.; 500 mg. in 10 ml.

CATEGORY and DOSE—See Dromostanolone Propionate.

Dydrogesterone*



9β,10α-Pregna-4,6-diene-3,20-dione

$C_{21}H_{28}O_2$ Mol. wt. 312.46

Dydrogesterone contains not less than 98.0 percent and not more than 102.0 percent of $C_{21}H_{28}O_2$, calculated on the dried basis.

Description—Dydrogesterone occurs as a white to pale yellow, crystalline powder.

Solubility—Dydrogesterone is practically insoluble in water and sparingly soluble in alcohol.

Identification—Dissolve about 50 mg. of Dydrogesterone in 5 ml. of dehydrated alcohol, add about 50 mg. each of hydroxylamine hydrochloride and anhydrous sodium acetate, and reflux gently for 2 hours. Concentrate the liquid to about 3 ml., then add 10 ml. of water, mix, and centrifuge. Wash the precipitate with two 3-ml. portions of warm methanol, and dry at 105° for 1 hour: the dydrogesterone dioxime so obtained melts between 275° and 282° with decomposition (*Class Ia*, page 815).

Melting range, *Class Ia*, page 815—Dydrogesterone melts between 167° and 171°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Dydrogesterone, previously dried in vacuum at 50° for 1 hour, exhibits maxima only at the same wavelengths as that of NF Dydrogesterone Reference Standard, similarly measured.

---

* Patented, see notice, p. ii.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 167,000 solution of Dydrogesterone in methanol exhibits maxima and minima at the same wavelengths as that of NF Dydrogesterone Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance occurring at about 285 mμ, do not differ by more than 2.5 percent.

Specific rotation, page 822—The specific rotation of Dydrogesterone, calculated on the dried basis, determined in a solution in chloroform containing 50 mg. in each 10 ml., is between −470° and −500°.

Loss on drying, page 814—Dry Dydrogesterone in vacuum at 50° for 1 hour: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Dydrogesterone yields not more than 0.1 percent of residue on ignition. Retain the residue for the *Heavy metals test.*

Heavy metals, page 806—Dissolve the residue obtained in the test for *Residue on ignition* in 4 drops of diluted hydrochloric acid, add about 5 ml. of water, filter, and wash the residue with sufficient water to make 25 ml.: the heavy metals limit for Dydrogesterone is 20 parts per million.

Foreign steroids and other impurities—

Standard preparation—Prepare as directed under *Steroid Chromatographic Purity,* page 876, using NF Dydrogesterone Reference Standard, previously dried in vacuum at 50° for 1 hour.

Test preparation—Weigh accurately about 80 mg. of Dydrogesterone, previously dried in vacuum at 50° for 1 hour, dissolve it in a sufficient quantity of a mixture of equal volumes of alcohol and chloroform to make 10.0 ml., and mix.

Procedure—Proceed as directed for *Procedure* under *Steroid Chromatographic Purity,* page 876, spotting 20 μl. each of the *Standard preparation* and of the *Test preparation* and using a solvent system consisting of benzene-acetone (4:1). Determine the absorbance at the maximum at about 285 mμ, and calculate the percentage of chromatographic impurities by the formula $100 - [100 \times 10 \times (C/W) \times (A_U/A_S)]$, in which C is the exact concentration, in mg. per ml., of the *Standard preparation,* and W is the weight, in mg., of Dydrogesterone taken: not more than 3 percent is found.

Assay—

Standard preparation—Dissolve in chloroform a suitable quantity of NF Dydrogesterone Reference Standard, accurately weighed, and dilute quantitatively and stepwise with chloroform to obtain a solution having a concentration of about 20 mcg. per ml. Transfer 5.0 ml. of this solution to a glass-stoppered 50-ml. conical flask.

Assay preparation—Weigh accurately about 100 mg. of Dydrogesterone, dissolve in sufficient chloroform to make 200.0 ml., and mix. Transfer 10.0 ml. of this solution to a 250-ml. volumetric flask, dilute to volume with chloroform, and mix. Transfer 5.0 ml. of this last solution to a glass-stoppered 50-ml. conical flask.

Procedure—To each of the flasks containing the *Standard preparation* and the *Assay preparation,* and to a similar flask containing 5.0 ml. of chloroform to serve as the blank, add 10.0 ml. of a solution of 375 mg. of isoniazid and 0.47 ml. of hydrochloric acid in 500 ml. of methanol. Mix, allow to stand for 45 minutes, and concomitantly determine the absorbances of the solutions in 1-cm. cells, at the maximum at about 420 mμ, with a suitable spectrophotometer, using the blank to set the instrument. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{21}H_{28}O_2$ in the Dydrogesterone taken by the formula $5C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation.*

Packaging and storage—Preserve Dydrogesterone in well-closed containers.

CATEGORY—Progestin.

USUAL DOSE—**10** to **20 mg.** daily in divided doses.

USUAL DOSE RANGE—**10** to **30 mg.**

Dydrogesterone Tablets

Dydrogesterone Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{21}H_{28}O_2$.

Identification—Triturate a quantity of finely powdered Dydrogesterone Tablets, equivalent to about 5 mg. of dydrogesterone, with 10 ml. of chloroform, and filter. On a suitable thin-layer chromatographic plate (see page 791), coated with a 0.25-mm. layer of silica gel G, spot 10 μl. of this solution and 10 μl. of a chloroform solution of NF Dydrogesterone Reference Standard containing 500 mcg. per ml. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of benzene and ether (3:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by viewing under shortwave ultraviolet light: the R_f value of the main spot obtained from the sample solution corresponds to that obtained from the Reference Standard solution.

Disintegration, page 878—The disintegration time limit for Dydrogesterone Tablets is 30 minutes.

Content uniformity, *Method II,* page 799—Dydrogesterone Tablets meet the requirements of the content uniformity test for tablets using the following special procedure: Quantitatively transfer a finely powdered tablet to a 100-ml. volumetric flask, add 50 ml. of methanol, and heat in a water bath at 60° for 10 minutes with frequent agitation. Remove from the bath, shake mechanically for 20 minutes, and cool. Dilute to volume with methanol, mix, and centrifuge. Dilute a portion of the clear, supernatant liquid with methanol to provide a solution containing approximately 5 mcg. of dydrogesterone per ml. Concomitantly determine the absorbance of this solution and of a solution of NF Dydrogesterone Reference Standard, in the same medium, at a concentration of about 5 mcg. per ml., in 1-cm. cells at the maximum at about 285 mμ, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg., of $C_{21}H_{28}O_2$ in the tablet by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity, in mg., of dydrogesterone in the tablet; D is the exact concentration, in mcg. per ml., of dydrogesterone in the sample solution, based upon the labeled quantity per tablet and the extent of dilution; C is the exact concentration of the Reference Standard solution, in mcg. per ml.; A_U is the absorbance of the sample solution; and A_S is the absorbance of the Reference Standard solution.

Assay—

Standard preparation—Prepare as directed in the *Assay* under *Dydrogesterone,* page 262.

Assay preparation—Weigh and finely powder not less than 10 Dydrogesterone Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 20 mg. of dydrogesterone, to a separator with the aid of about 15 ml. of water, and extract with four 25-ml. portions of chloroform, filtering each extract through chloroform-moistened cotton into a 250-ml. volumetric flask. Dilute the contents of the flask to volume with chloroform, and mix. Transfer 25.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with chloroform, and mix. Transfer 5.0 ml. of this last solution to a glass-stoppered 50-ml. conical flask.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Dydrogesterone,* page 262. Calculate the quantity, in mg., of $C_{21}H_{28}O_2$ in the portion of Tablets taken by the formula $C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation.*

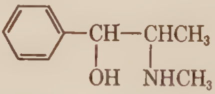
Packaging and storage—Preserve Dydrogesterone Tablets in well-closed containers.

Tablets available—Dydrogesterone Tablets usually available contain the following amounts of dydrogesterone: 5, 10, and 20 mg.

CATEGORY and DOSE—See Dydrogesterone.

Effervescent Sodium Phosphate, page 656

Ephedrine



(−)-*erythro*-α-[1-(Methylamino)ethyl]benzyl Alcohol

$C_{10}H_{15}NO$ Mol. wt. 165.24

Ephedrine is anhydrous or contains not more than one-half molecule of water of hydration. Anhydrous Ephedrine contains not less than 98.5 percent and not more than 100.5 percent of $C_{10}H_{15}NO$. Hydrated Ephedrine contains not less than 98.5 percent and not more than 100.5 percent of $C_{10}H_{15}NO$, calculated on the anhydrous basis.

Description—Ephedrine occurs as an unctuous, almost colorless solid, or white crystals or granules. It gradually decomposes on exposure to light. It melts between 33° and 40°, the variability in the melting point being due to differences in the moisture content, anhydrous Ephedrine having a lower melting point than the hemihydrate of Ephedrine. Its solutions are alkaline to litmus.

Solubility—Ephedrine is soluble in water, in alcohol, in chloroform, and in ether, and is moderately and slowly soluble in liquid petrolatum, the solution in the latter becoming turbid if the Ephedrine contains more than about 1 percent of water.

Identification—

A: Dissolve 10 mg. of Ephedrine in 1 ml. of water with the aid of 1 or 2 drops of diluted hydrochloric acid, and add 0.1 ml. of cupric sulfate T.S. followed by 1 ml. of sodium hydroxide solution (1 in 5): a reddish purple color develops. To the mixture add 1 ml. of ether and shake well: the ether layer is purple and the water layer is blue.

B: Dissolve 50 mg. of Ephedrine in 10 ml. of chloroform, allow the solution to stand overnight in a closely covered vessel, and then let the chloroform evaporate spontaneously: white crystals of ephedrine hydrochloride appear, which, when dissolved in water, respond to the test for *Chloride*, page 808.

Specific rotation, page 822—Dissolve about 500 mg. of Ephedrine in 10 ml. of ether in a tared beaker, add 0.5 ml. of hydrochloric acid, evaporate to dryness, and dry the residue at 105° for 3 hours. The specific rotation of the ephedrine hydrochloride so obtained, calculated on the anhydrous basis, determined in a solution containing 500 mg. in each 10 ml., is between −33° and −35.5°.

Water, page 900—Determine the water content of Hydrated Ephedrine by the titrimetric method (*residual titration procedure*): not less than 4.5 percent and not more than 5.5 percent is found.

Residue on ignition, page 858—Ephedrine yields not more than 0.1 percent of residue on ignition.

Chloride, page 784—A solution of 500 mg. of Ephedrine shows no more chloride than corresponds to 0.2 ml. of 0.02 *N* hydrochloric acid (0.028 percent).

Sulfate—Dissolve 100 mg. of Ephedrine in 40 ml. of water, and add 1 ml. of diluted hydrochloric acid and 1 ml. of barium chloride T.S.: no turbidity develops within 10 minutes.

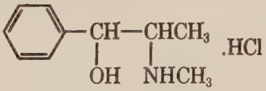
Assay—Dissolve about 500 mg. of Ephedrine, accurately weighed, in 10 ml. of neutralized alcohol, add 5 drops of methyl red T.S., and 40.0 ml. of 0.1 *N* hydrochloric acid. Titrate the excess acid with 0.1 *N* sodium hydroxide. Perform a blank determination (see *Residual Titrations*, page 883). Each ml. of 0.1 *N* hydrochloric acid is equivalent to 16.52 mg. of $C_{10}H_{15}NO$.

Labeling—The label shall declare whether the Ephedrine is hydrated or anhydrous. When the quantity of Ephedrine is indicated in the labeling of any preparation of Ephedrine, this shall be understood to be in terms of anhydrous Ephedrine.

Packaging and storage—Preserve Ephedrine in tight, light-resistant containers, in a cold place.

CATEGORY—Adrenergic (bronchodilator).

Ephedrine Hydrochloride



(−)-*erythro*-α-[1-(Methylamino)ethyl]benzyl Alcohol Hydrochloride

$C_{10}H_{15}NO.HCl$ Mol. wt. 201.70

Ephedrine Hydrochloride, dried at 105° for 3 hours, contains not less than 98.0 percent and not more than 100.5 percent of $C_{10}H_{15}NO.HCl$.

Description—Ephedrine Hydrochloride occurs as fine, white, odorless crystals or as a powder. It is affected by light.

Solubility—Ephedrine Hydrochloride is freely soluble in water and is soluble in alcohol. It is insoluble in ether.

Identification—

A: Dissolve 10 mg. of Ephedrine Hydrochloride in 1 ml. of water, and add 0.1 ml. of cupric sulfate T.S., followed by 1 ml. of sodium hydroxide solution (1 in 5): a reddish purple color develops. To the mixture add 1 ml. of ether and shake well: the ether layer becomes purple and the water layer blue.

B: A solution of Ephedrine Hydrochloride responds to the tests for *Chloride*, page 808.

Acidity or alkalinity—Dissolve 1 g. of Ephedrine Hydrochloride in 20 ml. of water and add 1 drop of methyl red T.S. If the solution is yellow, it is changed to red by not more than 0.1 ml. of 0.02 *N* sulfuric acid. If the solution is pink, it is changed to yellow by not more than 0.2 ml. of 0.02 *N* sodium hydroxide.

Melting range, page 814—Ephedrine Hydrochloride melts between 217° and 220°.

Specific rotation, page 822—The specific rotation of Ephedrine Hydrochloride, previously dried at 105° for 3 hours, determined in a solution containing 500 mg. of Ephedrine Hydrochloride in each 10 ml., is between $-33°$ and $-35.5°$.

Loss on drying, page 814—Dry Ephedrine Hydrochloride at 105° for 3 hours: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Ephedrine Hydrochloride yields not more than 0.1 percent of residue on ignition.

Sulfate—Dissolve 50 mg. of Ephedrine Hydrochloride in 40 ml. of water, and add 1 ml. of diluted hydrochloric acid and 1 ml. of barium chloride T.S.: no turbidity develops within 10 minutes.

Assay—Transfer about 300 mg. of Ephedrine Hydrochloride, previously dried at 105° for 3 hours and accurately weighed, into a separator, and dissolve in 10 ml. of water. Saturate the solution with sodium chloride (about 3 g.), add 5 ml. of sodium hydroxide T.S., and extract with four 25-ml. portions of chloroform. Wash the combined chloroform extracts with 10 ml. of water saturated with sodium chloride, and filter through chloroform-moistened cotton into a suitable flask. Extract the water wash with 10 ml. of chloroform, and add this extract to the main chloroform extract. Add 3 drops of methanolic methyl red T.S., and titrate with 0.1 *N* perchloric acid in dioxane. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 20.17 mg. of $C_{10}H_{15}NO.HCl$.

Packaging and storage—Preserve Ephedrine Hydrochloride in well-closed, light-resistant containers.

CATEGORY—Adrenergic (bronchodilator).

USUAL DOSE—**25** to **50 mg.** every 3 or 4 hours.

Ephedrine Hydrochloride, Theophylline, and Phenobarbital Tablets, page 695

Ephedrine Sulfate and Phenobarbital Capsules

Ephedrine Sulfate and Phenobarbital Capsules contain not less than 91.0 percent and not more than 109.0 percent of the labeled amounts of $(C_{10}H_{15}NO)_2.H_2SO_4$ (ephedrine sulfate) and of $C_{12}H_{12}N_2O_3$ (phenobarbital).

Identification—

A: Mix the contents of a sufficient number of Ephedrine Sulfate and Phenobarbital Capsules, equivalent to about 200 mg. of ephedrine sulfate, with 25 ml. of water. Filter into a separator, add 2 ml. of ammonia T.S., and extract with 2 successive 15-ml. portions of chloroform. Filter the chloroform solutions through a chloroform-washed pledget of cotton into a beaker and let the chloroform evaporate spontaneously: white crystals of ephedrine hydrochloride are produced. Dissolve 10 mg. of the crystals in 1 ml. of water, and add 0.1 ml. of cupric sulfate T.S., followed by 1 ml. of sodium hydroxide solution (1 in 5): a reddish purple color develops. To the mixture add 1 ml. of ether and shake well: the ether layer becomes purple and the water layer blue.

B: A solution of the crystals obtained in *Identification test A* responds to the tests for *Chloride*, page 808.

C: Mix the contents of a sufficient number of Ephedrine Sulfate and Phenobarbital Capsules, equivalent to about 500 mg. of phenobarbital, with 25 ml. of water and 4 ml. of sodium hydroxide T.S. Filter into a separator, acidify with hydrochloric acid, and add 1 ml. in excess. Extract with 3 successive 15-ml. portions of chloroform and pass the chloroform solution through a chloroform-moistened filter, collect it in a beaker and evaporate to dryness. The infrared absorption spectrum of a potassium bromide dispersion of the residue so obtained exhibits maxima only at the same wavelengths as that of USP Phenobarbital Reference Standard, similarly measured.

Content uniformity, *Method II*, page 798—Ephedrine Sulfate and Phenobarbital Capsules meet the requirements of the content uniformity test for capsules when tested for phenobarbital content, using the following special procedure: Quantitatively transfer the contents of a capsule to a separator, add 15 ml. of water and 5 ml. of diluted hydrochloric acid, and extract with four 25-ml. portions of chloroform, filtering each portion through chloroform-moistened cotton into a 250-ml. volumetric flask. Add chloroform to volume, and mix. Transfer an accurately measured volume of this solution, equivalent to about 1 mg. of phenobarbital, to a beaker, and evaporate just to dryness on a steam bath. Transfer the residue to a 100-ml. volumetric flask with the aid of 5 ml. of alcohol and then with pH 9.6 alkaline borate buffer solution (see page 783), then dilute to volume with the buffer solution, and mix. Concomitantly determine the absorbance of this solution and of a solution of USP Phenobarbital Reference Standard, in the same medium, at a concentration of about 10 mcg. per ml., in 1-cm. cells, at the maximum at about 240 mμ, with a suitable spectrophotometer, using pH 9.6 alkaline borate buffer solution as the blank. Calculate the quantity, in mg., of $C_{12}H_{12}N_2O_3$ in the capsule by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity, in mg., of phenobarbital in the capsule; D is the exact concentration, in mcg. per ml., of phenobarbital in the sample solution, based upon the labeled quantity per capsule and the extent of dilution; C is the exact concentration, in mcg. per ml., of the Reference Standard solution; A_U is the absorbance of the sample solution; and A_S is the absorbance of the Reference Standard solution.

Assay for phenobarbital—Transfer as completely as possible the contents of not less than 20 Ephedrine Sulfate and Phenobarbital Capsules to a tared weighing bottle, and weigh. Transfer an accurately weighed portion of the powder, equivalent to about 300 mg. of phenobarbital to a separator, and add 10 ml. of water and 1 ml. of 1 N hydrochloric acid, and extract the phenobarbital with four 25-ml. portions of chloroform. Wash the combined chloroform extracts with 5 ml. of water containing 1 drop of diluted hydrochloric acid, and add the washings to the water layer. Retain the water layer for the *Assay for ephedrine sulfate.* Transfer the chloroform extracts to a 125-ml. conical flask and evaporate just to dryness on a steam bath. Add 30 ml. of dimethylformamide, and 4 drops of thymol blue T.S., and titrate with 0.1 N sodium methoxide, using a magnetic stirrer and taking precautions against the absorption of atmospheric carbon dioxide. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 N sodium methoxide is equivalent to 23.22 mg. of $C_{12}H_{12}N_2O_3$.

Assay for ephedrine sulfate—Saturate the water layer from the *Assay for phenobarbital* with sodium chloride (about 3 g.), add 5 ml. of sodium hydroxide T.S., and extract with four 25-ml. portions of chloroform. Wash the combined chloroform extracts with 10 ml. of water saturated with sodium chloride, and filter the chloroform through chloroform-moistened cotton into a suitable flask. Extract the water wash with 10 ml. of chloroform, and add this extract to the main chloroform extract. Add 3 drops of methanolic methyl red T.S., and titrate with 0.1 N perchloric acid in dioxane. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 N perchloric acid is equivalent to 21.43 mg. of $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$.

Packaging and storage—Preserve Ephedrine Sulfate and Phenobarbital Capsules in well-closed containers.

Capsules available—Ephedrine Sulfate and Phenobarbital Capsules usually available contain the following amounts of ephedrine sulfate: 25 and 50 mg.; and of phenobarbital: 15 and 30 mg.

CATEGORY—Adrenergic (bronchodilator).

USUAL INDIVIDUAL DOSE OF EPHEDRINE SULFATE—**25 mg.**; OF PHENOBARBITAL—**30 mg.**

Ephedrine Sulfate Tablets

Ephedrine Sulfate Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $(C_{10}H_{15}NO)_2 . H_2SO_4$.

Identification—

A: Triturate a quantity of finely powdered Ephedrine Sulfate Tablets, equivalent to about 200 mg. of ephedrine sulfate, with 15 ml. of warm alcohol, filter, and evaporate the filtrate to dryness on a steam bath. Dissolve 10 mg. of the residue in 1 ml. of water, and add 0.1 ml. of cupric sulfate T.S., followed by 1 ml. of sodium hydroxide solution (1 in 5): a reddish purple color develops. To the mixture add 1 ml. of ether, and shake well: the ether layer becomes purple and the water layer blue.

B: A solution of a portion of the residue obtained in *Identification test A* responds to the tests for *Sulfate,* page 807.

Disintegration, page 878—The disintegration time limit for Ephedrine Sulfate Tablets is 30 minutes.

Content uniformity, *Method II,* page 799—Ephedrine Sulfate Tablets meet the requirements of the content uniformity test for tablets, using the following special procedure: Quantitatively transfer a finely powdered tablet to a 50-ml. volumetric flask, add methanol to volume, and mix by shaking thoroughly. Allow to stand until the undissolved particles settle, then filter, and discard the first 20 ml. of filtrate. Dilute a portion of the subsequent filtrate quantitatively and stepwise, if necessary, with methanol to provide a solution containing approximately 500 mcg. of ephedrine sulfate per ml. Concomitantly determine the absorbance of this solution and of a solution of NF Ephedrine Sulfate Reference Standard, in the same medium, at a concentration of about 500 mcg. per ml., in 1-cm. cells, at the maximum at about 257 mμ, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg., of $(C_{10}H_{15}NO)_2.H_2SO_4$ in the tablet by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity of ephedrine sulfate, in mg., in the tablet; D is the exact concentration, in mcg. per ml., of ephedrine sulfate in the sample solution, based upon the labeled quantity per tablet and the extent of dilution; C is the exact concentration, in mcg. per ml., of the Reference Standard solution; A_U is the absorbance of the sample solution; and A_S is the absorbance of the Reference Standard solution.

Assay—Weigh and finely powder not less than 50 Ephedrine Sulfate Tablets. Weigh accurately a portion of the powder, equivalent to about 1.25 g. of ephedrine sulfate, and transfer to a glass-stoppered 125-ml. conical flask. Add 50.0 ml. of 0.1 N sulfuric acid, shake the mixture, and filter, rejecting the first 20 ml. of filtrate. Transfer 10.0 ml. of the subsequent filtrate to a separator. Saturate the solution with sodium chloride (about 3 g.), add 5 ml. of sodium hydroxide T.S., and extract with four 25-ml. portions of chloroform. Wash the combined chloroform extracts with 10 ml. of water saturated with sodium chloride, and filter through chloroform-saturated cotton. Extract the water wash with 10 ml. of chloroform, and add to the main chloroform extract. Add 3 drops of methanolic methyl red T.S. to the combined chloroform extracts, and titrate with 0.1 N perchloric acid in dioxane. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 N perchloric acid is equivalent to 21.43 mg. of $(C_{10}H_{15}NO)_2.H_2SO_4$.

Packaging and storage—Preserve Ephedrine Sulfate Tablets in well-closed containers.

Tablets available—Ephedrine Sulfate Tablets usually available contain the following amounts of ephedrine sulfate: 25 and 50 mg.

CATEGORY—Adrenergic (bronchodilator).

USUAL DOSE OF EPHEDRINE SULFATE—**25 mg.**

Ergotamine Tartrate and Caffeine Suppositories

Ergotamine Tartrate and Caffeine Suppositories contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of $(C_{33}H_{35}N_5O_5)_2.C_4H_6O_6$ (ergotamine tartrate) and of $C_8H_{10}N_4O_2$ (caffeine).

Identification—Melt an Ergotamine Tartrate and Caffeine Suppository in 10 ml. of hot tartaric acid solution (1 in 100), and mix well. Chill the mixture until the layer of oil has hardened, then filter, and divide the filtrate into two parts.

A: To one part of the filtrate add 10 ml. of *p*-dimethylaminobenzaldehyde T.S.: a blue color develops (*presence of ergotamine tartrate*).

B: Transfer the remaining part of the filtrate to a small evaporating dish, evaporate to dryness on a steam bath, add 1 ml. of hydrochloric acid and 100 mg. of potassium chlorate, and re-evaporate. Invert the dish over a vessel containing stronger ammonia water: the residue acquires a purple color, which disappears upon the addition of a solution of fixed alkali (*presence of caffeine*).

Assay—[NOTE: Conduct the analysis for ergotamine tartrate with a minimum exposure to light.]

Preparation of chromatographic column—Pack a pledget of fine glass wool in the base of a chromatographic tube (22 × 250-mm. test tube to which is fused a 5-cm. length of 6 or 8-mm. tubing) with the aid of a tamping rod of stainless steel, aluminum, or glass, at least 30 cm. long and having a disk with a diameter about 1 mm. less than that of the chromatographic tube. Prepare a layer of adsorbent by intimately mixing 4 g. of purified siliceous earth with 3.0 ml. of 50 percent (w/w) citric acid solution, and then transfer the mixture to the chromatographic tube in two portions, packing each portion lightly with the tamping rod. Prepare a second layer of adsorbent in a similar manner, using 2 g. of purified siliceous earth and 2.0 ml. of potassium alum solution (prepared by dissolving 12 g. of potassium alum in sufficient water to make 1000 ml., and adjusting to pH 3.5 ± 0.2 if necessary). Transfer this mixture to the chromatographic tube, placing it on top of the first layer, and pack uniformly with the tamping rod. Finally, intimately mix 2 g. of purified siliceous earth with 2.0 ml. of water, transfer to the chromatographic tube on top of the second layer, and pack uniformly with the tamping rod.

Alcoholic tartrate solution—Just prior to use, mix equal volumes of tartaric acid solution (1 in 100) and alcohol.

Ergonovine maleate standard preparation—Transfer to a 500-ml. volumetric flask about 16.8 mg. of USP Ergonovine Maleate Reference Standard, previously dried over silica gel for 4 hours and accurately weighed, add *Alcoholic tartrate solution* to volume, and mix.

Caffeine standard preparation—Transfer to a 250-ml. volumetric flask about 40 mg. of NF Caffeine Reference Standard, previously dried at 80° for 4 hours and accurately weighed, add chloroform to volume, and mix. Transfer 5.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with chloroform, and mix.

Assay preparations—Transfer a number of Ergotamine Tartrate and Caffeine Suppositories, equivalent to about 10 mg. of ergotamine tartrate, to a 250-ml. separator, add 100 ml. of ether, and shake gently until the suppositories are completely dispersed. Extract with one 50-ml. portion and then with five 10-ml. portions of tartaric acid solution (1 in 100), collecting the extracts in a second 250-ml. separator. Wash the combined extracts with 10 ml. of ether, and transfer the tartaric acid layer to a 200-ml. volumetric flask. Wash the ether layer with 10 ml. of tartaric acid solution (1 in 100), add the washing to the 200-ml. volumetric flask, dilute to volume with tartaric acid solution (1 in 100), and mix. Discard the ether layer. Transfer 40.0 ml. of the tartaric acid solution to a 125-ml. separator, and add at least 25 ml. of sodium bicarbonate solution (1 in 10) to make the sample solution alkaline. Extract with four 30-ml. portions of chloroform, passing each extract through the prepared chromatographic column, and collecting the eluates in a 250-ml. volumetric flask. Rinse the column with several small portions of water-washed chloroform, collecting the chloroform in the 250-ml. volumetric flask. Dilute to volume with chloroform, and mix. Transfer 20.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with chloroform, and mix. Transfer 10.0 ml. of this last solution to a second 100-ml. volumetric flask, dilute to volume with chloroform, and mix. Label this solution as the *Caffeine assay preparation*.

Extrude the siliceous earth from the column, by means of slight air pressure, into a 400-ml. beaker, and rinse the walls of the column with 25 ml. of water, adding the rinsings to the beaker. To the beaker add, while stirring, 8 g. of sodium bicarbonate in small portions to prevent excess foaming, and then quantitatively transfer the mixture to a 250-ml. separator with the aid of water. Extract with five 15-ml. portions of chloroform, filtering each extract into a 200-ml. volumetric flask. Dilute to volume with chloroform, and mix. Evaporate a 25.0-ml. portion of this solution to dryness in a 50-ml. conical flask with the aid of a current of air, without heating. Dissolve the residue in 5.0 ml. of *Alcoholic tartrate solution*, and label the resulting solution as the *Ergotamine tartrate assay preparation*. Use this solution without delay in the *Procedure for ergotamine tartrate*.

Procedure for caffeine—Concomitantly determine the absorbance of the *Caffeine standard preparation* and of the *Caffeine assay preparation* in 1-cm. cells, at the maximum at about 276 mμ, with a suitable spectrophotometer, using chloroform as the blank. Record the absorbance of the *Caffeine standard preparation* as A_S and that of the *Caffeine assay preparation* as A_U. Calculate the quantity, in mg., of $C_8H_{10}N_4O_2$ in the Suppositories taken by the formula $62.5C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Caffeine standard preparation*.

Procedure for ergotamine tartrate—Transfer 5.0 ml. each of the *Ergonovine maleate standard preparation* and of *Alcoholic tartrate solution*, to serve as the blank, to separate 50-ml. conical flasks. Place these flasks and the flask containing the *Ergotamine tartrate assay preparation* in an ice bath, and add, dropwise with continuous swirling, 10.0 ml. of *p*-dimethylaminobenzaldehyde T.S. Stopper the flasks, shake to mix, and allow to stand in the dark for at least 30 minutes but no longer than 60 minutes. Concomitantly determine the absorbances of the solutions in 1-cm. cells, at the maximum at about 545 mμ, with a suitable spectrophotometer, using the blank to set the instrument. Record the absorbance of the solution from the *Ergonovine maleate standard preparation* as A_S and that from the *Ergotamine tartrate assay preparation* as A_U. Calculate the quantity, in mg., of $(C_{33}H_{35}N_5O_5)_2 . C_4H_6O_6$ in the Suppositories taken by the formula $0.2C \times 1.488 \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Ergonovine maleate standard preparation*, and 1.488 is the ratio of one-half the molecular weight of ergotamine tartrate to the molecular weight of ergonovine maleate.

Packaging and storage—Preserve Ergotamine Tartrate and Caffeine Suppositories in tight containers at temperatures below 25°. Do not expose unwrapped Suppositories to sunlight.

Suppositories available—Ergotamine Tartrate and Caffeine Suppositories usually available contain 2 mg. of ergotamine tartrate and 100 mg. of caffeine.

Category—Antiadrenergic-central stimulant (specific analgesic for migraine).

Usual dose—Rectal, **2 mg.** of ergotamine tartrate with **100 mg.** of caffeine, this dose may be repeated once only in 1 hour if necessary.

Ergotamine Tartrate and Caffeine Tablets

Ergotamine Tartrate and Caffeine Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of $(C_{33}H_{35}N_5O_5)_2.C_4H_6O_6$ (ergotamine tartrate) and of $C_8H_{10}N_4O_2$ (caffeine).

Identification—Crush an Ergotamine Tartrate and Caffeine Tablet, shake it with 10 ml. of chloroform and 3 drops of stronger ammonia water, and filter. Divide the filtrate into two parts in small evaporating dishes, and evaporate to dryness on a steam bath.

A: Mix one of the residues with 5 ml. of tartaric acid solution (1 in 100), and add 10 ml. of *p*-dimethylaminobenzaldehyde T.S.: a blue color develops (*presence of ergotamine tartrate*).

B: To the other residue add 1 ml. of hydrochloric acid and 100 mg. of potassium chlorate, and evaporate to dryness on a steam bath. Invert the dish over a vessel containing stronger ammonia water: the residue acquires a purple color, which disappears upon the addition of a solution of fixed alkali (*presence of caffeine*).

Disintegration, page 878—The disintegration time limit for Ergotamine Tartrate and Caffeine Tablets is 30 minutes.

Content uniformity, *Method I*, page 799—Ergotamine Tartrate and Caffeine Tablets meet the requirements of the content uniformity test for tablets with respect to ergotamine tartrate content.

Assay—[Note: Conduct the analysis of ergotamine tartrate with a minimum exposure to light.]

Preparation of chromatographic columns—

Column A—Pack a pledget of fine glass wool in the base of a chromatographic tube (22 × 250-mm. test tube to which is fused a 5-cm. length of 6 or 8-mm. tubing) with the aid of a tamping rod of stainless steel, aluminum, or glass, at least 30 cm. long and having a disk with a diameter about 1 mm. less than that of the chromatographic tube.

Weigh and finely powder not less than 10 Ergotamine Tartrate and Caffeine Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 1 mg. of ergotamine tartrate, to a 100-ml. beaker, add 5.0 ml. of tartaric acid solution (1 in 100), and allow to stand for 30 minutes. Add 5 ml. of chloroform and 1.5 ml. or more of sodium bicarbonate solution (1 in 10) to make the aqueous phase alkaline, and mix. Add 7 g. of purified siliceous earth, and mix intimately. Transfer the mixture to the chromatographic tube in three portions, packing each portion lightly with the tamping rod. Wash the tamping rod and the sides of the beaker with 5 ml. of chloroform, mix the chloroform in the beaker with 3 g. of purified siliceous earth, transfer to the chromatographic tube, and pack uniformly.

Column B—Pack a pledget of fine glass wool in the base of a second chromatographic tube of the size described under *Column A*. Prepare a layer of adsorbent by mixing intimately 4 g. of purified siliceous earth with 3.0 ml. of 50 percent (w/w) citric acid solution, and then transfer to the second chromatographic tube in two portions, packing each portion lightly with a tamping rod. Prepare a second adsorbent layer in a similar manner, using 2 g. of purified siliceous earth and 2.0 ml. of potassium alum solution (prepared by dissolving 12 g. of potassium alum in sufficient water to make 1000 ml., and adjusting the pH to 3.5 ± 0.2 if necessary). Transfer this mixture to the chromatographic tube, placing it on top of the first layer, and pack uniformly with the tamping rod. Finally, intimately mix 2 g. of purified siliceous earth with 2.0 ml. of water, transfer to the chromatographic tube on top of the second layer, and pack uniformly with the tamping rod.

Mount *Column A* directly over *Column B*.

Alcoholic tartrate solution, Ergonovine maleate standard preparation, and *Caffeine standard preparation*—Prepare as directed in the *Assay* under *Ergotamine Tartrate and Caffeine Suppositories*, page 268.

Assay preparations—Add 50 ml. of water-washed ether to *Column A*, allowing the eluate to pass through *Column B* and collecting the final eluate in a 250-ml. volumetric flask. In the same manner, pass 50 ml. of water-washed chloroform through the columns, collecting the final eluate in the 250-ml. volumetric flask containing the ether eluate. Rinse the tip of the stem of *Column A* with a few ml. of water-washed chloroform, adding the rinsings to the 250-ml. volumetric flask. Discard *Column A*. Allow *Column B* to drain completely into the 250-ml.

volumetric flask, and then rinse the walls of the column with a few ml. of water-washed chloroform, followed by 25 ml. of the same solvent to wash the entire column, collecting the eluate in the 250-ml. volumetric flask. Retain *Column B*. Dilute the solution in the volumetric flask to volume with chloroform, and mix. Transfer 20.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with chloroform, and mix. Transfer 10.0 ml. of this last solution to a second 100-ml. volumetric flask, dilute to volume with chloroform, and mix. Label this final solution as the *Caffeine assay preparation*.

Extrude the siliceous earth from *Column B*, by means of slight air pressure, into a 400-ml. beaker, and rinse the walls of the column with 25 ml. of water, adding the rinsings to the beaker. To the beaker add, while stirring, 8 g. of sodium bicarbonate in small portions to prevent excess foaming, and then quantitatively transfer the solution to a 250-ml. separator with the aid of water. Extract with five 15-ml. portions of chloroform, filtering each extract into a 100-ml. volumetric flask. Dilute to volume with chloroform, and mix. Evaporate a 25.0-ml. portion of this solution to dryness in a 50-ml. conical flask with the aid of a current of air, without heating. Dissolve the residue in 5.0 ml. of *Alcoholic tartrate solution*, and label the resulting solution as the *Ergotamine tartrate assay preparation*. Use this solution without delay in the *Procedure for ergotamine tartrate*.

Procedure for caffeine—Proceed as directed for *Procedure for caffeine* in the *Assay* under *Ergotamine Tartrate and Caffeine Suppositories*, page 268. Calculate the quantity, in mg., of $C_8H_{10}N_4O_2$ in the portion of Tablets taken by the formula $12.5C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Caffeine standard preparation*.

Procedure for ergotamine tartrate—Proceed as directed for *Procedure for ergotamine tartrate* in the *Assay* under *Ergotamine Tartrate and Caffeine Suppositories*, page 268. Calculate the quantity, in mg., of $(C_{33}H_{35}N_5O_5)_2 . C_4H_6O_6$ in the portion of Tablets taken by the formula $0.02C \times 1.488 \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Ergonovine maleate standard preparation*, and 1.488 is the ratio of one-half the molecular weight of ergotamine tartrate to the molecular weight of ergonovine maleate.

Packaging and storage—Preserve Ergotamine Tartrate and Caffeine Tablets in well-closed, light-resistant containers.

Tablets available—Ergotamine Tartrate and Caffeine Tablets usually available contain 1 mg. of ergotamine tartrate and 100 mg. of caffeine.

CATEGORY—Antiadrenergic-central stimulant (specific analgesic for migraine).

USUAL DOSE—Initial, **2 mg.** of ergotamine tartrate and **200 mg.** of caffeine, followed by one-half this dose every 30 minutes until relief is obtained, but not to exceed a total dose of 6 mg. of ergotamine tartrate.

Eriodictyon

Eriodictyon is the dried leaf of *Eriodictyon californicum* (Hooker et Arnott) Torrey (Fam. *Hydrophyllaceæ*).

Unground Eriodictyon usually occurs in fragments, but when it is entire, the leaf is lanceolate, from 5 to 15 cm. in length and from 1 to 3 cm. in breadth. The apex is acute and the base tapers slightly into a short petiole. The margin is irregularly serrate or crenate-dentate. The upper surface is weak brown to moderate olive-brown, and is covered with a more or less glistening resin while the lower surface is yellowish brown to weak greenish yellow, reticulate with conspicuous veins, and minutely tomentose between the reticulations. The leaf is quite thick and brittle. Eriodictyon has an aromatic odor and a balsamic, bitter taste which becomes sweetish and slightly acrid.

Histology—In Eriodictyon the upper epidermis consists of large cells, the outer walls of which are very uneven, as seen in cross-section, owing to indentations, which in surface view appear as striations. Also located on the upper epidermis are numerous, deep-seated glandular hairs, each possessing a 1- to 3-celled stalk, and a multicellular glandular head consisting usually of 8 cells. Nonglandular hairs are absent on the upper epidermis. The palisade cells are very narrow and are arranged in rows from 2 to 6 cells deep. Interspersed between them are regularly arranged perpendicular rows of parenchyma cells, each cell generally containing a calcium oxalate rosette aggregate. The cells of the spongy parenchyma comprise but a few layers and the vascular tissues are not strongly developed except in the midrib and in the more prominent veins. In cross-section, the lower surface shows numerous sinuses lined by the lower epidermis from which emanate occasional deep-seated glandular hairs and many curved nonglandular hairs, the latter nearly filling the sinuses and frequently concealing the stomata.

Powdered Eriodictyon is yellow. It

contains unicellular, undulate, thick-walled, non-glandular hairs up to 250 μ in length and up to 10 μ in width; glandular hairs with 1- to 3-celled stalks and multicellular heads consisting usually of 8 cells, the heads being up to 120 μ in diameter; fragments of palisade tissue containing regularly arranged columnar parenchyma cells, most of which contain a calcium oxalate rosette aggregate; and vessels with spiral thickenings or simple pits usually associated with lignified fibers. The calcium oxalate rosette aggregates are numerous and are from 5 to 30 μ in diameter.

Eriodictyon californicum stems—The stems show a subepidermal cork; a primary cortex of 10 to 20 rows of rounded parenchyma cells; a pericycle containing a nearly closed ring of lignified sclerenchyma; a narrow phloem; a xylem region consisting of wood-wedges separated by xylem rays 1 cell in width, the wood-wedges containing numerous strongly lignified wood fibers and spiral and pitted vessels; and a broad pith.

Stems—Eriodictyon contains not more than 5 percent of its stems.

Acid-insoluble ash, page 388—Eriodictyon yields not more than 2 percent of acid-insoluble ash.

Foreign organic matter, page 388—Eriodictyon contains not more than 2 percent of foreign organic matter other than stems.

CATEGORY—Flavor.

Eriodictyon Fluidextract

Eriodictyon, in moderately coarse powder	1000 g.

Prepare the Fluidextract by Process A, page 329, using a mixture of 4 volumes of alcohol and 1 volume of water as the menstruum. Macerate the drug during 48 hours, then percolate at a moderate rate, and reserve the first 800 ml. of percolate.

Alcohol content, page 372—Eriodictyon Fluidextract contains from 67 to 82 percent, by volume, of C_2H_5OH.

Packaging and storage—Preserve Eriodictyon Fluidextract in tight, light-resistant containers and avoid exposure to direct sunlight or to excessive heat.

CATEGORY—Flavor.

Aromatic Eriodictyon Syrup

Eriodictyon Fluidextract	32	ml.
Potassium Hydroxide Solution (1 in 20)	25	ml.
Compound Cardamom Tincture	65	ml.
Lemon Oil	0.5	ml.
Clove Oil	1	ml.
Alcohol	32	ml.
Sucrose	800	g.
Magnesium Carbonate	5	g.
Purified Water, a sufficient quantity,		
To make	1000	ml.

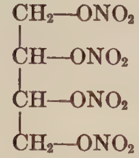
Dissolve the oils in the alcohol, add the fluidextract and the tincture, then the potassium hydroxide solution and 325 ml. of purified water. Add the magnesium carbonate, shake the mixture, allow it to stand overnight, filter, and add sufficient purified water through the filter to make the liquid measure 500 ml. Pour this filtrate upon the sucrose contained in a bottle, and dissolve by placing the bottle in hot water, and agitating the contents frequently. Cool the solution, and add sufficient purified water to make the product measure 1000 ml.

Alcohol content, page 372—Aromatic Eriodictyon Syrup contains from 6 to 8 percent, by volume, of C_2H_5OH.

Packaging and storage—Preserve Aromatic Eriodictyon Syrup in tight, light-resistant containers, and avoid excessive heat.

CATEGORY—Vehicle.

Diluted Erythrityl Tetranitrate



$$\begin{array}{l} CH_2—ONO_2 \\ | \\ CH—ONO_2 \\ | \\ CH—ONO_2 \\ | \\ CH_2—ONO_2 \end{array}$$

Erythritol Tetranitrate

$C_4H_6N_4O_{12}$ Mol. wt. 302.11

Diluted Erythrityl Tetranitrate is a dry mixture of erythrityl tetranitrate ($C_4H_6N_4O_{12}$) with lactose or other suitable inert excipients, to permit safe handling and compliance with federal Interstate Commerce Commission regulations pertaining to interstate shipment. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_4H_6N_4O_{12}$.

Caution: Undiluted erythrityl tetranitrate is a powerful explosive, and proper precautions must be taken in handling. It can be exploded by percussion or by excessive heat. Only extremely small quantities should be isolated.

Description—Diluted Erythrityl Tetranitrate occurs as a white powder having a slight odor of nitric oxides.

Solubility—Undiluted erythrityl tetranitrate is soluble in acetone, in acetonitrile, and in alcohol, and it is slightly soluble in alcohol and is practically insoluble in water.

Identification—Transfer an amount of Diluted Erythrityl Tetranitrate, equivalent to about 10 mg. of erythrityl tetranitrate, to a small separator, add 5 ml. of water and 1 ml. of diluted sulfuric acid, and extract with 25 ml. of chloroform. Transfer the chloroform layer to a small flask containing 1 g. of sodium chloride, shake well, and allow to settle. Transfer 2 ml. of the solution to the surface of 500 mg. of potassium bromide contained in a small beaker, and remove the chloroform by evaporation, using gentle heat: the infrared absorption spectrum of a pressed disk prepared from the residue exhibits maxima at the following wavelengths, in μ: 3.39 (*sh*), 3.45 (*m*), 3.52 (*w*), 6.00 (*s*), 6.12 (*s*), 6.88 (*m*), 7.26 (*m*), 7.45 (*sh*), 7.68 (*s*), 7.81 (*s*), 7.92 (*s*), 8.13 (*sh*), 9.43 (*m*), 9.68 (*s*), 10.16 (*s*), 10.88 (*s*), 11.40 (*s*), 11.99 (*s*), 13.22 (*m*), and 14.25 (*m*).

Assay—

Standard preparation—Transfer about 130 mg. of potassium nitrate, previously dried at 105° for 4 hours and accurately weighed, to a 10-ml. volumetric flask, add water to volume, and mix. Transfer 1.0 ml. of this solution to a 50-ml. volumetric flask, dilute to volume with glacial acetic acid, and mix.

Assay preparation—Transfer an accurately weighed amount of Diluted Erythrityl Tetranitrate, equivalent to about 10 mg. of erythrityl tetranitrate, to a small separator, add 20 ml. of chloroform and 10 ml. of water, and shake. Drain the chloroform layer into a 50-ml. volumetric flask. Extract the aqueous layer with two 10-ml. portions of chloroform, adding the extracts to the volumetric flask. Dilute the contents of the flask to volume with chloroform, and mix.

Procedure—Transfer 1.0 ml. each of the *Standard preparation* and of the *Assay preparation* to separate small beakers. Evaporate the chloroform from the *Assay preparation* with the aid of a current of air and very gentle heat, and then dissolve the residue in 1.0 ml. of glacial acetic acid. To each beaker add 2 ml. of phenoldisulfonic acid T.S., mix, and allow to stand for 15 minutes. Add 8 ml. of water to each beaker, mix, and carefully add 8 ml. of stronger ammonia T.S. Cool, quantitatively transfer the solutions to separate 25-ml. volumetric flasks, dilute each to volume with water, and mix. Concomitantly determine the absorbances of the solutions, in 1-cm. cells, at the maximum at about 405 mμ, with a suitable spectrophotometer, using water as the blank. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_4H_6N_4O_{12}$ in the Diluted Erythrityl Tetranitrate taken by the formula $0.05C \times 0.7470 \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of potassium nitrate in the *Standard preparation*, and 0.7470 is an equivalence factor relating potassium nitrate to erythrityl tetranitrate.

Packaging and storage—Preserve Diluted Erythrityl Tetranitrate in tight containers, and avoid exposure to excessive heat.

Concentrations available—Diluted Erythrityl Tetranitrate usually available contains 11 percent of erythrityl tetranitrate.

Category—Vasodilator.

Usual dose—Oral, initial, **10 mg.** of erythrityl tetranitrate three times a day; sublingual, initial, **5 mg.** of erythrityl tetranitrate three times a day. These doses may be increased in 2 or 3 days if needed.

Erythrityl Tetranitrate Tablets

Erythrityl Tetranitrate Tablets are prepared from diluted erythrityl tetranitrate. They contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_4H_6N_4O_{12}$.

Caution: Undiluted erythrityl tetranitrate is a powerful explosive, and proper precautions must be taken in handling. It can be exploded by percussion or by excessive heat. Only extremely small amounts should be isolated.

Identification—A portion of finely powdered Erythrityl Tetranitrate Tablets, equivalent to about 10 mg. of erythrityl tetranitrate, meets the requirements of the *Identification test* under *Diluted Erythrityl Tetranitrate*, page 273.

Disintegration, page 878—The disintegration time limit for Erythrityl Tetranitrate Tablets, determined without the use of disks, is 10 minutes.

Content uniformity, *Method I*, page 799—Erythrityl Tetranitrate Tablets meet the requirements of the content uniformity test for tablets.

Assay—

Standard preparation—Prepare as directed in the *Assay* under *Diluted Erythrityl Tetranitrate*, page 273.

Assay preparation—Weigh and finely powder not less than 20 Erythrityl Tetranitrate Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 10 mg. of erythrityl tetranitrate, to a small separator, and continue as directed for *Assay preparation* in the *Assay* under *Diluted Erythrityl Tetranitrate*, page 273, beginning with "... add 20 ml. of chloroform ..."

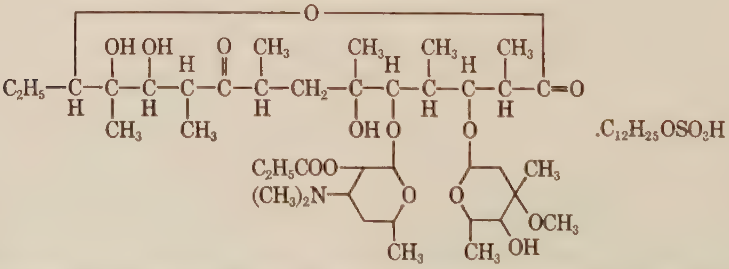
Procedure—Proceed as directed for *Procedure* in the *Assay* under *Diluted Erythrityl Tetranitrate*, page 273. Calculate the quantity, in mg., of $C_4H_6N_4O_{12}$ in the portion of Tablets taken by the formula $0.05C \times 0.7470 \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of potassium nitrate in the *Standard preparation*, and 0.7470 is an equivalence factor relating potassium nitrate and erythrityl tetranitrate.

Packaging and storage—Preserve Erythrityl Tetranitrate Tablets in tight containers.

Tablets available—Erythrityl Tetranitrate Tablets usually available contain diluted erythrityl tetranitrate equivalent to the following amounts of erythrityl tetranitrate: 5, 10, and 15 mg.

Category and Dose—See Diluted Erythrityl Tetranitrate.

Erythromycin Estolate*



Erythromycin 2′-Propionate (Ester) Dodecyl Hydrogen Sulfate (1:1) Compound

$C_{40}H_{71}NO_{14} . C_{12}H_{26}O_4S$ Mol. wt. 1056.41

---

* Patented. See notice, page ii.

Erythromycin Estolate contains not less than 60.0 percent of $C_{37}H_{67}NO_{13}$ (erythromycin), calculated on the anhydrous basis. Erythromycin Estolate conforms to the regulations of the federal Food and Drug Administration concerning certification of antibiotic drugs.

Description—Erythromycin Estolate occurs as a white, crystalline powder. It is odorless or practically odorless and is practically tasteless.

Solubility—Erythromycin Estolate is practically insoluble in water. It is soluble in alcohol, in acetone, and in chloroform.

Packaging and storage—Preserve Erythromycin Estolate in tight containers.

CATEGORY—Antibacterial.

USUAL DOSE—The equivalent of **250 mg.** of erythromycin every 6 hours.

USUAL DOSE RANGE—**250** to **500 mg.**

Erythromycin Estolate Capsules

Erythromycin Estolate Capsules contain an amount of erythromycin estolate equivalent to not less than 90.0 percent and not more than 115.0 percent of the labeled amount of $C_{37}H_{67}NO_{13}$ (erythromycin). Erythromycin Estolate Capsules conform to the regulations of the federal Food and Drug Administration concerning certification of antibiotic drugs.

Packaging and storage—Preserve Erythromycin Estolate Capsules in tight containers.

Capsules available—Erythromycin Estolate Capsules usually available contain the equivalent of the following amounts of erythromycin: 125 and 250 mg.

CATEGORY and DOSE—See Erythromycin Estolate.

Erythromycin Estolate for Oral Suspension

Erythromycin Estolate for Oral Suspension is erythromycin estolate admixed with one or more suitable suspending and dispersing agents. It may contain one or more suitable colors, flavors, buffers, and preservatives. Erythromycin Estolate for Oral Suspension contains an amount of erythromycin estolate equivalent to not less than 90.0 percent and not more than 115.0 percent of the labeled amount of $C_{37}H_{67}NO_{13}$ (erythromycin). Erythromycin Estolate for Oral Suspension conforms to the regulations of the federal Food and Drug Administration concerning certification of antibiotic drugs.

Packaging and storage—Preserve Erythromycin Estolate for Oral Suspension in tight containers.

Sizes available—Erythromycin Estolate for Oral Suspension usually available contains the equivalent of the following amounts of erythromycin: 1.50 g. in 60-ml. containers and 3.75 g. in 150-ml. containers.

CATEGORY and DOSE—See Erythromycin Estolate.

Erythromycin Estolate Tablets

Erythromycin Estolate Tablets contain an amount of erythromycin estolate equivalent to not less than 90.0 percent and not more than 120.0 percent of the labeled amount of $C_{37}H_{67}NO_{13}$ (erythromycin). Erythromycin Estolate Tablets conform to the regulations of the federal Food and Drug Administration concerning certification of antibiotic drugs.

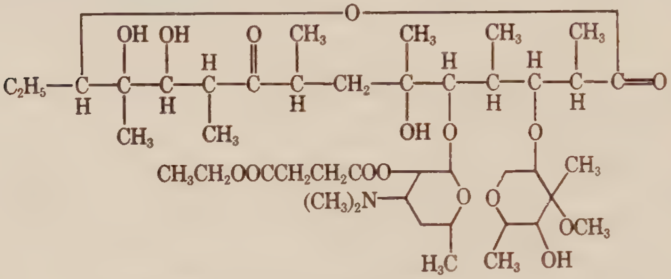
Packaging and storage—Preserve Erythromycin Estolate Tablets in tight containers.

Tablets available—Erythromycin Estolate Tablets usually available are chewable tablets and contain the equivalent of the following amount of erythromycin: 125 mg.

Labeling—Label Erythromycin Estolate Tablets to indicate that they are to be chewed before swallowing.

Category and Dose—See Erythromycin Estolate.

Erythromycin Ethylsuccinate*



Erythromycin 2′-(Ethyl Succinate)

$C_{43}H_{75}NO_{16}$ Mol. wt. 862.07

Erythromycin Ethylsuccinate contains the equivalent of not less than 76.5 percent of $C_{37}H_{67}NO_{13}$ (erythromycin base), calculated on the anhydrous basis. Erythromycin Ethylsuccinate conforms to the regulations of the federal Food and Drug Administration concerning certification of antibiotic drugs.

Description—Erythromycin Ethylsuccinate occurs as a white or slightly yellow, crystalline powder. It is odorless or practically odorless and is almost tasteless.

Solubility—Erythromycin Ethylsuccinate is freely soluble in alcohol, in chloroform, and in polyethylene glycol 400. It is very slightly soluble in water.

Packaging and storage—Preserve Erythromycin Ethylsuccinate in tight containers.

Category—Antibacterial.

Usual dose range—Intramuscular, **100 mg.** every 4 to 12 hours; oral, **1** to **2 g.** daily in divided doses.

---

* Patented. See notice, page ii.

Erythromycin Ethylsuccinate Injection

Erythromycin Ethylsuccinate Injection is a sterile solution of erythromycin ethylsuccinate in polyethylene glycol 400. It contains erythromycin ethylsuccinate equivalent to not less than 90.0 percent and not more than 115.0 percent of the labeled amount of $C_{37}H_{67}NO_{13}$ (erythromycin base). Erythromycin Ethylsuccinate Injection conforms to the regulations of the federal Food and Drug Administration concerning certification of antibiotic drugs.

Packaging and storage—Preserve Erythromycin Ethylsuccinate Injection in single-dose or in multiple-dose containers, preferably of Type I glass.

Injections available—Erythromycin Ethylsuccinate Injection usually available contains erythromycin ethylsuccinate equivalent to the following amounts of erythromycin base: 100 mg. in 2 ml.; 500 mg. in 10 ml.

Category and Dose—See Erythromycin Ethylsuccinate.

Erythromycin Ethylsuccinate for Oral Suspension

Erythromycin Ethylsuccinate for Oral Suspension is erythromycin ethylsuccinate admixed with one or more suitable suspending and dispersing agents. It may contain one or more suitable buffers, colors, flavors, and preservatives. It contains erythromycin ethylsuccinate equivalent to not less than 90.0 percent and not more than 120.0 percent of the labeled amount of $C_{37}H_{67}NO_{13}$ (erythromycin base). Erythromycin Ethylsuccinate for Oral Suspension conforms to the regulations of the federal Food and Drug Administration concerning certification of antibiotic drugs.

Packaging and storage—Preserve Erythromycin Ethylsuccinate for Oral Suspension in tight containers.

Sizes available—Erythromycin Ethylsuccinate for Oral Suspension usually available contains erythromycin ethylsuccinate equivalent to the following amounts of erythromycin base: 1.2 g. in a 30-ml. container; 2.4 g. in a 60-ml. container.

CATEGORY and DOSE—See Erythromycin Ethylsuccinate.

Erythromycin Ethylsuccinate Tablets

Erythromycin Ethylsuccinate Tablets contain erythromycin ethylsuccinate equivalent to not less than 90.0 percent and not more than 120.0 percent of the labeled amount of $C_{37}H_{67}NO_{13}$ (erythromycin base). Erythromycin Ethylsuccinate Tablets conform to the regulations of the federal Food and Drug Administration concerning certification of antibiotic drugs.

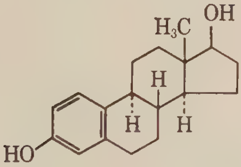
Packaging and storage—Preserve Erythromycin Ethylsuccinate Tablets in tight containers.

Tablets available—Erythromycin Ethylsuccinate Tablets usually available are chewable tablets and contain erythromycin ethylsuccinate equivalent to the following amount of erythromycin base: 200 mg

Labeling—Label Erythromycin Ethylsuccinate Tablets to indicate that they are to be chewed before swallowing.

CATEGORY and DOSE—See Erythromycin Ethylsuccinate.

Estradiol



Estra-1,3,5(10)-triene-3,17β-diol

$C_{18}H_{24}O_2$ Mol. wt. 272.39

Estradiol contains not less than 97.0 percent and not more than 103.0 percent of $C_{18}H_{24}O_2$, calculated on the dried basis.

Description—Estradiol occurs as white or creamy white, small crystals or as a crystalline powder. It is odorless, and is stable in air. It is hygroscopic.

Solubility—Estradiol is practically insoluble in water; it is soluble in alcohol, in acetone, in dioxane, in chloroform, and in solutions of fixed alkali hydroxides; it is sparingly soluble in vegetable oils.

Identification—Dissolve about 2 mg. of Estradiol in 2 ml. of sulfuric acid: the solution is greenish yellow and exhibits a green fluorescence. When the solution is diluted with 2 ml. of water, the color changes to pale orange. If 1 drop of ferric ammonium sulfate T.S. is added to the sulfuric acid solution before dilution with the water, the green color is strongly intensified, and after dilution with the water, the color is red.

Melting range, page 814—Estradiol melts between 173° and 179°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Estradiol, previously dried at 105° for 4 hours, exhibits maxima only at the same wavelengths as that of NF Estradiol Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 20,000 solution of Estradiol in alcohol exhibits maxima and minima at the same wavelengths as that of NF Estradiol Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance occurring at about 280 mμ, do not differ by more than 3 percent.

Specific rotation, page 822—The specific rotation of Estradiol, previously dried at 105° for 4 hours, determined in a solution in dioxane containing 100 mg. of Estradiol in each 10 ml., is between +76° and +83°.

Loss on drying, page 814—Dry Estradiol at 105° for 4 hours: it loses not more than 3.5 percent of its weight.

Limit of alpha-estradiol—Prepare a benzene solution of Estradiol, previously dried at 105° for 4 hours and accurately weighed, to contain about 50 mcg. in each ml. Prepare a similar solution of NF Estradiol Reference Standard. Transfer, in duplicate to separate 18 × 150-mm. test tubes, aliquots of the two solutions, each equivalent to 100 mcg. of Estradiol. Add a few small pieces of silicon carbide, or a few small glass beads to each tube, evaporate the solvent, and dry the residue over phosphorus pentoxide in a desiccator connected to a vacuum line for 1 hour.

To each tube and a blank tube, add 1.0 ml. of a reagent, prepared by mixing 1 volume of iron-phenol T.S. with 0.45 volume of water. Close the tubes with rubber finger stalls, and place in a boiling water bath for 2 minutes, shaking the tubes after 30 seconds for a few seconds without removing from the bath. Transfer to an ice bath for 2 minutes, then remove, add 4.0 ml. of dilute sulfuric acid (35 in 100), and mix thoroughly. Measure the absorbances of the solutions from the sample preparation (A_U) and the standard preparation (A_S) relative to the blank at 525 mμ and at 420 mμ, making any necessary correction for cell variation. Compare the relative amount of *alpha*-estradiol in the sample aliquot used by the following formula, $(A_{U525} - A_{U420}/2)/(A_{S525} - A_{S420}/2)$, in which A represents the absorbance at the indicated wavelength: the amount of *alpha*-estradiol in the sample preparation is not more than three times that in the NF Estradiol Reference Standard.

Foreign steroids and other impurities—

Standard preparation—Prepare as directed under *Steroid Chromatographic Purity*, page 876, using NF Estradiol Reference Standard.

Test preparation—Weigh accurately about 80 mg. of Estradiol previously dried at 105° for 3 hours, dissolve it in a sufficient quantity of a mixture of equal volumes of alcohol and chloroform to make 10.0 ml., and mix.

Procedure—Proceed as directed for *Procedure* under *Steroid Chromatographic Purity*, page 876, using a solvent system consisting of benzene and ethyl acetate (6:1). Use 25.0 ml. of methanol, rather than dehydrated alcohol, to elute the steroid from the silica gel. Determine the absorbance at the maximum at about 281 mμ and calculate the percentage of chromatographic impurities by the formula $100 - [100 \times 10 \times (C/W) \times (A_U/A_S)]$, in which C is the exact concentration, in mg. per ml., of the *Standard preparation*, and W is the weight, in mg., of Estradiol taken: not more than 3 percent is found.

Assay—

Diluted iron-phenol solution—Just prior to use, dilute 10.0 ml. of iron-phenol T.S. to 100.0 ml. with dilute sulfuric acid (1 in 2), and shake vigorously.

Standard preparation—Weigh accurately about 50 mg. of NF Estradiol Reference Standard, dissolve it in sufficient ethyl acetate to make 100.0 ml., and mix. Transfer 4.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with ethyl acetate, and mix.

Assay preparation—Weigh accurately about 50 mg. of Estradiol, dissolve it in sufficient ethyl acetate to make 100.0 ml., and mix. Transfer 4.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with ethyl acetate, and mix.

Procedure—Pipet 5.0 ml. each of the *Standard preparation* and of the *Assay preparation* into separate glass-stoppered tubes, and evaporate each solution to dryness on a steam bath. Dry the residues in vacuum at 40° for 15 minutes, and cool in a desiccator. To each tube add 10.0 ml. of *Diluted iron-phenol solution* and add 20 ml. of *Diluted iron-phenol solution* to a third tube to serve as a blank. Stopper the tubes, shake vigorously at 5-minute intervals over a period of 30 minutes, then immerse the stoppered tubes above the level of their contents in a water bath, and heat the tubes at 65° to 70° in the bath for 1 hour. Cool the tubes in an ice-water bath, mix by inverting, and allow to stand at room temperature for 15 minutes. Concomitantly determine the absorbances of the solutions in 1-cm. cells, at the maximum at about 525 mμ, with a suitable spectrophotometer, using the blank to set the instrument. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{18}H_{24}O_2$ in the Estradiol taken by the formula $2.5C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation.*

Packaging and storage—Preserve Estradiol in well-closed, light-resistant containers.

CATEGORY—Estrogen.

USUAL DOSE RANGE—Implantation, **25 mg.** repeated when necessary; intramuscular, **220 mcg.** to **1.5 mg.** two or three times a week; oral, **200** to **500 mcg.** one to three times a day.

Estradiol Pellets

Estradiol Pellets are sterile pellets composed of estradiol in compressed form, without the presence of any binder, diluent, or excipient. They contain not less than 97.0 percent and not more than 103.0 percent of $C_{18}H_{24}O_2$.

Requirements—Estradiol Pellets meet the requirements under *Estradiol,* page 277, and under *Sterility Test for Solids,* page 874.

Solubility in chloroform—A solution of 25 mg. of Estradiol Pellets in 1 ml. of chloroform is clear and practically free from insoluble residue.

Weight variation—Weigh 5 Estradiol Pellets singly, and calculate the average weight. The average weight is not less than 95 percent and not more than 105 percent of the labeled weight of $C_{18}H_{24}O_2$, and each pellet weighs not less than 90 percent and not more than 110 percent of the labeled weight of $C_{18}H_{24}O_2$.

Assay—Proceed as directed in the *Assay* under *Estradiol,* page 277.

Packaging and storage—Preserve Estradiol Pellets in tight containers suitable for maintaining sterile contents holding one pellet each.

Pellets available—Estradiol Pellets usually available contain the following amount of estradiol: 25 mg.

CATEGORY and DOSE—See Estradiol.

Sterile Estradiol Suspension

Sterile Estradiol Suspension is a sterile suspension of estradiol in water for injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{18}H_{24}O_2$.

Identification—Transfer a volume of well-mixed Sterile Estradiol Suspension, equivalent to about 10 mg. of estradiol, into a flask, make it acid to bromophenol blue T.S. with 1 *N* hydrochloric acid, mix thoroughly, and place in an ice bath for 15 minutes. Filter the acidified suspension with suction through a sintered-glass funnel. Wash the crystals of estradiol so isolated with five successive 5-ml. portions of water, and dry the funnel and contents to constant weight at 105°. The estradiol recovered meets the requirements for *Melting range* and for *Infrared absorption* under *Estradiol,* page 277.

Other requirements—Sterile Estradiol Suspension meets the requirements under *Injections,* page 810.

Assay—

Diluted iron-phenol solution and *Standard preparation*—Prepare as directed in the *Assay* under *Estradiol,* page 277.

Assay preparation—Transfer an accurately measured volume of Sterile Estradiol Suspension, equivalent to about 2 mg. of estradiol, to a 125-ml. separator containing 25 ml. of water, and extract with four 50-ml. portions and one 30-ml. portion of ethyl acetate. Filter each extract through ethyl acetate-washed cotton (layered over with anhydrous sodium sulfate) into a 500-ml. volumetric flask, dilute to volume with ethyl acetate, and mix.

Procedure—Pipet 5.0 ml. of the *Standard preparation* and 25 ml. of the *Assay preparation* into separate glass-stoppered tubes, and continue as directed for *Procedure* in the *Assay* under *Estradiol,* page 277, beginning with "... evaporate each solution to dryness on a steam bath." Calculate the quantity, in mg., of $C_{18}H_{24}O_2$ in each ml. of the Suspension taken by the formula $0.1 \times (C/V) \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*, and *V* is the volume, in ml., of the Suspension taken.

Packaging and storage—Preserve Sterile Estradiol Suspension in single-dose or multiple-dose containers, preferably of Type I glass.

Injections available—Sterile Estradiol Suspension usually available contains the following amounts of estradiol: 250 mcg. in 1 ml.; 1 mg. in 1 ml.; 2.5 mg. in 10 ml.; 2.2 mg. in 10 ml.; 4.4 mg. in 10 ml.; 11 mg. in 10 ml.; 5.5 mg. in 25 ml.

CATEGORY and DOSE—See Estradiol.

Estradiol Tablets

Estradiol Tablets contain not less than 90.0 percent and not more than 115.0 percent of the labeled amount of $C_{18}H_{24}O_2$.

Disintegration, page 878—The disintegration time limit for Estradiol Tablets is 15 minutes.

Content uniformity, *Method I,* page 799—Estradiol Tablets meet the requirements of the content uniformity test for tablets.

Assay—

Diluted iron-phenol solution and *Standard preparation*—Prepare as directed in the *Assay* under *Estradiol,* page 277.

Assay preparation—Weigh and finely powder not less than 20 Estradiol Tablets. Weigh accurately a portion of the powder, equivalent to about 500 mcg. of estradiol, and transfer to a 125-ml. separator containing 25 ml. of water, and extract with five 45-ml. portions of ethyl acetate. Filter each extract through ethyl acetate-washed cotton (layered over with anhydrous sodium sulfate) into a 250-ml. volumetric flask, dilute to volume with ethyl acetate, and mix.

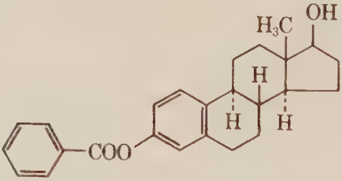
Procedure—Pipet 5.0 ml. of the *Standard preparation* and 50.0 ml. of the *Assay preparation* into separate glass-stoppered tubes, and continue as directed for *Procedure* in the *Assay* under *Estradiol,* page 277, beginning with "... evaporate each solution to dryness on a steam bath." Calculate the quantity, in mg., of $C_{18}H_{24}O_2$ in the portion of the Tablets taken by the formula $0.025C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation.*

Packaging and storage—Preserve Estradiol Tablets in well-closed containers.

Tablets available—Estradiol Tablets usually available contain the following amounts of estradiol: 200 and 500 mcg.

CATEGORY and DOSE—See Estradiol.

Estradiol Benzoate



Estradiol 3-Benzoate

$C_{25}H_{23}O_3$ Mol. wt. 376.50

Estradiol Benzoate contains not less than 97.0 percent and not more than 103.0 percent of $C_{25}H_{28}O_3$, calculated on the dried basis.

Description—Estradiol Benzoate occurs as a white or creamy white, crystalline powder. It is odorless, and is stable in air.

Solubility—Estradiol Benzoate is practically insoluble in water. It is soluble in alcohol, in acetone, in benzene, and in dioxane. It is slightly soluble in ether, and sparingly soluble in vegetable oils.

Identification—Prepare a solution of Estradiol Benzoate in benzene containing 5 mg. per ml. On a suitable thin-layer chromatographic plate (see page 791), coated with a 0.25-mm. layer of silica gel G, spot 10 µl. of this solution and 10 µl. of a benzene solution of NF Estradiol Benzoate Reference Standard containing 5 mg. per ml. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of benzene and ethyl acetate (6:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by spraying with a solution of vanillin and sulfuric acid in acetic acid (prepared by dissolving 1 g. of vanillin and 2 ml. of sulfuric acid in 98 ml. of acetic acid) and by heating at 100° for 10 minutes: the R_f value of the main spot obtained from the sample solution corresponds to that obtained from the Reference Standard solution, and the presence, size, and intensity of any secondary spots obtained from the sample solution do not exceed similar spots obtained from the Reference Standard solution.

Melting range, *Class Ia,* page 815—Estradiol Benzoate melts between 190° and 196°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Estradiol Benzoate, previously dried over silica gel for 4 hours, exhibits maxima only at the same wavelengths as that of NF Estradiol Benzoate Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 10,000 solution of Estradiol Benzoate in alcohol exhibits maxima and minima at the same wavelengths as that of NF Estradiol Benzoate Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance occurring at about 230 mμ, do not differ by more than 5 percent.

Specific rotation, page 822—The specific rotation of Estradiol Benzoate, previously dried over silica gel for 4 hours, determined in a solution in dioxane containing 100 mg. of Estradiol Benzoate in each 10 ml., is between +57° and +62°.

Loss on drying, page 814—Dry Estradiol Benzoate over silica gel for 4 hours: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—The residue on ignition from 100 mg. of Estradiol Benzoate is negligible.

Completeness and reaction of solution—Dissolve 100 mg. of Estradiol Benzoate in 5 ml. of warm alcohol: no insoluble residue remains and the solution after cooling is only slightly acid to litmus.

Foreign steroids and other impurities—

Standard preparation—Prepare as directed under *Steroid Chromatographic Purity,* page 876, using NF Estradiol Benzoate Reference Standard.

Test preparation—Weigh accurately about 80 mg. of Estradiol Benzoate previously dried at 105° for 3 hours, dissolve it in a sufficient quantity of a mixture of equal volumes of alcohol and chloroform to make 10.0 ml., and mix.

Procedure—Proceed as directed for *Procedure* under *Steroid Chromatographic Purity,* page 876, using a solvent system consisting of benzene and ethyl acetate (6:1). Use 25.0 ml. of methanol, rather than dehydrated alcohol, to elute the steroid from the silica gel. Determine the absorbance at the maximum at about 229 mμ and calculate the percentage of chromatographic impurities by the formula $100 - [100 \times 10 \times (C/W) \times (A_U/A_S)]$, in which C is the exact concentration, in mg. per ml., of the *Standard preparation,* and W is the weight, in mg., of Estradiol Benzoate taken: not more than 3 percent is found.

Assay—

Chromatographic column—Pack a pledget of glass wool in the base of an 18 × 300-mm. chromatographic tube having a 10-mm. stem extending about 100 mm. below an unlubricated stopcock. Arrange a long-stemmed, glass-stoppered 500-ml. separator to serve as a reservoir for maintaining a constant level of liquid in the tube. Transfer about 22 g. of dry silica gel G (10 to 30-μ particle size) to the tube, and pack the column by applying vacuum to the delivery tip. Adjust the column height to about 190 mm.

Mobile solvent—Mix 365 ml. of benzene with 50 ml. of ethyl acetate.

Diluted iron-phenol solution—Just prior to use, dilute 1 volume of iron-phenol T.S. to 10 volumes with a cool solution of 45 volumes of sulfuric acid in 55 volumes of water. Mix, and dispense from a small-bore buret, arranged to exclude moisture.

Standard preparation—Transfer about 50 mg. of NF Estradiol Benzoate Reference Standard, accurately weighed, to a 100-ml. volumetric flask, add dehydrated alcohol to volume, and mix. Transfer 2.0 ml. of this solution to a 50-ml. conical flask, and continue as directed under *Assay preparation* beginning with "... add 10 ml. of 0.1 *N* sodium hydroxide."

Assay preparation—Transfer about 10 mg. of Estradiol Benzoate, accurately weighed, to a 50-ml. volumetric flask, add *Mobile solvent* to volume, and mix. Slowly pipet 5.0 ml. of this solution onto the chromatographic column. (Note—At no time during the development of the chromatogram should the surface of the column be free of solvent.) Allow all but a 3-mm. layer of the solution to absorb into the column, then add 5 ml. of the *Mobile solvent,* and apply vacuum. Draw all but 3 mm. into the column, add 5 ml. more of the *Mobile solvent,* and again draw all but 3 mm. into the column. Pass 160 ml. of the *Mobile solvent* into the column. Withdraw and discard the first 47 ml. of eluate. Collect the next 100 ml. of eluate in two separate portions of 50 ml. each. Evaporate the first portion to dryness in a 50-ml. glass-stoppered conical flask on a steam bath with the aid of a current of air. Add the second 50-ml. portion to the same flask, and evaporate to dryness in the same manner. Dissolve the residue in 2.0 ml. of dehydrated alcohol, add 10 ml. of 0.1 *N* sodium hydroxide, mix, and heat in a water bath at 60° for 30 minutes. Cool, and transfer with the aid of two 10-ml. portions of 0.1 *N* sodium hydroxide to a 250-ml. separator. Cautiously add 10 ml. of cold dilute sulfuric acid (1 in 2), mix, and extract with 20 ml. of benzene. Dry the extract over 1 g. of anhydrous sodium sulfate, then transfer to a 50-ml. volumetric flask. Repeat the extraction with two 15-ml. portions of benzene, drying each extract over the same anhydrous sodium sulfate, and transfer to the volumetric flask. Dilute to volume with benzene, and mix.

Procedure—Transfer 5.0 ml. of each of the *Standard preparation* and of the *Assay preparation* to separate 50-ml. glass-stoppered test tubes, and evaporate to dryness on a steam bath with the aid of a stream of nitrogen. Wipe dry the exterior of the tubes, then dry the residues in vacuum at 40° for 15 minutes, and cool in a desiccator. Pipet 10.0 ml. of *Diluted iron-phenol solution* into each tube and into a third tube to serve as the blank, stopper the tubes, and shake vigorously at 5-minute intervals over a period of 30 minutes. Heat the solutions in a boiling water bath for 60 minutes, chill rapidly to room temperature in an ice-water bath, and then swirl the tubes in water at room temperature for several minutes. Concomitantly determine the absorbances of the solutions in 1-cm. cells, at the maximum at about 525 mμ, with a suitable spectrophotometer, using the blank to set the instrument. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{25}H_{28}O_3$ in the Estradiol Benzoate taken by the formula $0.5C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*.

Packaging and storage—Preserve Estradiol Benzoate in well-closed, light-resistant containers.

CATEGORY—Estrogen.

USUAL DOSE RANGE—Intramuscular, initial, **1.0** to **1.66 mg.** two or three times a week for 2 or 3 weeks; maintenance, **330 mcg.** to **1.0 mg.** twice weekly.

Estradiol Benzoate Injection

Estradiol Benzoate Injection is a sterile solution of estradiol benzoate in a suitable oil. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of $C_{25}H_{28}O_3$.

Identification—On a suitable thin-layer chromatographic plate (see page 791), coated with a 0.25-mm. layer of silica gel G, spot 40 μl. each of the *Assay preparation* and of the *Standard preparation* prepared as directed in the *Assay*. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of benzene and ethyl acetate (6:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots by viewing the plate under shortwave ultraviolet light: the R_f value of the main spot obtained from the *Assay preparation* corresponds to that obtained from the *Standard preparation*.

Other requirements—Estradiol Benzoate Injection meets the requirements under *Injections*, page 810.

Assay—

Chromatographic column, Mobile solvent, Diluted iron-phenol solution, and *Standard preparation*—Prepare as directed in the *Assay* under *Estradiol Benzoate*, page 280.

Assay preparation—Transfer an accurately measured volume of Estradiol Benzoate Injection, equivalent to about 10 mg. of estradiol benzoate, to a 50-ml. volumetric flask, add *Mobile solvent* to volume, and mix. (NOTE—If the concentration of estradiol benzoate is less than 1 mg. per ml., use 10.0 ml. of the Injection as the sample.) Continue as directed for *Assay preparation* in the *Assay* under *Estradiol Benzoate*, page 280, beginning with "Slowly pipet 5.0 ml. of this solution onto the chromatographic column."

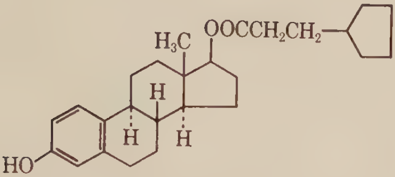
Procedure—Proceed as directed for *Procedure* in the *Assay* under *Estradiol Benzoate*, page 280. Calculate the quantity, in mg., of $C_{25}H_{28}O_3$ in each ml. of the Injection taken by the formula $0.5 \times (C/V) \times (A_U/A_S)$, in which V is the volume, in ml., of the Injection taken.

Packaging and storage—Preserve Estradiol Benzoate Injection in single-dose or in multiple-dose containers, preferably of Type I or Type III glass.

Injections available—Estradiol Benzoate Injection usually available contains the following amounts of estradiol benzoate: 10 and 33.3 mg. in 10 ml.

CATEGORY and DOSE—See Estradiol Benzoate.

Estradiol Cypionate*



Estradiol 17-Cyclopentanepropionate

$C_{26}H_{36}O_3$ Mol. wt. 396.58

Estradiol Cypionate contains not less than 97.0 percent and not more than 103.0 percent of $C_{26}H_{36}O_3$, calculated on the dried basis.

Description—Estradiol Cypionate is a white to practically white, crystalline powder. It is odorless or has a slight odor.

Solubility—Estradiol Cypionate is insoluble in water. It is soluble in alcohol, in acetone, in chloroform, and in dioxane. It is sparingly soluble in vegetable oils.

Identification—

A: Dissolve about 2 mg. of Estradiol Cypionate in 2 ml. of sulfuric acid: the solution is greenish yellow and exhibits a green fluorescence.

B: Transfer 5 mg. of Estradiol Cypionate to a small beaker, add 5 ml. of potassium hydroxide solution (1 in 10), and heat on a steam bath for 15 minutes. Mix 50 mg. of sulfanilic acid with 2 ml. of diluted hydrochloric acid, warm the mixture, then cool it in ice water, and slowly add, with agitation, 0.3 ml. of a solution of sodium nitrite (1 in 10). Add this solution to the saponified Estradiol Cypionate: a red color is produced.

Melting range, page 814—Estradiol Cypionate melts between 149° and 153°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Estradiol Cypionate, previously dried at 105° for 4 hours, exhibits maxima only at the same wavelengths as that of NF Estradiol Cypionate Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 10,000 solution of Estradiol Cypionate in alcohol exhibits maxima and minima at the same wavelengths as that of NF Estradiol Cypionate Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance occurring at about 280 mμ, do not differ by more than 3 percent.

Specific rotation, page 822—The specific rotation of Estradiol Cypionate, calculated on the dried basis, determined in a solution in dioxane containing 200 mg. of Estradiol Cypionate in each 10 ml., is between +39° and +44°.

Loss on drying, page 814—Dry Estradiol Cypionate at 105° for 4 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Estradiol Cypionate yields not more than 0.2 percent of residue on ignition.

Foreign steroids and other impurities—

Standard preparation—Prepare as directed under *Steroid Chromatographic Purity*, page 876, using NF Estradiol Cypionate Reference Standard.

Test preparation—Weigh accurately about 80 mg. of Estradiol Cypionate previously dried at 105° for 4 hours, dissolve it in a sufficient quantity of a mixture of equal volumes of alcohol and chloroform to make 10.0 ml., and mix.

Procedure—Proceed as directed for *Procedure* under *Steroid Chromatographic Purity*, page 876, using a solvent system consisting of benzene and acetone (4:1), and determining the absorbance at the maximum at about 280 mμ. Calculate the percentage of chromatographic impurities by the formula $100 - [100 \times 10 \times (C/W) \times (A_U/A_S)]$, in which C is the exact concentration, in mg. per ml., of the *Standard preparation*, and W is the weight, in mg., of Estradiol Cypionate taken: not more than 3 percent is found.

Assay—

Diluted iron-phenol solution—Just prior to use, dilute 10.0 ml. of iron-phenol T.S. to 100.0 ml. with dilute sulfuric acid (2 in 3), and shake vigorously.

Standard preparation—Weigh accurately about 25 mg. of NF Estradiol Cypionate Reference Standard, dissolve it in sufficient alcohol to make 100.0 ml., and mix. Transfer 5.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with alcohol, and mix.

Assay preparation—Weigh accurately about 25 mg. of Estradiol Cypionate, dissolve it in sufficient alcohol to make 100.0 ml., and mix. Transfer 5.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with alcohol, and mix.

---

* Patented. See notice, page ii.

Procedure—Pipet 4.0 ml. each of the *Standard preparation* and of the *Assay preparation* into separate glass-stoppered tubes, and evaporate each solution to dryness in a stream of air with the aid of gentle heat. Pipet 1.0 ml. of alcohol into each tube and into a third glass-stoppered tube to serve as the blank. Add 10.0 ml. of *Diluted iron-phenol solution* to each tube, stopper, and mix vigorously. Immerse the stoppered tubes above the level of their contents in a water bath, and heat in the bath at 75° to 80° for 2 hours. Cool the tubes in ice water, mix by inverting, and allow to stand at room temperature for 15 minutes. Concomitantly determine the absorbances of the solutions in 1-cm. cells, at the maximum at about 510 mμ, with a suitable spectrophotometer, using the blank to set the instrument. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{26}H_{36}O_3$ in the portion of Estradiol Cypionate taken by the formula $2C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*.

Packaging and storage—Preserve Estradiol Cypionate in tight, light-resistant containers.

CATEGORY—Estrogen.

USUAL DOSE RANGE—Intramuscular, initial, **1** to **5 mg.** weekly for 2 to 3 weeks; maintenance, **2** to **5 mg.** every 3 to 4 weeks.

Estradiol Cypionate Injection

Estradiol Cypionate Injection is a sterile solution of estradiol cypionate in a suitable oil. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{26}H_{36}O_3$.

Identification—Transfer an amount of Estradiol Cypionate Injection, equivalent to 5 mg. of estradiol cypionate, to a 50-ml. glass-stoppered test tube, and add 30 ml. of alcohol. Shake the mixture vigorously for 5 minutes, centrifuge until the two layers have separated, and transfer the alcohol layer, with the aid of a hypodermic syringe, to a 50-ml. beaker. Evaporate to dryness on a steam bath, add 5 ml. of potassium hydroxide solution (1 in 10), and heat on a steam bath for 15 minutes. Mix 50 mg. of sulfanilic acid with 2 ml. of diluted hydrochloric acid, warm the mixture, then cool it in ice water, and slowly add, with agitation, 0.3 ml. of a solution of sodium nitrite (1 in 10). Add this solution to the saponified estradiol cypionate: a red color is produced.

Other requirements—Estradiol Cypionate Injection meets the requirements under *Injections*, page 810.

Assay—

Diluted iron-phenol solution and *Standard preparation*—Prepare as directed in the *Assay* under *Estradiol Cypionate*, page 283.

Assay preparation—Transfer an accurately measured volume of Estradiol Cypionate Injection, equivalent to about 2.5 mg. of estradiol cypionate, to a 125-ml. separator containing 50 ml. of dilute alcohol (9 in 10), and shake well. Add 40 ml. of solvent hexane, shake, and collect the alcohol phase in a 250-ml. separator containing 25 ml. of solvent hexane. Extract the solvent hexane remaining in the first separator with two successive 25-ml. portions of dilute alcohol (9 in 10), and add each alcohol extract to the second separator. Shake the second separator, and filter the alcohol phase through paper into a 200-ml. volumetric flask. Extract the solvent hexane layer with 10 ml. of dilute alcohol (9 in 10), filter through the same paper into the 200-ml. volumetric flask, dilute to volume with alcohol, and mix.

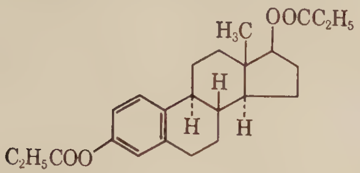
Procedure—Proceed as directed for *Procedure* in the *Assay* under *Estradiol Cypionate*, page 283. Calculate the quantity, in mg., of $C_{26}H_{36}O_3$ in each ml. of the Injection taken by the formula $0.2 \times (C/V) \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*, and V is the volume, in ml., of the Injection taken.

Packaging and storage—Preserve Estradiol Cypionate Injection in single-dose or multiple-dose containers, preferably of Type I glass.

Injections available—Estradiol Cypionate Injection usually available contains the following amounts of estradiol cypionate: 10 mg. in 10 ml.; 25 mg. in 5 ml.; 50 mg. in 10 ml.

CATEGORY and DOSE—See Estradiol Cypionate.

Estradiol Dipropionate



$C_{24}H_{32}O_4$ Mol. wt. 384.52

Estradiol Dipropionate contains not less than 97.0 percent and not more than 103.0 percent of $C_{24}H_{32}O_4$, calculated on the dried basis.

Description—Estradiol Dipropionate occurs as small, white or slightly off-white crystals or crystalline powder.

Solubility—Estradiol Dipropionate is practically insoluble in water. It is soluble in acetone and in alcohol, and is sparingly soluble in vegetable oils.

Identification—

A: Dissolve about 100 mg. of Estradiol Dipropionate in 10 ml. of methanol, add a solution of 150 mg. of potassium carbonate in 0.5 ml. of water, and reflux on a steam bath for 4 hours. At the end of this period add 30 ml. of water, and gently evaporate to about 15 ml. Cool, add 15 ml. of water, and keep the mixture between 5° and 10° for 1 hour. Filter the precipitate with suction, wash it with cold water until the last washing is neutral to litmus, and dry at 105°: the estradiol so obtained melts between 173° and 179°, page 814.

B: Dissolve about 2 mg. of the estradiol obtained in *Identification test A* in 2 ml. of sulfuric acid: the solution is greenish yellow and exhibits a green fluorescence Add to the solution 1 drop of ferric ammonium sulfate T.S.: the green color is strongly intensified, and on dilution with water the color changes to red or orange-red.

Melting range, *Class Ia,* page 814—Estradiol Dipropionate melts between 104° and 109°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Estradiol Dipropionate, previously dried in vacuum over silica gel for 4 hours, exhibits maxima only at the same wavelengths as that of NF Estradiol Dipropionate Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 5000 solution of Estradiol Dipropionate in alcohol exhibits maxima and minima at the same wavelengths as that of NF Estradiol Dipropionate Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance, occurring at about 268 $m\mu$, do not differ by more than 3 percent.

Specific rotation, page 822—The specific rotation of Estradiol Dipropionate, previously dried in vacuum over silica gel for 4 hours, determined in a solution in dioxane containing 100 mg. of Estradiol Dipropionate in each 10 ml., is between +36° and +40°.

Loss on drying, page 814—Dry Estradiol Dipropionate in vacuum over silica gel for 4 hours: it loses not more than 0.5 percent of its weight.

Completeness and reaction of solution—Dissolve 100 mg. of Estradiol Dipropionate in 5 ml. of warm alcohol: no insoluble residue remains and the solution after cooling is only slightly acid to litmus.

Foreign steroids and other impurities—

Standard preparation—Prepare as directed under *Steroid Chromatographic Purity,* page 876, using NF Estradiol Dipropionate Reference Standard, previously dried in vacuum over silica gel for 4 hours, to prepare a solution containing approximately 20 mg. per ml.

Test preparation—Weigh accurately about 100 mg. of Estradiol Dipropionate, previously dried in vacuum over silica gel for 4 hours, dissolve it in a sufficient quantity of a mixture of equal volumes of alcohol and chloroform to make 5.0 ml., and mix.

Procedure—Proceed as directed for *Procedure* under *Steroid Chromatographic Purity,* page 876, using a solvent system consisting of benzene and acetone (4:1), and determining the absorbance at the maximum at about 268 $m\mu$. Calculate the percentage of chromatographic impurities by the formula $100 - [100 \times 5 \times (C/W) \times (A_U/A_S)]$, in which C is the exact concentration, in mg. per ml., of the *Standard preparation,* and W is the weight, in mg., of Estradiol Dipropionate taken: not more than 3 percent is found.

Assay—

Standard preparation—Weigh accurately about 50 mg. of NF Estradiol Dipropionate Reference Standard, dissolve it in sufficient methanol to make 50.0 ml., and mix.

Transfer 10.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with 0.1 *N* sodium hydroxide, and mix.

Assay preparation—Transfer to a 40-ml. centrifuge tube 5.0 ml. of a 1 in 10 solution of sodium hydroxide in 80 percent methanol, then transfer to the tube 5.0 mg. of Estradiol Dipropionate, and shake mechanically for 15 minutes. Add 20 ml. of solvent hexane and 5 ml. of sodium hydroxide solution (1 in 10), shake for 2 minutes, and centrifuge. Remove the lower layer, and filter it through cotton into a 50-ml. volumetric flask. Add 10 ml. of sodium hydroxide solution (1 in 10) to the centrifuge tube, shake for 2 minutes, centrifuge, and add the lower layer to the volumetric flask. Carefully add, dropwise, cooled dilute sulfuric acid (1 in 2) until the solution is neutral to indicator paper, dilute to volume with 0.1 *N* sodium hydroxide, and mix. The solution may be slightly turbid.

Procedure—Into each of three 10-ml. volumetric flasks pipet 1.0 ml. of a 1 in 500 solution of NF 4-Amino-6-chloro-1,3-benzenedisulfonamide Reference Standard in methanol, 1.0 ml. of sodium nitrite solution (1 in 100), and 1.0 ml. of 1 *N* hydrochloric acid. Mix, and allow to stand for 2 minutes. Pipet 2.0 ml. of the *Standard preparation* into the first flask, 2.0 ml. of the *Assay preparation* into the second flask, and 2.0 ml. of water into the third flask to serve as the blank. To each flask add 2.0 ml. of 2 *N* sodium acetate, mix, and allow to stand for exactly 5 minutes. Dilute each flask to volume with 1 *N* sodium hydroxide, mix, and filter the solutions through a small medium-porosity sintered-glass funnel. Concomitantly determine the absorbances of the filtrates in 1-cm. cells, at the maximum at about 500 mμ, with a suitable spectrophotometer, using the blank to set the instrument. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{24}H_{32}O_4$ in the Estradiol Dipropionate taken by the formula $0.05C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*.

Packaging and storage—Preserve Estradiol Dipropionate in well-closed, light-resistant containers.

CATEGORY—Estrogen.

USUAL DOSE RANGE—Intramuscular, initial, **1 to 5 mg.** every 1 to 2 weeks; maintenance, **1 to 2.5 mg.** every 10 days to 2 weeks.

Estradiol Dipropionate Injection

Estradiol Dipropionate Injection is a sterile solution of estradiol dipropionate in a suitable oil. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of $C_{24}H_{32}O_4$.

Identification—Line the inside of a chromatographic chamber suitable for descending chromatography (see page 798) with filter paper (Whatman No. 1 or equivalent). Fill the solvent trough with *n*-heptane to serve as the mobile phase, and also place sufficient of the same liquid on the bottom of the chamber to permit the liner to be in contact with it. Allow the chamber to equilibrate overnight. Prepare a strip of filter paper, about 10 × 45 cm., draw a line across the narrow dimension about 6 cm. from one end, and mark two points for application of solutions along this line about 2.5 cm. from each edge of the paper. Immerse the paper in a 1 in 10 solution of 2-phenoxyethanol in acetone, and air-dry at room temperature for about 30 minutes. With a micropipet streak, over a distance of 1 to 2 cm., a volume of Injection equivalent to 25 mcg. of estradiol dipropionate at one application point, and similarly streak a solution equivalent to 25 mcg. of NF Estradiol Dipropionate Reference Standard, in equal volumes of chloroform and methanol, at the other application point. Suspend the strip in the chamber, and allow to develop for 90 minutes. Remove the strip, mark the solvent front, and dry the strip in an oven at 60° for 3 hours. Spray the strip with a 1 in 10 solution of phosphomolybdic acid in dehydrated alcohol, and heat the strip at 90° to 100° for several minutes. A blue spot on a bluish yellow background is produced by the sample at the same distance (R_f approximately 0.22) from the point of application as that produced by the standard. Other spots may be produced by the oil vehicle. Estradiol and ethinyl estradiol remain at the origin.

Other requirements—Estradiol Dipropionate Injection meets the requirements under *Injections*, page 810.

Assay—

Standard preparation—Prepare as directed in the *Assay* under ***Estradiol Dipropionate***, page 285.

Assay preparation—Transfer to a 40-ml. centrifuge tube 5.0 ml. of a 1 in 10 solution of sodium hydroxide in 80 percent methanol, then transfer to the tube an accurately measured volume of Estradiol Dipropionate Injection, equivalent to about 5 mg. of estradiol dipropionate, and continue as directed for *Assay preparation* in the *Assay* under *Estradiol Dipropionate,* page 285, beginning with "... and shake mechanically for 15 minutes."

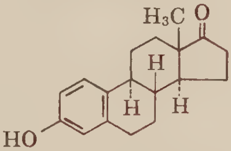
Procedure—Proceed as directed for *Procedure* in the *Assay* under *Estradiol Dipropionate,* page 285. Calculate the quantity, in mg., of $C_{24}H_{32}O_4$ in each ml. of the Injection taken by the formula $0.05 \times (C/V) \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation,* and V is the volume, in ml., of the Injection taken.

Packaging and storage—Preserve Estradiol Dipropionate Injection in single-dose or in multiple-dose containers, preferably of Type I or Type III glass.

Injections available—Estradiol Dipropionate Injection usually available contains the following amounts of estradiol dipropionate: 2.5 mg. in 1 ml.; 10 and 50 mg. in 10 ml.

CATEGORY and DOSE—See Estradiol Dipropionate.

Estrone



3-Hydroxyestra-1,3,5(10)-trien-17-one

$C_{18}H_{22}O_2$ Mol. wt. 270.37

Estrone contains not less than 97.0 percent and not more than 103.0 percent of $C_{18}H_{22}O_2$.

Description—Estrone occurs as small, white crystals, or as a white to creamy white, crystalline powder. It is odorless, and is stable in air.

Solubility—Estrone is practically insoluble in water. It is soluble in alcohol, in acetone, in dioxane, and in vegetable oils. It is slightly soluble in solutions of fixed alkali hydroxides.

Melting range, *Class Ia,* page 815—Estrone melts between 256° and 262°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Estrone exhibits maxima only at the same wavelengths as that of NF Estrone Reference Standard, similarly measured.

Ultraviolet absorption, page 866—Prepare a 1 in 20,000 solution of Estrone in alcohol by heating on a steam bath and cooling to room temperature. The solution exhibits maxima and minima at the same wavelengths as that of NF Estrone Reference Standard, similarly measured.

Clarity of solution—Add 100 mg. of Estrone to 100 ml. of sodium hydroxide T.S. in a 125-ml. conical flask, and heat on a steam bath until solution is complete, then cool, and transfer to a 100-ml. color-comparison tube: the solution is clear.

Specific rotation, page 822—The specific rotation of Estrone, determined in a solution in dioxane containing 100 mg. of Estrone in each 10 ml., is between +158° and +165°.

Residue on ignition, page 858—The residue on ignition from 100 mg. of Estrone is negligible.

Equilenin and equilin—Dissolve 10 mg. of Estrone in sufficient alcohol to make 50 ml. Transfer 5 ml. of the solution to a small beaker. Add 5 ml. of a buffer solution prepared by dissolving 2 ml. of glacial acetic acid and 13.3 g. of anhydrous sodium acetate in water to make 100 ml., warm to about 50°, and add 1 ml. of a freshly prepared 1 in 200 solution of 2,6-dibromoquinone-chlorimide in alcohol. Mix, and allow to stand for 30 minutes. Transfer the solution to a small separator, add 10 ml. of chloroform and 20 ml. of sodium hydroxide T.S., and shake vigorously for 2 minutes. Separate the chloroform layer, and filter rapidly through a dry filter paper into a dry test tube, rejecting the first 2 ml. of the filtrate. Viewed transversely against a white background, the chloroform filtrate shows no more red color than that produced by similarly treating 5 ml. of an alcohol solution containing 20 mcg. of equilenin.

Foreign steroids and other impurities—

Standard preparation—Prepare as directed under *Steroid Chromatographic Purity,* page 876, using NF Estrone Reference Standard to prepare a solution containing approximately 5 mg. per ml.

Test preparation—Weigh accurately about 50 mg. of Estrone, previously dried at 105° for 3 hours, dissolve it in a sufficient quantity of a mixture of equal volumes of alcohol and chloroform to make 10.0 ml., and mix.

Procedure—Proceed as directed for *Pro-*

cedure under *Steroid Chromatographic Purity*, page 876, using a solvent system consisting of benzene and acetone (4:1), and determining the absorbance at the maximum at about 280 mμ. Calculate the percentage of chromatographic impurities by the formula 100 − [100 × 10 × (C/W) × (A_U/A_S)], in which C is the exact concentration, in mg. per ml., of the *Standard preparation*, and W is the weight, in mg., of Estrone taken: not more than 3 percent is found.

Assay—Transfer about 50 mg. of Estrone, accurately weighed, to a 100-ml. volumetric flask, add 50 ml. of alcohol, dissolve by heating on a steam bath, and cool. Dilute to volume with alcohol, and mix. Transfer 10.0 ml. of this solution to a second 100-ml. volumetric flask, dilute to volume with alcohol, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Estrone Reference Standard, in the same medium at a concentration of about 50 mcg. per ml., in 1-cm. cells, at the maximum at about 280 mμ, with a suitable spectrophotometer, using alcohol as the blank. Calculate the quantity, in mg., of $C_{18}H_{22}O_2$ in the Estrone taken by the formula $C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Estrone in tight, light-resistant containers.

CATEGORY—Estrogen.

USUAL DOSE—Intramuscular, **1 mg.** one or more times a week as required; reduce to maintenance dose as soon as response is obtained.

USUAL DOSE RANGE—**200 mcg.** to **5 mg.** per week.

Estrone Injection

Estrone Injection is a sterile solution of estrone in a suitable oil. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of $C_{18}H_{22}O_2$.

Identification—Dissolve the residue obtained in the *Assay* in sufficient alcohol to make a solution containing 0.5 mg. of estrone in each ml. Transfer to an acetylation flask, and evaporate to dryness. Add 10 mg. of hydroxylamine hydrochloride, 0.2 ml. of glacial acetic acid, and 5 ml. of alcohol, and reflux for 5 hours. Dilute with 5 ml. of water, filter, and recrystallize the precipitate from hot alcohol: the estrone oxime so obtained melts between 236° and 242°, page 814.

Other requirements—Estrone Injection meets the requirements under *Injections*, page 810.

Assay—[NOTE: Use only water as a lubricant for the separators used in this assay, and complete the assay without interruption other than at the stage of obtaining the dry residue from the ether extract.] Pipet a volume of Estrone Injection, equivalent to about 10 mg. of estrone, into a suitable separator containing 25 ml., or not less than twice the volume of the Injection taken, of solvent hexane. Add 10 ml. of sodium hydroxide solution (1 in 10), shake vigorously for 2 minutes, and allow to separate completely. Transfer the aqueous layer to a second 125-ml. separator, and repeat the extraction of the solvent hexane with two additional, successive 10-ml. portions of the sodium hydroxide solution, adding each extract to the second separator. Complete the alkaline extraction as quickly as possible, since long standing in strongly alkaline solution may cause decomposition of the estrone. Wash the combined alkaline extracts with 25 ml. of solvent hexane. Using dilute sulfuric acid (1 in 2), acidify the combined alkaline extracts until acid to litmus. Cool thoroughly, add 25 ml. of benzene, shake carefully for 1 minute, and allow to separate. Transfer the acid layer to another 125-ml. separator, and extract with a second 25-ml. portion of benzene. Discard the acid layer. Extract the benzene layers with two 5-ml. portions of sodium carbonate T.S. and two 5-ml. portions of water. Discard the water layers. Transfer the benzene solutions to a beaker with the aid of benzene, and evaporate on a steam bath, with the aid of a current of air, to dryness.

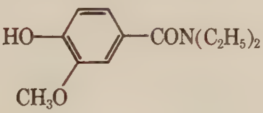
Dissolve the residue from the benzene extract in a small quantity of chloroform, warming, if necessary, and completely transfer the solution, with the aid of a few ml. of chloroform, to a 20 × 150-mm. test tube. Carefully evaporate the chloroform on a steam bath with the aid of a current of air. Add 100 mg. of trimethylacethydrazide ammonium chloride and 0.5 ml. of glacial acetic acid to the test tube, stopper loosely, and heat in a boiling water bath for 5 minutes. Cool the reaction mixture in an ice bath, dissolve it in a small volume of cold water, and completely transfer it, with the aid of a small volume of water, to a 125-ml. separator containing 25 ml. of cold water. Neutralize the solution to litmus paper with sodium hydroxide T.S. (approximately 6 ml.), and wash at once with three successive 15-ml. portions of chloroform. Combine the chloroform washings in another separator, and wash them with 5 ml. of water. Discard the chloroform, and add the wash water to the first separator. Add 2 ml. of dilute sulfuric acid (1 in 2), and allow to remain at room temperature for 2 hours. Add 15 ml. of chloroform, shake vigorously for 1 minute, and allow to separate. Transfer the chloroform layer to another separator, and repeat the extraction of the water layer with three additional, successive 15-ml. portions of chloroform. Wash the combined chloroform extracts with 5 ml. of water, filter through chloroform-washed cotton into a beaker, evaporate to a small volume, and transfer completely, with the aid of several small portions of chloroform, to a tared 25-ml. beaker. Evaporate on a steam bath, with the aid of a current of air, to dryness, and dry the residue of estrone in a vacuum desiccator to constant weight: the weight of the residue, corrected for the residue of a reagent blank following the above procedure, indicates the amount of $C_{18}H_{22}O_2$ in the volume of the Injection taken.

Packaging and storage—Preserve Estrone Injection in single-dose or in multiple-dose containers, preferably of Type I glass.

Injections available—Estrone Injection usually available contains the following amounts of estrone: 200 and 500 mcg. and 1 mg. in 1 ml.; 10 mg. in 10 ml.

CATEGORY and DOSE—See Estrone.

Ethamivan*



N,*N*-Diethylvanillamide

$C_{12}H_{17}NO_3$ Mol. wt. 223.27

Ethamivan contains not less than 98.0 percent and not more than 102.0 percent of $C_{12}H_{17}NO_3$, calculated on the dried basis.

Description—Ethamivan occurs as a white or practically white, crystalline powder having a faint, characteristic odor.

Solubility—Ethamivan is sparingly soluble in water and in ether. It is very soluble in chloroform and freely soluble in alcohol, in acetone, and in benzene.

Identification—

A: Dissolve about 100 mg. of Ethamivan in 5 ml. of water, and add 3 drops of ferric chloride T.S.: a blue color is produced.

B: Dissolve about 500 mg. of Ethamivan in 4 ml. of dilute sulfuric acid (1 in 4), boil for several minutes, and cool. Make the solution alkaline with a sodium hydroxide T.S., and heat over a gentle flame: a typical amine odor develops and the vapors turn red litmus blue.

Melting range, page 814—Ethamivan melts between 94° and 97°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Ethamivan, previously dried over phosphorus pentoxide for 24 hours, exhibits maxima only at the same wavelengths as that of NF Ethamivan Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 25,000 solution of Ethamivan in methanol exhibits maxima and minima at the same wavelengths as that of NF Ethamivan Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance occurring at about 281 mμ, do not differ by more than 3 percent.

pH, page 824—The pH of a solution of Ethamivan (1 in 100) is between 5.5 and 7.0.

Loss on drying, page 814—Dry Ethamivan in a desiccator over phosphorus pentoxide for 24 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Ethamivan yields not more than 0.1 percent of residue on ignition.

Heavy metals, *Method II*, page 806—The heavy metals limit for Ethamivan is 10 parts per million.

Assay—

Standard preparation—Transfer about 25 mg. of NF Ethamivan Reference Standard, accurately weighed, to a 250-ml. volumetric flask, add water to volume, and mix. Transfer 10.0 ml. of this solution to a 50-ml. volumetric flask, dilute to volume with water, and mix.

Assay preparation—Transfer about 25 mg. of Ethamivan, accurately weighed, to a 250-ml. volumetric flask, add water to volume, and mix. Transfer 10.0 ml. of this solution to a 50-ml. volumetric flask, dilute to volume with water, and mix.

---

* Patented. See notice, page ii.

Procedure—Transfer 5.0 ml. of the *Standard preparation*, of the *Assay preparation*, and of water to separate test tubes. To each tube add 3.0 ml. of diluted (1 in 4) Folin-Ciocalteu phenol T.S. and 10.0 ml. of sodium carbonate solution (1 in 7), mix, and allow to stand for 15 minutes. Concomitantly determine the absorbances of the solutions in 1-cm. cells, at the maximum at about 660 $m\mu$, with a suitable spectrophotometer, using the blank to set the instrument. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{12}H_{17}NO_3$ in the Ethamivan taken by the formula $1.25C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*.

Packaging and storage—Preserve Ethamivan in well-closed, light-resistant containers.

CATEGORY—Central and respiratory stimulant.

USUAL DOSE RANGE—Intravenous, **0.5 to 5 mg. per kg.** of body weight, given slowly as a single injection; and then may follow with continuous intravenous infusion at the rate of 10 mg. per minute as determined by response of the patient.

Ethamivan Injection

Ethamivan Injection is a sterile solution of ethamivan in water for injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{12}H_{17}NO_3$.

Identification—To 2 drops of Ethamivan Injection add 2 drops of a freshly prepared solution consisting of equal parts of sodium nitrite solution (1 in 20) and sulfanilic acid solution (1 in 10) in diluted hydrochloric acid: an orange color is produced.

Pyrogen—Ethamivan Injection meets the requirements of the *Pyrogen Test*, page 851, the test dose being 0.1 ml. per kg. of a solution containing 50 mg. of ethamivan in each ml.

pH, page 824—The pH of Ethamivan Injection is between 9.3 and 9.6.

Other requirements—Ethamivan Injection meets the requirements under *Injections*, page 810.

Assay—

Standard preparation—Prepare as directed in the *Assay* under *Ethamivan*, page 289.

Assay preparation—Transfer an accurately measured volume of Ethamivan Injection, equivalent to about 50 mg. of ethamivan, to a 100-ml. volumetric flask, dilute to volume with water, and mix. Transfer 10.0 ml. of this solution to a 250-ml. volumetric flask, dilute to volume with water, and mix.

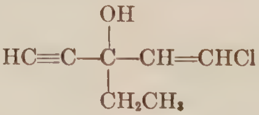
Procedure—Proceed as directed for *Procedure* in the *Assay* under *Ethamivan*, page 289. Calculate the quantity, in mg., of $C_{12}H_{17}NO_3$ in each ml. of the Injection taken by the formula $2.5 \times (C/V) \times (A_U/A_S)$, in which V is the volume, in ml., of the Injection taken.

Packaging and storage—Preserve Ethamivan Injection in single-dose or multiple-dose containers, preferably of Type I glass, protected from light.

Injections available—Ethamivan Injection usually available contains the following amounts of ethamivan: 100 mg. in 2 ml.; 500 mg. in 10 ml.

CATEGORY and DOSE—See Ethamivan.

Ethchlorvynol*



$$HC\equiv C-\overset{OH}{\underset{CH_2CH_3}{C}}-CH=CHCl$$

1-Chloro-3-ethyl-1-penten-4-yn-3-ol

C_7H_9ClO Mol. wt. 144.60

Ethchlorvynol contains not less than 95.0 percent and not more than 102.0 percent of C_7H_9ClO, calculated on the anhydrous basis.

---

* Patented. See notice, page ii.

Description—Ethchlorvynol occurs as a colorless to yellow liquid possessing a characteristic pungent odor. It darkens on exposure to light and to air.

Solubility—Ethchlorvynol is immiscible with water. It is miscible with most organic solvents.

Identification—

A: Dissolve 1 g. of Ethchlorvynol in 20 ml. of methanol. To 1 ml. of the solution add about 4 drops of ammonia T.S., mix, and then add silver nitrate T.S., a few drops at a time: a yellowish white precipitate forms which at first redissolves, but becomes insoluble when an excess of silver nitrate has been added.

B: To 10 ml. of the solution prepared in *Identification test A* add 5 ml. of freshly prepared *m*-phenylenediamine hydrochloride-oxalic acid T.S. (prepare the test solution by dissolving 1 g. of *m*-phenylenediamine hydrochloride and 1 g. of oxalic acid in 35 ml. of water, and filtering if necessary): a reddish orange color is produced in about 3 minutes.

Water, page 900—Determine the water content of Ethchlorvynol by the titrimetric method: not more than 0.2 percent is found.

Refractive index, page 858—The refractive index of Ethchlorvynol is not less than 1.476 and not more than 1.480.

Acidity—Dissolve 5 ml. of Ethchlorvynol in 50 ml. of a mixture of equal volumes of water and methanol which has been neutralized to the phenolphthalein end-point with 0.1 *N* sodium hydroxide. Add 1 ml. of phenolphthalein T.S. and titrate with 0.1 *N* sodium hydroxide to an amber end-point: not more than 1.7 ml. of 0.1 *N* sodium hydroxide is required for neutralization.

Assay—Transfer about 110 mg. of Ethchlorvynol, accurately weighed, to a 250-ml. conical flask containing 50 ml. of a solution of silver nitrate (1 in 40) in 70 percent alcohol. Immediately titrate with 0.05 *N* sodium hydroxide, using 8 to 10 drops of methyl red-methylene blue T.S., to a gray end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.05 *N* sodium hydroxide is equivalent to 7.230 mg. of C_7H_9ClO.

Packaging and storage—Preserve Ethchlorvynol in tight, light-resistant glass containers, using polyethylene-lined closures.

CATEGORY—Sedative.

USUAL DOSE—Sedative, **100 mg.** two or three times a day; hypnotic, **500 mg.**

USUAL DOSE RANGE—Sedative, **100** to **200 mg.**; hypnotic, **500 mg.** to **1 g.**

Ethchlorvynol Capsules

Ethchlorvynol Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of C_7H_9ClO.

Identification—Dissolve an amount of the contents of Ethchlorvynol Capsules, equivalent to about 1 g. of ethchlorvynol, in 20 ml. of methanol. The solution responds to the *Identification tests* under *Ethchlorvynol,* page 290.

Weight variation, page 901—Ethchlorvynol Capsules meet the requirements of the weight variation test for capsules, using chloroform as the solvent in the procedure for *Soft capsules*.

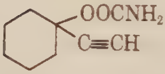
Assay—Weigh accurately 20 Ethchlorvynol Capsules in a tared weighing bottle. Carefully open the capsules, without loss of shell material, and transfer the contents to a 20-ml. beaker. Remove any liquid from the emptied capsules by washing with several small portions of chloroform, and allow the capsules to dry in a jet of dry air until the odor of chloroform is no longer perceptible. Weigh the empty capsules in the original tared weighing bottle. The difference represents the weight of the contents of 20 capsules. Transfer an accurately weighed amount of capsule contents, equivalent to about 110 mg. of ethchlorvynol, to a 250-ml. conical flask containing 50 ml. of a solution of silver nitrate (1 in 40) in 70 percent alcohol. Proceed as directed in the *Assay* under *Ethchlorvynol*, page 290, beginning with "Immediately titrate with 0.05 *N* sodium hydroxide . . ."

Packaging and storage—Preserve Ethchlorvynol Capsules in tight, light-resistant containers.

Capsules available—Ethchlorvynol Capsules usually available contain the following amounts of ethchlorvynol: 100, 200, and 500 mg.

CATEGORY and DOSE—See Ethchlorvynol.

Ethinamate*



1-Ethynylcyclohexanol Carbamate

$C_9H_{13}NO_2$ Mol. wt. 167.21

Ethinamate contains not less than 98.0 percent and not more than 100.5 percent of $C_9H_{13}NO_2$, calculated on the dried basis.

Description—Ethinamate occurs as a white, essentially odorless powder.

Solubility—Ethinamate is slightly soluble in water. It is freely soluble in alcohol, in chloroform, and in ether.

Identification—Dissolve about 100 mg. of Ethinamate in 10 ml. of alcohol, and divide the solution into three equal portions. To one portion add bromine T.S., dropwise: it is instantly decolorized (*presence of unsaturation*). To the second portion add 10 ml. of silver nitrate T.S.: a white precipitate forms. Add 1 ml. of ammonium hydroxide T.S. to the reaction mixture: a yellow color, which slowly deepens, is produced. Add 10 ml. of alcohol to this alkaline mixture: the precipitate dissolves, leaving a yellow to red solution. To the third portion add 10 ml. of water: no precipitate forms.

Melting range, page 814—Ethinamate melts between 95° and 98°.

pH, page 824—The pH of a saturated solution of Ethinamate is between 6.5 and 7.0.

Loss on drying, page 814—Dry Ethinamate in vacuum at 50° for 4 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Ethinamate yields not more than 0.2 percent of residue on ignition.

Assay—Transfer about 200 mg. of Ethinamate, accurately weighed, to a 250-ml. glass-stoppered conical flask, and dissolve it in 25 ml. of alcohol. Add 100 ml. of silver nitrate solution (1 in 20), and shake or stir vigorously for 1 to 2 minutes. Using 8 to 10 drops of methyl red-methylene blue T.S., titrate with 0.05 *N* sodium hydroxide to a gray end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.05 *N* sodium hydroxide is equivalent to 8.360 mg. of $C_9H_{13}NO_2$.

Packaging and storage—Preserve Ethinamate in tight containers.

CATEGORY—Sedative.
USUAL DOSE—**500 mg.**
USUAL DOSE RANGE—**500 mg.** to **1 g.**

---

* Patented. See notice, page ii.

Ethinamate Tablets

Ethinamate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_9H_{13}NO_2$.

Identification—Transfer to a beaker an amount of powdered Ethinamate Tablets equivalent to about 500 mg. of ethinamate, add 50 ml. of alcohol, mix, and filter. A 10-ml. portion of the filtrate responds to the *Identification tests* under *Ethinamate*, page 292, beginning with "... divide the solution into three equal portions ...."

Disintegration, page 878—The disintegration time limit for Ethinamate Tablets is 30 minutes.

Weight variation, page 901—Ethinamate Tablets meet the requirements of the weight variation test for tablets.

Assay—Weigh and finely powder not less than 20 Ethinamate Tablets. Transfer to a flask an accurately weighed portion of the powder, equivalent to about 200 mg. of ethinamate, add 30 ml. of alcohol, and reflux for 20 minutes. Filter while hot, and wash the flask and filter with several small portions of hot alcohol. Evaporate the filtrate to about 25 ml., and proceed as directed in the *Assay* under *Ethinamate*, page 292, beginning with "Add 100 ml. of silver nitrate solution (1 in 20) ...."

Packaging and storage—Preserve Ethinamate Tablets in tight containers.

Tablets available—Ethinamate Tablets usually available contain the following amount of ethinamate: 500 mg.

CATEGORY and DOSE—See Ethinamate.

Ethinyl Estradiol and Dimethisterone Tablets

Ethinyl Estradiol and Dimethisterone Tablets contain not less than 90.0 percent and not more than 115.0 percent of the labeled amount of $C_{20}H_{24}O_2$ (ethinyl estradiol) and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{23}H_{32}O_2 . H_2O$ (dimethisterone).

Identification—Triturate 5 Ethinyl Estradiol and Dimethisterone Tablets with 5 ml. of chloroform, and filter into a separator. Add 20 ml. of *n*-hexane and 20 ml. of sodium hydroxide solution (1 in 10), shake for 1 minute, and allow the layers to separate. Transfer the aqueous phase to a second separator and use in *test A;* retain the chloroform-hexane layer for *test B.*

A: Acidify the aqueous solution in the second separator to litmus paper with diluted sulfuric acid, adding 2 drops in excess, and extract with 10 ml. of chloroform. Transfer the chloroform extract to a beaker containing 1 g. of anhydrous sodium sulfate, mix, and decant the dried chloroform into a test tube. Evaporate the chloroform on a steam bath with the aid of a current of dry air, and add 0.5 ml. of sulfuric acid: the solution appears orange-red by transmitted light and has a yellow-green fluorescence by reflected light; after the addition of 2 ml. of water, the solution is pink or contains a pink precipitate (*presence of ethinyl estradiol*).

B: Transfer the chloroform-hexane solution remaining in the first separator to a 100-ml. beaker containing 1 g. of anhydrous sodium sulfate, mix, decant the dried solution into a second beaker, and evaporate to dryness on a steam bath. Dissolve the residue in 5 ml. of methanol, add 25 ml. of water, and stir until precipitation is completed. Filter the crystals of dimethisterone, wash with water, and dry in vacuum over silica gel. The infrared absorption spectrum of a potassium bromide dispersion of the residue so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of NF Dimethisterone Reference Standard (*presence of dimethisterone*).

Disintegration, page 878—The disintegration time limit for Ethinyl Estradiol and Dimethisterone Tablets is 30 minutes.

Content uniformity, *Method I,* page 799—Ethinyl Estradiol and Dimethisterone Tablets meet the requirements of the content uniformity test for tablets when assayed for dimethisterone only.

Assay for ethinyl estradiol—[NOTE—Use only water as a lubricant for the separators used in this assay.]

Standard preparation—Prepare a solution, in alcohol, containing about 200 mcg. of USP Ethinyl Estradiol Reference Standard per ml., and transfer 1.0 ml. of the solution to a 125-ml. separator containing 25 ml. of water and 5 ml. of diluted sulfuric acid.

Assay preparation—Weigh and finely powder not less than 20 Ethinyl Estradiol and Dimethisterone Tablets. Weigh accurately a portion of the powder, equivalent to about 200 mcg. of ethinyl estradiol, and transfer to a 125-ml. separator containing 25 ml. of water, 1 ml. of alcohol, and 5 ml. of diluted sulfuric acid.

Procedure—Treat the *Standard preparation* and *Assay preparation,* in the two separators, identically, as follows: Extract the solution with four 20-ml. portions of chloroform. Evaporate the combined chloroform extracts to about 5 ml., add about 25 ml. of solvent hexane, and transfer to a 125-ml. separator with the aid of several small portions of solvent hexane. Add 10 ml. of sodium hydroxide solution (1 in 10), shake vigorously for 2 minutes, and allow to separate completely. Transfer the water layer, avoiding withdrawal of any insoluble matter at the interface, to a second 125-ml. separator containing 5 ml. of carbon tetrachloride. Repeat the extraction with two additional 10-ml. portions of the sodium hydroxide solution. Discard the solvent hexane. Shake the alkaline solution vigorously with the carbon tetrachloride, transfer the carbon tetrachloride to another separator, wash it with 5 ml. of the sodium hydroxide solution, discard the carbon tetrachloride, and add the alkaline wash to the main sodium hydroxide extract. (Perform the alkali extractions promptly.) Carefully render the combined alkaline extracts distinctly acid with cooled dilute sulfuric acid (1 in 2), cool thoroughly, and shake for 2 minutes with 20 ml. of benzene. Transfer the water layer to another separator, and extract with a second 20-ml. portion of benzene. Discard the water layer. Wash the benzene solutions in the two separators with two 5-ml. portions of sodium carbonate T.S. and two 5-ml. portions of water, shaking gently to avoid emulsification. Transfer the benzene in the first separator to a beaker, add about 1 g. of powdered anhydrous sodium sulfate, and swirl until entirely clear. Decant the benzene into a 50-ml. volumetric flask. Rinse the first separator with the second 20-ml. portion of benzene, clarify the benzene over the sodium sulfate, and add to the flask. Wash the separators and the beaker with two 4-ml. portions of benzene, add the washings to the flask, and add benzene to volume. (A slight turbidity persisting after standing for 5 minutes in the benzene extracts may be ignored if the interface is sharply defined.)

Transfer in duplicate to dry 23 × 150-mm. test tubes 10.0 ml. of each of the benzene solutions, add a few boiling chips to each tube, and evaporate the solvent on a steam bath without the aid of a current of air, until ebullition just stops. Instantly remove the tubes, wipe them dry quickly, and dry the residue in vacuum over phosphorus pentoxide for 1 hour. To each tube and to a blank tube add a glass bead and add from a buret 1.0 ml. of iron-phenol T.S. Immediately cap the tubes, and allow to stand for 30 minutes, shaking vigorously at 5-minute intervals. Place the tubes in a boiling water bath for 35 minutes, shaking each tube for a few seconds after the first 5 minutes. Transfer to an ice bath for 2 minutes, then remove, and add from a buret 4.0 ml. of dilute sulfuric acid (35 volumes of acid added to 65 volumes of water). Allow to stand for 5 minutes, then mix by shaking, first gently, then vigorously. Concomitantly determine the absorbances of the solutions from the *Standard preparation* and from the *Assay preparation*, in 1-cm. cells, at 529 mμ and at 420 mμ, with a suitable spectrophotometer, using the blank to set the instrument. Calculate the quantity, in mcg., of $C_{20}H_{24}O_2$ in the portion of the Tablets taken by the formula $C \times (A_{\Delta U}/A_{\Delta S})$, in which C is the exact concentration, in mcg. per ml., of USP Ethinyl Estradiol Reference Standard in the *Standard preparation*, $A_{\Delta U}$ is the difference obtained by subtracting one-half of the absorbance (A_{420}) observed at 420 mμ from that (A_{529}) observed at 529 mμ for the solution from the *Assay preparation*, and $A_{\Delta S}$ is the difference obtained similarly for the solution from the *Standard preparation*.

Assay for dimethisterone—

Isoniazid reagent—Dissolve 500 mg. of isonicotinic acid hydrazide in 100 ml. of methanol, add 0.5 ml. of hydrochloric acid, and mix.

Standard preparation—Transfer about 50 mg. of NF Dimethisterone Reference Standard, accurately weighed, to a 50-ml. volumetric flask, add chloroform to volume, and mix. Transfer 5.0 ml. of this solution to a second 50-ml. volumetric flask, dilute to volume with chloroform, and mix.

Assay preparation—Weigh and finely powder not less than 20 Ethinyl Estradiol and Dimethisterone Tablets. Weigh accurately a portion of the powder, equivalent to about 25 mg. of dimethisterone, and transfer it to a 60-ml. separator with the aid of about 10 ml. of water. Add 25 ml. of chloroform, and shake for about 5 minutes. Filter the chloroform layer through a chloroform-washed cotton pledget into a 100-ml. volumetric flask. Repeat the extraction with two 25-ml. portions of chloroform, and wash the cotton with chloroform, receiving the washings in the same flask. Dilute to volume with chloroform, and mix. Transfer 10.0 ml. of this solution to a 25-ml. volumetric flask, dilute to volume with chloroform, and mix.

Procedure—Transfer 2.0 ml. each of the *Standard preparation*, of the *Assay preparation*, and of chloroform to serve as the blank, to separate 50-ml. glass-stoppered conical flasks. To each flask add 10.0 ml. of *Isoniazid reagent*, mix, and allow to stand for 30 minutes. Concomitantly determine the absorbances of the solutions in 1-cm. cells, at the maximum at about 380 mμ, with a suitable spectrophotometer, using the blank to set the instrument. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{23}H_{32}O_2.H_2O$ in the portion of the Tablets taken by the formula $0.25C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*.

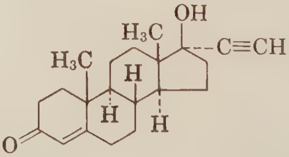
Packaging and storage—Preserve Ethinyl Estradiol and Dimethisterone Tablets in well-closed containers.

Tablets available—Ethinyl Estradiol and Dimethisterone Tablets usually available contain the following amount of ethinyl estradiol: 100 mcg.; and of dimethisterone: 25 mg.

CATEGORY—Estrogen-progestin (ovulation control).

USUAL DOSE—Ethinyl estradiol, **100 mcg.** daily for 20 days of each menstrual cycle; dimethisterone, **25 mg.** daily for 5 days of each cycle.

Ethisterone



17-Hydroxy-17α-pregn-4-en-20-yn-3-one

$C_{21}H_{28}O_2$ Mol. wt. 312.46

Ethisterone contains not less than 98.0 percent and not more than 102.0 percent of $C_{21}H_{28}O_2$, calculated on the dried basis.

Description—Ethisterone occurs as white or slightly yellow crystals or as a crystalline powder. It is odorless and is stable in air. It is affected by light.

Solubility—Ethisterone is practically insoluble in water. It is slightly soluble in alcohol, in chloroform, in ether, and in vegetable oils.

Identification—Reflux about 25 mg. of Ethisterone for 5 hours with 3.5 ml. of a solution prepared by dissolving 50 mg. of hydroxylamine hydrochloride and 50 mg. of anhydrous sodium acetate in 25 ml. of methanol. Add to the solution 15 ml. of water, filter, and wash the precipitate with a small volume of water: the precipitated oxime, when recrystallized from 70 percent methanol and dried at 105° for 1 hour, melts between 225° and 232°, page 814.

Melting range, *Class Ia,* page 815—Ethisterone melts between 267° and 277°, with some decomposition.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Ethisterone, previously dried over silica gel for 4 hours, exhibits maxima only at the same wavelengths as that of NF Ethisterone Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 100,000 solution of Ethisterone in methanol exhibits maxima and minima at the same wavelengths as that of NF Ethisterone Reference Standard, similarly measured.

Specific rotation, page 822—The specific rotation of Ethisterone, previously dried in vacuum over silica gel for 4 hours, determined in a solution in pyridine containing 100 mg. of Ethisterone in each 10 ml., is between +29° and +33°.

Loss on drying, page 814—Dry Ethisterone in vacuum over silica gel for 4 hours: it loses not more than 0.5 percent of its weight.

Foreign steroids and other impurities—*Standard preparation*—Prepare as directed under *Steroid Chromatographic Purity,* page 876, using NF Ethisterone Reference Standard, previously dried in vacuum over silica gel for 4 hours, and dioxane as the solvent.

Test preparation—Weigh accurately about 80 mg. of Ethisterone, previously dried in vacuum over silica gel for 4 hours, dissolve it in a sufficient quantity of dioxane to make 10.0 ml., and mix.

Procedure—Proceed as directed for *Procedure* under *Steroid Chromatographic Purity,* page 876, using a solvent system consisting of chloroform and ethyl acetate (2:1). Use 25.0 ml. of dioxane, rather than dehydrated alcohol, to elute the steroid from the silica gel. Determine the absorbance at the maximum at about 235 mμ, and calculate the percentage of chromatographic impurities by the formula $100 - [100 \times 10 \times (C/W) \times (A_U/A_S)]$, in which C is the exact concentration, in mg. per ml., of the *Standard preparation,* and W is the weight, in mg., of Ethisterone taken: not more than 3 percent is found.

Assay—Transfer about 25 mg. of Ethisterone, accurately weighed, to a 250-ml. volumetric flask, add 50 ml. of methanol, dissolve by heating on a steam bath, and cool. Dilute to volume with methanol, and mix. Transfer 10.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with methanol, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Ethisterone Reference Standard, in the same medium at a concentration of about 10 mcg. per ml., in 1-cm. cells, at the maximum at about 241 mμ, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg., of $C_{21}H_{28}O_2$ in the Ethisterone taken by the formula $2.5C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Ethisterone in well-closed, light-resistant containers.

CATEGORY—Progestin.

USUAL DOSE—**25 mg.** up to four times a day.

Ethisterone Tablets

Ethisterone Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{21}H_{28}O_2$.

Identification—The ethisterone obtained in the *Assay* melts between 266° and 277°, with some decomposition, *Class Ia,* page 815, and responds to the *Identification test* under *Ethisterone,* page 294.

Disintegration, page 878—The disintegration time limit for Ethisterone Tablets is 30 minutes.

Content uniformity, *Method II,* page 799—Ethisterone Tablets meet the requirements of the content uniformity test for tablets, using the following special procedure: Quantitatively transfer a finely powdered tablet to a 100-ml. volumetric flask, add 50 ml. of methanol, mix, and shake mechanically for 30 minutes. Dilute to volume with methanol, and filter, discarding the first 20 ml. of filtrate. Dilute a portion of the subsequent filtrate quantitatively and stepwise, if necessary, with methanol to provide a solution containing approximately 5 mcg. of ethisterone per ml. Concomitantly determine the absorbance of this solution and of a solution of NF Ethisterone Reference Standard, in the same medium at a concentration of about 5 mcg. per ml., in 1-cm. cells, at the maximum at about 241 mμ, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg., of $C_{21}H_{28}O_2$ in the tablet by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity of ethisterone, in mg., in the tablet; D is the exact concentration, in mcg. per ml., of ethisterone in the sample solution, based upon the labeled quantity per tablet and the extent of dilution; C is the exact concentration of the Reference Standard solution, in mcg. per ml.; A_U is the absorbance of the sample solution; and A_S is the absorbance of the Reference Standard solution.

Other requirements—The ethisterone obtained in the *Assay* meets the requirements of the test for *Specific rotation*, under *Ethisterone*, page 294.

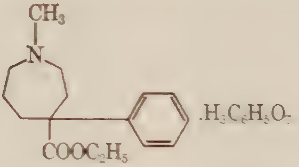
Assay—Weigh and finely powder not less than 20 Ethisterone Tablets. Weigh accurately a portion of the powder, equivalent to about 100 mg. of ethisterone, into the thimble of a micro continuous-extraction apparatus, extract with solvent hexane for 4 hours, and discard the extract. Remove the thimble from the extractor, and allow the solvent hexane to evaporate. Return the thimble to the extractor, replace the solvent flask with a tared flask, and extract the ethisterone with chloroform for 4 hours. Evaporate the extract almost to dryness, remove the last traces of chloroform at room temperature with the aid of a current of air, dry at 105° for 2 hours, and cool: the weight of the residue is the amount of $C_{21}H_{28}O_2$ in the portion of the Tablets taken.

Packaging and storage—Preserve Ethisterone Tablets in well-closed containers.

Tablets available—Ethisterone Tablets usually available contain the following amounts of ethisterone: 5, 10, and 25 mg.

Category and Dose—See Ethisterone.

Ethoheptazine Citrate*



Ethyl Hexahydro-1-methyl-4-phenyl-1*H*-azepine-4-carboxylate Citrate (1:1)

$C_{16}H_{23}NO_2 . C_6H_8O_7$ Mol. wt. 453.49

Ethoheptazine Citrate, dried at 60° in vacuum for 3 hours, contains not less than 97.0 percent and not more than 102.0 percent of $C_{16}H_{23}NO_2 . C_6H_8O_7$.

Description—Ethoheptazine Citrate occurs as a white to nearly white, practically odorless powder.

Solubility—Ethoheptazine Citrate is sparingly soluble in water, slightly soluble in alcohol, and insoluble in ether.

Identification—Dissolve about 100 mg. of Ethoheptazine Citrate in 10 ml. of alcohol, add, with stirring, 5 ml. of an alcoholic solution of picric acid (1 in 15), and allow to stand overnight. Filter the precipitate, wash with a few small portions of water, and dry at 105° for 2 hours: the picrate so obtained melts between 163° and 170°, page 814. *Caution: Picrates may be explosive.*

Melting range, page 814—Ethoheptazine Citrate melts within a range of 3° between 135° and 145°.

pH, page 824—The pH of a solution of Ethoheptazine Citrate (1 in 100) is between 3.5 and 4.5.

Loss on drying, page 814—Dry Ethoheptazine Citrate in vacuum at 60° for 3 hours: it loses not more than 3 percent of its weight.

Residue on ignition, page 858—Ethoheptazine Citrate yields not more than 0.1 percent of residue on ignition.

Assay—Dissolve about 900 mg. of

---

* Patented. See notice, page ii.

Ethoheptazine Citrate, previously dried in vacuum at 60° for 3 hours and accurately weighed, in 50 ml. of glacial acetic acid, add 1 drop of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a blue-green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 45.35 mg. of $C_{16}H_{23}NO_2 . C_6H_8O_7$.

Packaging and storage—Preserve Ethoheptazine Citrate in tight containers.

Category—Analgesic.

Usual dose—**75 mg.** three or four times a day.

Usual dose range—**75** to **150 mg.**

Ethoheptazine Citrate Tablets

Ethoheptazine Citrate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{16}H_{23}NO_2 . C_6H_8O_7$.

Identification—Macerate a portion of finely powdered Ethoheptazine Citrate Tablets, equivalent to about 200 mg. of ethoheptazine citrate, with 10 ml. of alcohol, and transfer to a 50-ml. beaker. Add 20 ml. of alcohol, warm to dissolve as completely as possible, cool the solution, and filter through paper into a 50-ml. glass-stoppered conical flask. This solution responds to the *Identification test* under *Ethoheptazine Citrate*, page 298.

Disintegration, page 878—The disintegration time limit for Ethoheptazine Citrate Tablets is 15 minutes.

Weight variation, page 901—Ethoheptazine Citrate tablets meet the requirements of the weight variation test for tablets.

Assay—Weigh and finely powder not less than 20 Ethoheptazine Citrate Tablets. Transfer an accurately weighed portion of the powder, equivalent to 150 mg. of ethoheptazine citrate, to a separator, add 20 ml. of alkaline sodium chloride T.S., stopper, and shake vigorously for about 5 minutes. Extract with five 30-ml. portions of carbon tetrachloride, filtering the extracts through a pledget of cotton overlaid with anhydrous sodium sulfate, both previously wetted with carbon tetrachloride, into a 250-ml. wide-mouth conical flask. Add 20 ml. of glacial acetic acid and 2 drops of crystal violet T.S., and titrate with 0.025 *N* perchloric acid in glacial acetic acid to a blue end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.025 *N* perchloric acid is equivalent to 11.34 mg. of $C_{16}H_{23}NO_2 . C_6H_8O_7$.

Packaging and storage—Preserve Ethoheptazine Citrate Tablets in tight containers.

Tablets available—Ethoheptazine Citrate Tablets usually available contain the following amount of ethoheptazine citrate: 75 mg.

Category and Dose—See Ethoheptazine Citrate.

Ethyl Acetate

$CH_3COOC_2H_5$

$C_4H_8O_2$ Mol. wt. 88.11

Ethyl Acetate contains not less than 99.0 percent and not more than 100.5 percent of $C_4H_8O_2$.

Description—Ethyl Acetate is a transparent, colorless liquid, with a fragrant, refreshing, slightly acetous odor, and a peculiar, acetous, burning taste.

Solubility—Ethyl Acetate is soluble in water. It is miscible with alcohol, ether, fixed oils, and volatile oils.

Identification—Ethyl Acetate is readily volatilized even at low temperatures and is flammable; when burned, a yellow flame and an acetous odor are produced.

Specific gravity, page 866—The specific gravity of Ethyl Acetate is not less than 0.894 and not more than 0.898.

Distilling range, page 782—Ethyl Acetate distils between 76° and 77.5°.

Acidity—A solution of 2 ml. of Ethyl Acetate in 10 ml. of neutralized alcohol requires not more than 0.1 ml. of 0.1 *N* sodium hydroxide for neutralization, using 2 drops of phenolphthalein T.S. as the indicator.

Nonvolatile residue—Evaporate Ethyl Acetate in a tared porcelain dish on a steam bath and dry at 105° for 1 hour: not more than 0.02 percent of residue remains.

Readily carbonizable substances—Pour 2 ml. of Ethyl Acetate carefully upon 10 ml. of sulfuric acid T.S. so as to form separate layers: no dark zone is developed within 15 minutes.

Butyl or amyl derivatives—Allow 10 ml. of Ethyl Acetate to evaporate spontaneously from clean, odorless blotting-paper: the final odor does not resemble that of pineapple or banana.

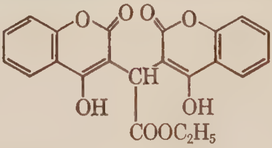
Methyl compounds—Place 20 ml. of Ethyl Acetate in a 500-ml. separator, add a solution of 20 g. of sodium hydroxide in 50 ml. of water, stopper the separator, and wrap it securely in a towel for protection against the heat of the reaction. Shake the mixture vigorously for about 5 minutes, cautiously opening the stopcock from time to time to permit the escape of air. Continue shaking vigorously until a homogeneous liquid results, then distil and collect about 25 ml. of the distillate. To 50 μl. of the distillate add 1 drop of dilute phosphoric acid (1 in 20), and 1 drop of potassium permanganate solution (1 in 20). Mix, allow to stand 1 minute, and add sodium bisulfite solution (1 in 20), dropwise, until the permanganate color is discharged. If a brown color remains, add 1 drop of the dilute phosphoric acid. To the colorless solution add 5 ml. of freshly prepared chromotropic acid T.S. and heat on a steam bath for 10 minutes at 60°: no violet color appears.

Assay—Transfer about 1.5 g. of Ethyl Acetate, accurately weighed in a tared, stoppered weighing bottle, to a suitable flask, add 50.0 ml. of 0.5 *N* sodium hydroxide, and heat on a steam bath under a reflux condenser for 1 hour. Allow it to cool, add phenolphthalein T.S., and titrate the excess sodium hydroxide with 0.5 *N* hydrochloric acid. Perform a blank determination (see *Residual Titrations*, page 883). Each ml. of 0.5 *N* sodium hydroxide is equivalent to 44.05 mg. of $C_4H_8O_2$.

Packaging and storage—Preserve Ethyl Acetate in tight containers and avoid excessive heat.

CATEGORY—Flavor.

Ethyl Biscoumacetate



Ethyl Bis(4-hydroxy-2-oxo-2*H*-1-benzopyran-3-yl)acetate

$C_{22}H_{16}O_8$ Mol. wt. 408.37

Ethyl Biscoumacetate, dried at 105° for 2 hours, contains not less than 97.0 percent and not more than 101.0 percent of $C_{22}H_{16}O_8$.

Description—Ethyl Biscoumacetate occurs as a white to yellowish white, crystalline powder.

Solubility—Ethyl Biscoumacetate is soluble in acetone and in benzene. It is slightly soluble in alcohol and in ether. It is insoluble in water.

Identification—

A: Dissolve 25 mg. of Ethyl Biscoumacetate in 5 ml. of alcohol and add a few drops of ferric chloride T.S.: a reddish brown color is produced.

B: Dissolve 500 mg. of Ethyl Biscoumacetate in 3 ml. of 2 *N* sodium hydroxide and allow the solution to stand for several hours, then add about 0.5 ml. of 0.1 *N* iodine: the odor of iodoform is perceptible.

Melting range, *Class Ia*, page 815—Ethyl Biscoumacetate exists in two tautomeric forms, melting between 153° and 158°, and between 177° and 182°.

Loss on drying, page 814—Dry Ethyl Biscoumacetate at 105° for 2 hours: it loses not more than 0.3 percent of its weight.

Residue on ignition, page 858—Ethyl Biscoumacetate yields not more than 0.1 percent of residue on ignition.

Heavy metals, *Method II*, page 806—The heavy metals limit for Ethyl Biscoumacetate is 10 parts per million.

Assay—Dissolve about 600 mg. of Ethyl Biscoumacetate, previously dried at 105° for 2 hours and accurately weighed, in 25 ml. of acetone. Heat gently to dissolve, cool the solution, add 5 drops of methyl red T.S., and titrate with 0.1 *N* sodium hydroxide to the first yellow color. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* sodium hydroxide is equivalent to 40.84 mg. of $C_{22}H_{16}O_8$.

Packaging and storage—Preserve Ethyl Biscoumacetate in tight containers.

CATEGORY—Anticoagulant.

USUAL DOSE—Initial, **1.2** to **1.8 g.,** then **300** to **900 mg.** daily in accordance with prothrombin time determinations.

Ethyl Biscoumacetate Tablets

Ethyl Biscoumacetate Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{22}H_{16}O_8$.

Identification—Macerate a portion of powdered Ethyl Biscoumacetate Tablets, equivalent to 300 mg. of ethyl biscoumacetate, with 10 ml. of warm acetone. Filter into a test tube, concentrate the filtrate to about 2.5 ml. on a steam bath, and allow to cool. Collect the crystalline precipitate by filtration, and dry the crystals at 100° for 30 minutes. The ethyl biscoumacetate so obtained melts between 151° and 158°, page 814, and responds to the *Identification tests* under *Ethyl Biscoumacetate*, page 298.

Disintegration, page 878—The disintegration time limit for Ethyl Biscoumacetate Tablets, using simulated gastric fluid T.S., is 5 minutes.

Weight variation, page 901—Ethyl Biscoumacetate Tablets meet the requirements of the weight variation test for tablets.

Assay—Weigh and finely powder not less than 20 Ethyl Biscoumacetate Tablets. Weigh accurately a portion of powder equivalent to about 750 mg. of ethyl biscoumacetate, and transfer to a 250-ml. beaker. Add 100 ml. of benzene, warm on a steam bath, stirring to dissolve the ethyl biscoumacetate, then filter through a fine sintered-glass funnel, receiving the filtrate in a second 250-ml. beaker. Wash the beaker and funnel with small portions of warm benzene, adding the washings to the filtrate. Evaporate the filtrate to dryness on a steam bath with the aid of a gentle stream of air. Add 30 ml. of acetone to the dried residue, and heat to dissolve. Cool, add 10 to 15 drops of methyl red T.S., and titrate with 0.1 *N* sodium hydroxide. Perform a blank titration on 30 ml. of acetone, and make any necessary correction. Each ml. of 0.1 *N* sodium hydroxide is equivalent to 40.84 mg. of $C_{22}H_{16}O_8$.

Packaging and storage—Preserve Ethyl Biscoumacetate Tablets in tight containers.

Tablets available—Ethyl Biscoumacetate Tablets usually available contain the following amounts of ethyl biscoumacetate: 150 and 300 mg.

CATEGORY and DOSE—See Ethyl Biscoumacetate.

Ethyl Chloride

CH_3CH_2Cl

Chloroethane

C_2H_5Cl Mol. wt. 64.52

Ethyl Chloride contains not less than 99.5 percent and not more than 100.5 percent of C_2H_5Cl.

Caution—Ethyl Chloride is highly flammable. Do not use where it may be ignited.

Description—Ethyl Chloride occurs as a colorless, mobile, very volatile liquid at low temperatures or under pressure, having a characteristic, ethereal odor. Ethyl Chloride boils between 12° and 13°, and its specific gravity is about 0.921 at 0°. When liberated at room temperature from its sealed container, it vaporizes at once. It burns with a smoky, greenish flame, producing hydrogen chloride.

Solubility—Ethyl Chloride is slightly soluble in water and is freely soluble in alcohol and in ether.

Reaction—Shake 10 ml. of Ethyl Chloride with 10 ml. of water, both having been previously cooled to 0°, and allow the supernatant layer of ethyl chloride to volatilize spontaneously: the remaining liquid is neutral to litmus. Retain the liquid for the test for *Alcohol.*

Nonvolatile residue, and odor—Allow 5 ml. of Ethyl Chloride to evaporate spontaneously from a tared, shallow dish: no foreign odor is perceptible while the last portions evaporate, and the weight of the residue is negligible.

Chloride—Add a few drops of silver nitrate T.S. to 10 ml. of alcohol, cool to 0°, and add to the clear liquid about 0.5 ml. of Ethyl Chloride cooled to the same temperature: no turbidity is produced immediately.

Alcohol—To the liquid obtained in the test for *Reaction* add a few drops of potassium dichromate T.S. and 2 ml. of diluted sulfuric acid, and boil the mixture: no odor of acetaldehyde is perceptible, and no greenish or purplish color is produced.

Assay—Introduce about 1.5 ml. of cold Ethyl Chloride into a tared glass-stoppered bottle containing 25.0 ml. of 1 *N* alcoholic potassium hydroxide, rapidly replace the stopper, and weigh accurately. Tie down the stopper, heat in a boiling water bath for 30 minutes, and cool. Remove the stopper, add 3 drops of phenolphthalein T.S., and titrate the excess alkali with 1 *N* hydrochloric acid. Perform a blank determination (see *Residual Titrations,* page 883). Each ml. of 1 *N* alcoholic potassium hydroxide is equivalent to 64.52 mg. of C_2H_5Cl.

Packaging and storage—Preserve Ethyl Chloride in tight containers, preferably hermetically sealed, and remote from fire.

CATEGORY—Local anesthetic.

FOR EXTERNAL USE—Topically, as spray on intact skin.

Ethylcellulose

Ethylcellulose is an ethyl ether of cellulose containing not less than 44.0 percent and not more than 51.0 percent of ethoxy ($—OC_2H_5$) groups, calculated on the dried basis. The viscosity of a 5 percent (w/w) solution of medium-type Ethylcellulose, containing less than 46.5 percent of ethoxy groups, in a mixture of 60 parts of toluene and 40 parts of alcohol, by weight, is not less than 90.0 percent and not more than 110.0 percent of that stated on the label in centipoises. The viscosity of a 5 percent (w/w) solution of standard-type Ethylcellulose, containing 46.5 percent or more of ethoxy groups, in a mixture of 80 parts of toluene and 20 parts of alcohol, by weight, is not less than 90.0 percent and not more than 110.0 percent of that stated on the label in centipoises, with the exception that the 7-centipoise viscosity grade may vary between 6.0 and 8.0 centipoises and the 4-centipoise viscosity grade may vary between 3.0 and 5.5 centipoises.

Description—Ethylcellulose occurs as a free flowing, white to light tan powder. It forms films that have a refractive index of about 1.47. Its aqueous suspensions are neutral to litmus.

Solubility—Medium type Ethylcellulose is freely soluble in tetrahydrofuran, in methyl acetate, in chloroform, and in mixtures of aromatic hydrocarbons with alcohol. Standard-grade Ethylcellulose is freely soluble in alcohol, in methanol, in toluene, in chloroform, and in ethyl acetate. Both types are insoluble in water, in glycerin, and in propylene glycol

Identification—

A: Dissolve 5 g. of Ethylcellulose in 95 g. of a mixture of 80 parts of toluene and 20 parts of alcohol, by weight: a clear, stable, slightly yellow solution results.

B: Pour a few ml. of the solution of Ethylcellulose prepared in *Identification test A* on a glass plate and allow the solvent to evaporate: a thin, tough, continuous, clear film remains. The film is flammable.

Loss on drying, page 814—Dry Ethylcellulose at 105° for 2 hours: it loses not more than 3 percent of its weight.

Residue on ignition, page 858—Ethylcellulose yields not more than 0.4 percent of residue on ignition.

Viscosity—

Solvent systems—For medium type Ethylcellulose prepare a solvent system consisting of 60 parts of toluene and 40 parts of alcohol, by weight. For standard type Ethylcellulose prepare a solvent system consisting of 80 parts of toluene and 20 parts of alcohol, by weight.

Procedure—Transfer an accurately weighed portion of Ethylcellulose, equivalent to 5.0 g. on the dried basis, into a bottle containing 95 ± 0.05 g. of the appropriate solvent system. Shake or tumble the bottle until the sample is completely dissolved. Adjust the temperature of the solution to 25° ± 0.1° and determine the viscosity as described under *Procedure for Cellulose Derivatives,* page 889, but make all determinations at 25°/25° instead of 20°/20° as directed therein.

Assay—Place about 50 mg. of Ethylcellulose in an empty tared gelatin capsule. Weigh the Ethylcellulose accurately and transfer the capsule and contents to the boiling flask of an alkoxyl apparatus. Proceed as directed under *Methoxy Determination,* page 817. Each ml. of 0.1 *N* sodium thiosulfate is equivalent to 0.7510 mg. of ($—OC_2H_5$).

Packaging and storage—Preserve Ethylcellulose in well-closed containers.

Labeling—Label Ethylcellulose to indicate the type (low or high ethoxy content, i.e., medium or standard type) and viscosity of its solution (under the conditions specified above).

CATEGORY—Tablet binder.

Ethylene

$CH_2{=}CH_2$

C_2H_4 Mol. wt. 28.05

Ethylene contains not less than 99.0 percent by volume of C_2H_4.

Caution: Ethylene is highly flammable. Do not use where it may be ignited.

Note: Maintain cylinders of Ethylene at 25° ± 2° for at least 6 hours prior to withdrawing samples for the tests and assay, and correct the results to 25° and 760 mm. of mercury.

Description—Ethylene is a colorless gas, somewhat lighter than air, and has a slightly sweet odor and taste. One liter of Ethylene at a pressure of 760 mm. of mercury and at 0° weighs 1.260 g.

Solubility—One volume of Ethylene dissolves in about 4 volumes of water at 0° and in about 9 volumes of water at 25°. One volume of it dissolves in about 0.5 volume of alcohol at 25° and in about 0.05 volume of ether at 15.5°.

Identification—

A: Ethylene is slowly soluble in sulfuric acid but is rapidly absorbed by fuming sulfuric acid and by concentrated solutions of potassium permanganate.

B: Bubble Ethylene through bromine T.S.: the reagent is decolorized.

Acidity or alkalinity—Mix 0.3 ml. of methyl red T.S. and 0.3 ml. of bromothymol blue T.S. with 400 ml. of boiling water, and boil the solution for 5 minutes. Pour 100 ml. of the boiling solution into each of three similar, clear-glass color-comparison tubes. Add 0.2 ml. of 0.01 *N* hydrochloric acid to one tube (A), and 0.4 ml. of 0.01 *N* hydrochloric acid to the second tube (B). Stopper each of the tubes, and cool them to room temperature. Pass 2000 ml. of Ethylene through the solution in tube A at a rate requiring about 30 minutes for the passage of the gas. The color of the solution in tube A is no deeper orange-red than that of the solution in tube B and no deeper yellow-green than that of the untreated solution in the third tube.

Carbon dioxide—Pass 1000 ml. of Ethylene through 50 ml. of clear barium hydroxide T.S., contained in a vessel of such size and shape that the depth of the solution is from 12 to 14 cm., employing a delivery tube with an orifice approximately 1 mm. in diameter and extending to within 2 mm. of the bottom of the vessel, and regulating the flow of the Ethylene so as to require approximately 15 minutes for the delivery of 1000 ml. Any turbidity produced does not exceed that produced when 1 ml. of a solution of 100 mg. of sodium bicarbonate in 100 ml. of carbon dioxide-free water is added to 50 ml. of clear barium hydroxide T.S. (about 0.04 percent).

Acetylene, aldehyde, hydrogen sulfide, phosphine—Under the conditions prescribed in the test for *Carbon dioxide*, pass 1000 ml. of Ethylene through 25 ml. of silver ammonium nitrate T.S.: no turbidity or darkening is produced.

Carbon monoxide—Collect, in separate, suitable flasks, 1000 ml. of Ethylene and 1000 ml. of air obtained at a place removed from sources of carbon monoxide. Immediately add to each flask 2.5 ml. of a blood solution prepared by adding 10 ml. of water to 0.5 ml. of blood, and mixing thoroughly. Stopper the flasks and shake frequently during 15 minutes. To each flask add 40 mg. of a mixture of equal parts by weight of pyrogallol and tannic acid. Shake thoroughly, and allow the flasks to stand in the dark for 15 minutes. Pour the contents of each flask into a test tube for observation. The solution from the Ethylene being tested shows no pink coloration and matches the gray color produced in the solution from the air.

Assay—Place a sufficient quantity of clean mercury in a 100-ml. gas buret or nitrometer provided with a two-way stopcock and a two-way outlet and properly connected with a balancing tube. Connect one of the outlet tubes with a gas pipet of suitable capacity containing 125 ml. of bromine T.S. By proper manipulation of the balancing tube, draw the bromine T.S. (excluding bubbles of air) through the capillary of the pipet, the outlet tube, and the bore of the stopcock of the buret, and at once close the stopcock. Now by reversing the movement of the balancing tube, completely fill the buret, the other bore of the stopcock, and the other outlet tube with mercury. Draw into the buret about 105 ml. of Ethylene by again lowering the balancing tube. Disconnect the container of gas, and, with the stopcock open, adjust the volume of Ethylene to 100.0 ml., having the level of the mercury exactly the same in the buret and balancing tube, and close the stopcock. Raise the balancing tube to increase the pressure in the buret, and open the other bore of the stopcock, forcing all of the Ethylene into the gas pipet. Close the stopcock, and rock the gas pipet gently for 5 minutes. Open the stopcock, lower the balancing bulb to draw the gas completely back to the buret, then raise the balancing tube, and force the gas once more into the pipet. Gently rock the pipet until there is no further apparent diminution of the volume of the gas. Draw the residual gas completely into the buret, close the stopcock, remove the bromine pipet, and replace it with one containing a saturated solution of potassium hydroxide. Force the residual gas into the pipet, rock it gently for 5 minutes, return the gas to the buret, close the bore of the stopcock, and equalize the height of mercury in the two tubes of the buret: not more than 1 ml. of gas remains.

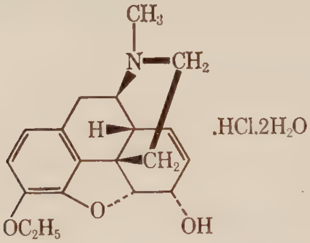
Packaging and storage—Preserve Ethylene in cylinders, remote from fire.

Labeling—Label Ethylene with the statement "*Caution: Ethylene is flammable, and a mixture of it with oxygen or air will explode when brought in contact with a flame or other cause of ignition.*"

CATEGORY—General anesthetic.

APPLICATION—By inhalation as required.

Ethylmorphine Hydrochloride



7,8-Didehydro-4,5α-epoxy-3-ethoxy-17-methylmorphinan-6α-ol Hydrochloride

$C_{19}H_{23}NO_3 . HCl . 2H_2O$ Mol. wt. 385.89

Ethylmorphine Hydrochloride contains not less than 99.0 percent and not more than 100.5 percent of $C_{19}H_{23}NO_3 . HCl$, calculated on the anhydrous basis.

Description—Ethylmorphine Hydrochloride occurs as a white or faintly yellow, odorless, microcrystalline powder. It melts with decomposition at about 123°.

Solubility—Ethylmorphine Hydrochloride is soluble in water and in alcohol. It is slightly soluble in ether and in chloroform.

Identification—

A: To a solution of about 10 mg. of Ethylmorphine Hydrochloride in 10 ml. of sulfuric acid add a drop of ferric chloride T.S., and warm it on a steam bath: the mixture at first becomes green, then deep violet-blue, and after the addition of a drop of nitric acid, deep red.

B: A solution of Ethylmorphine Hydrochloride responds to the tests for *Chloride*, page 808.

Specific rotation, page 822—The specific rotation of Ethylmorphine Hydrochloride, calculated on the anhydrous basis, determined in a solution containing 200 mg. of Ethylmorphine Hydrochloride in each 10 ml., is between −102° and −105°.

Distinction from codeine hydrochloride—To 5 ml. of a solution of Ethylmorphine Hydrochloride (1 in 25) add 1 ml. of ammonia T.S.: a white turbidity is produced immediately.

Acidity—Dissolve 500 mg. of Ethylmorphine Hydrochloride in 15 ml. of water, add 1 drop of methyl red T.S., and titrate with 0.02 *N* sodium hydroxide: not more than 0.3 ml. is required to produce a yellow color.

Water, page 900—Determine the water content of Ethylmorphine Hydrochloride by the titrimetric method: not less than 8 percent and not more than 10 percent is found.

Residue on ignition, page 858—The residue on ignition from 200 mg. of Ethylmorphine Hydrochloride is negligible.

Ammonium compounds—Heat 5 ml. of a solution of Ethylmorphine Hydrochloride (1 in 20) with 5 ml. of sodium hydroxide T.S. in a test tube in a water bath: moistened red litmus paper held in the escaping vapors does not turn blue immediately.

Morphine—Dissolve about 50 mg. of potassium ferricyanide in 10 ml. of water, and add 1 ml. of diluted ferric chloride solution (1 volume of ferric chloride T.S. to 9 volumes of water) and 1 ml. of a solution of Ethylmorphine Hydrochloride (1 in 100): no green or blue color is produced immediately.

Assay—Dissolve about 700 mg. of Ethylmorphine Hydrochloride, accurately weighed, in 50 ml. of glacial acetic acid, add 1 drop of crystal violet T.S. and 10 ml.

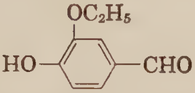
of mercuric acetate T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a blue-green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 34.99 mg. of $C_{19}H_{23}NO_3 . HCl$.

Packaging and storage—Preserve Ethylmorphine Hydrochloride in tight, light-resistant containers.

CATEGORY—Chemotic.

APPLICATION—Topically as a 1 to 5 percent solution in the eye.

Ethyl Vanillin



3-Ethoxy-4-hydroxybenzaldehyde

$C_9H_{10}O_3$ Mol. wt. 166.18

Ethyl Vanillin, dried over phosphorus pentoxide for 4 hours, contains not less than 98.0 percent and not more than 101.0 percent of $C_9H_{10}O_3$.

Description—Ethyl Vanillin occurs as fine white or slightly yellowish crystals. Its taste and odor are similar to the taste and odor of vanillin. It is affected by light. Its solutions are acid to litmus.

Solubility—Ethyl Vanillin is sparingly soluble in water at 50°. It is freely soluble in alcohol, in chloroform, in ether, and in solutions of alkali hydroxides.

Identification—

A: Warm about 100 mg. of Ethyl Vanillin with 1 ml. of 25 percent hydrochloric acid until complete solution is effected. Cool, add about 1 ml. of hydrogen peroxide T.S., and allow the mixture to stand, with frequent shaking, until precipitation is complete (10 to 20 minutes). Add an equal volume of benzene and shake thoroughly: the benzene layer is violet in color (*distinction from vanillin*).

B: Ethyl Vanillin is extracted completely from its solution in ether by shaking with a saturated solution of sodium bisulfite, from which it is precipitated by acids.

C: To a cold solution of Ethyl Vanillin add lead subacetate T.S.: a white precipitate is produced which is sparingly soluble in hot water, but soluble in acetic acid.

Melting range, page 814—Ethyl Vanillin melts between 76° and 78°.

Loss on drying, page 814—Dry Ethyl Vanillin over phosphorus pentoxide for 4 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Ethyl Vanillin yields not more than 0.05 percent of residue on ignition.

Assay—Dissolve about 300 mg. of Ethyl Vanillin, previously dried for 4 hours over phosphorus pentoxide and accurately weighed, in 50 ml. of dimethylformamide contained in a 125-ml. conical flask. Add 3 drops of thymol blue T.S., and titrate with 0.1 *N* sodium methoxide, using a magnetic stirrer and taking precautions against the absorption of atmospheric carbon dioxide. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* sodium methoxide is equivalent to 16.62 mg. of $C_9H_{10}O_3$.

Packaging and storage—Preserve Ethyl Vanillin in tight, light-resistant containers.

CATEGORY—Flavor.

Eucalyptus Oil

Eucalyptus Oil is the volatile oil distilled with steam from the fresh leaf of *Eucalyptus globulus* Labillardière or of some other species of *Eucalyptus* L'Heritier (Fam. *Myrtaceæ*). Eucalyptus Oil contains not less than 70.0 percent of $C_{10}H_{18}O$ (eucalyptol).

Description—Eucalyptus Oil is a colorless or pale yellow liquid, having a characteristic, aromatic, somewhat camphoraceous odor, and a pungent, spicy, cooling taste.

Solubility test—One volume of Eucalyptus Oil is soluble in 5 volumes of 70 percent alcohol.

Specific gravity, page 866—The specific gravity of Eucalyptus Oil is not less than 0.905 and not more than 0.925.

Congealing temperature, page 794—

Eucalyptus Oil congeals at a temperature not lower than −15.4°, indicating not less than 70.0 percent of $C_{10}H_{18}O$ (eucalyptol).

Refractive index, page 858—The refractive index of Eucalyptus Oil is not less than 1.458 and not more than 1.470 at 20°.

Heavy metals, page 806—Eucalyptus Oil meets the requirements of the test for heavy metals in volatile oils.

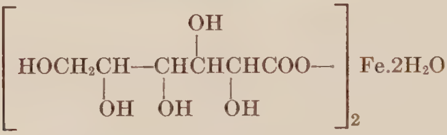
Phellandrene—Mix 2.5 ml. of Eucalyptus Oil with 5 ml. of solvent hexane, add 5 ml. of a solution of sodium nitrite made by dissolving 5 g. of sodium nitrite in 8 ml. of water, then gradually add 5 ml. of glacial acetic acid: no crystals form in the mixture within 10 minutes.

Packaging and storage—Preserve Eucalyptus Oil in tight containers.

Category—Flavor.

Eugenol-Zinc Cement, page 766

Ferrous Gluconate



$$\left[\mathrm{HOCH_2}\underset{\mathrm{OH}}{\mathrm{CH}}\mathrm{{-}}\underset{\mathrm{OH}}{\mathrm{CH}}\overset{\mathrm{OH}}{\mathrm{C}}\mathrm{H}\underset{\mathrm{OH}}{\mathrm{CH}}\mathrm{COO{-}}\right]_2\mathrm{Fe.2H_2O}$$

Iron (2+) Gluconate

$C_{12}H_{22}FeO_{14}.2H_2O$ Mol. wt. 482.18

Ferrous Gluconate, dried at 105° for 4 hours, contains not less than 95.0 percent and not more than 100.5 percent of $C_{12}H_{22}FeO_{14}$.

Description—Ferrous Gluconate occurs as a yellowish gray or pale greenish yellow, fine powder or granules having a slight odor resembling that of burned sugar. Its 1 in 20 solution is acid to litmus.

Solubility—Ferrous Gluconate is soluble in water with slight heating. It is practically insoluble in alcohol.

Identification—

A: To 5 ml. of a warm solution of Ferrous Gluconate (1 in 10) add 0.65 ml. of glacial acetic acid and 1 ml. of freshly distilled phenylhydrazine, and heat the mixture on a steam bath for 30 minutes. Cool the mixture, and scratch the inner surface of the container with a glass stirring rod: crystals of gluconic acid phenylhydrazide form.

B: A solution of Ferrous Gluconate (1 in 20) responds to the tests for *Ferrous salts*, page 809.

Loss on drying, page 814—Dry Ferrous Gluconate at 105° for 4 hours: it loses not less than 6.5 percent and not more than 10 percent of its weight.

Chloride, page 784—One g. of Ferrous Gluconate shows no more chloride than corresponds to 1 ml. of 0.02 *N* hydrochloric acid (0.07 percent).

Sulfate, page 784—One g. of Ferrous Gluconate shows no more sulfate than corresponds to 1 ml. of 0.02 *N* sulfuric acid (0.1 percent).

Oxalic acid—Dissolve 1 g. of Ferrous Gluconate in 10 ml. of water, add 2 ml. of hydrochloric acid, and transfer to a separator. Extract successively with 50 and 20 ml. of ether. Combine the ether extracts, add 10 ml. of water, and evaporate the ether on a steam bath. Add 1 drop of acetic acid and 1 ml. of calcium acetate solution (1 in 20): no turbidity is produced within 5 minutes.

Ferric iron—Dissolve about 5 g. of Ferrous Gluconate, accurately weighed, in a mixture of 100 ml. of water and 10 ml. of hydrochloric acid, and add 3 g. of potassium iodide. Shake well, and allow to stand in the dark for 5 minutes. Titrate any liberated iodine with 0.1 *N* sodium thiosulfate, using starch T.S. as the indicator. Each ml. of 0.1 *N* sodium thiosulfate is equivalent to 5.585 mg. of ferric iron. Ferrous Gluconate contains not more than 2 percent of ferric iron.

Reducing sugars—Dissolve 500 mg. of Ferrous Gluconate in 10 ml. of water, warm, and make alkaline with 1 ml. of ammonia T.S. Pass hydrogen sulfide gas into the solution to precipitate the iron, and permit the solution to stand for 30 minutes to coagulate the precipitate. Filter, and wash the precipitate with two successive 5-ml. portions of water. Acidify the combined filtrate and washings with hydrochloric acid, and add 2 ml. of diluted hydrochloric acid in excess. Boil the solution until the vapors no longer darken lead acetate paper, and continue to boil, if necessary, until it has been concentrated to about 10 ml. Cool, add 5 ml. of sodium carbonate T.S. and 20 ml. of water, filter, and adjust the volume of the filtrate to 100 ml. To 5 ml. of the filtrate add 2 ml. of alkaline cupric tartrate T.S., and boil for 1 minute: no red precipitate is formed within 1 minute.

Assay—Dissolve about 1.5 g. of Ferrous Gluconate, previously dried at 105° for 4 hours and accurately weighed, in a mixture of 75 ml. of water and 15 ml. of diluted sulfuric acid in a 300-ml. conical flask. Add 250 mg. of zinc dust, close the flask with a stopper containing a Bunsen valve, and allow to stand at room temperature for 20 minutes or until the solution becomes colorless. Filter the solution through a Gooch crucible containing an asbestos mat coated with a thin layer of zinc dust, and wash the crucible and contents with 10 ml. of diluted sulfuric acid, followed by 10 ml. of water. Add orthophenanthroline T.S., and titrate the filtrate in the suction flask immediately with 0.1 *N* ceric sulfate. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* ceric sulfate is equivalent to 44.62 mg. of $C_{12}H_{22}FeO_{14}$.

Packaging and storage—Preserve Ferrous Gluconate in tight containers.

Category—Iron supplement.
Usual dose—**300 mg.** three times a day.
Usual dose range—**200** to **600 mg.**

Ferrous Gluconate Tablets

Ferrous Gluconate Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{12}H_{22}FeO_{14}.2H_2O$.

Identification—Dissolve a quantity of powdered Ferrous Gluconate Tablets, equivalent to about 1 g. of ferrous gluconate, in 10 ml. of water, and filter: the solution responds to the *Identification tests* under *Ferrous Gluconate*, page 304.

Disintegration, page 878—The disintegration time limit for Ferrous Gluconate Tablets is 60 minutes.

Weight variation, page 901—Ferrous Gluconate Tablets meet the requirements of the weight variation test for tablets.

Assay—Weigh and finely powder not less than 20 Ferrous Gluconate Tablets. Weigh accurately a portion of the powder, equivalent to about 1.5 g. of ferrous gluconate, and dissolve it in a mixture of 75 ml. of water and 15 ml. of diluted sulfuric acid contained in a 300-ml. conical flask. Proceed as directed in the *Assay* under *Ferrous Gluconate*, page 304, beginning with "Add 250 mg. of zinc dust. . . ." Each ml. of 0.1 *N* ceric sulfate is equivalent to 48.22 mg. of $C_{12}H_{22}FeO_{14}.2H_2O$.

Packaging and storage—Preserve Ferrous Gluconate Tablets in tight containers.

Tablets available—Ferrous Gluconate Tablets usually available contain the following amount of ferrous gluconate: 300 mg.

Category and Dose—See Ferrous Gluconate.

Ferrous Sulfate Syrup

Ferrous Sulfate Syrup contains, in each 100 ml., not less than 3.75 g. and not more than 4.25 g. of $FeSO_4.7H_2O$.

Ferrous Sulfate	40	g.
Citric Acid, hydrous	2.1	g.
Peppermint Spirit	2	ml.
Sucrose	825	g.
Purified Water, a sufficient quantity,		
To make	1000	ml.

Dissolve the ferrous sulfate, the citric acid, the peppermint spirit, and 200 g. of sucrose in 450 ml. of purified water, and filter the solution until clear. Then dissolve the remainder of the sucrose in the clear filtrate, and add sufficient purified water to make 1000 ml. Mix well, and filter, if necessary, through a pledget of cotton.

Assay—Transfer 25 ml. of Ferrous Sulfate Syrup, accurately measured, to a 250-ml. conical flask. Add 15 ml. of diluted sulfuric acid and 100 ml. of water, and shake well. Add 3 drops of orthophenanthroline T.S., and titrate with 0.1 *N* ceric sulfate. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* ceric sulfate is equivalent to 27.80 mg. of $FeSO_4.7H_2O$.

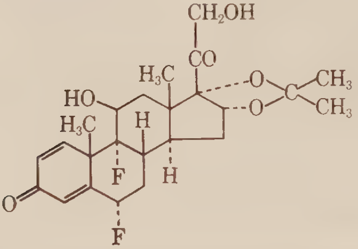
Packaging and storage—Preserve Ferrous Sulfate Syrup in tight containers.

Category—Iron supplement.

Usual dose—**10 ml.**

One usual dose contains about 400 mg. of ferrous sulfate.

Fluocinolone Acetonide*



6α,9α-Difluoro-11β,16α,17,21-tetrahydroxypregna-1,4-diene-3,20-dione, Cyclic 16,17-Acetal with Acetone

$C_{24}H_{30}F_2O_6$ Mol. wt. 452.50

Fluocinolone Acetonide contains not less than 97.0 percent and not more than 103.0 percent of $C_{24}H_{30}F_2O_6$, calculated on the dried basis.

Description—Fluocinolone Acetonide occurs as a white or practically white, odorless, crystalline powder. It is stable in air, and when tested by the method for *Class Ia,* page 815, it melts at about 270° with decomposition.

Solubility—Fluocinolone Acetonide is insoluble in water. It is soluble in methanol and is slightly soluble in ether and in chloroform.

Identification—Prepare a solution of Fluocinolone Acetonide in chloroform containing 500 mcg. per ml. On a suitable thin-layer chromatographic plate (see page 791), coated with a 0.25-mm. layer of silica gel G, spot 10 μl. of this solution and 10 μl. of a chloroform solution of NF Fluocinolone Acetonide Reference Standard containing 500 mcg. per ml. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of chloroform and diethylamine (2:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by lightly spraying with dilute sulfuric acid (1 in 2) and heating on a hot plate or under a lamp until spots appear: the R_f value of the main spot obtained from the sample solution corresponds to that obtained from the Reference Standard solution.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Fluocinolone Acetonide, previously dried at 105° for 3 hours, exhibits maxima only at the same wavelengths as that of NF Fluocinolone Acetonide Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 100,000 solution of Fluocinolone Acetonide in methanol exhibits maxima and minima at the same wavelengths as that of NF Fluocinolone Acetonide Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance, occurring at about 238 mμ, do not differ by more than 3 percent.

Specific rotation, page 822—The specific rotation of Fluocinolone Acetonide, calculated on the dried basis, determined in a solution in methanol containing 100 mg. of Fluocinolone Acetonide in each 10 ml., is between +98° and +108°.

Loss on drying, page 814—Dry Fluocinolone Acetonide at 105° for 3 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—The residue on ignition from 100 mg. of Fluocinolone Acetonide is negligible.

Foreign steroids and other impurities—*Standard preparation*—Prepare as directed under *Steroid Chromatographic Purity,* page 876, using NF Fluocinolone Acetonide Reference Standard.

Test preparation—Weigh accurately about 80 mg. of Fluocinolone Acetonide, previously dried at 105° for 3 hours, dissolve it in a sufficient quantity of a mixture of equal volumes of alcohol and chloroform to make 10.0 ml., and mix.

Procedure—Proceed as directed for

---

* Patented. See notice, page ii.

Procedure under *Steroid Chromatographic Purity,* page 876, using a solvent system consisting of methanol and chloroform (95:5) and determining the absorbance at the maximum at about 238 mμ. Calculate the percentage of chromatographic impurities by the formula $100 - [100 \times 10 \times (C/W) \times (A_U/A_S)]$, in which C is the exact concentration, in mg. per ml., of the *Standard preparation,* and W is the weight, in mg. of Fluocinolone Acetonide taken: not more than 3 percent is found.

Assay—

Standard preparation—Prepare as directed under *Steroid Assay,* page 876, using NF Fluocinolone Acetonide Reference Standard.

Assay preparation—Weigh accurately about 100 mg. of Fluocinolone Acetonide, dissolve it in sufficient alcohol to make 200.0 ml., and mix. Pipet 5.0 ml. of this solution into a 250 ml. volumetric flask, add alcohol to volume, and mix. Pipet 20.0 ml. of this solution into a glass-stoppered 50-ml. conical flask.

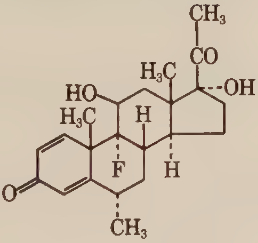
Procedure—Proceed as directed under *Steroid Assay,* page 876, except allow to stand in the dark for 45 minutes. Calculate the quantity, in mg., of $C_{24}H_{30}F_2O_6$ in the portion of Fluocinolone Acetonide taken by the formula $10C \times (A_U/A_S)$.

Packaging and storage—Preserve Fluocinolone Acetonide in well-closed containers.

CATEGORY—Glucocorticoid.

FOR EXTERNAL USE—Topically as a 0.01 to 0.2 percent cream, ointment or solution.

Fluorometholone*



9-Fluoro-11β,17-dihydroxy-6α-methylpregna-1,4-diene-3,20-dione

$C_{22}H_{29}FO_4$ Mol. wt. 376.47

Fluorometholone contains not less than 97.0 percent and not more than 103.0 percent of $C_{22}H_{29}FO_4$, calculated on the dried basis.

Description—Fluorometholone occurs as a white to yellowish white, odorless, crystalline powder. When tested by the method for *Class Ia,* page 815, it melts at about 280° with some decomposition.

Solubility—Fluorometholone is practically insoluble in water. It is slightly soluble in alcohol and is very slightly soluble in chloroform and in ether.

Identification—Prepare a solution of Fluorometholone in methanol containing 500 mcg. per ml. On a suitable thin-layer chromatographic plate (page 871), coated with a 0.25-mm. layer of chromatographic silica gel mixture, spot 100 μl. of this solution and 100 μl. of a methanol solution of NF Fluorometholone Reference Standard containing 500 mcg. per ml. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of methylene chloride and acetone (4:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by examination under short-wave ultraviolet light: the R_f value of the main spot obtained from the sample solution corresponds to that obtained with the Reference Standard solution.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Fluorometholone, previously dried at 60° in vacuum for 3 hours, exhibits maxima only at the same wavelengths as that of NF Fluorometholone Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 100,000 solution of Fluorometholone in methanol exhibits maxima and minima at the same wavelengths as that of NF Fluorometholone Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance occurring at about 239 mμ, do not differ by more than 3 percent.

---

* Patented. See notice, page ii.

Specific rotation, page 822—The specific rotation of Fluorometholone, calculated on the dried basis, determined in a solution in pyridine containing 100 mg. of Fluorometholone in each 10 ml., is between +52° and +60°.

Loss on drying, page 814—Dry Fluorometholone at 60° in vacuum for 3 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Fluorometholone yields not more than 0.2 percent of residue on ignition.

Foreign steroids and other impurities—

Standard preparation—Prepare as directed under *Steroid Chromatographic Purity*, page 876, using NF Fluorometholone Reference Standard.

Test preparation—Weigh accurately about 80 mg. of Fluorometholone previously dried at 60° in vacuum for 3 hours, dissolve it in a sufficient quantity of a mixture of equal volumes of alcohol and chloroform to make 10.0 ml., and mix.

Procedure—Proceed as directed for *Procedure* under *Steroid Chromatographic Purity*, page 876, using a solvent system consisting of benzene and acetone (4:1), and determining the absorbance at the maximum at about 239 mμ. Calculate the percentage of chromatographic impurities by the formula $100 - [100 \times 10 \times (C/W) \times (A_U/A_S)]$, in which C is the exact concentration, in mg. per ml., of the *Standard preparation*, and W is the weight, in mg., of Fluorometholone taken: not more than 3 percent is found.

Assay—

Standard preparation—Dissolve in alcohol a suitable quantity of NF Fluorometholone Reference Standard, previously dried at 60° in vacuum for 3 hours and accurately weighed, and dilute quantitatively and stepwise with alcohol to obtain a solution having a concentration of about 20 mcg. per ml.

Assay preparation—Weigh accurately about 100 mg. of Fluorometholone, dissolve in sufficient alcohol to make 200.0 ml., and mix. Pipet 10.0 ml. of this solution into a 250-ml. volumetric flask, dilute to volume with alcohol, and mix.

Procedure—Transfer 5.0 ml. each of the *Standard preparation* and of the *Assay preparation* to separate 50-ml. glass-stoppered conical flasks, and evaporate to dryness on a steam bath. To each flask, and to a similar flask to provide the blank, add 15.0 ml. of a solution of 250 mg. of isoniazid and 0.3 ml. of hydrochloric acid in 500 ml. of methanol. Rotate the flasks to dissolve all residue remaining from the evaporation, and allow to stand in a water bath at 40° for 1 hour. Cool to room temperature, and determine the absorbances of the solutions obtained from the *Assay preparation* and the *Standard preparation*, in 1-cm. cells, at the maximum at about 410 mμ, with a suitable spectrophotometer, using the blank to set the instrument. Record the absorbance of the solution from the *Assay preparation* as A_U and that from the *Standard preparation* as A_S. Calculate the quantity, in mg., of $C_{22}H_{29}FO_4$ in the portion of Fluorometholone taken by the formula $5C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*.

Packaging and storage—Preserve Fluorometholone in tight, light-resistant containers.

Category—Glucocorticoid.

For external use—Topically, as a 0.025 percent cream one to three times a day.

Fluorometholone Cream

Fluorometholone Cream contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{22}H_{29}FO_4$.

Identification—Transfer a quantity of Fluorometholone Cream, equivalent to about 1 mg. of fluorometholone, to a separator, disperse in 5 ml. of water, and extract with 10 ml. of chloroform. Remove the chloroform layer, evaporate to dryness, and dissolve the residue in 2.0 ml. of methanol. Proceed as directed for *Identification* under *Fluorometholone*, page 307, beginning with "On a suitable thin-layer chromatographic plate . . . ."

Weight variation, page 901—Fluorometholone Cream meets the requirements of the weight variation test for creams.

Assay—

Standard preparation—Prepare as directed in the *Assay* under *Fluorometholone*, page 307.

Assay preparation—Transfer an accurately weighed portion of Fluorometholone Cream, equivalent to about 500 mcg. of fluorometholone, to a 100-ml. volumetric flask, add 40 ml. of methanol, heat to boiling in a water bath, and agitate to assure complete solution of the fluorometholone. Cool to room temperature, dilute to volume with methanol, and mix. Cool this solution in ice water for 30 minutes, filter the chilled solution, and allow the filtrate to return to room temperature. Use the filtrate as directed in the *Procedure.*

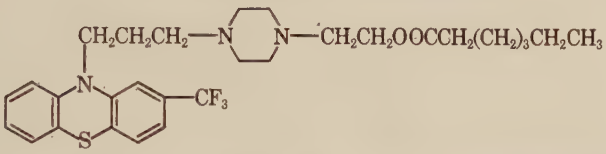
Procedure—Transfer 5.0 ml. of the *Standard preparation* and 20.0 ml. of the *Assay preparation* to separate 50-ml. glass-stoppered conical flasks, evaporate to dryness on a steam bath, and proceed as directed for *Procedure* in the *Assay* under *Fluorometholone*, page 307. Calculate the quantity, in mg., of $C_{22}H_{29}FO_4$ in the portion of Fluorometholone Cream taken by the formula $0.025C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation.*

Packaging and storage—Preserve Fluorometholone Cream in collapsible tubes.

Cream available—Fluorometholone Cream is usually available in the following concentration: 0.025 percent.

Category and Application—See Fluorometholone.

Fluphenazine Enanthate*



4-[3-[2-(Trifluoromethyl)phenothiazin-10-yl]propyl]-1-piperazineethanol Heptanoate (ester)

$C_{29}H_{38}F_3N_3O_2S$ Mol. wt. 549.70

Fluphenazine Enanthate contains not less than 97.0 percent and not more than 103.0 percent of $C_{29}H_{38}F_3N_3O_2S$, calculated on the dried basis.

Description—Fluphenazine Enanthate occurs as a pale yellow to yellow-orange, clear to slightly turbid, viscous liquid. It has a characteristic odor. It is unstable in strong light, but stable to air at room temperature.

Solubility—Fluphenazine Enanthate is insoluble in water. It is freely soluble in alcohol, in chloroform, and in ether.

Identification—Dissolve 50 mg. of Fluphenazine Enanthate in 2 ml. of methanol, and add 3 ml. of palladium chloride solution (1 in 1000): a rusty-red color is produced. Add an excess of the palladium chloride solution: the color intensifies to a brownish red.

Loss on drying, page 814—Dry Fluphenazine Enanthate in vacuum at 60° for 3 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Fluphenazine Enanthate yields not more than 0.2 percent of residue on ignition. Retain the residue from a 1-g. sample for the *Heavy metals test.*

Heavy metals, page 806—Dissolve the residue resulting from the *Residue on ignition test* in 23 ml. of water and 2 ml. of diluted acetic acid: the heavy metals limit for Fluphenazine Enanthate is 30 parts per million.

Assay—Dissolve about 500 mg. of Fluphenazine Enanthate, accurately weighed, in 50 ml. of glacial acetic acid, add 1 drop of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a blue-green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 27.49 mg. of $C_{29}H_{38}F_3N_3O_2S$.

Packaging and storage—Preserve Fluphenazine Enanthate in tight, light-resistant containers.

Category—Tranquilizer (major).

Usual dose—Intramuscular or subcutaneous, **25 mg.** every 2 weeks.

Usual dose range—**12.5** to **100 mg.**

---

* Patented. See notice, page ii.

Fluphenazine Enanthate Injection

Fluphenazine Enanthate Injection is a sterile solution of fluphenazine enanthate in a suitable vegetable oil. It contains not less than 90.0 percent and not more than 125.0 percent of the labeled amount of $C_{29}H_{38}F_3N_3O_2S$.

Identification—A volume of Fluphenazine Enanthate Injection, equivalent to about 50 mg. of fluphenazine enanthate, responds to the *Identification test* under *Fluphenazine Enanthate,* page 309.

Other requirements—Fluphenazine Enanthate Injection meets the requirements under *Injections,* page 810.

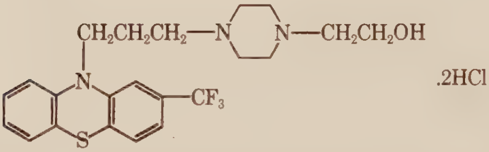
Assay—Dissolve an accurately measured volume of Fluphenazine Enanthate Injection, equivalent to about 150 mg. of fluphenazine enanthate, in 75 ml. of glacial acetic acid, add 1 drop of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a blue-green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 27.49 mg. of $C_{29}H_{38}F_3N_3O_2S$.

Packaging and storage—Preserve Fluphenazine Enanthate Injection in single-dose or in multiple-dose containers, preferably of Type I or Type III glass.

Injections available—Fluphenazine Enanthate Injection usually available contains the following amounts of fluphenazine enanthate: 25 mg. in 1 ml.; 125 mg. in 5 ml., and 250 mg. in 10 ml.

CATEGORY and DOSE—See Fluphenazine Enanthate.

Fluphenazine Hydrochloride*



4-[3-[2-(Trifluoromethyl)phenothiazin-10-yl]propyl]-1-piperazineethanol Dihydrochloride

$C_{22}H_{26}F_3N_3OS.2HCl$ Mol. wt. 510.45

Fluphenazine Hydrochloride, dried at 65° for 3 hours, contains not less than 97.0 percent and not more than 103.0 percent of $C_{22}H_{26}F_3N_3OS.2HCl$.

Description—Fluphenazine Hydrochloride occurs as a white or nearly white odorless, crystalline powder. It melts within a range of 5° above 225°.

Solubility—Fluphenazine Hydrochloride is freely soluble in water. It is slightly soluble in acetone, in alcohol, and in chloroform. It is practically insoluble in benzene and in ether.

Identification—

A: Dissolve about 5 mg. of Fluphenazine Hydrochloride in 5 ml. of methanol and add cautiously 2 ml. of sulfuric acid: a pink color is produced. Add 1 drop of ferric ammonium sulfate T.S.: the color changes to reddish purple.

B: A solution of Fluphenazine Hydrochloride responds to the test for *Chloride,* page 808.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Fluphenazine Hydrochloride, previously dried at 65° for 3 hours, exhibits maxima only at the same wavelengths as that of NF Fluphenazine Hydrochloride Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 100,000 solution of Fluphenazine Hydrochloride in methanol exhibits maxima and minima at the same wavelengths as that of NF Fluphenazine Hydrochloride Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance occurring at about 259 mμ, do not differ by more than 2.5 percent.

Loss on drying, page 814—Dry Fluphenazine Hydrochloride at 65° for 3 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Fluphenazine Hydrochloride yields not more than 0.5 percent of residue on ignition.

Heavy metals, *Method II,* page 806—The heavy metals limit for Fluphenazine Hydrochloride is 30 parts per million.

Assay—Dissolve about 500 mg. of Fluphenazine Hydrochloride, previously dried at 65° for 3 hours and accurately weighed, in a mixture of 50 ml. of glacial acetic acid and 10 ml. of mercuric acetate T.S., warming slightly if necessary to effect solution. Add 1 drop of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a blue-green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 25.52 mg. of $C_{22}H_{26}F_3N_3OS.2HCl$.

---

* Patented. See notice, page ii.

Packaging and storage—Preserve Fluphenazine Hydrochloride in tight, light-resistant containers.

CATEGORY—Tranquilizer (major).

USUAL DOSE RANGE—**0.5** to **2 mg.** daily.

Fluphenazine Hydrochloride Injection*

Fluphenazine Hydrochloride Injection is a sterile solution of fluphenazine hydrochloride in water for injection. It contains not less than 95.0 percent and not more than 110.0 percent of the labeled amount of $C_{22}H_{26}F_3N_3OS.2HCl$.

Identification—

A: Transfer a volume of Fluphenazine Hydrochloride Injection, equivalent to about 5 mg. of fluphenazine hydrochloride to a test tube, add 8 ml. of water, and mix. Divide the solution into two 5-ml. portions. To one portion add 5 ml. of a mixture of equal volumes of nitric acid and water, and mix: a peach to amber color develops quickly, which turns dark brown, then suddenly changes to a clear solution with a yellow tint. To the other portion add 1 ml. of hydrochloric acid, and mix: the solution remains clear.

B: The ultraviolet absorption spectum of the *Assay preparation*, prepared as directed in the *Assay*, exhibits maxima and minima at the same wavelengths as that of the *Standard preparation*, similarly measured.

pH, page 824—The pH of Fluphenazine Hydrochloride Injection is between 4.8 and 5.2.

Other requirements—Fluphenazine Hydrochloride Injection meets the requirements under *Injections*, page 810.

Assay—

Solvent mixture—Wash 800 ml. of *n*-heptane with 200 ml. each of 1 *N* sodium hydroxide and of 1 *N* hydrochloric acid, followed by three 200-ml. portions of water. Wash 40 ml. of isoamyl alcohol with 10 ml. each of 1 *N* sodium hydroxide and of 1 *N* hydrochloric acid, followed by three 10-ml. portions of water. Prepare a 97:3 mixture of the washed *n*-heptane and isoamyl alcohol.

pH 5.6 buffer—Adjust the pH of 0.1 *M* sodium acetate to 5.6 using glacial acetic acid.

Standard preparation—Transfer about 35 mg. of NF Fluphenazine Hydrochloride Reference Standard, accurately weighed, to a 50-ml. volumetric flask, add water to volume, and mix.

Assay preparation—Transfer an accurately measured volume of Fluphenazine Hydrochloride Injection, equivalent to about 7.5 mg. of fluphenazine hydrochloride, to a 10-ml. volumetric flask, dilute to volume with water, and mix.

Procedure—Transfer 1.0 ml. each of the *Standard preparation* and of the *Assay preparation* to separate centrifuge bottles each containing 2 ml. of water. Treat each solution as follows: add 100.0 ml. of *Solvent mixture* followed by 1 ml. of sodium hydroxide solution (1 in 10), shake mechanically for 10 minutes, and centrifuge. Transfer 25.0 ml. of the organic phase to a second centrifuge bottle containing 5 ml. of *pH 5.6 buffer*, shake mechanically for 3 minutes, and centrifuge. Transfer 20.0 ml. of the organic phase from this bottle to a third centrifuge bottle containing 20.0 ml. of 0.5 *N* sulfuric acid, shake mechanically for 5 minutes, and centrifuge. Remove and discard the organic phase, and concomitantly determine the absorbances of the aqueous acid solutions in 1-cm. cells, at the maximum at about 255 mμ, with a suitable spectrophotometer, using 0.5 *N* sulfuric acid as the blank. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{22}H_{26}F_3N_3OS.2HCl$ in each ml. of the Injection taken by the formula $0.01 \times (C/V) \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*, and V is the volume, in ml., of the Injection taken.

Packaging and storage—Preserve Fluphenazine Hydrochloride Injection in single-dose or in multiple-dose containers, preferably of Type I glass, protected from light.

Injection available—Fluphenazine Hydrochloride Injection usually available contains the following amount of fluphenazine hydrochloride: 25 mg. in 10 ml.

CATEGORY and DOSE—See Fluphenazine Hydrochloride.

---

* Patented. See notice, page ii.

Fluphenazine Hydrochloride Tablets*

Fluphenazine Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{22}H_{26}F_3N_3OS \cdot 2HCl$.

Identification—Digest an amount of finely powdered Fluphenazine Hydrochloride Tablets, equivalent to about 5 mg. of fluphenazine hydrochloride, with 5 ml. of methanol, and filter: the filtrate responds to *Identification test A* under *Fluphenazine Hydrochloride*, page 310.

Disintegration—The disintegration time limit for Fluphenazine Hydrochloride Tablets is 30 minutes.

Content uniformity, *Method I*, page 799—Fluphenazine Hydrochloride Tablets meet the requirements of the content uniformity test for tablets.

Assay—

Palladium chloride solution—Dissolve 500 mg. of palladium chloride in a mixture of 250 ml. of water and 5 ml. of hydrochloric acid, heating on a steam bath until solution is effected, cool, and dilute with water to 500 ml. Store in an amber bottle and use within 30 days. On the day of use, dilute 5 ml. of this solution and 9.6 ml. of 1 *N* hydrochloric acid to 100 ml. with water.

Standard preparation—Transfer about 50 mg. of NF Fluphenazine Hydrochloride Reference Standard, accurately weighed, to a 500-ml. volumetric flask, dilute to volume with water, and mix. Transfer 10.0 ml. of this solution to a separator, add 1 ml. of sodium hydroxide solution (1 in 2), and extract with four 20-ml. portions of *n*-hexane. Filter the extracts through a pledget of glass wool into a 100-ml. volumetric flask. Dilute to volume with *n*-hexane and mix.

Assay preparation—Weigh and finely powder not less than 20 Fluphenazine Hydrochloride Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 1 mg. of fluphenazine hydrochloride, to a separator, add 10 ml. of water, and proceed as directed under *Standard preparation*, beginning with "... add 1 ml. of sodium hydroxide solution ... ."

Procedure—Extract 20.0 ml. each of the *Standard preparation* and of the *Assay preparation* with 4.0 ml. of *Palladium chloride solution*, and concomitantly determine the absorbance of each extract in 1-cm. cells, at the maximum at about 480 mμ, with a suitable spectrophotometer, using *Palladium chloride solution* as the blank. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{22}H_{26}F_3N_3OS \cdot 2HCl$ in the portion of Tablets taken by the formula $0.1C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*.

Packaging and storage—Preserve Fluphenazine Hydrochloride Tablets in tight containers.

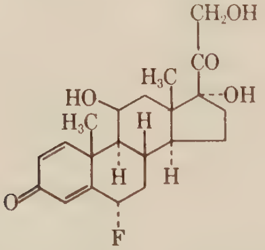
Tablets available—Fluphenazine Hydrochloride Tablets usually available contain the following amounts of fluphenazine hydrochloride: 250 mcg., and 1, 2.5, 5, and 10 mg.

CATEGORY and DOSE—See Fluphenazine Hydrochloride.

---

* Patented. See notice, page ii.

Fluprednisolone*



6α-Fluoro-11β,17,21-trihydroxypregna-1,4-diene-3,20-dione

$C_{21}H_{27}FO_5$ Mol. wt. 378.44

Fluprednisolone contains not less than 97.0 percent and not more than 103.0 percent of $C_{21}H_{27}FO_5$, calculated on the dried basis.

---

* Patented. See notice, page ii.

Description—Fluprednisolone occurs as a white to off-white, odorless, crystalline powder.

Solubility—Fluprednisolone is sparingly soluble in alcohol, slightly soluble in chloroform and in ether, and practically insoluble in water.

Identification—Prepare a solution of Fluprednisolone in chloroform containing 500 mcg. per ml. On a suitable thin-layer chromatographic plate (see page 791), coated with a 0.25-mm. layer of chromatographic silica gel mixture, spot 10 μl. of this solution and 10 μl. of a chloroform solution of NF Fluprednisolone Reference Standard containing 500 mcg. per ml. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of methylene chloride and acetone (4:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by examination under shortwave ultraviolet light: the R_f value of the main spot obtained from the sample solution corresponds to that obtained from the Reference Standard solution.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 100,000 solution of Fluprednisolone in alcohol exhibits maxima and minima at the same wavelengths as that of NF Fluprednisolone Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis at the point of maximum absorbance occurring at about 242 mμ, do not differ by more than 3 percent.

Specific rotation, page 822—The specific rotation of Fluprednisolone, calculated on the dried basis, determined in a solution of dioxane containing 100 mg. of Fluprednisolone in each 10 ml., is between +87° and +95°.

X-ray diffraction, page 902—The X-ray diffraction pattern of Fluprednisolone conforms to either one or a mixture of the patterns described by the following data:

Form A		Form B	
d	I/I_1	d	I/I_1
7.65	2	10.39	2

2.28	5	2.30	3
2.25	3		

Loss on drying, page 814—Dry Fluprednisolone at 105° for 3 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Fluprednisolone yields not more than 0.2 percent of residue on ignition.

Foreign steroids and other impurities—

Standard preparation—Prepare as directed under *Steroid Chromatographic Purity,* page 876, using NF Fluprednisolone Reference Standard.

Test preparation—Weigh accurately about 80 mg. of Fluprednisolone previously dried at 105° for 3 hours, dissolve it in a sufficient quantity of a mixture of equal volumes of alcohol and chloroform to make 10.0 ml., and mix.

Procedure—Proceed as directed for *Procedure* under *Steroid Chromatographic Purity,* page 876, using a solvent system consisting of benzene and acetone (4:1), and determining the absorbance at the maximum at about 242 mμ. Calculate the percentage of chromatographic impurities by the formula $100 - [100 \times 10 \times (C/W) \times (A_U/A_S)]$, in which C is the exact concentration, in mg. per ml., of the *Standard preparation,* and W is the weight, in mg., of Fluprednisolone taken: not more than 3 percent is found.

Assay—

Standard preparation—Prepare as directed under *Steroid Assay,* page 876, using NF Fluprednisolone Reference Standard.

Assay preparation—Weigh accurately about 100 mg. of Fluprednisolone, dissolve it in sufficient alcohol to make 200.0 ml., and mix. Pipet 5.0 ml. of this solution into a 250-ml. volumetric flask, add alcohol to volume, and mix. Pipet 20.0 ml. of this solution into a glass-stoppered 50-ml. conical flask.

Procedure—Proceed as directed for *Procedure* under *Steroid Assay*, page 876. Calculate the quantity, in mg., of $C_{21}H_{27}FO_5$ in the portion of Fluprednisolone taken by the formula $10C \times (A_U/A_S)$.

Packaging and storage—Preserve Fluprednisolone in well-closed containers.

Category—Glucocorticoid.

Usual dose range—**750 mcg.** to **5.25 mg.** one to four times daily.

Fluprednisolone Tablets

Fluprednisolone Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{21}H_{27}FO_5$.

Identification—Evaporate 25 ml. of the *Assay preparation* from the *Assay* on a steam bath just to dryness, dissolve the residue in 1 ml. of chloroform, and proceed as directed for *Identification* under *Fluprednisolone*, page 312.

Disintegration, page 878—The disintegration time limit for Fluprednisolone Tablets is 30 minutes.

Content uniformity, *Method I*, page 799—Fluprednisolone Tablets meet the requirements of the content uniformity test for tablets.

Assay—

Standard preparation—Prepare as directed under *Steroid Assay*, page 876, using NF Fluprednisolone Reference Standard.

Assay preparation—Weigh and finely powder not less than 10 Fluprednisolone Tablets. Weigh accurately a portion of the powder, equivalent to about 5 mg. of fluprednisolone, and transfer with the aid of 10 ml. of water to a separator. Extract the fluprednisolone completely using four 25-ml. portions of chloroform, filtering each extract through chloroform-washed cotton into a 250-ml. volumetric flask. Add chloroform to volume, and mix. Pipet 10.0 ml. of this solution into a glass-stoppered 50-ml. conical flask, evaporate the chloroform on a steam bath just to dryness, cool, and dissolve the residue in 20.0 ml. of alcohol.

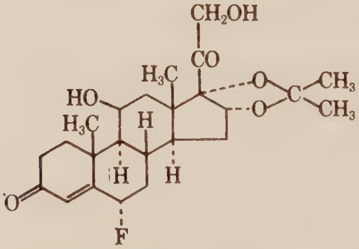
Procedure—Proceed as directed for *Procedure* under *Steroid Assay*, page 876. Calculate the quantity, in mg., of $C_{21}H_{27}FO_5$ in the portion of the tablets taken by the formula $0.5C \times (A_U/A_S)$.

Packaging and storage—Preserve Fluprednisolone Tablets in well-closed containers.

Tablets available—Fluprednisolone Tablets usually available contain the following amounts of fluprednisolone: 750 mcg. and 1.5 mg.

Category and Dose—See Fluprednisolone.

Flurandrenolide*



6α-Fluoro-11β,16α,17,21-tetrahydroxypregn-4-ene-3,20-dione, Cyclic 16,17-Acetal with Acetone

$C_{24}H_{33}FO_6$ Mol. wt. 436.53

Flurandrenolide contains not less than 95.0 percent and not more than 102.0 percent of $C_{24}H_{33}FO_6$, calculated on the dried basis.

Description—Flurandrenolide occurs as a white to off-white, fluffy, crystalline powder. It is odorless.

Solubility—Flurandrenolide is freely soluble in chloroform, soluble in methanol, and sparingly soluble in alcohol. It is practically insoluble in water and in ether.

---

* Patented. See notice, page ii.

Identification—Line the inside of a chromatographic chamber suitable for descending chromatography (see page 789) with Whatman No. 1 or equivalent filter paper. Fill the solvent trough with benzene previously saturated with formamide to serve as the mobile phase, and also place sufficient of the same liquid on the bottom of the chamber to permit the liner to be in contact with it. Allow the chamber to equilibrate for 16 hours. Prepare a strip of filter paper, about 15 × 46 cm., draw a line across the narrow dimension about 6 cm. from one end, and mark two points for application of solutions along this line about 3.5 cm. from each edge of the paper. Immerse the strip in a mixture of acetone and formamide (2:1), blot, and air-dry at room temperature. Spot 10 μl. of a 1 in 100 solution of Flurandrenolide in chloroform-methanol (1:1) at one application point, and similarly spot 10 μl. of a 1 in 100 solution of NF Flurandrenolide Reference Standard at another application point. Suspend the strip in the chamber, and allow to develop until the solvent front is within 2.5 to 3 cm. of the bottom of the paper (about 3.5 hours). Remove the strip, mark the solvent front, and air-dry the strip in a hood at room temperature overnight. Spray the strip with a 2:1 mixture of blue tetrazolium solution (1 in 500) and sodium hydroxide solution (1 in 10), circle all purplish spots with a soft-lead pencil while the paper is still wet, and then air-dry the chromatogram at room temperature in a hood: the spots produced by the sample solution correspond in pattern and intensity to those produced by the Reference Standard solution.

Infrared absorption, page 866—The infrared absorption spectrum of a 1 in 20 solution of Flurandrenolide, previously dried in vacuum at 105° for 4 hours, in chloroform exhibits maxima only at the same wavelengths as that of NF Flurandrenolide Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 25,000 solution of Flurandrenolide in methanol exhibits maxima and minima at the same wavelengths as that of NF Flurandrenolide Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance occurring at about 237 mμ, do not differ by more than about 3 percent.

Specific rotation, page 822—The specific rotation of Flurandrenolide, previously dried in vacuum at 105° for 4 hours, determined in a solution in chloroform containing 100 mg. of Flurandrenolide in each 10 ml. is between +140° and +150°.

X-ray diffraction, page 902—The X-ray diffraction pattern of Flurandrenolide conforms to either one or a mixture of the patterns described by the following data:

Form A		Form B	
d	I/I_1	d	I/I_1

Loss on drying, page 814—Dry Flurandrenolide in vacuum at 105° for 4 hours: it loses not more than 1 percent of its weight.

Foreign steroids and other impurities—

Standard preparation—Prepare as directed under *Steroid Chromatographic Purity,* page 876, using NF Flurandrenolide Reference Standard to prepare a solution containing approximately 10 mg. per ml.

Test preparation—Weigh accurately about 50 mg. of Flurandrenolide, previously dried in vacuum at 105° for 4 hours, dissolve it in a sufficient quantity of a mixture of equal volumes of alcohol and chloroform to make 5.0 ml., and mix.

Procedure—Proceed as directed for *Procedure* under *Steroid Chromatographic Purity,* page 876, applying 10 μl. each of the *Test Preparation* and of the *Standard Preparation* to the chromatographic plate (previously activated by heating at 110° for 1 hour), and using a solvent system consisting of benzene and ethyl acetate (1:1). Determine the absorbances at the maximum at about 237 mμ. Calculate the percentage of chromatographic impurities by the formula $100 - [100 \times 5 \times (C/W) \times (A_U/A_S)]$, in which C is the exact concentration, in mg. per ml., of the

Standard preparation, and W is the weight, in mg., of Flurandrenolide taken: not more than 3 percent is found.

Assay—

Blue tetrazolium solution—Dissolve 75 mg. of blue tetrazolium in 50 ml. of a 1 in 10 solution of water in dehydrated alcohol, and mix.

Tetramethylammonium hydroxide solution—Dilute 10.0 ml. of tetramethylammonium hydroxide (1 in 10) with sufficient dehydrated alcohol to make 50.0 ml., and mix.

Standard preparation—Transfer about 10 mg. of NF Flurandrenolide Reference Standard, accurately weighed, to a 100-ml. volumetric flask, dissolve in dehydrated alcohol, dilute to volume with dehydrated alcohol, and mix. Transfer 10.0 ml. of the solution to a 50-ml. volumetric flask, dilute to volume with dehydrated alcohol, and mix. Transfer 10.0 ml. of this solution to a 25-ml. volumetric flask, dilute to volume with dehydrated alcohol, and mix.

Assay preparation—Prepare from Flurandrenolide as directed under *Standard preparation.*

Procedure—Transfer 5.0 ml. each of the *Standard preparation* and of the *Assay preparation* to separate 10-ml. volumetric flasks, and transfer 5.0 ml. of dehydrated alcohol to a third flask to serve as the reagent blank. To each flask add 1.0 ml. of *Blue tetrazolium solution*, mix, heat in a water bath at 39° to 41°, swirling occasionally, and then, after 5.0 minutes, add 1.0 ml. of *Tetramethylammonium hydroxide solution*, and mix. Remove each flask from the water bath 10.0 minutes after addition of the latter reagent, allow to stand at room temperature for 5.0 minutes, dilute to volume with glacial acetic acid, and mix. Five minutes after the addition of the glacial acetic acid, concomitantly determine the absorbance of each solution, in 1-cm. cells, at the maximum at about 520 mμ, with a suitable spectrophotometer, using the reagent blank to set the instrument. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{24}H_{33}FO_6$ in the Flurandrenolide taken by the formula $1.25C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation.*

Packaging and storage—Preserve Flurandrenolide in tight containers in a cold place, protected from light.

Category—Glucocorticoid.

For External Use—Topically, as a **0.025** or **0.05 percent** cream or ointment to the affected area two or three times a day.

Flurandrenolide Cream*

Flurandrenolide Cream contains not less than 85.0 percent and not more than 115.0 percent of the labeled amount of $C_{24}H_{33}FO_6$.

Identification—The *Assay preparation*, treated as directed for *Procedure* in the *Assay*, exhibits an absorbance maximum at about 520 mμ.

Weight variation, page 901—Flurandrenolide Cream meets the requirements of the weight variation test for creams.

Assay—

Blue tetrazolium solution and *Tetramethylammonium hydroxide solution*—Prepare as directed in the *Assay* under *Flurandrenolide* page 314.

Acetic acid-chloroform (1 in 200)—Wash chloroform with water to remove completely any alcohol that may be present, and dry over anhydrous sodium sulfate. Transfer 5.0 ml. of glacial acetic acid to a 1000-ml. volumetric flask, dilute to volume with the washed and dried chloroform, and mix.

Alcohol-chloroform (1 in 200)—Wash chloroform with water to remove completely any alcohol that may be present, and dry over anhydrous sodium sulfate. Transfer 5.0 ml. of dehydrated alcohol to a 1000-ml. volumetric flask, dilute to volume with the washed and dried chloroform, and mix.

Alcohol-chloroform (1 in 20)—Transfer 5.0 ml. of dehydrated alcohol to a 100-ml. volumetric flask, dilute to volume with *Alcohol-chloroform (1 in 200)*, and mix.

Adsorbent—Slowly add, with constant stirring, chromatographic magnesium silicate to a beaker containing a slightly larger volume of hydrochloric acid than the chromatographic magnesium silicate to be treated, boil on a steam bath for 15 minutes, stirring frequently to prevent spattering. Insert into the stem of a glass funnel a pledget of glass wool that has previously been washed successively with hydrochloric acid, water, dehydrated alcohol, and *Alcohol-chloroform (1 in 200)*. Place a short length of vinyl tubing equipped with a screw clamp over the stem of the funnel, close the clamp, and add sufficient hydrochloric acid through the funnel to fill the stem. Transfer the adsorbent slurry to the funnel, and release the clamp. Wash the chromatographic magnesium silicate in the funnel with hydrochloric acid until the yellow color is removed and the washings are colorless, then wash with water until free from chloride, and finally wash with dehydrated alcohol followed by *Alcohol-chloroform (1 in 200)*. Dry at 100° for 16 hours, and store in a tight container.

---

* Patented. See notice, page ii.

Chromatographic columns—Pack pledgets of glass wool, previously washed as described under *Adsorbent*, at the base of 1.2 × 30-cm. chromatographic tubes equipped with stopcocks. Add to each tube a slurry prepared by mixing 4 g. of *Adsorbent* with *Alcohol-chloroform (1 in 200)*, taking precautions to prevent the formation of air pockets or channels. Wash down the sides of the tubes with *Alcohol-chloroform (1 in 200)*, allow the adsorbent to settle, and tap the tubes gently and uniformly. Insert a pledget of the previously washed glass wool in the top of each tube. (*Caution:* Do not allow the top of the adsorbent to become dry during the preparation of the columns.)

Standard preparation—Transfer about 10 mg. of NF Flurandrenolide Reference Standard, accurately weighed, to a 100-ml. volumetric flask, add *Alcohol-chloroform (1 in 200)* to volume, dissolve, and mix. Transfer 10.0 ml. of this solution to a 50-ml. glass-stoppered flask, add 20 ml. of *Alcohol-chloroform (1 in 200)*, and continue as directed under *Assay preparation*, beginning with "Filter into a 50-ml. volumetric flask . . . ."

Assay preparation—Transfer an accurately weighed portion of Flurandrenolide Cream, equivalent to about 1 mg. of flurandrenolide, to a 50-ml. glass-stoppered flask, add 30 ml. of *Alcohol-chloroform (1 in 200)*, stopper, and stir mechanically for 10 minutes. Filter into a 50-ml. volumetric flask through a coarse-porosity sintered-glass funnel containing 20 g. of anhydrous sodium sulfate. Wash the sodium sulfate with several small portions of *Alcohol-chloroform (1 in 200)*, dilute to volume with *Alcohol-Chloroform (1 in 200)*, and mix. Add 10.0 ml. of this solution to the top of a chromatographic column, and adjust the flow rate of the column to about 50 drops per minute. When the last of the solution just enters the column, add two 2-ml. portions of *Acetic acid-chloroform (1 in 200)*, allow each portion to drain into the column, and add 40 ml. more of *Acetic acid-chloroform (1 in 200)*. When this disappears into the column, add 2.0 ml. of *Alcohol-chloroform (1 in 20)*, and allow this solution to drain into the column. Discard all column washings. Place a 25-ml. volumetric flask under the column, and continue adding *Alcohol-chloroform (1 in 20)* until the eluate has filled the flask to the mark, stopper the flask, and mix.

Procedure—Transfer 5.0 ml. each of the *Standard preparation* and of the *Assay preparation* into separate 10-ml. volumetric flasks, and transfer 5.0 ml. of *Alcohol-chloroform (1 in 20)* to a third flask to serve as the reagent blank. Using mild heat and a stream of air, evaporate the contents of each flask nearly to dryness, remove from the heat, and complete the evaporation to dryness with the stream of air until the odor of acetic acid is no longer perceptible. Dissolve each residue in 5.0 ml. of dehydrated alcohol, then add to each flask 1.0 ml. of *Blue tetrazolium solution*, mix, and continue as directed in the *Assay* under *Flurandrenolide*, page 314, beginning with "... heat in a water bath at 39° to 41° . . . ." Calculate the quantity, in mg., of $C_{24}H_{33}FO_6$ in the portion of the Cream taken by the formula $0.125C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*.

Packaging and storage—Preserve Flurandrenolide Cream in tight containers, protected from light.

Creams available—Flurandrenolide Cream usually available contains 0.025 percent or 0.05 percent of flurandrenolide.

Category and Application—See Flurandrenolide.

Flurandrenolide Ointment*

Flurandrenolide Ointment contains not less than 85.0 percent and not more than 115.0 percent of the labeled amount of $C_{24}H_{33}FO_6$.

Identification—The *Assay preparation*, treated as directed for *Procedure* in the *Assay*, exhibits an absorbance maximum at about 520 mμ.

Weight variation, page 901—Flurandrenolide Ointment meets the requirements of the weight variation test for ointments.

Assay—

Blue tetrazolium solution and *Tetramethylammonium hydroxide solution*—Prepare as directed in the *Assay* under *Flurandrenolide*, page 314.

Alcohol-chloroform (1 in 200), Alcohol-chloroform (1 in 20), Adsorbent, and *Chromatographic columns*—Prepare as directed in the *Assay* under *Flurandrenolide Cream*, page 316.

Standard preparation—Transfer about 10 mg. of NF Flurandrenolide Reference Standard, accurately weighed, to a 100-ml. volumetric flask, add dehydrated alcohol to volume, dissolve, and mix. Transfer 10.0 ml. of this solution to a 250-ml. separator containing 75 ml. of dehydrated alcohol and continue as directed under *Assay*

---

* Patented. See notice, page ii.

preparation, beginning with "... and then add to the separator 1.0 ml. of 0.5 *N* hydrochloric acid and 150 ml. of water."

Assay preparation—Transfer an accurately weighed portion of Flurandrenolide Ointment, equivalent to about 1 mg. of flurandrenolide, to a 125-ml. conical flask, add 25 ml. of dehydrated alcohol, and heat on a steam bath until the sample has liquefied. Place a magnetic stirring bar in the flask, and stir for 5 minutes, heating the flask at intervals to keep the contents in a semi-liquid state. Cool to 10° in an ice water bath, and decant the alcohol solution through Whatman No. 1 or equivalent filter paper, collecting the filtrate in a 250-ml. separator. Treat the ointment remaining in the flask with two additional 25-ml. portions of dehydrated alcohol, in the same manner, filtering each solution into the separator. Wash the filter with two 5-ml. portions of dehydrated alcohol, add the washings to the separator, and then add to the separator 1.0 ml. of 0.5 *N* hydrochloric acid and 150 ml. of water. Extract with 25 ml. of *Alcohol-chloroform (1 in 200)*, shaking for 3 minutes, and filter the chloroform layer into a 100-ml. volumetric flask through a coarse-porosity sintered-glass funnel containing 20 g. of anhydrous sodium sulfate. Extract with two additional 25-ml. portions of *Alcohol-chloroform (1 in 200)*, filtering each into the flask, and wash the sodium sulfate and funnel with several small portions of *Alcohol-chloroform (1 in 200)*, dilute to volume with *Alcohol-chloroform (1 in 200)*, and mix. Transfer 20.0 ml. of this solution to a 50-ml. conical flask, evaporate the contents of the flask to dryness using mild heat and a stream of air, and dissolve the residue in 6 ml. of *Alcohol-chloroform (1 in 200)*. Add this solution to the top of a chromatographic column, rinsing the flask with two 2.0-ml. portions of *Alcohol-chloroform (1 in 200)* and adding the washings to the column. Adjust the flow rate of the column to about 50 drops per minute. When the last of the solution just enters the column, add two additional 2.0-ml. portions of *Alcohol-chloroform (1 in 200)*, allow each portion to drain into the column, and then add 30 ml. more of *Alcohol-chloroform (1 in 200)*. When this disappears into the column, add 2.0 ml. of *Alcohol-chloroform (1 in 20)*, and allow it to drain into the column. Discard all washings. Place a 25-ml. volumetric flask under the column, and continue adding *Alcohol-chloroform (1 in 20)* until the eluate has filled the flask to the mark, stopper the flask, and mix.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Flurandrenolide Cream*, page 316. Calculate the quantity, in mg., of $C_{24}H_{33}FO_6$ in the portion of Ointment taken by the formula $0.125C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*.

Packaging and storage—Preserve Flurandrenolide Ointment in tight containers, protected from light.

Ointments available—Flurandrenolide Ointment usually available contains 0.025 percent or 0.05 percent of flurandrenolide.

Category and Application—See Flurandrenolide.

Flurothyl*

$CF_3CH_2—O—CH_2CF_3$

Bis(2,2,2-trifluoroethyl) Ether

$C_4H_4F_6O$ Mol. wt. 182.07

Flurothyl contains not less than 99.6 percent and not more than 100.0 percent of $C_4H_4F_6O$.

Caution—Flurothyl is volatile and flammable. Inhalation of vapors can produce convulsions.

Description—Flurothyl occurs as a clear, colorless, volatile liquid having a pleasant, mild, ethereal odor. It boils at about 64°.

Solubility—Flurothyl is slightly soluble in water. It is miscible with alcohol, with ether, with propylene glycol, and with halogenated solvents.

Specific gravity, page 866—The specific gravity of Flurothyl is not less than 1.415 and not more than 1.419 at 20°.

Refractive index, page 858—The refractive index of Flurothyl is not less than 1.279 and not greater than 1.281 at 20°.

Infrared absorption, page 866—The infrared absorption spectrum of a 1 in 50 solution of Flurothyl in chloroform exhibits maxima at the following wavelengths, in μ: 6.85 (*w*), 6.95 (*w*), 7.10 (*w*), 7.65 (*m*), 7.80 (*s*), 8.55 (*s*), 8.85 (*m*), 9.95 (*m*), 10.30 (*w*), and 12.00 (*w*).

Ultraviolet absorption, page 866—Record the ultraviolet absorption spectrum of Flurothyl, in a 1-cm. cell, with a suitable spectrophotometer, from 220 mμ to 346 mμ, using water as the blank: the absorbance throughout this range does not exceed 0.2 (distinction from *benzene*,

---

* Patent pending. See notice, page ii.

toluene, p-toluenesulfonic acid or its esters).

Nonvolatile residue—Allow 10 ml. of Flurothyl to evaporate at room temperature in a tared evaporating dish, and dry the residue at 50° for 2 hours: the weight of the residue does not exceed 2 mg.

Peroxide—Place 10 ml. of Flurothyl in a glass-stoppered, 25-ml. cylinder containing 1 ml. of a freshly prepared solution of potassium iodide (1 in 10), and shake occasionally during 1 hour, protecting the mixture from light. View the mixture transversely against a white background: no color is seen in either liquid.

Assay—Inject 30 µl. of Flurothyl into a suitable gas chromatograph, page 787, equipped with a thermal conductivity detector. Under typical conditions, the instrument contains a 3-m. × 6-mm. (outside diameter) column packed with diethylene glycol succinate 20 percent, on calcined diatomaceous silica (Chromosorb P); the column is maintained at a temperature of 70°, the injection port is maintained at 150°, the detector block is maintained at 100–150°, and helium is used as a carrier gas at a flow rate of about 80 ml. per minute. From the area under the curve, calculate the percent (a/a) of $C_4H_4F_6O$ in the Flurothyl taken.

Packaging and storage—Preserve Flurothyl in single-dose glass ampuls, and avoid exposure to excessive heat.

Category—Central stimulant (convulsant).

Application—**1 ml.** by special inhalation.

Fluroxene*

$CF_3CH_2—O—CH{=}CH_2$

2,2,2-Trifluoroethyl Vinyl Ether

$C_4H_5F_3O$ Mol. wt. 126.08

Fluroxene contains not less than 99.0 percent and not more than 100.0 percent of $C_4H_5F_3O$. It contains a suitable stabilizer.

Caution—Fluroxene is highly volatile and flammable. Its vapor, when mixed with air and ignited, may explode.

Description—Fluroxene is a clear, practically colorless, volatile liquid having a mild, ethereal odor. It boils at about 43°.

Solubility—Fluroxene is slightly soluble in water. It is miscible with alcohol, with ether, with acetone, and with most halogenated solvents.

Specific gravity, page 866—The specific gravity of Fluroxene is not less than 1.125 and not more than 1.129.

Refractive index, page 858—The refractive index of Fluroxene is not less than 1.319 and not more than 1.320 at 20°.

Infrared absorption, page 866—The infrared absorption spectrum of a 1 in 20 solution of Fluroxene in carbon disulfide exhibits maxima at the following wavelengths, in µ: 3.45 (*w*), 6.13 (*m*), 6.22 (*m*), 7.88 (*s*), 8.35 (*s*), 8.63 (*s*), 8.80 (*m*), 9.10 (w), 9.69 (*w*), 10.27 (*m*), 10.40 (*m*), 10.76 (*w*), 11.75 (*w*), 12.12 (*m*), and 14.83 (*w*).

Reaction—Agitate 5 ml. of Fluroxene with 2 ml. of carbon dioxide-free water for 30 seconds: the water layer is neutral to litmus.

Nonvolatile residue—Allow 10 ml. of Fluroxene to evaporate at room temperature in a tared evaporating dish, and dry the residue at 50° for 2 hours: the weight of the residue does not exceed 2 mg.

Foreign odor—Place 10 ml. of Fluroxene in a small, dry evaporating dish, and allow to evaporate spontaneously to about 1 ml.: no foreign odor is perceptible during the evaporation. Pour the residue onto odorless filter paper: no foreign odor is perceptible as the last portion disappears from the paper.

Aldehydes—Place 20 ml. of Fluroxene in a glass-stoppered cylinder, add 7 ml. of a mixture of 1 ml. of alkaline mercuric-potassium iodide T.S. and 17 ml. of a saturated solution of sodium chloride. Stopper the cylinder, shake it vigorously for 10 seconds, and then set aside for 1 minute: the water layer shows no turbidity.

Assay—Inject 30 µl. of Fluroxene into a suitable gas chromatograph, page 787. Under typical conditions the instrument contains a 3 m. × 6-mm. (outside diameter) column packed with di(2-ethylhexyl)-sebacate, 20 percent on purified siliceous earth; the column is heated initially at 50° and after 5 minutes is increased at a rate of 10° per minute to 100°. The column is maintained at 100° for 8 minutes; the injection port is maintained at 150°, and helium is used as the carrier gas at a flow rate of about 80 ml. per minute. From the area under the curve, calculate the percent (a/a) of $C_4H_5F_3O$ in the Fluroxene taken.

Packaging and storage—Preserve Fluroxene in tight, light-resistant containers, and avoid exposure to excessive heat.

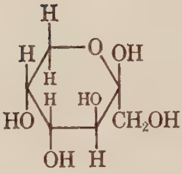
Category—General anesthetic.

Usual dose—By inhalation as required.

---

* Patented. See notice, page ii.

Fructose



D(−)-Fructose

$C_6H_{12}O_6$ Mol. wt. 180.16

Fructose, dried in vacuum at 70° for 4 hours, contains not less than 98.0 percent and not more than 102.0 percent of $C_6H_{12}O_6$.

Description—Fructose occurs as colorless crystals or as a white, crystalline or granular powder. It is odorless and has a sweet taste.

Solubility—Fructose is soluble in alcohol and in methanol. It is freely soluble in water.

Identification—

A: To 5 ml. of hot alkaline cupric tartrate T.S. add a few drops of a solution of Fructose (1 in 10): a copious red precipitate of cuprous oxide is formed.

B: Heat to about 60°, a mixture of 1 g. of phenylhydrazine hydrochloride and 1.5 g. of sodium acetate with 10 ml. of water, cool, and filter. To 5 ml. of this solution in a test tube add 1.5 ml. of a solution of Fructose (1 in 10), heat in boiling water for 5 minutes, then cool, filter, and wash the precipitate with three 10-ml. portions of water followed by single washings of 5 ml. each of alcohol and of ether. Dry the residue at 105° for 30 minutes: the yellow osazone so obtained melts between 205° and 210° (with decomposition), page 814.

Color of solution—Dissolve 25 g. of Fructose in sufficient water to make 50.0 ml. of solution: the solution has no more color than a solution prepared by mixing 1.0 ml. of cobaltous chloride C.S., 3.0 ml. of ferric chloride C.S., and 2.0 ml. of cupric sulfate C.S. with water to make 10 ml., and diluting 3 ml. of this solution with water to make 50 ml. Make the comparison by viewing the solutions downward in matched color-comparison tubes against a white surface.

Acidity—Dissolve 5 g. of Fructose in 50 ml. of carbon dioxide-free water. Add 3 drops of phenolphthalein T.S., and titrate with 0.02 *N* sodium hydroxide to the production of a distinct pink color: not more than 0.5 ml. of 0.02 *N* sodium hydroxide is required for neutralization.

Loss on drying, page 814—Dry Fructose in vacuum at 70° for 4 hours: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Fructose yields not more than 0.5 percent of residue on ignition.

Chloride, page 784—A 2-g. portion of Fructose shows no more chloride than corresponds to 0.5 ml. of 0.02 *N* hydrochloric acid (0.018 percent).

Sulfate, page 784—A 2-g. portion of Fructose shows no more sulfate than corresponds to 0.5 ml. of 0.02 *N* sulfuric acid (0.025 percent).

Arsenic—A *Test Preparation* prepared with 10.0 g. of Fructose, as directed for organic compounds, meets the requirements of the *Arsenic Test,* page 777 (1 part per million As).

Calcium—To 10 ml. of Fructose solution (1 in 10) add 1 ml. of ammonium oxalate T.S.: the solution remains clear for 1 minute.

Heavy metals, page 806—Dissolve 5 g. of Fructose in 23 ml. of water, and add 2 ml. of diluted acetic acid: the heavy metals limit for Fructose is 5 parts per million.

Hydroxymethylfurfural—Transfer to a test tube 10 ml. of a solution of Fructose (1 in 10), add 5 ml. of ether, and shake vigorously. Transfer 2 ml. of the ether layer to a test tube and add 1 ml. of a solution of resorcinol in hydrochloric acid (1 in 100): a slight pink color may form, but no cherry-red color appears immediately.

Assay—Transfer about 10 g. of Fructose, previously dried in vacuum at 70° for 4 hours and accurately weighed, to a 100-ml. volumetric flask, and dissolve in 50 ml. of water. Add 0.2 ml. of ammonia T.S., then dilute to volume with water, and mix. After 30 minutes, determine the angular rotation in a 100-mm. tube at 25° (see page 822). The observed rotation, in degrees, multiplied by 1.124, represents the weight, in g., of $C_6H_{12}O_6$ in the Fructose taken.

Packaging and storage—Preserve Fructose in well-closed containers.

CATEGORY and DOSE—See Fructose Injection and Fructose and Sodium Chloride Injection.

Fructose Injection

Fructose Injection is a sterile solution of fructose in water for injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_6H_{12}O_6$.

Bacteriostatic agents are not to be added to Fructose Injection.

Identification—Fructose Injection responds to the *Identification tests* under *Fructose*, page 320.

Pyrogen—Fructose Injection, diluted if necessary with water for injection to contain 10 percent of fructose, meets the requirements of the *Pyrogen Test*, page 851.

pH, page 824—The pH of Fructose Injection is between 3.0 and 6.0.

Heavy metals—Place a volume of Fructose Injection, equivalent to 3 g. of fructose, in a porcelain dish and evaporate to a volume of about 10 ml. Cool, dilute to 20 ml. with water, add 2 ml. of diluted acetic acid, and add water to make 25 ml.: the heavy metals limit for Fructose Injection is 5 parts per million.

Hydroxymethylfurfural—Fructose Injection meets the requirements of the test for *Hydroxymethylfurfural* under *Fructose*, page 320.

Other requirements—Fructose Injection meets the requirements under *Injections*, page 810.

Assay—Transfer an accurately measured volume of Fructose Injection, containing about 5 g. of fructose, to a 100-ml. volumetric flask. Add 0.2 ml. of ammonia T.S., dilute to volume with water, and mix. After 30 minutes determine the angular rotation in a 200-mm. tube at 25° (see page 822). The observed rotation, in degrees, multiplied by 0.5618, represents the weight, in g., of $C_6H_{12}O_6$ in the volume of the Injection taken for the assay.

Packaging and storage—Preserve Fructose Injection in single-dose containers, preferably of Type I or Type II glass.

Injection available—Fructose Injection usually available contains the following amount of fructose: 100 g. in 1000 ml.

CATEGORY—Fluid and nutrient replenisher.

USUAL DOSE—Intravenous and subcutaneous, as required.

Fructose and Sodium Chloride Injection

Fructose and Sodium Chloride Injection is a sterile solution of fructose and sodium chloride in water for injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amounts of $C_6H_{12}O_6$ (fructose) and of NaCl (sodium chloride).

Bacteriostatic agents are not to be added to Fructose and Sodium Chloride Injection.

Identification—Fructose and Sodium Chloride Injection responds to the *Identification tests* under *Fructose*, page 320, and to the tests for *Sodium*, page 810, and for *Chloride*, page 808.

Pyrogen—Fructose and Sodium Chloride Injection, diluted, if necessary, with water for injection to contain not more than 0.9 percent of sodium chloride and not more than 10 percent of fructose, meets the requirements of the *Pyrogen Test*, page 851.

pH, page 824—The pH of Fructose and Sodium Chloride Injection is between 3.0 and 6.0.

Heavy metals, page 806—Proceed as directed in the *Heavy metals test* under *Fructose Injection*, page 321: the heavy metals limit for Fructose and Sodium Chloride Injection is 5 parts per million.

Hydroxymethylfurfural—Fructose and Sodium Chloride Injection meets the requirements of the test for *Hydroxymethylfurfural* under *Fructose*, page 320.

Other requirements—Fructose and Sodium Chloride Injection meets the requirements under *Injections*, page 810.

Assay for fructose—Transfer an accurately measured volume of Fructose and Sodium Chloride Injection, containing about 5 g. of fructose, to a 100-ml. volumetric flask. Add 0.2 ml. of ammonia T.S., dilute to volume with water, and mix. After 30 minutes determine the angular rotation in a 200-mm. tube at 25° (see page 822). The observed rotation in degrees, multiplied by 0.5618, represents the weight, in g., of $C_6H_{12}O_6$ in the volume of the Injection taken for the assay.

Assay for sodium chloride—Transfer an accurately measured volume of Fructose and Sodium Chloride Injection, equivalent to about 200 mg. of sodium chloride, to a glass-stoppered flask, and add water, if necessary, to make about 50 ml. Add, while agitating, 50.0 ml. of 0.1 *N* silver nitrate, then add 3 ml. of nitric acid and 5 ml. of nitrobenzene, and shake well. Add 2 ml. of ferric ammonium sulfate T.S., and titrate the excess silver nitrate with 0.1 *N* ammonium thiocyanate. Each ml. of 0.1 *N* silver nitrate is equivalent to 5.844 mg. of NaCl.

Packaging and storage—Preserve Fructose and Sodium Chloride Injection in single-dose containers, preferably of Type I or Type II glass.

Injection available—Fructose and Sodium Chloride Injection usually available contains the following amounts of fructose and sodium chloride: fructose, 100 g., and sodium chloride, 9 g. in 1000 ml.

Category—Fluid, nutrient, and electrolyte replenisher.

Usual dose—Intravenous and subcutaneous, as required.

Basic Fuchsin

Basic Fuchsin is a mixture of rosaniline and pararosaniline hydrochlorides.

Description—Basic Fuchsin occurs as a dark green powder or greenish glistening crystalline fragments having a bronze-like luster, and not more than a faint odor.

Solubility—Basic Fuchsin is soluble in water, in alcohol, and in amyl alcohol. It is insoluble in ether.

Identification—

A: To 5 ml. of a solution (1 in 1000) of Basic Fuchsin add a few drops of hydrochloric acid: a yellow color is produced (*distinction from acid fuchsin*).

B: To 5 ml. of a solution (1 in 500) of Basic Fuchsin add a few drops of tannic acid T.S.: a red precipitate forms.

C: To 10 ml. of a solution (1 in 500) of Basic Fuchsin add 10 ml. of ammonia T.S. and 500 mg. of zinc dust, and agitate the mixture: the solution becomes decolorized. Place a few drops of the decolorized solution upon filter paper and nearby, on the same paper, place a few drops of diluted hydrochloric acid: a red color develops at the zone of contact.

Loss on drying, page 814—Dry Basic Fuchsin at 105° to constant weight: it loses not more than 5 percent of its weight.

Residue on ignition, page 858—Ignite 1 g. of Basic Fuchsin with 0.5 ml. of sulfuric acid: the weight of the residue is not more than 0.3 percent.

Alcohol-insoluble substances—Boil 1 g. of Basic Fuchsin, accurately weighed, with 50 ml. of alcohol under a reflux condenser for 15 minutes, filter through a tared filtering crucible, wash the residue on the filter with hot alcohol until the washings cease to be colored violet, and dry the crucible at 105° for 1 hour: the insoluble residue amounts to not more than 1 percent.

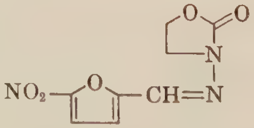
Arsenic—A *Test Preparation* of 1.25 g. of Basic Fuchsin, prepared as directed for organic compounds, meets the requirements of the *Arsenic Test*, page 777 (8 parts per million As).

Lead—Place 1 g. of Basic Fuchsin in a small Kjeldahl flask, add 5 ml. of sulfuric acid, and insert a small funnel into the flask. Gently rotate the flask until the sulfuric acid has completely wetted the Basic Fuchsin, then heat with a small flame until complete carbonization has taken place. Allow to cool, and add, in small quantities, 5 ml. of nitric acid. Again heat gently until fumes of sulfur trioxide are evolved. Allow to cool, add another 5 ml. of nitric acid, and again heat to the evolution of sulfur trioxide. Allow to cool, add about 25 ml. of water, and boil for a few minutes. After cooling, neutralize with stronger ammonia water, using litmus paper as the indicator, and add 5 ml. of nitric acid. Transfer the solution completely to a 100-ml. volumetric flask, dilute to volume, and mix. Use 20 ml. of this solution for the *Lead Limit Test*, page 813. Basic Fuchsin contains not more than 30 parts per million of lead.

Packaging and storage—Preserve Basic Fuchsin in well-closed containers.

Category—Local anti-infective.

Furazolidone*



3-[(5-Nitrofurfurylidene)amino]-2-oxazolidinone

$C_8H_7N_3O_5$ Mol. wt. 225.16

---

* Patented. See notice, page ii.

Furazolidone contains not less than 97.0 percent and not more than 103.0 percent of $C_8H_7N_3O_5$, calculated on the dried basis.

Description—Furazolidone occurs as a yellow, odorless, crystalline powder. It is tasteless at first, developing a bitter aftertaste.

Solubility—Furazolidone is practically insoluble in water, in alcohol, and in carbon tetrachloride.

Identification—To about 50 mg. of Furazolidone add 5 ml. of water and 5 ml. of sodium hydroxide T.S.: an orange-red solution is formed.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Furazolidone, previously dried at 100° for 1 hour, exhibits maxima only at the same wavelengths as that of NF Furazolidone Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 100,000 solution of Furazolidone, prepared as directed in the *Assay*, exhibits maxima and minima at the same wavelengths as that of NF Furazolidone Reference Standard, similarly measured.

Loss on drying, page 814—Dry Furazolidone for 1 hour at 100°: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Furazolidone yields not more than 0.05 percent of residue on ignition.

Assay—Transfer about 100 mg. of Furazolidone, accurately weighed, to a 250-ml. volumetric flask, dilute to volume with dimethylformamide, and mix. Transfer 5.0 ml. of this solution to a 250-ml. volumetric flask, dilute to volume with water, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Furazolidone Reference Standard, in the same medium, at a concentration of about 8 mcg. per ml., in 1-cm. cells, at the maximum at about 367 mμ, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg., of $C_8H_7N_3O_5$ in the Furazolidone taken by the formula $12.5C \times (A_U/A_S)$, in which C is the exact concentration of the Reference Standard solution, in mcg. per ml., A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Furazolidone in tight, light-resistant containers and avoid exposure to direct sunlight.

CATEGORY—Local anti-infective, local antitrichomonal.

Furazolidone and Nifuroxime Powder

Furazolidone and Nifuroxime Powder contains not less than 0.09 percent and not more than 0.11 percent of $C_8H_7N_3O_5$ (furazolidone), and not less than 0.45 percent and not more than 0.55 percent of $C_5H_4N_2O_4$ (nifuroxime) in a suitable, slightly acidified powder base.

Identification—Mix about 250 mg. of Furazolidone and Nifuroxime Powder with 5 ml. of water and add 5 ml. of sodium hydroxide T.S.: an orange-red color develops.

pH, page 824—The pH of a dispersion of Furazolidone and Nifuroxime Powder in carbon dioxide-free water (1 in 25) is between 3.0 and 4.5.

Other tests—Not less than 99 percent of Furazolidone and Nifuroxime Powder passes through a No. 100 sieve (see page 849).

Assay—

Chromatographic column—Prepare a chromatographic column as directed in the *Assay* under *Furazolidone* and *Nifuroxime Suppositories*, page 324.

NOTE: Protect all solutions from light.

Furazolidone standard preparation—Transfer to a 500-ml. volumetric flask about 40 mg. of NF Furazolidone Reference Standard, previously dried at 100° for 1 hour and accurately weighed, dissolve it in 50 ml. of dimethylformamide, dilute to volume with water, and mix. Transfer 5.0 ml. of this solution to a 200-ml. volumetric flask, add 39.5 ml. of dimethylformamide, dilute to volume with water, and mix.

Nifuroxime standard preparation—Transfer to a 500-ml. volumetric flask about 50 mg. of NF Nifuroxime Reference Standard, previously dried at 55° for 2 hours and accurately weighed, dilute to volume with water, and mix. Transfer 5.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with water, and mix.

Assay preparation—Transfer about 2 g. of Furazolidone and Nifuroxime Powder to a 100-ml. volumetric flask, add 50 ml. of water, agitate for 10 minutes, dilute to volume with water, and mix. Shake thoroughly just prior to use in the *Procedure.*

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Furazolidone and Nifuroxime Suppositories,* page 324, but dilute the nifuroxime eluate to 100.0 ml. rather than to 50.0 ml.

Calculation for nifuroxime—Calculate the quantity, in mg., of $C_5H_4N_2O_4$ in the Powder sample taken by the formula $2C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Nifuroxime standard preparation.*

Calculation for furazolidone—Calculate the quantity, in mg., of $C_8H_7N_3O_5$ in the Powder sample taken by the formula $C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Furazolidone standard preparation.*

Packaging and storage—Preserve Furazolidone and Nifuroxime Powder in tight, light-resistant containers.

Category—Antitrichomonal, local anti-infective.

Application—Vaginal insufflation, one or two times a week.

Furazolidone and Nifuroxime Suppositories

Furazolidone and Nifuroxime Suppositories contain not less than 0.225 percent and not more than 0.275 percent of $C_8H_7N_3O_5$ (furazolidone), and not less than 0.337 percent and not more than 0.413 percent of $C_5H_4N_2O_4$ (nifuroxime).

Identification—Disperse about 500 mg. of Furazolidone and Nifuroxime Suppositories in 5 ml. of water and add 5 ml. of sodium hydroxide T.S.: an orange-red color develops.

Assay—

Chromatographic column—Pack a pledget of fine glass wool at the base of a standard 10 × 150-mm. chromatographic tube. Add to the tube about 63.5 mm. of adsorbent, prepared by thoroughly mixing 1 part of acid-activated montmorillonite and two parts of unwashed and unignited purified siliceous earth, and pack carefully to avoid air pockets or channels. Wash the column so prepared with at least 10 ml. of water and discard the washings.

Note: Protect all solutions from light.

Furazolidone standard preparation—Transfer to a 500-ml. volumetric flask about 50 mg. of NF Furazolidone Reference Standard, previously dried at 100° for 1 hour and accurately weighed, dissolve it in 50 ml. of dimethylformamide, dilute to volume with water, and mix. Transfer 5.0 ml. of this solution to a 200-ml. volumetric flask, add 39.5 ml. of dimethylformamide, dilute to volume with water, and mix.

Nifuroxime standard preparation—Transfer to a 1000-ml. volumetric flask about 75 mg. of NF Nifuroxime Reference Standard, previously dried at 55° for 2 hours and accurately weighed, dilute to volume with water, and mix. Transfer 10.0 ml. of this solution to a 200-ml. volumetric flask, dilute to volume with water, and mix.

Assay preparation—Transfer to a small beaker about 2 g. of Furazolidone and Nifuroxime Suppositories, accurately weighed, and dissolve in about 30 ml. of warm water (not above 50°). With the aid of water, quantitatively transfer the clear, yellow solution to a 200-ml. volumetric flask, dilute to volume with water, and mix.

Procedure—Add 5.0 ml. of the *Assay preparation* to the top of the column, then after almost all of the solution has passed into the column, complete the elution of the nifuroxime with about 40 ml. of water, maintaining the fluid level above the adsorbant column throughout the elution. Gentle vacuum may be applied to provide a flow of about 0.5 ml. per minute from the column. Dilute the nifuroxime eluate to 50.0 ml. with water, mix, centrifuge for 15 minutes, and filter through hard paper. To elute the furazolidone, pass through the column 10.0 ml. of dimethylformamide followed by about 30 ml. of water. Dilute the eluate to 50.0 ml. with water, mix, centrifuge for 15 minutes, and filter through hard paper.

Determine the absorbance of each solution in a 1-cm. cell, with a suitable spectrophotometer, at 341 mμ for the nifuroxime assay solution and at 367 mμ for the furazolidone assay solution, using water as the blank for the nifuroxime and a 1:4 dimethylformamide-water mixture as the blank for the furazolidone. Record the absorbance of each assay solution as A_U and that of the corresponding *Standard preparation* as A_S.

Calculation for nifuroxime—Calculate the quantity, in mg., of $C_5H_4N_2O_4$ in the portion of the Suppositories taken by the formula $2C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Nifuroxime standard preparation.*

Calculation for furazolidone—Calculate the quantity, in mg., of $C_8H_7N_3O_5$ in the portion of the Suppositories taken by the formula $2C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Furazolidone standard preparation.*

Packaging and storage—Preserve Furazolidone and Nifuroxime Suppositories in bulk in tight containers at temperatures below 37°. Do not expose unwrapped suppositories to sunlight.

Category—Antitrichomonal; local anti-infective.

Usual dose—Vaginal, one suppository one or two times a day.

Gas Gangrene and Tetanus Antitoxin, page 689

Gitalin

Gitalin is a cardiotonic glycosidal constituent obtained from *Digitalis purpurea* Linné (Fam. *Scrophulariaceæ*). It contains not less than 13.0 percent and not more than 19.0 percent of gitoxin, not less than 13.0 percent and not more than 19.0 percent of gitaloxin, and not less than 14.0 percent and not more than 20.0 percent of digitoxin calculated on the dried basis.

Description—Gitalin occurs as a white or pale buff, amorphous powder. It decomposes with liquefaction between 120° and 150°.

Solubility—Gitalin is freely soluble in acetone, in alcohol, in chloroform, and is very slightly soluble in ether.

Identification—Dissolve 1.2 mg. of Gitalin in 0.5 ml. of a mixture of chloroform and methanol (1:1). Dissolve 1.2 mg. of NF Gitalin Reference Standard in 0.5 ml. of the same medium. On a suitable thin-layer chromatographic plate (page 791), coated with a 0.25-mm. layer of chromatographic silica gel mixture, spot 10 µl. of each solution. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of cyclohexane, acetone, and glacial acetic acid (49:49:2) until the solvent front has moved about three-fourths of the length of the plate. Dry the plate at 100° to remove the solvent. Spray the plate with a mixture of 1 part sodium *p*-toluenesulfonchloramide solution (3 in 100) and 15 parts alcoholic trichloroacetic acid solution (1 in 4), heat at 115° for 15 minutes, and observe under longwave ultraviolet light: the R_f values and fluorescence of the spots obtained from the sample solution correspond to those obtained from the Reference Standard solution.

Loss on drying, page 814—Dry Gitalin in vacuum over phosphorus pentoxide for 3 hours: it loses not more than 2 percent of its weight.

Residue on ignition, page 858—Gitalin yields not more than 0.5 percent of residue on ignition.

Assay—

Reagent—Mix 4 ml. of a freshly prepared 3 in 100 solution of sodium *p*-toluenesulfonchloramide with 60 ml. of a 1 in 4 solution of trichloroacetic acid in alcohol.

Xanthydrol solution—Dissolve 30 mg. of xanthydrol in a mixture of 50 ml. of glacial acetic acid and 3 ml. of hydrochloric acid, dilute to 300 ml. with glacial acetic acid, and mix. Prepare this solution fresh.

Preparation of chromatograms—Cut a 58 × 60-cm. sheet of suitable filter paper* into 14.5 × 60-cm. strips. Fold each strip 6 cm. from the top for suspension on the antisiphon rods. On each of 3 papers draw two 1.5-cm. horizontal spotting lines, 8.5 cm. from the top of the paper and 3 cm. from each side edge of the paper. One of these is for the sample application and the other is for the standard application. Mark the fourth paper with two 1.5-cm. lines, 8.5 cm. from the top and 1.5 cm. and 4.5 cm. from one side edge. These two applications (one sample and one standard) are chromatographed to aid in the location and identification of the 3 major glycosides being analyzed. The other half of this fourth paper is used as a paper blank. Impregnate the four papers with a mixture of formamide and acetone (1:4) contained in a closed vessel. Immerse the papers in this solution for 5 minutes, then remove, drain momentarily in the direction of chromatography (*i.e.*, holding the top of the paper), and quickly blot with filter paper.

Standard preparation—Dissolve about 60 mg. of NF Gitalin Reference Standard, accurately weighed, in 2.0 ml. of a mixture of chloroform-methanol (1:1).

Assay preparation—Dissolve about 60 mg. of Gitalin, accurately weighed, in 2.0 ml. of chloroform-methanol (1:1).

Procedure—Streak 10 µl. of the *Assay preparation* on the sample spotting line on each of the four papers. In the same manner, apply 10 µl. of the *Standard preparation*. Place the four papers in troughs of a suitable chromatographic chamber prepared for descending chromatography (see page 789) without paper liner. Cover the bottom of the chamber with a 3-cm. layer of the mobile phase consisting of xylene-methyl ethyl ketone (1:1), saturated with formamide. Place the mobile phase in the troughs containing the chromatograms, and allow to run for 4.5 hours or about 1 hour longer than it takes for the solvent front to reach the bottom of the chromatogram. Remove the chromatograms, and place in a draft oven for 1 hour at 100°, to remove the formamide. Place the fourth paper (the chromatogram containing the sample, standard, and blank areas) flat on a glass plate. Using a micropipet or a pointed porous nylon applicator, apply three parallel streaks of the *Reagent* to the sample and the standard areas, one streak through the midpoint of the origin line and one through each end of this line, from the spotting line to the lower edge of the paper. Make these streaks as narrow as possible, approaching a pencil-line in thickness.

---

* Schleicher and Schuell filter paper no. 2043B, or equivalent, is suitable.

Heat the paper at 110° to 120° for 3 minutes, then view under longwave ultraviolet light, and mark the fluorescent lines carefully with a pencil. Cut away the half of the paper which is to be used for a blank, and keep for marking when the size of the band areas to be analyzed is determined. Spray the other half of the paper, which has been streaked and marked, with the *Reagent*, and heat for 3 minutes at 110° to 120°. View under longwave ultraviolet light: the bands of gitoxin (and the less polar band containing mono- and bis-gitoxin), gitaloxin (and the less polar band containing mono- and bis-gitaloxin), and digitoxin (and the less polar band containing mono- and bis-digitoxin) are visible through fluorescence; outline these bands carefully.

[NOTE: Gitoxin has blue fluorescence and is the slowest moving of the three strongest bands. Gitaloxin has blue fluorescence and is the middle one of the three strongest bands. Digitoxin has yellow fluorescence and is the fastest moving of the three strongest bands. Minor glycosides, strospeside, verodoxin, gitoxigenin, and digitoxigenin are detectable but are not included for quantitation.]

Streak each sample and standard of the three papers to be analyzed with the *Reagent*, applying it in three narrow, parallel lines using the same technique as was used for the fourth paper. Heat, and mark under longwave ultraviolet light, using the sprayed fourth paper as a reference for estimating the width of the bands.

When the average area for each of the three glycosides is known, mark the blank paper accordingly. Evaluate each glycoside (including its mono- and bis-compounds) and its corresponding blank separately: cut each into 1-cm. squares, and place into a properly labeled 25 × 200-mm. tube with plastic-lined screw cap.

Spray the remaining paper of each cut chromatogram with the *Reagent*, and heat to determine if any of a desired band was missed in cutting. If more than a trace of a desired band is detectable, discard the corresponding band and base the result on the average of the two chromatograms which were cut satisfactorily.

Transfer 10.0 ml. of *Xanthydrol solution* into each glycoside tube and into a blank tube. Tighten the screw cap, and agitate each tube for about 10 seconds. Heat the tubes in a boiling water bath for 3 minutes, and then allow to stand in a room-temperature water bath protected from light until the absorbance is read. (The xanthydrol colors are stable for several hours if protected from light exposure.) Determine the absorbance of each solution, at the maximum at about 531 mμ, with a suitable spectrophotometer using alcohol to set the instrument. Subtract the appropriate paper blank absorbance from each glycoside absorbance, and calculate the percent of glycoside in the sample by comparison with the average corrected absorbance for the corresponding standard glycoside of known concentration, using the following formula: % glycoside = $(A_U/A_S) \times (W_S/W_U) \times$ (% glycoside in Standard), in which A_U is the absorbance of the glycoside sample, A_S is the absorbance of the respective glycoside standard, W_U is the weight of the sample taken, in mg., and W_S is the weight of the NF Gitalin Reference Standard, in mg., used in preparing the *Standard preparation*.

Packaging and storage—Preserve Gitalin in tight, light-resistant containers.

CATEGORY—Cardiotonic.

USUAL DOSE—Initial—rapid digitalization, **2.5 mg.** followed by **750 mcg.** every 6 hours until therapeutic effect or toxicity develops, with a total dose of about **6 mg.** being given in 24 hours; slow digitalization, **1.5 mg.** daily for 4 to 6 days. Maintenance, **0.5 mg.** daily.

USUAL DOSE RANGE—Maintenance, **250 mcg.** to **1.25 mg.** daily.

Gitalin Tablets

Gitalin Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of gitalin.

Identification—Evaporate the remaining 20 ml. of chloroform extract, obtained in the *Assay*, to dryness on a steam bath, dissolve the residue in 0.5 ml. of a mixture of chloroform and methanol (1:1), and proceed as directed in the *Identification test* under *Gitalin*, page 325, beginning with "Dissolve 1.2 mg. of NF Gitalin Reference Standard. . . . "

Disintegration, page 878—The disintegration time limit for Gitalin Tablets is 30 minutes.

Content uniformity, *Method I*, page 799—Gitalin Tablets meet the requirements of the content uniformity test for tablets.

Assay—

Trinitrophenol solution—On the day of use, dissolve 2.0 g. of trinitrophenol in 50 ml. of methanol, add 10 ml. of water, then add 5 ml. of sodium hydroxide solution (1 in 10) and sufficient water to make 100 ml. Mix, and allow to stand in the dark for at least 30 minutes before use. If the solution is not clear, filter before use.

Standard preparation—Dissolve about 50 mg. of NF Gitalin Reference Standard, accurately weighed, in sufficient methanol to make 50.0 ml., and mix. Transfer 3.0 ml. of this solution to a 60-ml. separator, and continue as directed under *Assay preparation*, beginning with "... add 10 ml. of water, and mix."

Assay preparation—Weigh and finely powder not less than 20 Gitalin Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 3 mg. of gitalin, to a 60-ml. separator containing 3 ml. of methanol, add 10 ml. of water, and mix. Add 15 ml. of chloroform, and shake for 2 minutes. Filter the separated chloroform layer through a chloroform-moistened pledget of cotton into a 50-ml. volumetric flask, and repeat the extraction procedure with two additional 15-ml. portions of chloroform. Dilute to volume with chloroform, and mix.

Procedure—Transfer 15.0 ml. each of the *Standard preparation* and of the *Assay preparation* to low-actinic 50-ml. flasks, and evaporate to dryness on a steam bath with the aid of a stream of nitrogen. Pipet 10.0 ml. of methanol into each flask, swirl to dissolve the residue, and pipet 10.0 ml. of methanol into a third flask to serve as the blank. Pipet 10.0 ml. of *Trinitrophenol solution* into each flask, mix, and allow to stand for 60 minutes. Concomitantly determine the absorbances of the solutions in 1-cm. cells, at 495 mμ, with a suitable spectrophotometer, using methanol as the blank, and correct the absorbance of each solution by subtracting the absorbance of the reagent blank. The spectrophotometric readings must be taken without delay since heat from the light source causes error. Record the corrected absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of gitalin in the portion of Tablets taken by the formula $0.05C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*.

Packaging and storage—Preserve Gitalin Tablets in tight containers.

Tablets available—Gitalin Tablets usually available contain the following amount of gitalin: 500 mcg.

CATEGORY and DOSE—See Gitalin.

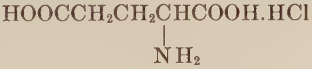
Glutamic Acid Hydrochloride



$$\mathrm{HOOCCH_2CH_2\underset{\substack{|\\ NH_2}}{C}HCOOH.HCl}$$

$C_5H_9NO_4.HCl$ Mol. wt. 183.59

Glutamic Acid Hydrochloride, dried at 80° for 4 hours, contains not less than 99.0 percent and not more than 101.0 percent of $C_5H_9NO_4.HCl$.

Description—Glutamic Acid Hydrochloride occurs as a white, crystalline powder. Its solution is acid to litmus.

Solubility—Glutamic Acid Hydrochloride is freely soluble in water. It is almost insoluble in alcohol and in ether.

Identification—

A: To 1 ml. of a solution of Glutamic Acid Hydrochloride (1 in 3) add 1 ml. of barium hydroxide solution (1 in 50), filter, and add 10 ml. of alcohol: a white, crystalline precipitate of barium glutamate forms on standing.

B: Dissolve 25 mg. of Glutamic Acid Hydrochloride in 100 ml. of water. To 1 ml. of this solution add 1 ml. of ninhydrin T.S. and 100 mg. of sodium acetate, and heat in a steam bath for 5 minutes: a violet-blue color is produced.

C: A solution of Glutamic Acid Hydrochloride (1 in 20) responds to the tests for *Chloride*, page 808.

Specific rotation, page 822—The specific rotation of Glutamic Acid Hydrochloride, previously dried at 80° for 4 hours, determined in 3.0 N hydrochloric acid solution containing 125 mg. of Glutamic Acid Hydrochloride in each ml., is between +23.5° and +25.5°.

Loss on drying, page 814—Dry Glutamic Acid Hydrochloride at 80° for 4 hours: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Glutamic Acid Hydrochloride yields not more than 0.25 percent residue on ignition.

Readily carbonizable substances, page 856—Dissolve 500 mg. of Glutamic Acid Hydrochloride in 5 ml. of sulfuric acid T.S.: the solution is colorless.

Chloride—Weigh accurately about 325 mg. of Glutamic Acid Hydrochloride, previously dried in vacuum at 80° for 4 hours, and transfer it to a 125-ml. conical flask. Add 25 ml. of water, 10 ml. of glacial acetic acid, and 0.2 ml. of a 1 in 100 solution of eosin in methanol, and titrate with 0.1 *N* silver nitrate to a rose end-point. Each ml. of 0.1 *N* silver nitrate is equivalent to 3.545 mg. of Cl. Not less than 18.8 percent and not more than 19.8 percent of Cl is found.

Sulfate, page 784—To 10 ml. of a solution of Glutamic Acid Hydrochloride (1 in 10), add 3 drops of diluted hydrochloric acid and 5 drops of barium chloride T.S.: the turbidity does not exceed that produced by 1 ml. of 0.02 *N* sulfuric acid (0.1 percent).

Heavy metals, page 806—Dissolve 1 g. of Glutamic Acid Hydrochloride in 15 ml. of water, add 1 ml. of diluted hydrochloric acid, and dilute to 25 ml. with water: the heavy metals limit for Glutamic Acid Hydrochloride is 20 parts per million.

Assay—Dissolve about 300 mg. of Glutamic Acid Hydrochloride, previously dried at 80° for 4 hours and accurately weighed, in 50 ml. of water. Add bromothymol blue T.S., and titrate with 0.1 *N* sodium hydroxide. Each ml. of 0.1 *N* sodium hydroxide is equivalent to 9.180 mg. of $C_5H_9NO_4.HCl$.

Packaging and storage—Preserve Glutamic Acid Hydrochloride in well-closed, light-resistant containers.

CATEGORY—Acidifier (gastric).

USUAL DOSE RANGE—**600 mg.** to **1.8 g.** during meals.

Glutamic Acid Hydrochloride Capsules

Glutamic Acid Hydrochloride Capsules contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_5H_9NO_4.HCl$.

Identification—Macerate the contents of a convenient number of Glutamic Acid Hydrochloride Capsules with sufficient water to make about 5 ml. of a solution (1 in 3). The solution responds to the *Identification tests* under *Glutamic Acid Hydrochloride*, page 327.

Weight variation, page 901—Glutamic Acid Hydrochloride Capsules meet the requirements of the weight variation test for capsules.

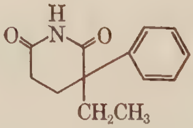
Assay—Transfer, as completely as possible, the contents of not less than 20 Glutamic Acid Hydrochloride Capsules into a 1000-ml. volumetric flask. Wash the emptied capsules with cold water and transfer the washings to the flask. Add water to volume, and shake until the glutamic acid hydrochloride is dissolved. Transfer a convenient volume of the solution, equivalent to about 300 mg. of glutamic acid hydrochloride, to a 300-ml. conical flask, add bromothymol blue T.S., and titrate with 0.1 *N* sodium hydroxide. Each ml. of 0.1 *N* sodium hydroxide is equivalent to 9.180 mg. of $C_5H_9NO_4.HCl$.

Packaging and storage—Preserve Glutamic Acid Hydrochloride Capsules in well-closed containers.

Capsules available—Glutamic Acid Hydrochloride Capsules usually available contain the following amount of glutamic acid hydrochloride: 300 mg.

CATEGORY and DOSE—See Glutamic Acid Hydrochloride.

Glutethimide*



2-Ethyl-2-phenylglutarimide

$C_{13}H_{15}NO_2$ Mol. wt. 217.27

Glutethimide, dried at 45° over phosphorus pentoxide to constant weight, contains not less than 98.0 percent and not more than 101.0 percent of $C_{13}H_{15}NO_2$.

---

* Patented. See notice, page ii.

Description—Glutethimide occurs as a white, crystalline powder. A saturated solution of Glutethimide is acid to litmus.

Solubility—Glutethimide is freely soluble in ethyl acetate, in acetone, in ether, and in chloroform. It is soluble in alcohol and in methanol and is practically insoluble in water.

Identification—Dissolve about 500 mg. of Glutethimide in 20 ml. of sodium hydroxide T.S., heat on a steam bath for 30 minutes, cool, and add diluted hydrochloric acid until the mixture is distinctly acid. Collect the precipitate on a filter, wash well with water, and dry at 105° for 1 hour: the 4-phenyl-4-ethylglutaramic acid so obtained melts between 155° and 160°, page 814.

Melting range, page 814—Glutethimide melts between 86° and 89°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Glutethimide, previously dried at 45° over phosphorus pentoxide to constant weight, exhibits maxima only at the same wavelengths as that of NF Glutethimide Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 4000 solution of Glutethimide in methanol exhibits maxima and minima at the same wavelengths as that of NF Glutethimide Reference Standard, similarly measured.

Loss on drying, page 814—Dry Glutethimide at 45° over phosphorus pentoxide to constant weight: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Glutethimide yields not more than 0.075 percent of residue on ignition.

Assay—Transfer to a 200-ml. volumetric flask about 50 mg. of Glutethimide, previously dried to constant weight at 45° over phosphorus pentoxide and accurately weighed, add 100 ml. of methanol, shake, dilute to volume with methanol, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Glutethimide Reference Standard, in the same medium, at a concentration of about 250 mcg. per ml. in 1-cm. cells, at the maximum at about 257 mμ, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg., of $C_{13}H_{15}NO_2$ in the Glutethimide taken by the formula $0.2C \times (A_U/A_S)$, in which C is the exact concentration of the Reference Standard solution, in mcg. per ml., A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Glutethimide in well-closed containers.

CATEGORY—Sedative.

USUAL DOSE RANGE—Sedative, **125** to **250 mg.** up to three times a day; hypnotic, **500 mg.** to **1 g.**

Glutethimide Tablets

Glutethimide Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{13}H_{15}NO_2$.

Identification—Extract a quantity of finely powdered Glutethimide Tablets, equivalent to about 500 mg. of glutethimide, with three 25-ml. portions of ether. Filter the combined ether extracts and evaporate to dryness without heat: the residue so obtained responds to the *Identification test* under Glutethimide, page 328.

Infrared absorption, page 866—Evaporate to dryness a portion of the eluate obtained in the *Assay.* The infrared absorption spectrum of a potassium bromide dispersion of the residue exhibits absorption maxima only at the same wavelengths as that of NF Glutethimide Reference Standard, similarly measured.

Disintegration, page 878—The disintegration time limit for Glutethimide Tablets is 30 minutes.

Weight variation, page 901—Glutethimide Tablets meet the requirements of the weight variation test for tablets.

Assay—

Preparation of chromatographic column—Pack a pledget of fine glass wool in the base of a chromatographic tube (25 × 200-mm. test tube to which is fused a 5-cm. length of 6 or 8-mm. tubing) with the aid of a tamping rod of stainless steel, aluminum or glass at least 30 cm. long and having a disk with a diameter about 1 mm. less than that of the chromatographic tube. To 2.0 g. of purified siliceous earth in a 100-ml. beaker add 2.0 ml. of 4 N sulfuric acid, and incorporate by kneading thoroughly with a flexible spatula blade until the mixture is fluffy. Transfer to the chromatographic tube and tamp gently to compress the material to a uniform mass. In like manner, mix 2.0 g. of purified siliceous earth with 2.0 ml. of 1 N sodium bicarbonate, transfer it to the chromatographic tube and gently compress with the tamping rod. Wash the column with 50 ml. of water-saturated ether followed by 25 ml. of water-saturated chloroform.

Procedure—Weigh and finely powder not less than 20 Glutethimide Tablets. Transfer to a 100-ml. volumetric flask an accurately weighed portion of the powder, equivalent to about 250 mg. of glutethimide, dilute to volume with water-saturated chloroform, and mix. Transfer 10.0 ml. of this solution to the column and elute with 90 ml. of water-saturated chloroform, collecting the eluate in a 100-ml. volumetric flask. Dilute to volume with water-saturated chloroform, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Glutethimide Reference Standard, in the same medium, at a concentration of about 250 mcg. per ml., in 1-cm. cells, at the maximum at about 257 mμ, with a suitable spectrophotometer, using water-saturated chloroform as the blank. Calculate the quantity, in mg., of $C_{13}H_{15}NO_2$ in the portion of the Tablets taken by the formula $C \times (A_U/A_S)$, in which C is the exact concentration of the Reference Standard solution, in mcg. per ml., A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Glutethimide Tablets in well-closed containers.

Tablets available—Glutethimide Tablets usually available contain the following amounts of glutethimide: 125, 250, and 500 mg.

CATEGORY and DOSE—See Glutethimide.

Glycerin Suppositories

Glycerin	**91 g.**
Sodium Stearate	**9 g.**
Purified Water	**5 g.**
To make about	**100 g.**

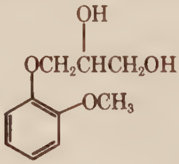
Heat the glycerin in a suitable container to about 120°. Dissolve the sodium stearate, with gentle stirring, in the heated glycerin. Then add the purified water, mix, and immediately pour the hot mixture into a suitable mold, which, if made of metal, previously has been heated and is used while hot. Cool the suppositories completely before removal.

NOTE: If preferred, the sodium stearate for Glycerin Suppositories may be prepared during the making of the Suppositories by the direct reaction between stearic acid and sodium bicarbonate, sodium carbonate, or sodium hydroxide, these being taken in correct proportion.

Packaging and storage—Preserve Glycerin Suppositories in tight containers, preferably at a temperature not above 25°.

CATEGORY—Cathartic.

Glyceryl Guaiacolate



3-(*o*-Methoxyphenoxy)-1,2-propanediol

$C_{10}H_{14}O_4$ Mol. wt. 198.22

Glyceryl Guaiacolate contains not less than 98.0 percent and not more than 102.0 percent of $C_{10}H_{14}O_4$, calculated on the dried basis.

Description—Glyceryl Guaiacolate occurs as a white to slightly gray, crystalline powder having a bitter taste. It may have a slight characteristic odor.

Solubility—Glyceryl Guaiacolate is soluble in water, in alcohol, in chloroform, in glycerin, and in propylene glycol.

Identification—Mix about 5 mg. of Glyceryl Guaiacolate with 1 drop of formaldehyde and a few drops of sulfuric acid: a deep cherry-red to purple color is produced.

Melting range, *Class Ia,* page 815—Glyceryl Guaiacolate melts within a range of 3° between 78° and 82°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Glyceryl Guaiacolate, previously dried in vacuum at 60° to constant weight, exhibits maxima and minima at the same wavelengths as that of NF Glyceryl Guaiacolate Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The

ultraviolet absorption spectrum of a 1 in 50,000 solution of Glyceryl Guaiacolate in chloroform exhibits maxima and minima at the same wavelengths as that of NF Glyceryl Guaiacolate Reference Standard, similarly measured.

pH, page 824—The pH of a solution of Glyceryl Guaiacolate (1 in 100) is between 5.0 and 7.0.

Loss on drying, page 814—Dry Glyceryl Guaiacolate in vacuum at 60° to constant weight: it loses not more than 0.5 percent of its weight.

Heavy metals, *Method II,* page 806—The heavy metals limit for Glyceryl Guaiacolate is 25 parts per million.

Free guaiacol—Transfer 1.000 g. of Glyceryl Guaiacolate to a 100-ml. volumetric flask, add 25.0 ml. of water, warming if necessary to effect solution, and 1.0 ml. of potassium ferricyanide T.S., and swirl to moisten the sample. Add 5 ml. of 4-aminoantipyrine solution (1 in 200), and begin timing the reaction with a stop watch. Swirl the flask for 5 seconds, immediately dilute to volume with 0.01 *M* sodium bicarbonate, and mix. Exactly 15 minutes after the addition of the 4-aminoantipyrine solution, determine the absorbance of the solution in a 1-cm. cell, at the maximum at about 500 mμ, with a suitable spectrophotometer, using a reagent blank to set the instrument at zero. The absorbance of the solution is not greater than that of a control similarly prepared with 3.0 ml. of a 1 in 10,000 solution of NF Guaiacol Reference Standard, using the same quantities of the same reagents and in the same manner (0.03 percent).

Assay—Transfer about 100 mg. of Glyceryl Guaiacolate, accurately weighed, to a 100-ml. volumetric flask, add chloroform to volume, and mix. Transfer 4.0 ml. of the solution to a second 100-ml. volumetric flask, dilute to volume with chloroform, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Glyceryl Guaiacolate Reference Standard, in the same medium at a concentration of about 40 mcg. per ml., in 1-cm. cells, at the maximum at about 276 mμ, with a suitable spectrophotometer, using chloroform as the blank and setting the instrument at zero at 300 mμ. Calculate the quantity, in mg., of $C_{10}H_{14}O_4$ in the Glyceryl Guaiacolate taken by the formula $2.5C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Glyceryl Guaiacolate in tight containers.

CATEGORY—Expectorant.

USUAL DOSE—**100 mg.** every 3 or 4 hours.

Glyceryl Guaiacolate Syrup

Glyceryl Guaiacolate Syrup contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{10}H_{14}O_4$.

Identification—The solution of Glyceryl Guaiacolate prepared for measurement of absorbance in the *Assay* exhibits a maximum at 276 ± 2 mμ.

pH, page 824—The pH of Glyceryl Guaiacolate Syrup is between 2.3 and 3.0.

Assay—Transfer an accurately measured volume of Glyceryl Guaiacolate Syrup, equivalent to about 100 mg. of glyceryl guaiacolate, to a separator, add 5 ml. of diluted sulfuric acid, and extract with four 25-ml. portions of chloroform. Wash the combined chloroform extracts in a second separator with 5 ml. of water, discard the washing, and filter the extracts through chloroform-moistened paper into a 100-ml. volumetric flask. Dilute to volume with chloroform, and mix. Transfer 4.0 ml. of the solution to a second 100-ml. volumetric flask, dilute to volume with chloroform, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Glyceryl Guaiacolate Reference Standard, in chloroform at a concentration of about 40 mcg. per ml., in 1-cm. cells, at the maximum at about 276 mμ, with a suitable spectrophotometer, using chloroform as the blank and setting the instrument at zero at 300 mμ. Calculate the quantity, in mg., of $C_{10}H_{14}O_4$ in each ml. of the Syrup taken by the formula $2.5 \times (C/V) \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, V is the volume, in ml., of Syrup taken, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Alcohol, page 772—Glyceryl Guaiacolate Syrup contains from 3 to 4 percent (v/v) of C_2H_5OH.

Packaging and storage—Preserve Glyceryl Guaiacolate Syrup in tight, light-resistant containers.

Syrup available—Glyceryl Guaiacolate Syrup usually available contains the following amount of glyceryl guaiacolate: 100 mg. in 5 ml.

CATEGORY and DOSE—See Glyceryl Guaiacolate.

Glyceryl Monostearate

Description—Glyceryl Monostearate occurs as a white, wax-like solid or as white, wax-like beads or flakes. It has a slight, agreeable, fatty odor and taste. It is affected by light.

Solubility—Glyceryl Monostearate dissolves in hot organic solvents such as alcohol, mineral or fixed oils, benzene, ether, and acetone. It is insoluble in water but it may be dispersed in hot water with the aid of a small amount of soap or other suitable surface-active agent.

Melting range, page 814—Glyceryl Monostearate does not melt below 55°.

Residue on ignition, page 858—Glyceryl Monostearate yields not more than 0.1 percent of residue on ignition.

Acid value, page 804—The acid value of Glyceryl Monostearate is not more than 18.

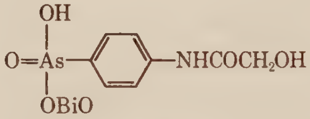
Saponification value, page 805—The saponification value of Glyceryl Monostearate is not less than 155 and not more than 165.

Iodine value, page 804—The iodine value of Glyceryl Monostearate is not more than 6.

Packaging and storage—Preserve Glyceryl Monostearate in tight, light-resistant containers.

CATEGORY—Emulsifying agent.

Glycobiarsol



(Hydrogen *N*-Glycoloylarsanilato)oxobismuth

$C_8H_9AsBiNO_6$ Mol. wt. 499.07

Glycobiarsol contains not less than 97.0 percent and not more than 103.0 percent of $C_8H_9AsBiNO_6$, calculated on the dried basis.

Description—Glycobiarsol occurs as an odorless, yellowish white to flesh-colored, amorphous powder. It decomposes on heating.

Solubility—Glycobiarsol is very slightly soluble in alcohol and in water, and is practically insoluble in benzene, in chloroform, and in ether.

Identification—

A: Dissolve 1 g. of Glycobiarsol in 32 ml. of dilute hydrochloric acid (1 in 15), boil gently for 2 minutes, cool, and divide the solution into three equal portions. To one portion add 1 ml. of sodium sulfide T.S.: a heavy, dark-brown precipitate is formed.

B: To a second portion of the solution prepared in *Identification test A* add bromine T.S. until a permanent, light yellow color is produced and a curdy, white precipitate forms. Separate the precipitate by filtration, dissolve it in 10 ml. of ether, and filter the ether solution. Evaporate the filtrate to dryness, take up the residue in alcohol, add activated charcoal, and filter: the tan-colored crystals of tribromoaniline obtained by crystallization from the alcohol melt between 118° and 121°, page 814.

C: The third portion of the solution prepared in *Identification test A* responds strongly to the *Arsenic Test,* page 777.

Loss on drying, page 814—Dry Glycobiarsol at 105° for 24 hours: it loses not more than 3 percent of its weight.

Arsenic content—Transfer about 300 mg. of Glycobiarsol, previously dried at 105° for 24 hours and accurately weighed, to a 100-ml. Kjeldahl flask. Add 5 ml. of a solution of 1 part of nitric acid in 9 parts of sulfuric acid, and digest over low heat for about 15 minutes or until the mixture is light tan in color. Cool, cautiously dilute with 5 ml. of water, and evaporate until fumes of sulfur trioxide appear. Add 50 mg. of starch, and digest the solution over low heat for about 2 hours or until it becomes light orange in color. Cool, add 50 ml. of water, and transfer the solution to a 600-ml. beaker containing 25 ml. of potassium sodium tartrate solution (1 in 20). Cool the solution with ice, immerse a small piece of congo red paper in it, and add sodium hydroxide solution (4 in 10) until the solution is slightly alkaline. Add diluted sulfuric acid, dropwise, until the solution is slightly acid, neutralize with sodium bicarbonate, and add 3 g. in excess. Titrate the resulting solution with 0.1 *N* iodine. Each ml. of 0.1 *N* iodine is equivalent to 3.746 mg. of As. Not less than 14 percent and not more than 16 percent of As is found.

Free arsanilic acid—

Standard preparation—Place about 500

mg. of arsanilic acid, accurately weighed, in a 1000-ml. volumetric flask, dissolve in sodium hydroxide solution (1 in 1000), dilute to volume with sodium hydroxide solution (1 in 1000), and mix. Pipet 10.0 ml. of this solution into a second 1000-ml. volumetric flask, dilute to volume with sodium hydroxide solution (1 in 1000) and mix.

N-(1-Naphthyl)ethylenediamine dihydrochloride solution—Dissolve 50 mg. of *N*-(1-naphthyl)ethylenediamine dihydrochloride in 15 ml. of water, and dilute with propylene glycol to 50 ml.

Standard arsanilic acid graph—To four 25-ml. volumetric flasks add, respectively, 1.0, 3.0, 5.0, and 7.0-ml. portions of the *Standard preparation*, and for a control add 5 ml. of water to a fifth flask. To each flask add 0.2 ml. of diluted hydrochloric acid and 0.3 ml. of sodium nitrite solution (1 in 50), mix, let stand for 3 to 4 minutes, add 0.3 ml. of sulfamic acid solution (1 in 25), mix, and let stand for 1 minute. Add 1 ml. of *N-(1-Naphthyl)ethylenediamine dihydrochloride solution*, mix, dilute with water to volume, and mix. Determine the absorbance of each solution at 525 mμ with a suitable spectrophotometer, using the control solution as the blank. Plot the observed absorbance on the ordinate scale against the corresponding concentration of arsanilic acid, in mg., on the abscissa scale.

Procedure—Weigh accurately about 150 mg. of Glycobiarsol, and transfer it to a 50-ml. volumetric flask. Add 5 ml. of disodium ethylenediaminetetraacetate solution (1 in 20), and warm the flask, with shaking, at about 90° until solution is complete. Cool to room temperature, dilute with water to volume, and mix. Pipet 10.0 ml. of the solution into a second 50-ml. volumetric flask, dilute with water to volume, and mix. Pipet 5.0 ml. of this solution into a 25-ml. volumetric flask, and to a second 25-ml. volumetric flask add 5 ml. of water to serve as the control. To each flask add 0.2 ml. of diluted hydrochloric acid and 0.3 ml. of sodium nitrite solution (1 in 50), mix, and let stand for 3 to 4 minutes. Add 0.3 ml. of sulfamic acid solution (1 in 25), mix, and let stand for 1 minute. Add 1 ml. of *N-(1-Naphthyl)ethylenediamine dihydrochloride solution*, mix, dilute with water to volume, and mix. Determine the absorbance of the solution at 525 mμ with the same spectrophotometer used in preparing the *Standard arsanilic acid graph*, using the control as the blank. From the observed absorbance calculate the weight of free arsanilic acid in the Glycobiarsol taken. Not more than 1 percent of free arsanilic acid, calculated on the dried basis, is found.

Bismuth content—Transfer about 200 mg. of Glycobiarsol, accurately weighed, to a 250-ml. flask, and add 10.0 ml. of 0.05 *M* disodium ethylenediaminetetraacetate. Warm the flask until the sample is completely dissolved, and cool to room temperature. Add 10 ml. of acetic acid-ammonium acetate buffer T.S., 25 ml. of alcohol, and 2 ml. of dithizone T.S., and titrate the excess disodium ethylenediaminetetraacetate with 0.025 *M* zinc sulfate until the solution is clear rose-pink in color. Each ml. of 0.05 *M* disodium ethylenediaminetetraacetate consumed is equivalent to 10.45 mg. of Bi. Glycobiarsol contains not less than 38 percent and not more than 42.5 percent of Bi, calculated on the dried basis.

Assay—Dissolve about 500 mg. of Glycobiarsol, accurately weighed, in 30 ml. of diluted hydrochloric acid, and gently reflux the solution for 5 to 6 minutes. Cool, transfer to a 400-ml. beaker, add 50 g. of crushed ice, and dilute to 200 ml. with water. Titrate slowly with 0.1 *M* sodium nitrite, stirring vigorously, until a sharp-edged blue spot is produced when the titration mixture is spotted on starch iodide paper. When the titration is complete, the end-point is reproducible after the mixture has been allowed to stand for one minute. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *M* sodium nitrite is equivalent to 49.91 mg. of $C_8H_9AsBiNO_6$.

Packaging and storage—Preserve Glycobiarsol in well-closed, light-resistant containers.

CATEGORY—Antiamebic.

USUAL DOSE—**500 mg.** three times a day for 7 to 10 days.

Glycobiarsol Tablets

Glycobiarsol Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_8H_9AsBiNO_6$.

Identification—Dissolve a portion of powdered Glycobiarsol Tablets, equivalent to about 1 g. of glycobiarsol, in 32 ml. of dilute hydrochloric acid (1 in 15), boil gently for 2 minutes, cool, and filter: separate 10-ml. portions of this filtrate respond to *Identification tests A* and *C* under *Glycobiarsol*, page 332.

Disintegration, page 878—The disintegration time limit for Glycobiarsol Tablets is 30 minutes.

Weight variation, page 901—Glycobiarsol Tablets meet the requirements of the weight variation test for tablets.

Bismuth content—Weigh and finely powder not less than 20 Glycobiarsol

Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 200 mg. of glycobiarsol, to a 250-ml. conical flask, and proceed as directed in the test for *Bismuth content* under *Glycobiarsol*, page 332, beginning with "... add 10.0 ml. of 0.05 *M* disodium ethylenediaminetetraacetate." Glycobiarsol Tablets contain an amount of Bi not less than 38 percent and not more than 42.5 percent of the weight of $C_3H_9AsBiNO_6$ found in the *Assay*.

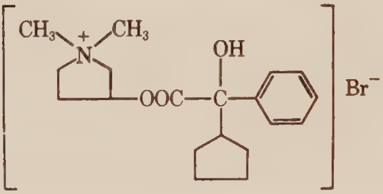
Assay—Transfer an accurately weighed portion of the powder prepared in the test for *Bismuth content*, equivalent to about 500 mg. of glycobiarsol, to a suitable flask, add 30 ml. of diluted hydrochloric acid, and proceed as directed in the *Assay* under *Glycobiarsol*, page 332, beginning with "gently reflux the solution. . . ."

Packaging and storage—Preserve Glycobiarsol Tablets in well-closed, light-resistant containers.

Tablets available—Glycobiarsol Tablets usually available contain the following amount of glycobiarsol: 500 mg.

CATEGORY and DOSE—See Glycobiarsol.

Glycopyrrolate*



3-Hydroxy-1,1-dimethylpyrrolidinium Bromide α-Cyclopentylmandelate

$C_{19}H_{28}BrNO_3$ Mol. wt. 398.34

Glycopyrrolate, dried at 105° for 3 hours, contains not less than 98.0 percent and not more than 100.5 percent of $C_{19}H_{28}BrNO_3$.

Description—Glycopyrrolate occurs as a white, odorless, crystalline powder.

Solubility—Glycopyrrolate is soluble in water and in alcohol. It is practically insoluble in chloroform and in ether.

Identification—

A: A solution of Glycopyrrolate (1 in 40) responds to the tests for *Bromide*, page 808.

B: Dissolve about 500 mg. of Glycopyrrolate in 20 ml. of water, add 2.5 ml. of sodium hydroxide T.S., and boil for 10 minutes. Cool, add 5 ml. of diluted hydrochloric acid, and filter. Wash the precipitate with five 5-ml. portions of water, and dry the residue at 105° for 1 hour: the crystals of α-phenylcyclopentaneglycolic acid so obtained melt between 146° and 149°, page 814.

Melting range, page 814—Glycopyrrolate melts within a range of 2° between 193° and 198°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Glycopyrrolate, previously dried at 105° for 3 hours, exhibits maxima only at the same wavelengths as that of NF Glycopyrrolate Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 2000 solution of Glycopyrrolate in water exhibits maxima and minima at the same wavelengths as that of NF Glycopyrrolate Reference Standard, similarly measured.

Loss on drying, page 814—Dry Glycopyrrolate at 105° for 3 hours: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Glycopyrrolate yields not more than 0.3 percent of residue on ignition.

Assay—Dissolve about 800 mg. of Glycopyrrolate, previously dried at 105° for 3 hours and accurately weighed, in 50 ml. of glacial acetic acid, add 10 ml. of mercuric acetate T.S. and 1 drop of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 39.83 mg. of $C_{19}H_{28}BrNO_3$.

Packaging and storage—Preserve Glycopyrrolate in tight containers.

CATEGORY—Anticholinergic.
USUAL DOSE—**1 mg.** three times a day.
USUAL DOSE RANGE—**1** to **2 mg.**

---

* Patented. See notice, page ii.

Glycopyrrolate Tablets

Glycopyrrolate Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{19}H_{28}BrNO_3$.

Identification—Blend a portion of finely powdered Glycopyrrolate Tablets, equivalent to about 25 mg. of glycopyrrolate, with 50 ml. of water in a high-speed blender, and filter through very retentive filter paper: the ultraviolet absorption spectrum of the filtrate exhibits maxima and minima at the same wavelengths as that of a 1 in 2000 solution of NF Glycopyrrolate Reference Standard.

Disintegration, page 878—The disintegration time limit for Glycopyrrolate Tablets is 30 minutes.

Content uniformity, *Method I*, page 799—Glycopyrrolate Tablets meet the requirements of the content uniformity test for tablets.

Assay—

pH 5.3 Phosphate buffer—Dissolve 38.0 g. of monobasic sodium phosphate and 2.0 g. of anhydrous dibasic sodium phosphate in sufficient water to make 1000.0 ml., and adjust the pH, if necessary, to 5.3 ± 0.1.

Bromocresol purple solution—Dissolve 400 mg. of bromocresol purple in 30 ml. of alcohol, add 6.3 ml. of 0.1 *N* sodium hydroxide, and dilute to 500 ml. with water.

Buffer-dye mixture—On the day of use, mix equal volumes of *pH 5.3 Phosphate buffer* and of *Bromocresol purple solution,* and extract with chloroform until the last extract is colorless.

Standard preparation—Transfer about 100 mg. of NF Glycopyrrolate Reference Standard, accurately weighed, to a 100-ml. volumetric flask, add water to volume, and mix. Transfer 10.0 ml. of this solution to a second 100-ml. volumetric flask, dilute to volume with water, and mix.

Assay preparation—Weigh and finely powder not less than 20 Glycopyrrolate Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 10 mg. of glycopyrrolate, to a 100-ml. volumetric flask, add 50 ml. of water, and shake mechanically for 10 minutes. Dilute to volume with water, mix, and filter, discarding the first 20 ml. of filtrate. Use the subsequent filtrate as directed in the *Procedure.*

Procedure—Transfer 10.0 ml. each of the *Standard preparation* and of the *Assay preparation* to separate separators, each containing 10.0 ml. of *Buffer-dye mixture,* and transfer 10.0 ml. of water to a third separator containing 10.0 ml. of *Buffer-dye mixture* to serve as the blank. Mix, and extract each solution with four 25-ml. portions of chloroform, filtering the extracts from each solution through chloroform-moistened filter paper into separate 100-ml. volumetric flasks. Dilute each solution to volume with chloroform, and mix. Concomitantly determine the absorbances of the solutions in 1-cm. cells, at the maximum at about 410 mμ, with a suitable spectrophotometer, using the blank to set the instrument. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{19}H_{28}BrNO_3$ in the portion of the Tablets taken by the formula $0.1C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation.*

Packaging and storage—Preserve Glycopyrrolate Tablets in tight containers.

Tablets available—Glycopyrrolate Tablets usually available contain the following amounts of glycopyrrolate: 1 and 2 mg.

Category and Dose—See Glycopyrrolate.

Gramicidin

Gramicidin is an antibacterial substance produced by the growth of *Bacillus brevis* Dubos (Fam. *Bacillaceæ*). It may be obtained from tyrothricin.

Gramicidin has a potency of not less than 900 mcg. of activity per mg. Gramicidin conforms to the regulations of the federal Food and Drug Administration concerning certification of antibiotic drugs.

Description—Gramicidin occurs as a white, or nearly white, odorless, crystalline powder.

Solubility—Gramicidin is soluble in alcohol and insoluble in water.

Color—The absorbance of a 1 in 20 alcohol solution of Gramicidin, determined in a 1-cm. cell, using a suitable spectrophotometer at a wavelength of 440 mμ, does not exceed 0.096.

Packaging and storage—Preserve Gramicidin in tight containers.

Category—Antibacterial.

Application—Topically as 0.05 percent solution.

Gramicidin, Neomycin Sulfate and Polymyxin B Sulfate Ophthalmic Solution, page 475

Green Soap

Green Soap is a potassium soap made by the saponification of suitable vegetable oils, excluding coconut oil and palm kernel oil, without the removal of glycerin.

Green Soap may be prepared as follows:

The Vegetable Oil	380	g.
Oleic Acid	20	g.
Potassium Hydroxide (total alkali 85 percent)	91.7	g.
Glycerin	50	ml.
Purified Water, a sufficient quantity		
To make about	1000	g.

Mix the oil and oleic acid, and heat the mixture to about 80°. Dissolve the potassium hydroxide in a mixture of the glycerin and 100 ml. of purified water, and add the solution, while it is still hot, to the hot oil. Stir the mixture vigorously until emulsified, then heat while continuing the stirring, until the mixture is homogeneous and a test portion will dissolve to give a clear solution in hot water. Add sufficient hot purified water to make the product weigh 1000 g., continuing the stirring until the Soap is homogeneous.

Description—Green Soap occurs as a soft, unctuous, yellowish white to brownish or greenish yellow, transparent to translucent mass. It has a slight, characteristic odor, often suggesting the oil from which it was prepared. Its 1 in 20 solution is alkaline to bromothymol blue T.S.

Water—Place about 5 g. of Green Soap, quickly weighed to the nearest centigram, in the distilling flask of the apparatus for *Moisture Method by Toluene Distillation,* page 886. (The Soap is most conveniently weighed in a boat of metal foil, of a size that will just pass through the neck of the flask.) Place 250 ml. of toluene and 10 g. of anhydrous barium chloride in the flask, connect the flask through a ground-glass joint to the distilling apparatus, fill the receiving tube with toluene, and determine the water as directed, beginning with "Heat the flask gently." The volume of water found corresponds to not more than 52 percent by weight of the Green Soap taken.

Alcohol-insoluble substances—Dissolve about 5 g. of Green Soap, rapidly and accurately weighed, in 100 ml. of hot neutralized alcohol, collect the residue, if any, on a tared filter, thoroughly wash it with hot neutralized alcohol, and dry at 105° for 1 hour: the weight of the residue obtained does not exceed 3 percent of the weight of the Green Soap taken. Save the solution and the residue.

Free alkali hydroxides—To the combined filtrate and washings obtained in the test for *Alcohol-insoluble substances* add 0.5 ml. of phenolphthalein T.S. If a pink color is produced, titrate the solution with 0.1 *N* sulfuric acid until the pink color is just discharged. Each ml. of 0.1 *N* sulfuric acid is equivalent to 5.611 mg. of KOH. The volume of 0.1 *N* sulfuric acid consumed corresponds to not more than 0.25 percent of KOH.

Alkali carbonates—Wash the filter containing the *Alcohol-insoluble substances* with 50 ml. of boiling water, cool, add methyl orange T.S., and titrate the filtrate with 0.1 *N* sulfuric acid. Not more than 0.5 ml. of 0.1 *N* sulfuric acid per g. of Green Soap originally taken is required (0.35 percent as K_2CO_3).

Unsaponified matter—A solution of Green Soap in hot water (1 in 20) is nearly clear.

Characteristics of the liberated fatty acids—Dissolve about 30 g. of Green Soap in 300 ml. of hot water in a beaker, add gradually 60 ml. of diluted sulfuric acid, and heat on a steam bath until the liberated acids form a transparent layer. Decant the fatty acids into a separator, and wash them with 50-ml. portions of hot water until the last washing, when cool, is neutral to methyl orange T.S. Transfer the fatty acids to a dry beaker, and allow them to stand in a warm oven until any water that may be present has separated. Then filter the acids through a dry filter in the warm oven. Determine the acid value (see page 804) of about 1 g., accurately weighed, of the fatty acids: it is not more than 205. Determine the iodine value (see page 804) of 150 to 200 mg., accurately weighed, of the fatty acids: it is not less than 85.

Packaging and storage—Preserve Green Soap in well-closed containers.

Category and Use—See Green Soap Tincture.

Green Soap Tincture

Green Soap	**650 g.**
Lavender Oil	**20 ml.**
Alcohol, a sufficient quantity	
To make	**1000 ml.**

Mix the lavender oil with 300 ml. of alcohol, dissolve in this the green soap by stirring or by agitation, set the solution aside for 24 hours, filter through paper, and add alcohol to make 1000 ml.

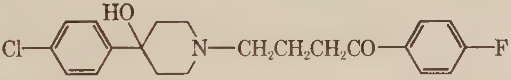
Alcohol content, page 772—Green Soap Tincture contains from 28 to 32 percent (v/v) of C_2H_5OH.

Packaging and storage—Preserve Green Soap Tincture in tight containers.

Category—Detergent.
For external use—Topically to skin.

Guaiacolsulfonate, Potassium, page 574

Haloperidol*



4-[4-(*p*-Chlorophenyl)-4-hydroxypiperidino]-4′-fluorobutyrophenone

$C_{21}H_{23}ClFNO_2$ Mol. wt. 375.87

Haloperidol, dried in vacuum at 60° for 3 hours, contains not less than 98.0 percent and not more than 102.0 percent $C_{21}H_{23}ClFNO_2$.

Description—Haloperidol occurs as a white to faintly yellowish, amorphous or microcrystalline powder. Its saturated solution is neutral to litmus.

Solubility—Haloperidol is practically insoluble in water. It is soluble in chloroform, sparingly soluble in alcohol, and slightly soluble in ether.

Melting range, page 814—Haloperidol, dried in vacuum at 60° for 3 hours, melts between 147° and 152°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Haloperidol, previously dried in vacuum at 60° for 3 hours, exhibits maxima only at the same wavelengths as that of NF Haloperidol Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 50,000 solution of Haloperidol in 0.1 *N* hydrochloric acid–isopropyl alcohol (1:9) exhibits maxima and minima at the same wavelengths as that of NF Haloperidol Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance occurring at about 245 mμ, do not differ by more than 3 percent.

Loss on drying, page 814—Dry Haloperidol in vacuum at 60° for 3 hours: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Haloperidol yields not more than 0.25 percent of residue on ignition.

Assay—Dissolve about 125 mg. of Haloperidol, previously dried in vacuum at 60° for 3 hours and accurately weighed, in 25 ml. of glacial acetic acid, add 3 drops of α-naphtholbenzein T.S., and titrate with 0.05 *N* perchloric acid in glacial acetic acid. Perform a blank determination, and make any necessary correction. Each ml. of 0.05 *N* perchloric acid is equivalent to 18.79 mg. of $C_{21}H_{23}ClFNO_2$.

Packaging and storage—Store in tight, light-resistant containers.

---

* Patent pending. See notice, page ii.

CATEGORY—Tranquilizer (major).

USUAL DOSE—**1** to **2 mg.** two or three times a day.

USUAL DOSE RANGE—**1** to **5 mg.**; daily doses greater than 15 mg. are not recommended.

Haloperidol Solution

Haloperidol Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{21}H_{23}ClFNO_2$.

Identification—The solution prepared for measurement of absorbance in the *Assay* exhibits a maximum at 245 ± 2 mμ.

Assay—Transfer an accurately measured volume of Haloperidol Solution, equivalent to about 10 mg. of haloperidol, to a separator, and add 20 ml. of 0.5 *N* hydrochloric acid. Extract the solution with four 20-ml. portions of ether and wash the combined ether extracts with four 5-ml. portions of 0.5 *N* hydrochloric acid. Discard the ether, and add the acid washes to the aqueous phase. Filter the aqueous phase through a pledget of cotton into a 50-ml. volumetric flask, dilute to volume with water, and mix. Transfer 10.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with methanol, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Haloperidol Reference Standard, in the same medium at a concentration of about 20 mcg. per ml., in 1-cm. cells, at the maximum at about 245 mμ, with a suitable spectrophotometer, using 0.5 *N* hydrochloric acid in methanol (1 in 10) as the blank. Calculate the quantity, in mg., of $C_{21}H_{23}ClFNO_2$ in the portion of Solution taken by the formula $0.5C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and Storage—Preserve Haloperidol Solution in tight, light-resistant containers.

Solution available—Haloperidol Solution usually available contains the following amount of haloperidol: 2.0 mg. per ml.

CATEGORY and DOSE—See Haloperidol.

Haloperidol Tablets

Haloperidol Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount $C_{21}H_{23}ClFNO_2$.

Identification—The solution prepared for measurement of absorbance in the *Assay* exhibits a maximum at 245 ± 2 mμ.

Disintegration, page 878—The disintegration time limit for Haloperidol Tablets is 15 minutes.

Content uniformity, *Method II*, page 799—Haloperidol Tablets meet the requirements of the content uniformity test for tablets using the following special procedure: Quantitatively transfer a finely powdered tablet to a suitable volumetric flask to provide a solution containing about 20 mcg. per ml. Add warm methanol and shake for 15 minutes. Dilute to volume with methanol, and filter, discarding the first 20 ml. of filtrate. Concomitantly determine the absorbance of the sample solution and of a solution of NF Haloperidol Reference Standard, in the same medium, at a concentration of about 20 mcg. per ml., in 1-cm. cells, at the maximum at about 245 mμ, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg., of $C_{21}H_{23}ClFNO_2$ in the Tablet by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity, in mg., of haloperidol in the tablet; D is the exact concentration, in mcg. per ml., of the sample solution, based upon the labeled quantity per tablet and the extent of dilution; C is the exact concentration, in mcg. per ml., of the Reference Standard solution; A_U is the absorbance of the sample solution; and A_S is the absorbance of the Reference Standard solution.

Assay—(NOTE: Use sulfuric acid that has been saturated with chloroform.) Weigh and finely powder not less than 20 Haloperidol Tablets. Weigh accurately a portion of powder, equivalent to about 2.5 mg. of haloperidol, and transfer to a glass-stoppered flask. Add 25 ml. of 0.1 *N* sodium hydroxide and 50.0 ml. of chloroform, and shake for 30 minutes. Centrifuge the mixture, remove the aqueous layer, and transfer 25.0 ml. of the chloroform layer to a glass-stoppered flask. Add 50.0 ml. of 0.1 *N* sulfuric acid, shake for 15 minutes and centrifuge. Concomitantly determine the absorbance of the acid layer and of a solution of NF Haloperidol Reference Standard, in 0.1 *N* sulfuric acid at a concentration of about 25 mcg. per ml., in 1-cm. cells, at the maximum at about 245 mμ, with a suitable spectrophotometer, using 0.1 *N* sulfuric acid as the blank. Calculate the quantity, in mg., of $C_{21}H_{23}ClFNO_2$ in the portion of the tablets taken by the formula $0.1\,C \times (A_U/A_S)$, in which C is the exact concentration in mcg. per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Haloperidol Tablets in tight, light-resistant containers.

Tablets available—Haloperidol Tablets usually available contain the following amounts of haloperidol: 0.5, 1, 2, and 5 mg.

CATEGORY and DOSE—See Haloperidol.

Hexavitamin Capsules

Hexavitamin Capsules contain, in each capsule, not less than 1.5 mg. (5000 USP Units) of vitamin A in the form of retinol; not less than 10 mcg. (400 USP Units) of vitamin D from natural sources or as ergocalciferol or cholecalciferol or the products obtained by the activation of either ergosterol or 7-dehydrocholesterol; not less than 75 mg. of ascorbic acid ($C_6H_8O_6$); not less than 2 mg. of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS.HCl$) or an equivalent amount of thiamine mononitrate ($C_{12}H_{17}N_5O_4S$); not less than 3 mg. of riboflavin ($C_{17}H_{20}N_4O_6$); and not less than 20 mg. of niacinamide ($C_6H_6N_2O$).

Assay for vitamin A—Transfer to a saponification flask not less than 5 Hexavitamin Capsules, add 10 to 20 ml. of water, and heat for about 10 minutes. Crush any remaining solids with the blunt end of a glass rod and proceed as directed in the paragraph titled *Saponification* under *Vitamin A Assay,* page 891, beginning with "Boil under a reflux condenser . . . ."

Assay for vitamin D—Transfer to a saponification flask not less than 5 Hexavitamin Capsules, add 10 to 20 ml. of water, and heat for about 10 minutes. Crush any remaining solids with the blunt end of a glass rod and proceed as directed under *Vitamin D Assay, Chemical Method,* page 895.

The *Sample Preparation* used in the chromatographic procedure must contain not more than the equivalent of 7.5 mg. of vitamin A or less than 25 mcg. of vitamin D. If the ratio of vitamin A to vitamin D in the sample exceeds 300 to 1, proceed as directed under *Vitamin D Assay, Biological Method,* page 895.

Assay for ascorbic acid—Add not less than 10 Hexavitamin Capsules to 75 ml. of metaphosphoric-acetic acids T.S., and heat rapidly to not over 90°, with continuous swirling, until complete disintegration occurs. Transfer the suspension to a 500-ml. glass-stoppered volumetric flask containing 125 ml. of unheated metaphosphoric-acetic acids T.S., and immediately cool rapidly to room temperature. Transfer any remaining residue by rinsing with four or five successive, 10-ml. portions of the extracting solution, and add water to make 500.0 ml. Transfer, if necessary, any solid fatty material to the wall of the flask above the calibration line, using a dry glass rod so as not to affect the volume of the water solution. After thorough mixing, the fatty solids may be removed. Use an aliquot that will consume not less than 20 ml. of standard dichlorophenol-indophenol solution, and titrate with standard dichlorophenol-indophenol solution (see *Volumetric Solutions,* USP XVIII) until a pink color persists for at least 5 seconds. Correct for the volume of the dichlorophenol-indophenol solution consumed by a mixture of 5.5 ml. of the metaphosphoric-acetic acids T.S. and 15 ml. of water.

From the ascorbic acid equivalent of the standard dichlorophenol-indophenol solution, calculate the content of $C_6H_8O_6$ in each Capsule.

Assay for niacinamide—Proceed as directed under *Niacin or Niacinamide Assay, Chemical Method,* page 818, using *Standard Niacinamide Preparation* as the *Standard Preparation* in the *Assay Procedure,* and the following as the *Sample Preparation:* Transfer not less than 10 Hexavitamin Capsules to a 1000-ml. volumetric flask. Add about 200 ml. of water and place the flask on a steam bath for 1 hour. Cool to room temperature, add 10 ml. of a mixture of equal volumes of ether and solvent hexane, and shake well. Add sufficient water to make the aqueous phase 1000.0 ml., and shake well. Allow the solvent mixture to rise to the top and remove the solvent by suction. Transfer an aliquot containing about 1 mg. of niacinamide (V ml.) to a 100-ml. volumetric flask, dilute to volume with water, and mix.

Calculate the quantity, in mg., of $C_6H_6N_2O$ in each capsule by the formula $(A_U/A_S) \times [1000/(V \times \text{No. of capsules taken})]$, in which V is the volume, in ml., of the aliquot of the sample used for final dilution to 100.0 ml.

Assay for thiamine hydrochloride (or mononitrate)—Using not less than 10 Hexavitamin Capsules, proceed as directed under *Thiamine Assay*, page 881.

Assay for riboflavin—Using not less than 10 Hexavitamin Capsules, proceed as directed under *Riboflavin Assay*, page 859.

Packaging and storage—Preserve Hexavitamin Capsules in tight, light-resistant containers.

Labeling—The labeling shall include no claim based upon any quantity of vitamin in excess of that specified in this monograph.

Category—Multivitamin supplement.

Usual dose—To be determined by the physician according to the needs of the patient.

Hexavitamin Tablets

Hexavitamin Tablets contain, in each tablet, not less than 1.5 mg. (5000 USP Units) of vitamin A in the form of retinol; not less than 10 mcg. (400 USP Units) of vitamin D from natural sources or as ergocalciferol or cholecalciferol or the products obtained by the activation of either ergosterol or 7-dehydrocholesterol; not less than 75 mg. of ascorbic acid ($C_6H_8O_6$); not less than 2 mg. of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS.HCl$) or an equivalent amount of thiamine mononitrate ($C_{12}H_{17}N_5O_4S$); not less than 3 mg. of riboflavin ($C_{17}H_{20}N_4O_6$); and not less than 20 mg. of niacinamide ($C_6H_6N_2O$).

Disintegration, page 878—The disintegration time limit for Hexavitamin Tablets is 30 minutes.

Weight variation, page 901—Hexavitamin Tablets meet the requirements of the weight variation test for tablets.

Assay for vitamin A—Transfer to a saponification flask not less than 5 Hexavitamin Tablets, add 10 to 20 ml. of water, and heat for about 10 minutes. Crush any remaining solids with the blunt end of a glass rod and proceed as directed in the paragraph titled *Saponification* under *Vitamin A Assay*, page 891, beginning with "Boil under a reflux condenser . . . ."

Assay for vitamin D—Transfer to a saponification flask not less than 5 Hexavitamin Tablets, add 10 to 20 ml. of water, and heat for about 10 minutes. Crush any remaining solids with the blunt end of a glass rod and proceed as directed under *Vitamin D Assay, Chemical Method*, page 895.

The *Sample Preparation* used in the chromatographic procedure must contain not more than the equivalent of 7.5 mg. of vitamin A or less than 25 mcg. of vitamin D. If the ratio of vitamin A to vitamin D in the sample exceeds 300 to 1, proceed as directed under *Vitamin D Assay, Biological Method*, page 895.

Assay for ascorbic acid—Grind not less than 10 Hexavitamin Tablets in a mortar, in sufficient metaphosphoric-acetic acids T.S., to make a paste. Transfer the paste to a 500-ml. volumetric flask with the aid of 225 ml. of metaphosphoric-acetic acids T.S., add water to make 500.0 ml., and proceed as directed in the *Assay for ascorbic acid* under *Hexavitamin Capsules*, page 339, beginning with "Use an aliquot . . . ."

Assay for niacinamide—Proceed as directed under *Niacin or Niacinamide Assay, Chemical Method*, page 818, using *Standard Niacinamide Preparation* as the *Standard Preparation* in the *Assay Procedure*, and the following as the *Sample Preparation*: Crush and finely powder, without appreciable loss, not less than 10 Hexavitamin Tablets. Transfer with the aid of water to a 1000-ml. volumetric flask. Add about 200 ml. of water. Heat, if necessary, and mix until the powder has completely dissolved. Cool and dilute to 1000.0 ml. with water. Transfer an aliquot containing about 1 mg. of niacinamide (V ml.) to a 100-ml. volumetric flask, dilute to volume with water, and mix.

Calculate the quantity, in mg., of $C_6H_6N_2O$ in each tablet by the formula $(A_U/A_S) \times [1000/(V \times \text{No. of tablets taken})]$, in which V is the volume, in ml., of the aliquot of the sample used for final dilution to 100.0 ml.

Assay for thiamine hydrochloride (or mononitrate)—Using not less than 10 Hexavitamin Tablets, proceed as directed under *Thiamine Assay*, page 881.

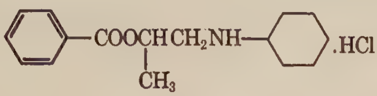
Assay for riboflavin—Using not less than 10 *Hexavitamin Tablets*, proceed as directed under *Riboflavin Assay*, page 859.

Packaging and storage—Preserve Hexavitamin Tablets in tight containers.

Labeling—The labeling shall include no claim based upon any quantity of vitamin in excess of that specified in this monograph.

Category and Dose—See Hexavitamin Capsules.

Hexylcaine Hydrochloride



1-(Cyclohexylamino)-2-propanol Benzoate (Ester) Hydrochloride

$C_{16}H_{23}NO_2 \cdot HCl$ Mol. wt. 297.83

Hexylcaine Hydrochloride, dried in vacuum over phosphorus pentoxide for 4 hours, contains not less than 98.0 percent and not more than 102.0 percent of $C_{16}H_{23}NO_2 \cdot HCl$.

Description—Hexylcaine Hydrochloride occurs as a white powder, having a bitter taste and not more than a slight aromatic odor.

Solubility—Hexylcaine Hydrochloride is soluble in water. It is freely soluble in alcohol and in chloroform, and practically insoluble in ether.

Identification—

A: To 5 ml. of a solution of Hexylcaine Hydrochloride (1 in 20) add 2 drops of diluted hydrochloric acid and 2 drops of a solution of sodium nitrite (1 in 10) and gradually mix with a solution of 200 mg. of betanaphthol in 10 ml. of a sodium hydroxide solution (1 in 10): a white precipitate forms which changes to a yellowish, oily mass (*distinction from the anesthetics responding to the diazo reaction*).

B: Dissolve about 100 mg. of Hexylcaine Hydrochloride in 10 ml. of water and divide the solution into two equal portions. To one portion add 2 ml. of ammonia T.S. and filter. Neutralize the clear filtrate with nitric acid and add 2 drops in excess: the solution responds to the tests for *Chloride*, page 808. To the second portion add 10 ml. of a saturated solution of picric acid and 2 drops of diluted sulfuric acid. Cool in a refrigerator for 30 minutes, filter, wash the precipitate with three 2-ml. portions of cold ether, and dry it at 105° for 15 minutes: the picrate so obtained melts between 129° and 133°, page 814. (*Caution: Picrates may be explosive.*)

Melting range, page 814—Hexylcaine Hydrochloride melts between 182° and 184°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Hexylcaine Hydrochloride, previously dried in vacuum over phosphorus pentoxide for 4 hours, exhibits maxima only at the same wavelengths as that of NF Hexylcaine Hydrochloride Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 100,000 solution of Hexylcaine Hydrochloride in 0.1 N hydrochloric acid exhibits maxima and minima at the same wavelengths as that of NF Hexylcaine Hydrochloride Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the points of maximum absorbance occurring at about 232 mμ and 275 mμ do not differ by more than 3 percent.

pH, page 824—The pH of a solution of Hexylcaine Hydrochloride (1 in 20) is between 4.0 and 6.0.

Acidity—Dissolve 1 g. of Hexylcaine Hydrochloride in 25 ml. of water, add methyl red T.S., and titrate with 0.02 N sodium hydroxide: not more than 0.5 ml. is required for neutralization.

Loss on drying, page 814—Dry Hexylcaine Hydrochloride in vacuum over phosphorus pentoxide for 4 hours: it loses not more than 0.2 percent of its weight.

Residue on ignition, page 858—Hexylcaine Hydrochloride yields not more than 0.1 percent of residue on ignition.

Heavy metals, page 806—Dissolve 1 g. of Hexylcaine Hydrochloride in 15 ml. of water, add 1 ml. of 1 N hydrochloric acid, and dilute with water to 25 ml.: the heavy metals limit for Hexylcaine Hydrochloride is 30 parts per million.

Assay—Transfer about 100 mg. of Hexylcaine Hydrochloride, previously dried in vacuum over phosphorus pentoxide for 4 hours and accurately weighed, to a 100-ml. volumetric flask, dissolve in 0.1 N hydrochloric acid, dilute to volume with 0.1 N hydrochloric acid, and mix. Transfer 10.0 ml. of this solution to a second 100-ml. volumetric flask, dilute to volume with 0.1 N hydrochloric acid, and mix. Transfer 10.0 ml. of this last solution to a third 100-ml. volumetric flask, dilute to volume with 0.1 N hydrochloric acid, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Hexylcaine Hydrochloride Reference Standard, in the same medium, at a concentration of about 10 mcg. per ml. in 1-cm. cells, at the maximum at about 232 mμ, with a suitable spectrophotometer, using 0.1 N hydrochloric acid as the blank. Calculate the quantity, in mg., of $C_{16}H_{23}NO_2 \cdot HCl$ in the Hexylcaine Hydrochloride taken by the formula $10C \times (A_U/A_S)$, in which C is the exact concentration of the Reference Standard solution, in mcg. per ml., A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Hexylcaine Hydrochloride in tight containers.

Category—Local anesthetic.

Usual dose—Topically or by injection according to site and condition.

Hexylcaine Hydrochloride Injection

Hexylcaine Hydrochloride Injection is a sterile solution of hexylcaine hydrochloride in water for injection, with or without the addition of dextrose ($C_6H_{12}O_6 . H_2O$). It contains not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{16}H_{23}NO_2 . HCl$(hexylcaine hydrochloride).

Identification—Hexylcaine Hydrochloride Injection responds to *Identification test B* under *Hexylcaine Hydrochloride*, page 341.

Ultraviolet absorption, page 866—Hexylcaine Hydrochloride Injection diluted with 0.1 *N* hydrochloric acid exhibits absorbance maxima at about 232 mμ and 275 mμ.

pH, page 824—The pH of Hexylcaine Hydrochloride Injection is between 3.0 and 5.0.

Other requirements—Hexylcaine Hydrochloride Injection meets the requirements under *Injections*, page 810.

Dextrose—If dextrose is present, transfer an accurately measured volume of Hexylcaine Hydrochloride Injection, containing about 1 g. of dextrose, to a 50-ml. volumetric flask, add 0.2 ml. of ammonia T.S., dilute to volume with water, mix, and filter. Then after 30 minutes, determine the angular rotation of the filtrate in a 200-mm. tube at 25° (see page 822). The observed rotation, in degrees, multiplied by 0.5213, represents the weight, in g., of $C_6H_{12}O_6 . H_2O$ in the volume of the Injection taken. Hexylcaine Hydrochloride Injection contains not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_6H_{12}O_6 . H_2O$.

Assay—

Mixed solvent—Prepare a solution by mixing 8 ml. of methanol, 1 ml. of glacial acetic acid, 0.2 ml. of hydrochloric acid, and sufficient water-saturated chloroform to make 100 ml.

Standard preparation—Dissolve a suitable quantity of NF Hexylcaine Hydrochloride Reference Standard, accurately weighed, in the *Mixed solvent*, and prepare, by stepwise dilution, a solution containing about 200 mcg. in each ml., calculated on the dried basis.

Assay preparation—Transfer an accurately measured volume of Hexylcaine Hydrochloride Injection, equivalent to about 100 mg. of hexylcaine hydrochloride, to a 10-ml. volumetric flask, dilute to volume with water, and mix.

Preparation of the chromatographic column—Pack a pledget of fine glass wool in the base of a chromatographic tube (25 × 250-mm. test tube to which is fused a 5-cm. length of 7-mm. tubing) with the aid of a tamping rod of stainless steel, aluminum, or glass, about 45 cm. long and having a disk with a diameter about 1 mm. less than that of the tube. To 2 g. of purified siliceous earth in a 100-ml. beaker, add 1 ml. of sulfamic acid solution (1 in 20), and mix until a fluffy mixture is obtained. Transfer the mixture to the chromatographic tube and tamp gently to compress the material to a uniform mass. Similarly, mix 4 g. of purified siliceous earth with a mixture of 2.0 ml. of the *Assay preparation* and 1 ml. of sulfamic acid solution (15 in 100), and transfer to the column. Dry-rinse the beaker with 1 g. of purified siliceous earth, transfer it to the column, and tamp. (The ether wash, in the *Procedure*, will pass through a properly prepared column in 5 to 10 minutes.)

Procedure—Wash the column with 100 ml. of water-saturated ether, and discard the washings. Place under the column, as a receiver, a 100-ml. volumetric flask containing 8 ml. of methanol and 0.2 ml. of hydrochloric acid. Pass through the column a mixture of 1 ml. of glacial acetic acid and 90 ml. of water-saturated chloroform. Mix the eluate, allow it to come to room temperature, dilute to volume with water-saturated chloroform, and mix. Concomitantly determine the absorbance of this solution (A_U) and of the *Standard preparation* (A_S) at the maximum absorbance at about 275 mμ, in 1-cm. cells with a suitable spectrophotometer, using the *Mixed solvent* as the blank.

Calculate the quantity, in mg., of $C_{16}H_{23}NO_2 . HCl$ in each ml. of the Injection taken by the formula $0.5 \times (C/V) \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*, and V is the volume, in ml., of the Injection taken.

Packaging and storage—Preserve Hexylcaine Hydrochloride Injection in single-dose or multiple-dose containers, preferably of Type I glass.

Injections available—Hexylcaine Hydrochloride Injection usually available contains the following amounts of hexylcaine hydrochloride: 1 percent in 30, 50, and 100 ml., 2 percent in 20 ml., 2.5 precent with 10 percent dextrose in 2 ml.

CATEGORY and DOSE—See Hexylcaine Hydrochloride.

Hexylcaine Hydrochloride Solution

Hexylcaine Hydrochloride Solution contains not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{16}H_{23}NO_2 . HCl$.

Description—Hexylcaine Hydrochloride Solution is a clear, colorless solution of hexylcaine hydrochloride in water.

Identification—Hexylcaine Hydrochloride Solution responds to *Identification test B* under *Hexylcaine Hydrochloride*, page 341.

pH, page 824—The pH of Hexylcaine Hydrochloride Solution is between 3.0 and 5.0.

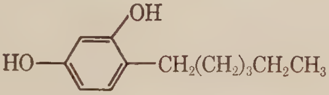
Assay—Proceed as directed in the *Assay* under *Hexylcaine Hydrochloride Injection*, page 342, using as the *Assay preparation* a solution prepared by diluting a volume of Hexylcaine Hydrochloride Solution, equivalent to about 500 mg. of hexylcaine hydrochloride, with sufficient water to make 50.0 ml. Calculate the quantity, in mg., of $C_{16}H_{23}NO_2 . HCl$ in each ml. of the Solution taken by the formula $2.5 \times (C/V) \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*, and V is the volume, in ml., of the Solution taken.

Packaging and storage—Preserve Hexylcaine Hydrochloride Solution in tight containers.

Solution available—Hexylcaine Hydrochloride Solution usually available contains the following amount of hexylcaine hydrochloride: 5 percent.

CATEGORY and DOSE—See Hexylcaine Hydrochloride.

Hexylresorcinol



4-Hexylresorcinol

$C_{12}H_{18}O_2$ Mol. wt. 194.28

Hexylresorcinol, dried over silica gel for 4 hours, contains not less than 98.0 percent and not more than 100.5 percent of $C_{12}H_{18}O_2$.

Caution: Hexylresorcinol is irritating to the oral mucosa and respiratory tract and to the skin, and its solution in alcohol has vesicant properties.

Description—Hexylresorcinol occurs as white, or yellowish white, needle-shaped crystals. It has a faint odor and a sharp, astringent taste, and produces a sensation of numbness when placed on the tongue. It acquires a brownish pink tint on exposure to light and air.

Solubility—Hexylresorcinol is very slightly soluble in water. It is freely soluble in alcohol, in methanol, in glycerin, in ether, in chloroform, in benzene, and in vegetable oils.

Identification—

A: To 1 ml. of a saturated solution of Hexylresorcinol add 1 ml. of nitric acid: a light red color appears.

B: To 1 ml. of a saturated solution of Hexylresorcinol add 1 ml. of bromine T.S.: a yellow, flocculent precipitate forms. Add 2 ml. of ammonia T.S.: the precipitate dissolves, producing a solution with a yellow color.

Melting range, page 814—Hexylresorcinol melts between 62° and 67°.

Acidity—Dissolve 250 mg. of Hexylresorcinol in 500 ml. of water, add methyl red T.S., and titrate with 0.02 *N* sodium hydroxide: not more than 1 ml. is required for neutralization.

Residue on ignition, page 858—Hexylresorcinol yields not more than 0.1 percent of residue on ignition.

Resorcinol and other phenols—Shake about 1 g. of Hexylresorcinol with 50 ml. of water for a few minutes, filter, and to the filtrate add 3 drops of ferric chloride T.S.: no red or blue color is produced.

Assay—Dissolve 70 to 100 mg. of Hexylresorcinol, previously dried over silica gel for 4 hours and accurately weighed, in 10 ml. of methanol in a 250-ml. iodine flask. Add 30.0 ml. of 0.1 *N* bromine, then add quickly 5 ml. of hydrochloric acid, and stopper the flask immediately. Cool the flask under running water to room temperature, shake it vigorously for 5 minutes, then set it aside for 5 minutes. Cautiously loosen the stopper, add 6 ml. of potassium iodide T.S. around the stopper, again stopper tightly, and swirl gently. Add 1 ml. of chloroform, and titrate the liberated iodine with 0.1 *N* sodium thiosulfate, adding 3 drops of starch T.S. as the end-point is neared. Perform a blank determination (see *Residual Titrations,* page 883). Each ml. of 0.1 *N* bromine is equivalent to 4.857 mg. of $C_{12}H_{18}O_2$.

Packaging and storage—Preserve Hexylresorcinol in tight, light-resistant containers.

CATEGORY—Anthelmintic (intestinal roundworms and trematodes).

USUAL DOSE—**1 g.** May repeat at weekly intervals if necessary.

Hexylresorcinol Pills

Hexylresorcinol Pills consist of hexylresorcinol covered with a rupture-resistant coating that is dispersible in the digestive tract. Hexylresorcinol Pills contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{12}H_{18}O_2$.

Identification—Carefully remove the coating from a sufficient number of Hexylresorcinol Pills, and triturate a quantity of the contents, equivalent to about 100 mg. of hexylresorcinol, with about 10 ml. of solvent hexane. Transfer the mixture, with the aid of 15 ml. of solvent hexane, to a small flask, attach a reflux condenser, and reflux for 15 minutes. Filter the liquid while hot, and place it in a refrigerator for 2 hours. Collect the precipitate of hexylresorcinol on a filter, drain thoroughly with the aid of suction, wash with several successive 1-ml. portions of solvent hexane, and dry with a current of air: the hexylresorcinol so obtained melts between 62° and 67°, page 814, and responds to the *Identification tests* under *Hexylresorcinol,* page 343.

Rupture resistance—Place 50 Hexylresorcinol Pills each in turn upon a hard surface, and apply pressure gradually up to a total of 10 kg. by means of a suitable press. After releasing the pressure place each pill in a small test tube, cover with 5 ml. of alcohol, and allow to stand for 5 minutes. Remove the pill, evaporate the alcohol nearly to dryness, and take up the residue with 10 ml. of water. Add 3 drops of bromine T.S., shake vigorously, and add ammonia T.S. dropwise: the yellow color is discharged. If more than 2 Pills fail the test, repeat the test upon 50 additional Pills: the total number of failures in the 100 Pills taken for the test does not exceed 6.

Disintegration, page 878—The disintegration time limit for Hexylresorcinol Pills is 4 hours, simulated gastric fluid T.S. being substituted for water in the test.

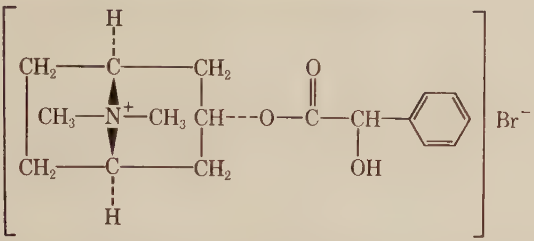
Assay—Weigh and finely powder not less than 20 Hexylresorcinol Pills. Weigh accurately a portion of the powder, equivalent to about 800 mg. of hexylresorcinol, triturate well with 25 ml. of methanol, and decant through a filter into a 100-ml. volumetric flask. Triturate the residue in the mortar with 15 ml. of methanol, decant through the same filter, and completely transfer the residue to the filter. Wash the mortar and the filter with successive portions of methanol until the total filtrate measures about 95 ml., then add methanol to volume, and mix. Pipet 10.0 ml. of the methanol solution to a 250-ml. iodine flask, and proceed as directed in the *Assay* under *Hexylresorcinol,* page 343, beginning with "Add 30.0 ml. of 0.1 *N* bromine . . . ."

Packaging and storage—Preserve Hexylresorcinol Pills in well-closed containers.

Pills available—Hexylresorcinol Pills usually available contain the following amounts of hexylresorcinol: 100 and 200 mg.

CATEGORY and DOSE—See Hexylresorcinol.

Homatropine Methylbromide



3α-Hydroxy-8-methyl-1αH,5αH-tropanium Bromide Mandelate

$C_{17}H_{24}BrNO_3$ Mol. wt. 370.29

Homatropine Methylbromide contains not less than 98.5 percent and not more than 100.5 percent of $C_{17}H_{24}BrNO_3$, calculated on the dried basis.

Description—Homatropine Methylbromide occurs as a white, odorless powder. It slowly darkens on exposure to light.

Solubility—Homatropine Methylbromide is very soluble in water. It is freely soluble in alcohol. It is practically insoluble in ether and in acetone, but is freely soluble in acetone containing about 20 percent of water.

Identification—

A: Mercuric-potassium iodide T.S. produces in a solution of Homatropine Methylbromide (1 in 50) a white or slightly yellowish precipitate, but no precipitation is caused by solutions of alkali hydroxides or carbonates, even in concentrated solutions of the substance (distinction from most alkaloids).

B: To a solution of Homatropine Methylbromide (1 in 50) add ammonium reineckate T.S.: a red precipitate is formed.

C: A solution of Homatropine Methylbromide (1 in 20) responds to the tests for *Bromide,* page 808.

Melting range, *Class Ia,* page 815—Homatropine Methylbromide melts between 190° and 198°, the temperature at which distinct liquefaction of the sample is first observed being taken as the beginning of melting.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Homatropine Methylbromide, previously dried at 105° for 3 hours, exhibits maxima only at the same wavelengths as that of NF Homatropine Methylbromide Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 1000 solution of Homatropine Methylbromide in alcohol exhibits maxima and minima at the same wavelengths as that of NF Homatropine Methylbromide Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis at the point of maximum absorbance occurring at about 258 mμ, do not differ by more than 3 percent.

pH, page 824—The pH of a solution of Homatropine Methylbromide (1 in 100) is between 4.5 and 6.5.

Loss on drying, page 814—Dry Homatropine Methylbromide at 105° for 3 hours: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—The residue on ignition from 250 mg. of Homatropine Methylbromide is negligible.

Homatropine, atropine, and other solanaceous alkaloids—To 1 ml. of a solution of Homatropine Methylbromide (1 in 50) add a few drops of ammonia T.S., shake the solution with 5 ml. of chloroform, and evaporate the separated chloroform layer on a steam bath to dryness. Warm the residue with 1.5 ml. of a solution made by dissolving 500 mg. of mercuric chloride in 25 ml. of a mixture of 5 volumes of alcohol and 3 volumes of water: no yellow or red color develops.

Assay—Dissolve about 700 mg. of Homatropine Methylbromide, accurately weighed, in a mixture of 50 ml. of glacial acetic acid and 10 ml. of mercuric acetate T.S. Add 1 drop of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a blue-green endpoint. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 37.03 mg. of $C_{17}H_{24}BrNO_3$.

Packaging and storage—Preserve Homatropine Methylbromide in tight, light-resistant containers.

CATEGORY—Anticholinergic.

USUAL DOSE—**2.5** to **5 mg.** four times a day.

Homatropine Methylbromide Tablets

Homatropine Methylbromide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{17}H_{24}BrNO_3$.

Identification—Shake a quantity of finely powdered Homatropine Methylbromide Tablets, representing about 10 mg. of homatropine methylbromide, with 15 ml. of a mixture of equal volumes of methanol and water for 10 minutes, and filter. Evaporate the filtrate on a steam bath to dryness, and dry at 105° for 1 hour. The residue of homatropine methylbromide so obtained melts between 190° and 198°, page 814, the temperature at which distinct liquefaction of the sample is first observed being taken as the beginning of melting.

Disintegration, page 878—The disintegration time limit for Homatropine Methylbromide Tablets is 30 minutes.

Content uniformity, *Method II*, page 799—Homatropine Methylbromide Tablets meet the requirements of the content uniformity test for tablets, using the following special procedure:

Standard preparation—Transfer about 25 mg. of NF Homatropine Methylbromide Reference Standard, accurately weighed, to a 50-ml. volumetric flask, add water to volume, and mix. Transfer 10.0 ml. of this solution to a second 50-ml. volumetric flask, dilute to volume with water, and mix.

Test preparation—Transfer a finely powdered tablet to a volumetric flask, suitably sized such that the concentration, when diluted to volume, is equivalent to about 100 mcg. of homatropine methylbromide per ml. Add water to about one-half of the volume of the flask, shake for 10 minutes, dilute to volume with water, mix, and filter, discarding the first 10 ml. of filtrate. Use the subsequent filtrate as directed in the *Procedure*.

Procedure—Transfer 2.0 ml. each of the *Standard preparation* and of the *Test preparation* to separate 50-ml. volumetric flasks. To each flask add 0.1 ml. of 2.5 *N* sodium hydroxide, and heat in a water bath at 80° for 15 minutes. Cool to room temperature, add 2.0 ml. of 0.2 *M* ceric ammonium sulfate in 1 *N* sulfuric acid, and mix. To each flask add 20.0 ml. of *n*-hexane, and shake for 15 minutes. Decant the hexane layers into separate 1-cm. cells, and concomitantly determine the absorbances of the solutions at the maximum at about 242 mμ, with a suitable spectrophotometer, using *n*-hexane as the blank. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Test preparation* as A_U. Calculate the quantity, in mg., of $C_{17}H_{24}BrNO_3$ in the tablet by the formula $(T/D) \times C\,(A_U/A_S)$, in which T is the labeled quantity of homatropine methylbromide, in mg., in the tablet; D is the exact concentration, in mcg. per ml., of the *Test preparation* based upon the labeled quantity per tablet and the extent of dilution; and C is the exact concentration, in mcg. per ml., of the *Standard preparation*.

Assay—

Standard preparation—Weigh accurately about 25 mg. of NF Homatropine Methylbromide Reference Standard, previously dried at 105° for 3 hours, and dissolve it in water to make 50.0 ml.

Assay preparation—Weigh and finely powder not less than 20 Homatropine Methylbromide Tablets. Weigh accurately a portion of the powder, equivalent to about 12.5 mg. of homatropine methylbromide, and shake it with 10 ml. of water at frequent intervals during 30 minutes. Filter under reduced pressure through a sintered-glass crucible into a test tube placed in the suction flask under the filtering funnel, and wash under suction with several small portions of water. Transfer the contents of the test tube to a 25-ml. volumetric flask, add water to volume, and mix.

Procedure—Pipet 10.0 ml. each of the *Standard preparation* and of the *Assay preparation* into separate test tubes, to each add 1 ml. of dilute sulfuric acid (1 in 7) and 2 ml. of ammonium reineckate T.S., shake gently but well, and allow to stand for 1 hour. Filter through a sintered-glass crucible with suction, using portions of the filtrate to transfer the precipitate completely to the filter, and wash it with three 2-ml. portions of ice-cold water. Completely dissolve the precipitate by pouring over it 1-ml. portions of acetone with the application of suction, receiving the solution in a 10-ml. volumetric flask, add acetone to volume, and mix. Concomitantly determine the absorbance of each solution with a suitable spectrophotometer at the maximum at about 525 mμ, using acetone as the blank. Record the absorbance of the solution from the *Standard preparation* as A_S, and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{17}H_{24}BrNO_3$ in the portion of the Tablets taken by the formula $0.025C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*.

Packaging and storage—Preserve Homatropine Methylbromide Tablets in tight, light-resistant containers.

Tablets available—Homatropine Methylbromide Tablets usually available contain the following amounts of Homatropine Methylbromide: 2.5 and 5 mg.

CATEGORY and DOSE—See Homatropine Methylbromide.

Hyaluronidase for Injection

Hyaluronidase for Injection is a sterile, dry, soluble, enzyme product prepared from mammalian testes and capable of hydrolyzing mucopolysaccharides of the type of hyaluronic acid. Its potency, in NF Hyaluronidase Units, is not less than the labeled potency. Hyaluronidase for Injection contains not more than 0.25 mcg. of tyrosine for each NF Hyaluronidase Unit. It may contain a suitable stabilizer.

Description—Hyaluronidase for Injection is a white, amorphous solid. It is destroyed by heat. Its solutions are colorless and odorless.

Tyrosine—Dissolve the entire contents of 1 or more containers of Hyaluronidase for Injection in sufficient water, accurately measured, to give a concentration of about 60 NF Hyaluronidase Units per ml. Pipet 2.0 ml. of the solution into a 15-ml. centrifuge tube calibrated at 6 ml., and evaporate at 105° to dryness. Add 0.2 ml. of 6 N sodium hydroxide, and heat with steam under pressure at 121° for 3 hours. Add 0.3 ml. of 7 N sulfuric acid, then add 1.5 ml. of water and 1.5 ml. of a 15 in 100 solution of mercuric sulfate in 5 N sulfuric acid. Heat in a steam bath for 10 minutes, and cool to room temperature. Add 1 ml. of 7 N sulfuric acid and 1 ml. of sodium nitrite solution (1 in 500), with shaking. Add water to make 6 ml., mix, centrifuge, and decant the supernatant liquid. Twenty minutes after diluting to 6-ml. volume, determine the absorbance of the supernatant liquid at 540 mμ, with a suitable spectrophotometer.

Repeat the preceding test, using the same quantities of the same reagents and in the same manner but omitting the Hyaluronidase for Injection and replacing the 1.5 ml. of water with 1.5 ml. of a solution of NF Tyrosine Reference Standard in 0.4 N sulfuric acid containing 30 mcg. in each ml.

Calculate the quantity, in mcg., of tyrosine in the 2-ml. aliquot of the solution of Hyaluronidase for Injection by the formula $45 \times (A_U/A_S)$, in which A_U is the absorbance of the solution prepared from the Hyaluronidase for Injection and A_S is that of the solution of NF Tyrosine Reference Standard: not more than 0.25 mcg. of tyrosine is found for each Unit of hyaluronidase.

Pyrogen—Hyaluronidase for Injection meets the requirements of the *Pyrogen Test*, page 851, the test dose being 1.0 ml. per kg., of a solution containing 75 NF Hyaluronidase Units in each ml.

Sterility—Hyaluronidase for Injection meets the requirements under *Sterility Tests*, page 874.

Assay—

Acetate buffer solution—Dissolve 14 g. of potassium acetate and 20.5 ml. of glacial acetic acid in sufficient water to make 1000 ml.

Phosphate buffer solution—Dissolve 2.5 g. of sodium biphosphate, 1.0 g. of anhydrous sodium phosphate, and 8.2 g. of sodium chloride in sufficient water to make 1000 ml.

Hydrolyzed gelatin—Dissolve 50 g. of bacteriological gelatin in 1000 ml. of water, heat in an autoclave at 121° for 90 minutes, and freeze-dry the solution.

Diluent for hyaluronidase solutions—Mix 250 ml. of *Phosphate buffer solution* with 250 ml. of water and, within 2 hours before use, dissolve 330 mg. of *Hydrolyzed gelatin* in the mixture.

Serum stock solution—Reconstitute dried horse serum with water to its original volume, and dilute it with 9 volumes of *Acetate buffer solution*. Adjust the pH to 3.1 with 4 N hydrochloric acid, and allow the solution to stand at room temperature for 18 to 24 hours. Store the solution at 0° to 4°, and use within 30 days.

Serum solution—On the day of the assay, dilute 1 volume of *Serum stock solution* with 3 volumes of *Acetate buffer solution*, and adjust to room temperature.

Potassium hyaluronate stock solution—Prepare a stock solution to contain, in each ml., 500 mcg. of potassium hyaluronate, previously dried in vacuum over phosphorus pentoxide for 48 hours. The use of a weighing bottle is desirable. Store the solution at a temperature not above 5°, and use within 30 days. Do not keep the hyaluronate over phosphorus pentoxide indefinitely.

Hyaluronate solution—On the day of the assay, dilute 1 volume of *Potassium hyaluronate stock solution* with 1 volume of *Phosphate buffer solution*.

Standard solution—Dissolve a suitable quantity of NF Hyaluronidase Reference Standard, accurately weighed, in sufficient cold *Diluent for hyaluronidase solutions* to provide a solution of known concentration containing about 1.5 NF Hyaluronidase Units in each ml. Prepare this solution immediately before use in the assay.

Assay solution—Dissolve the contents of the container of Hyaluronidase for Injection by adding cold *Diluent for hyaluronidase solutions* directly to the container. On the basis of trial or experience dilute the solution so prepared with cold *Diluent for hyaluronidase solutions* so that the observed absorbances with the three dilutions of Hyaluronidase for Injection will fall on the upper, linear part of the standard curve prepared as directed below.

Procedure—Prepare a standard concentration-response curve by adding to each of twelve 16 × 100-mm. test tubes 0.50 ml. of *Hyaluronate solution*. To each of two of the tubes add, respectively, 0.50 ml., 0.40 ml., 0.30 ml., 0.20 ml., 0.10 ml., and none, of *Diluent for hyaluronidase solutions*. If quantities of *Standard solution* other than those indicated below are used, change the above-specified quantities of *Diluent for hyaluronidase solutions* so that the final volume of solution in each tube, after the addition of the *Standard solution*, will be 1.00 ml.

On a rigid time schedule, add to each of two tubes, at half-minute intervals, none, 0.10 ml., 0.20 ml., 0.30 ml., 0.40 ml., and 0.50 ml., respectively, of *Standard solution*. Mix the contents by gentle shaking, and place each tube in a water bath maintained at 37 ± 0.2°. After 30 ± 0.25 minutes, remove each tube, in order, from the water bath at half-minute intervals, and immediately add 4.0 ml. of *Serum solution*. Shake the tube, and allow it to stand at room temperature for 30 ± 2 minutes. Then shake the tube, and determine the absorbance at 640 mμ, with a suitable spectrophotometer. Perform a blank determination but omit the hyaluronate, and make any necessary correction. Plot the average absorbance value for each level against the hyaluronidase activity expressed in Units, and draw the smooth curve which best fits the plotted points.

Concurrently, to six test tubes add 0.50 ml. of *Hyaluronate solution* and sufficient *Diluent for hyaluronidase solutions* so that the final volume, after the addition of the *Assay solution*, is 1.00 ml. Add, at half-minute intervals, sufficient *Assay solution* so that duplicate tubes contain about 0.30, 0.50, and 0.70 Units, respectively. Shake each tube gently, and treat as directed in the preceding paragraph for the Standard, beginning with "place each tube in a water bath." Measure the absorbance in the spectrophotometer, and make any necessary correction for the blank. The potency of Hyaluronidase for Injection is given by the average of the six activity values read from the standard curve.

Packaging and storage—Preserve Hyaluronidase for Injection in *Containers for Sterile Solids* as described under *Injections*, page 810, preferably of Type I or Type III glass, in a cool, dry place.

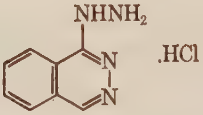
Labeling—Hyaluronidase for Injection complies with the requirements for *Labeling* under *Injections*, page 810.

Sizes available—Hyaluronidase for Injection is usually available in the following amounts: 150 and 1500 NF Hyaluronidase Units.

CATEGORY—Spreading agent.

USUAL DOSE—Hypodermoclysis, **150 NF Units.**

Hydralazine Hydrochloride



1-Hydrazinophthalazine Monohydrochloride

$C_8H_8N_4 . HCl$ Mol. wt. 196.64

Hydralazine Hydrochloride contains not less than 98.0 percent and not more than 100.5 percent of $C_8H_8N_4 . HCl$, calculated on the dried basis.

Description—Hydralazine Hydrochloride occurs as a white, odorless, crystalline powder.

Solubility—Hydralazine Hydrochloride is soluble in water and is slightly soluble in alcohol. It is very slightly soluble in ether.

Identification—

A: A solution of Hydralazine Hydrochloride (1 in 4000) responds to the tests for *Chloride*, page 808.

B: To 5 ml. of a solution of Hydralazine Hydrochloride (1 in 100) add 5 ml. of a solution of *o*-nitrobenzaldehyde in alcohol (1 in 50): an orange precipitate is formed.

Melting range, *Class Ia*, page 815—Hydralazine Hydrochloride melts between 270° and 280° with decomposition.

Loss on drying, page 814—Dry Hydralazine Hydrochloride in vacuum over phosphorus pentoxide for 8 hours: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 878—Hydralazine Hydrochloride yields not more than 0.1 percent of residue on ignition.

Water-insoluble substances—Transfer 2 g. of Hydralazine Hydrochloride to a

250-ml. conical flask, add 100 ml. of water, and shake mechanically for about 30 minutes. Filter the solution through a tared sintered-glass crucible and wash into the crucible any undissolved residue remaining in the flask. Wash the residue with three 10-ml. portions of water, dry at 105° for about 3 hours, cool, and weigh: the weight of the residue does not exceed 10 mg. (0.5 percent).

Assay—Transfer to a 250-ml. iodine flask about 150 mg. of Hydralazine Hydrochloride, accurately weighed, and dissolve it in 25 ml. of water. Add 25 ml. of hydrochloric acid, cool to room temperature, add 5 ml. of chloroform, and titrate with 0.02 *M* potassium iodate until the purple color of iodine disappears from the chloroform. The last portion of the iodate solution must be added dropwise, the mixture being agitated vigorously and continuously. Each ml. of 0.02 *M* potassium iodate is equivalent to 3.933 mg. of $C_8H_8N_4.HCl$.

Packaging and storage—Preserve Hydralazine Hydrochloride in tight containers.

CATEGORY—Antihypertensive.

USUAL DOSE RANGE—Oral, Initial, **10 mg.** four times a day. Maintenance, up to **100 mg.** four times a day. Intramuscular or intravenous, **20** to **40 mg.** repeated as necessary.

Hydralazine Hydrochloride Injection

Hydralazine Hydrochloride Injection is a sterile solution of hydralazine hydrochloride in water for injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_8H_8N_4.HCl$.

Identification—Hydralazine Hydrochloride Injection responds to *Identification test B* under *Hydralazine Hydrochloride*, page 348.

Other requirements—Hydralazine Hydrochloride Injection meets the requirements under *Injections*, page 810.

Assay—Transfer to a 250-ml. iodine flask an accurately measured amount of Hydralazine Hydrochloride Injection, equivalent to about 100 mg. of hydralazine hydrochloride, add 20 ml. of hydrochloric acid, and proceed as directed in the *Assay* under *Hydralazine Hydrochloride*, page 348, beginning with "... cool to room temperature ...."

Packaging and storage—Preserve Hydralazine Hydrochloride Injection in single-dose or multiple-dose containers, preferably of Type I glass.

Injection available—Hydralazine Hydrochloride Injection usually available contains the following amount of hydralazine hydrochloride: 20 mg. in 1 ml.

CATEGORY and DOSE—See Hydralazine Hydrochloride.

Hydralazine Hydrochloride Tablets

Hydralazine Hydrochloride Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_8H_8N_4.HCl$.

Identification—Extract a quantity of finely powdered Hydralazine Hydrochloride Tablets, equivalent to about 100 mg. of hydralazine hydrochloride, with two 25-ml. portions of methanol. Filter the combined methanol extracts, and evaporate to dryness on a steam bath: the residue of hydralazine hydrochloride so obtained responds to *Identification test B* under *Hydralazine Hydrochloride*, page 348.

Disintegration, page 878—The disintegration time limit for Hydralazine Hydrochloride Tablets is 30 minutes.

Content uniformity, *Method II*, page 799—Hydralazine Hydrochloride Tablets meet the requirements of the content uniformity test for tablets, using the following special procedure: Quantitatively transfer a finely powdered tablet to a 50-ml. volumetric flask with the aid of 25 ml. of dilute methanol (1 in 2). Shake mechanically for 10 minutes, dilute to volume with dilute methanol (1 in 2), and mix. Filter, and discard the first 5 ml. of filtrate. Dilute a portion of the subsequent filtrate quantitatively and stepwise, if necessary, with water to provide a solution containing approximately 10 mcg. of hydralazine hydrochloride per ml. Concomitantly determine the absorbance of this solution and of a solution of NF Hydralazine Hydrochloride Reference Standard, in the same medium, at a concentration of about 10 mcg. per ml., in 1-cm. cells, at the maximum at about 260 mμ, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg., of $C_8H_8N_4.HCl$ in the tablet by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity of hydralazine hydrochloride, in mg., in the tablet; D is the exact concentration, in mcg. per ml., of hydralazine hydrochloride in the sample solution, based upon the labeled quantity per tablet and the extent of dilution; C is the exact concentration, in mcg. per ml., of the Reference Standard solution; A_U is the absorbance of the sample solution; and A_S is the absorbance of the Reference Standard solution.

Assay—Weigh and finely powder not less than 25 Hydralazine Hydrochloride Tablets. Transfer to a 500-ml. iodine flask an accurately weighed amount of the powder, equivalent to about 150 mg. of hydralazine hydrochloride, add 100 ml. of water, and shake mechanically for 15 minutes. Add 40 ml. of hydrochloric acid, and proceed as directed in the *Assay* under *Hydralazine Hydrochloride,* page 348, beginning with "... cool to room temperature. ..."

Packaging and storage—Preserve Hydralazine Hydrochloride Tablets in tight containers.

Tablets available—Hydralazine Hydrochloride Tablets usually available contain the following amounts of hydralazine hydrochloride: 10, 25, 50, and 100 mg.

CATEGORY and DOSE—See Hydralazine Hydrochloride.

Diluted Hydrochloric Acid

Diluted Hydrochloric Acid contains, in each 100 ml., not less than 9.5 g. and not more than 10.5 g. of HCl. Diluted Hydrochloric Acid may be prepared as follows:

Hydrochloric Acid	**234 ml.**
Purified Water, a sufficient quantity,	
To make	**1000 ml.**

Mix the ingredients.

Description—Diluted Hydrochloric Acid is a colorless, odorless liquid. Its specific gravity is about 1.05.

Identification—Diluted Hydrochloric Acid responds to the tests for *Chloride,* page 808.

Residue on ignition, page 858—To 20 ml. of Diluted Hydrochloric Acid add 2 drops of sulfuric acid, evaporate to dryness, and ignite: not more than 2 mg. of residue remains.

Free bromine or chlorine—Add 1 ml. of potassium iodide T.S. and 1 ml. of chloroform to 10 ml. of Diluted Hydrochloric Acid, and agitate the mixture: the chloroform remains free from any violet coloration for at least 1 minute.

Sulfate—To a mixture of 3 ml. of Diluted Hydrochloric Acid and 5 ml. of water add 5 drops of barium chloride T.S.: neither turbidity nor precipitate appears within 1 hour.

Sulfite—On the completion of the test for *Sulfate,* the further addition to the liquid of 2 drops of 0.1 N iodine produces neither turbidity nor decolorization of the iodine.

Arsenic—A 16.7-ml. portion of Diluted Hydrochloric Acid meets the requirements of the *Arsenic Test,* page 777 (0.6 part per million As).

Heavy metals, page 806—To 9.5 ml. (10 g.) of Diluted Hydrochloric Acid add 5 ml. of water and 1 drop of phenolphthalein T.S. Add ammonia T.S. until the solution assumes a faint pink color. Add 2 ml. of diluted acetic acid, and water to make 25 ml.: the heavy metals limit for Diluted Hydrochloric Acid is 5 parts per million.

Assay—Transfer 10.0 ml. of Diluted Hydrochloric Acid to a conical flask, and add about 20 ml. of water. Add 3 drops of methyl red T.S., and titrate the solution with 1 N sodium hydroxide. Each ml. of 1 N sodium hydroxide is equivalent to 36.46 mg. of HCl.

Packaging and storage—Preserve Diluted Hydrochloric Acid in tight containers.

CATEGORY—Acidifier (gastric).

USUAL DOSE—**5 ml.,** well diluted in water.

Hydrocortisone Lotion

Hydrocortisone Lotion is hydrocortisone in a suitable aqueous vehicle. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{21}H_{30}O_5$.

Identification—Transfer a quantity of Hydrocortisone Lotion, equivalent to about 5 mg. of hydrocortisone, to a separator containing 10 ml. of methylene chloride, shake for 1 minute, and allow the layers to separate. Filter the methylene chloride extract onto a suitable chromatographic column that has been packed with 2 g. of a suitable activated magnesium silicate. Wash the column with 25 ml. of methylene chloride, with the aid of slight air pressure, discarding the washings, and elute the hydrocortisone with 10 ml. of methanol. Spot a 10-μl. portion of the eluate and 10 μl. of a solution in methanol containing 500 mcg. per ml. of USP Hydrocortisone Reference Standard on a suitable thin-layer chromatographic plate (see page 791), coated with a 0.25-mm. layer of silica gel G. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of 180 parts of chloroform, 15 parts of methanol, and 1 part of water until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by examination under shortwave ultraviolet light: the R_f value of the main spot obtained from the sample solution corresponds to that obtained from the Reference Standard solution.

Assay—

Standard preparation—Prepare as directed for *Standard preparation* under *Steroid Assay*, page 876, using USP Hydrocortisone Reference Standard.

Assay preparation—Transfer to a separator an accurately weighed quantity of Hydrocortisone Lotion, equivalent to about 20 mg. of hydrocortisone, and add 15 ml. of water. Extract with four 25-ml. portions of chloroform, filtering each portion through chloroform-washed cotton into a 200-ml. volumetric flask. Add chloroform to volume, and mix. Pipet 20.0 ml. of this solution into a 100-ml. volumetric flask, add chloroform to volume, and mix. Pipet 10.0 ml. of the resulting solution into a glass-stoppered, 50-ml. conical flask, evaporate on a steam bath just to dryness, cool, and dissolve the residue in 20.0 ml. of alcohol.

Procedure—Proceed as directed for *Procedure* under *Steroid Assay*, page 876. Calculate the quantity, in mg., of $C_{21}H_{30}O_5$ in the portion of the Lotion taken by the formula $2C \times (A_U/A_S)$.

Packaging and storage—Preserve Hydrocortisone Lotion in tight containers.

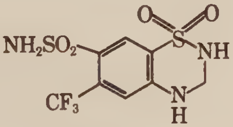
Lotions available—Hydrocortisone Lotion usually available contains hydrocortisone in the following concentrations: 0.125, 0.25, 0.5, and 1 percent.

CATEGORY—Glucocorticoid.

APPLICATION—Topically, to the affected area as a 0.125, 0.25, 0.5, or 1 percent lotion three or four times a day.

Hydrocortisone and Iodochlorhydroxyquin Cream, page 371
Hydrocortisone and Iodochlorhydroxyquin Lotion, page 372
Hydrocortisone and Iodochlorhydroxyquin Ointment, page 373
Hydrocortisone Acetate and Neomycin Sulfate Lotion, page 474

Hydroflumethiazide*



3,4-Dihydro-6-(trifluoromethyl)-2*H*-1,2,4-benzothiadiazine-7-sulfonamide 1,1-Dioxide

$C_8H_8F_3N_3O_4S_2$ Mol. wt. 331.29

Hydroflumethiazide contains not less than 98.0 percent and not more than 102.0 percent of $C_8H_8F_3N_3O_4S_2$, calculated on the anhydrous basis.

Description—Hydroflumethiazide occurs as a white to cream colored, finely divided, crystalline powder. It is odorless.

Solubility—Hydroflumethiazide is very slightly soluble in water. It is soluble in alcohol, and is freely soluble in acetone.

Melting range, page 814—Hydroflumethiazide melts between 270° and 275°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Hydroflumethiazide, previously dried over a suitable desiccant, exhibits maxima only at the same wavelengths as that of NF Hydroflumethiazide

---

* Patented. See notice, page ii.

Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 100,000 solution of Hydroflumethiazide in methanol exhibits maxima and minima at the same wavelengths as that of NF Hydroflumethiazide Reference Standard, similarly measured.

pH, page 824—The pH of a 1 in 100 dispersion of Hydroflumethiazide in water is between 4.5 and 7.5.

Water, page 900—Determine the water content of Hydroflumethiazide by the titrimetric method: not more than 1 percent is found.

Residue on ignition, page 858—Hydroflumethiazide yields not more than 1 percent of residue on ignition.

Heavy metals, *Method II*, page 806—The heavy metals limit for Hydroflumethiazide is 20 parts per million.

Selenium—A *Test preparation* prepared with 200 mg. of Hydroflumethiazide meets the requirements of the *Selenium Limit Test*, page 865 (30 parts per million).

Diazotizable substances—

Standard preparation—Weigh accurately 10.0 mg. of NF 2,4-Disulfamyl-5-trifluoromethylaniline Reference Standard, and dissolve in 10 ml. of methanol contained in a 50-ml. volumetric flask. Dilute to volume with methanol, and mix. Transfer 10.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with methanol, and mix.

Test preparation—Weigh accurately 100 mg. of Hydroflumethiazide, transfer to a 50-ml. volumetric flask, and dissolve in 20 ml. methanol. Dilute to volume with methanol, and mix.

Procedure—Transfer 5.0 ml. each of the *Standard preparation* and of the *Test preparation* to separate 50-ml. volumetric flasks. Transfer 5.0 ml. of water to a third 50-ml. volumetric flask to serve as a blank. To each flask add 1 ml. of freshly prepared sodium nitrite solution (1 in 100) and 2 ml. of 1 *N* hydrochloric acid, and allow to stand for 5 minutes. Add 2 ml. of ammonium sulfamate solution (1 in 50), and allow to stand for 5 minutes with frequent swirling. Add 1 ml. of freshly prepared *N*-1-naphthylethylenediamine dihydrochloride solution (1 in 1000). Dilute to volume with water, and mix. Concomitantly determine the absorbances of the solutions in 1-cm. cells, at 520 mμ, with a suitable spectrophotometer, using the blank to set the instrument: the absorbance of the solution from the *Test preparation* does not exceed that of the solution from the *Standard preparation*, corresponding to not more than 1 percent of diazotizable substances.

Assay—Transfer to a 100-ml. volumetric flask about 50 mg. of Hydroflumethiazide, accurately weighed, add methanol to volume, and mix. Transfer 2.0 ml. of this solution to a second 100-ml. volumetric flask, dilute to volume with methanol, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Hydroflumethiazide Reference Standard, in the same medium, at a concentration of about 10 mcg. per ml., in 1-cm. cells, at the maximum at about 273 mμ, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg. of $C_8H_8F_3N_3O_4S_2$ in the Hydroflumethiazide taken by the formula $5C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Hydroflumethiazide in tight containers.

CATEGORY—Antihypertensive; diuretic.

USUAL DOSE—**50 mg.** to **100 mg.** per day.

USUAL DOSE RANGE—**25 mg.** to **200 mg.**

Hydroflumethiazide Tablets

Hydroflumethiazide Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_8H_8F_3N_3O_4S_2$.

Identification—The solution prepared for measurement of absorbance in the *Assay* exhibits a maximum at 273 ± 2 mμ.

Disintegration, page 878—The disintegration time limit for Hydroflumethiazide Tablets is 15 minutes.

Content uniformity, *Method II*, page 799—Hydroflumethiazide Tablets meet the requirements of the content uniformity test for tablets, using the following special procedure: Transfer one tablet to a 100-ml. volumetric flask, add 50 ml. of methanol, and shake the flask until the tablet is completely disintegrated. Dilute to volume with methanol, mix, and filter, discarding the first 20 ml. of filtrate. Dilute a portion of the subsequent filtrate with methanol to provide a solution containing approximately 10 mcg. of hydroflumethiazide per ml. Concomitantly determine the absorbance of this solution and of a solution of NF Hydroflumethiazide Reference Standard, in the same medium, at a concentration of about 10 mcg. per ml., in 1-cm. cells, at the maximum at about 273 mμ, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg., of $C_8H_8F_3N_3O_4S_2$ in the tablet by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity, in mg., of hydroflumethiazide in the tablet; D is the exact concentration, in mcg. per ml., of hydroflumethiazide in the sample solution, based upon the labeled quantity per tablet and the extent of dilution; C is the exact concentration of the Reference Standard solution, in mcg. per ml.; A_U is the absorbance of the sample solution; and A_S is the absorbance of the Reference Standard solution.

Assay—

Standard preparation—Transfer about 30 mg. of NF Hydroflumethiazide Reference Standard, accurately weighed, to a 100-ml. volumetric flask, add sodium hydroxide solution (1 in 100) to volume, and mix. Transfer 5.0 ml. of this solution to a second 100-ml. volumetric flask, dilute to volume with sodium hydroxide solution (1 in 100), and mix.

Chromatographic column—Pack a pledget of fine glass wool in the base of a chromatographic tube (25 × 250-mm. test tube to which is fused a 5-cm. length of 7-mm. tubing) with the aid of a tamping rod about 45 cm. in length and having a disk with a diameter about 1-mm. less than that of the tube. To 1 g. of purified siliceous earth in a 100-ml. beaker add 1 ml. of sodium hydroxide solution (1 in 100), and mix until a uniform, fluffy mixture is obtained. Transfer to the tube, and tamp gently to compress the mixture to a uniform mass.

Assay preparation—Weigh and finely powder not less than 20 Hydroflumethiazide Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 75 mg. of hydroflumethiazide, to a 50-ml. volumetric flask, add about 35 ml. of sodium hydroxide solution (1 in 100), shake vigorously, dilute to volume with sodium hydroxide solution (1 in 100), and mix. Transfer 2.0 ml. of this solution to a beaker, and mix with 3 g. of purified siliceous earth until a uniform, fluffy mixture is obtained. Transfer to the prepared chromatographic column, and tamp gently to compress. Scrub the beaker with 1 g. of purified siliceous earth mixed with 1 drop of water, transfer to the column, and tamp gently. Wash the column with 50 ml. of water-saturated chloroform, followed by 50 ml. of water-saturated ether, and discard the eluates. Elute the hydroflumethiazide from the column with 100 ml. of a 1 in 1000 solution of glacial acetic acid in ether, collecting the eluate in a 250-ml. separator. Add 60 ml. of isooctane to the separator, mix, and extract the resulting solution with three 50-ml. portions of sodium hydroxide solution (1 in 100), collecting the extracts in a 200-ml. volumetric flask. Dilute to volume with sodium hydroxide solution (1 in 100), and mix.

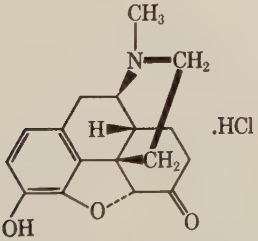
Procedure—Concomitantly determine the absorbances of the solutions in 1-cm. cells, at the maximum at about 273 mμ, with a suitable spectrophotometer, using sodium hydroxide solution (1 in 100) as the blank. Record the absorbance of the *Standard preparation* as A_S and that of the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_8H_8F_3N_3O_4S_2$ in the portion of Tablets taken by the formula $5C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*.

Packaging and storage—Preserve Hydroflumethiazide Tablets in tight containers.

Tablets available—Hydroflumethiazide Tablets usually available contain the following amount of hydroflumethiazide: 50 mg.

CATEGORY and DOSE—See Hydroflumethiazide.

Hydromorphone Hydrochloride



4,5α-Epoxy-3-hydroxy-17-methylmorphinan-6-one Hydrochloride

$C_{17}H_{19}NO_3 . HCl$ Mol. wt. 321.81

Hydromorphone Hydrochloride, dried at 105° for 2 hours, contains not less than 98.0 percent and not more than 101.0 percent of $C_{17}H_{19}NO_3.HCl$.

Description—Hydromorphone Hydrochloride occurs as a fine, white or practically white, odorless, crystalline powder. It is affected by light.

Solubility—Hydromorphone Hydrochloride is freely soluble in water. Hydromorphone Hydrochloride is sparingly soluble in alcohol, and is practically insoluble in ether.

Identification—

A: Dissolve about 250 mg. of Hydromorphone Hydrochloride in 25 ml. of water, and add enough ammonia T.S. to render the solution distinctly alkaline. Transfer to a separator, and extract the base with 25 ml. of chloroform. Collect approximately 20 ml. of the chloroform solution and evaporate to dryness on a steam bath. Dry the residue at 105° for 2 hours: the hydromorphone so obtained melts with decomposition at about 260°, *Class Ia*, page 815.

B: A solution of Hydromorphone Hydrochloride (1 in 20) responds to the tests for *Chloride*, page 808.

C: Dissolve 10 mg. of Hydromorphone Hydrochloride in 1 ml. of water, and add a mixture of 5 ml. of potassium ferricyanide T.S. and 5 drops of ferric chloride T.S.: a deep blue color is produced at once.

Specific rotation, page 822—The specific rotation of Hydromorphone Hydrochloride, calculated on the dried basis, determined in a solution containing 200 mg. of Hydromorphone Hydrochloride in each 10 ml., is between −136° and −139°.

Acidity—Dissolve 300 mg. of Hydromorphone Hydrochloride in 10 ml. of water, add 1 drop of methyl red T.S., and titrate with 0.02 *N* sodium hydroxide: not more than 0.3 ml. is required to produce a yellow color.

Loss on drying, page 814—Dry Hydromorphone Hydrochloride at 105° for 2 hours: it loses not more than 1.5 percent of its weight.

Residue on ignition, page 858—The residue on ignition from 200 mg. of Hydromorphone Hydrochloride is negligible.

Sulfate—To a solution of 100 mg. of Hydromorphone Hydrochloride in 5 ml. of water add 0.5 ml. of diluted hydrochloric acid and 1 ml. of barium chloride T.S.: no turbidity is produced.

Codeine—Dissolve 20 mg. of Hydromorphone Hydrochloride in 5 ml. of sulfuric acid, add 1 drop of ferric chloride T.S. and heat in a boiling water bath for 2 minutes: no blue color results.

Assay—Weigh accurately about 225 mg. of Hydromorphone Hydrochloride, previously dried at 105° for 2 hours, transfer to a 250-ml. conical flask, and dissolve in 80 ml. of glacial acetic acid, warming if necessary. Cool, and add 5 ml. of acetic anhydride and 10 ml. of mercuric acetate T.S. Add 1 drop of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a blue end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 32.18 mg. of $C_{17}H_{19}NO_3.HCl$.

Packaging and storage—Preserve Hydromorphone Hydrochloride in tight, light-resistant containers.

CATEGORY—Analgesic (narcotic).

USUAL DOSE—Oral and subcutaneous, **2 mg.** every 4 hours as necessary.

USUAL DOSE RANGE—**1** to **4 mg.**

Hydromorphone Hydrochloride Injection

Hydromorphone Hydrochloride Injection is a sterile solution of hydromorphone hydrochloride in water for injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{17}H_{19}NO_3.HCl$.

Identification—From a volume of Hydromorphone Hydrochloride Injection, equivalent to about 50 mg. of hydromorphone hydrochloride, extract the base as described in *Identification test A* under *Hydromorphone Hydrochloride*, page 353, using proportionate quantities of the reagents: the base so obtained melts with decomposition at about 260°, page 814. A 10-mg. portion of the base dissolved in a mixture of 1 drop of diluted hydrochloric acid and 1 ml. of water responds to *Identification test C* under *Hydromorphone Hydrochloride*, page 353.

pH, page 824—The pH of Hydromorphone Hydrochloride Injection is between 4.0 and 5.5.

Other requirements—Hydromorphone

Hydrochloride Injection meets the requirements under *Injections*, page 810.

Assay—

Standard preparation—Weigh accurately about 50 mg. of NF Hydromorphone Hydrochloride, previously dried at 105° for 2 hours, and dissolve in sufficient water to make 50.0 ml.

Assay preparation—Transfer an accurately measured volume of Hydromorphone Hydrochloride Injection, equivalent to about 24 mg. of hydromorphone hydrochloride, to a 25-ml. volumetric flask, dilute to volume with water, and mix.

Procedure—Transfer 6.0 ml. each of the *Standard preparation* and of the *Assay preparation* to separate 50-ml. volumetric flasks. To each flask add, with mixing, 10 ml. of 1 *N* hydrochloric acid and 1.0 ml. of freshly prepared sodium nitrite solution (1 in 20). Stopper the flasks, allow to stand for 15 to 20 minutes, then add 2 ml. of stronger ammonia T.S., and mix. Dilute to volume with water, and mix. Concomitantly determine the absorbances of the solutions in 1-cm. cells, at the maximum at about 440 mμ, with a suitable spectrophotometer, using water as the blank. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{17}H_{19}NO_3 . HCl$ in each ml. of the Injection taken by the formula $0.025 \times (C/V) \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*, and V is the volume, in ml., of the Injection taken.

Packaging and storage—Preserve Hydromorphone Hydrochloride Injection in single-dose or in multiple-dose containers, of Type I glass, protected from light.

Injections available—Hydromorphone Hydrochloride Injection usually available contains the following amounts of hydromorphone hydrochloride: 1, 2, 3, and 4 mg. in 1 ml.; 20 mg. in 10 ml.; 40 mg. in 20 ml.

CATEGORY and DOSE—See Hydromorphone Hydrochloride.

Hydromorphone Hydrochloride Tablets

Hydromorphone Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{17}H_{19}NO_3 . HCl$.

Identification—Dissolve a quantity of Hydromorphone Hydrochloride Tablets, equivalent to about 50 mg. of hydromorphone hydrochloride, in 10 ml. of water, and filter if necessary. Extract the base as described in *Identification test A* under *Hydromorphone Hydrochloride*, page 353. The base so obtained melts with decomposition at about 260°, page 814. A 10-mg. portion of the base, dissolved in a mixture of 1 drop of diluted hydrochloric acid and 1 ml. of water, responds to *Identification test C* under *Hydromorphone Hydrochloride*, page 353.

Disintegration, page 878—The disintegration time limit for Hydromorphone Hydrochloride Tablets is 30 minutes.

Content uniformity, *Method I*, page 799—Hydromorphone Hydrochloride Tablets meet the requirements of the content uniformity test for tablets.

Assay—

Standard preparation—Prepare as directed in the *Assay* under *Hydromorphone Hydrochloride Injection*, page 354.

Assay preparation—Weigh and finely powder not less than 20 Hydromorphone Hydrochloride Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg. of hydromorphone hydrochloride, to a 50-ml. volumetric flask, add water to volume, mix, and filter.

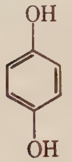
Procedure—Proceed as directed for *Procedure* in the *Assay* under *Hydromorphone Hydrochloride Injection*, page 354. Calculate the quantity, in mg., of $C_{17}H_{19}NO_3 . HCl$ in the portion of the Tablets taken by the formula $0.05C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*.

Packaging and storage—Preserve Hydromorphone Hydrochloride Tablets in tight, light-resistant containers.

Tablets available—Hydromorphone Hydrochloride Tablets usually available contain the following amounts of hydromorphone hydrochloride: 1, 2, 3, and 4 mg.

CATEGORY and DOSE—See Hydromorphone Hydrochloride.

Hydroquinone



$C_6H_6O_2$ Mol. wt. 110.11

Hydroquinone, dried at 105° for 3 hours, contains not less than 99.0 percent and not more than 100.5 percent of $C_6H_6O_2$.

Description—Hydroquinone occurs as fine white needles. It darkens upon exposure to light and air.

Solubility—Hydroquinone is freely soluble in water, in alcohol, and in ether.

Identification—

A: Prepare a solution of Hydroquinone in methanol containing approximately 1 mg. per ml., and spot 5 µl. of this solution on a suitable thin-layer chromatographic plate (see page 791), coated with a 0.25-mm. layer of silica gel G. Allow the spot to dry, and develop the chromatogram in a solvent system consisting of methanol and chloroform (1:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Heat on a hot plate or under a lamp until spots appear: the R_f value of Hydroquinone is about 0.86.

B: A 1 in 40,000 solution of Hydroquinone in methanol exhibits an absorbance maximum at 293 ± 2 mµ.

Melting range, page 814—Hydroquinone melts between 172° and 174°.

Loss on drying, page 814—Dry Hydroquinone at 105° for 3 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Hydroquinone yields not more than 0.5 percent of residue on ignition.

Assay—Dissolve about 250 mg. of Hydroquinone, previously dried at 105° for 3 hours and accurately weighed, in a mixture of 100 ml. of water and 10 ml. of 0.1 *N* sulfuric acid, add 3 drops of diphenylamine T.S., and titrate with 0.1 *N* ceric sulfate until a red-violet end-point is reached. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* ceric sulfate is equivalent to 5.506 mg. of $C_6H_6O_2$.

Packaging and storage—Preserve Hydroquinone in well-closed, light-resistant containers.

CATEGORY—Depigmenting agent.

FOR EXTERNAL USE—Topically as a 2 percent ointment to the affected area once or twice daily at 12-hour intervals.

Hydroquinone Ointment

Hydroquinone Ointment contains not less than 94.0 percent and not more than 106.0 percent of the labeled amount of $C_6H_6O_2$.

Identification—Dissolve a portion of Hydroquinone Ointment, equivalent to about 50 mg. of hydroquinone, in sufficient methanol-chloroform solution (1:1) to make 50 ml.: a 5-µl. portion of this solution responds to *Identification test A* under *Hydroquinone,* page 356.

Weight variation, page 901—Hydroquinone Ointment meets the requirements of the weight variation test for ointments.

Assay—Dissolve an accurately weighed portion of Hydroquinone Ointment, equivalent to about 80 mg. of hydroquinone, in a mixture of 100 ml. of water and 10 ml. of 0.1 *N* sulfuric acid, and continue as directed in the *Assay* under *Hydroquinone,* page 356, beginning with "... add 3 drops of diphenylamine T.S. ..."

Packaging and storage—Preserve Hydroquinone Ointment in well-closed, light-resistant containers.

Ointment available—Hydroquinone Ointment usually available contains 2 percent of hydroquinone.

CATEGORY and USE—See Hydroquinone.

Hydroxypropyl Methylcellulose

Hydroxypropyl Methylcellulose is the propylene glycol ether of methylcellulose. The proportions of its hydroxypropyl and methyl groups, which are attached to the anhydroglucose rings of cellulose by ether linkages, may be varied to produce a range of characteristic properties. Hydroxypropyl Methylcellulose, previously dried at 105° for 2 hours, contains not less than 19.0 percent and not more than 30.0 percent of methoxy (—OCH_3), and not less than 3.0 percent and not more than 12.0 percent of hydroxypropoxy (—OC_3H_6OH). The viscosity of a solution containing 2 g. of Hydroxypropyl Methylcellulose in each 100 g. of solution is not less than 80.0 percent and not more than 120.0 percent of that stated on the label for viscosity types of 100 centipoises or less, and not less than 75.0 percent and not more than 140.0 percent of that stated on the label for viscosity types higher than 100 centipoises.

Description—Hydroxypropyl Methylcellulose occurs as a white to slightly off-white, fibrous or granular powder.

Solubility—Hydroxypropyl Methylcellulose swells in water and produces a clear to opalescent, viscous, colloidal solution. It is insoluble in anhydrous alcohol, in ether, and in chloroform.

Identification—

A: To 100 ml. of water add 1 g. of Hydroxypropyl Methylcellulose: it swells and disperses to form a clear to opalescent, mucilaginous solution, depending upon the intrinsic viscosity, which is stable in the presence of most electrolytes.

B: Add 1 g. of Hydroxypropyl Methylcellulose to 100 ml. of boiling water and stir the mixture: a slurry is formed, but the powdered material does not dissolve. Cool the slurry to 20°: the powder dissolves to form a clear or opalescent mucilaginous solution.

C: Pour a few ml. of the solution prepared for *Identification test B* onto a glass plate, and allow the water to evaporate: a thin, self-sustaining film results.

Loss on drying, page 814—Dry Hydroxypropyl Methylcellulose at 105° for 2 hours: it loses not more than 5 percent of its weight.

Residue on ignition, page 858—Hydroxypropyl Methylcellulose with nominal viscosities of 50 centipoises and greater yields not more than 1.5 percent of residue on ignition. Hydroxypropyl Methylcellulose with nominal viscosities of less than 50 centipoises yields not more than 3 percent of residue on ignition.

Viscosity—Weigh accurately a sample of Hydroxypropyl Methylcellulose, equivalent to 2 g. on the anhydrous basis, transfer to a wide-mouth, 250-ml. centrifuge bottle, and add 98 g. of water, previously heated to 80° to 90°. Mix with a mechanical stirrer for 10 minutes, then place the bottle in an ice bath until solution is complete, adjust the weight of the solution to 100 g., if necessary, and centrifuge the solution to expel any entrapped air. Adjust the temperature of the solution to 20° ± 0.1°, and determine the viscosity in a suitable viscosimeter of the modified Ubbelohde type as directed under *Viscosity—Procedure for Cellulose Derivatives,* page 889.

Assay for hydroxypropoxy groups—Transfer about 50 mg. of Hydroxypropyl Methylcellulose, previously dried at 105° for 2 hours and accurately weighed, into the 100-ml. boiling flask of a hydroxypropoxy apparatus, and proceed as directed under *Hydroxypropoxy Determination,* page 807. Each ml. of 0.02 N sodium hydroxide is equivalent to 1.5 mg. of hydroxypropoxy groups (—OC_3H_6OH).

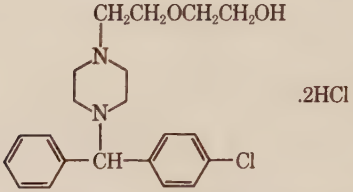
Assay for methoxy groups—Place about 50 mg. of Hydroxypropyl Methylcellulose, previously dried at 105° for 2 hours, in an empty, tared, gelatin capsule, weigh accurately, place the capsule and contents in the boiling flask of a methoxy apparatus, and proceed as directed under *Methoxy Determination,* page 817. Each ml. of 0.1 N sodium thiosulfate is equivalent to 0.5172 mg. of methoxy groups (—OCH_3). Correct the percent of methoxy groups thus determined by the formula $A - (B \times 0.93 \times 31/75)$, in which A is the total —OCH_3 groups determined in the *Assay,* B is the percent of —OC_3H_6OH determined in the *Assay for hydroxypropoxy groups,* and 0.93 is an average obtained by determining, on a large number of samples, the propylene produced from the reaction of hydriodic acid with hydroxypropoxy groups during the assay for methoxy groups. The result represents the actual percent of methoxy groups (—OCH_3) determined in the sample taken for the assay.

Packaging and storage—Preserve Hydroxypropyl Methylcellulose in well-closed containers.

Labeling—Label Hydroxypropyl Methylcellulose to indicate its viscosity type.

CATEGORY—Suspending agent.

Hydroxyzine Hydrochloride*



2-[2-[4-(*p*-Chloro-α-phenylbenzyl)-1-piperazinyl]ethoxy]ethanol Dihydrochloride

$C_{21}H_{27}ClN_2O_2 . 2HCl$ Mol. wt. 447.84

Hydroxyzine Hydrochloride, dried at 105° for two hours, contains not less than 98.0 percent and not more than 100.5 percent of $C_{21}H_{27}ClN_2O_2 . 2HCl$.

Description—Hydroxyzine Hydrochloride occurs as a white, odorless powder.

Solubility—Hydroxyzine Hydrochloride is soluble in chloroform. It is very soluble in water, slightly soluble in acetone, and practically insoluble in ether.

Identification—To 10 ml. of a solution of Hydroxyzine Hydrochloride (1 in 400) add 2 drops of nitric acid and 1 ml. of silver nitrate T.S.: a curdy, white precipitate, insoluble in diluted nitric acid, but soluble in ammonia T.S., separates (*presence of chloride*).

Melting range, *Class Ia*, page 815—Hydroxyzine Hydrochloride melts with decomposition between 196° and 204°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Hydroxyzine Hydrochloride, previously dried at 105° for 2 hours, exhibits maxima only at the same wavelengths as that of NF Hydroxyzine Hydrochloride Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 100,000 solution of Hydroxyzine Hydrochloride in alcohol exhibits maxima and minima at the same wavelengths as that of NF Hydroxyzine Hydrochloride Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance, occurring at about 230 mμ, do not differ by more than 3 percent.

Loss on drying, page 814—Dry Hydroxyzine Hydrochloride at 105° for 2 hours: it loses not more than 5 percent of its weight.

Residue on ignition, page 858—Hydroxyzine Hydrochloride yields not more than 0.5 percent of residue on ignition. Retain the residue from a 1-g. sample for the *Heavy metals test*.

Heavy metals, page 806—Dissolve the residue resulting from *Residue on ignition* in 23 ml. of water and add 2 ml. of diluted acetic acid: the heavy metals limit for Hydroxyzine Hydrochloride is 50 parts per million.

Assay—Dissolve about 150 mg. of Hydroxyzine Hydrochloride, previously dried at 105° for 2 hours and accurately weighed, in 10 ml. of chloroform. Add 50 ml. of glacial acetic acid, 5 ml. of mercuric acetate T.S., and 4 drops of quinaldine red T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 22.39 mg. of $C_{21}H_{27}ClN_2O_2 . 2HCl$.

Packaging and storage—Preserve Hydroxyzine Hydrochloride in tight containers.

CATEGORY—Tranquilizer (minor).
USUAL DOSE—**25 mg.** three times a day.
USUAL DOSE RANGE—**25** to **100 mg.**

---

* Patented. See notice, page ii.

Hydroxyzine Hydrochloride Injection

Hydroxyzine Hydrochloride Injection is a sterile solution of hydroxyzine hydrochloride in water for injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{21}H_{27}ClN_2O_2 . 2HCl$.

Identification—Dilute a volume of Hydroxyzine Hydrochloride Injection with 0.1 *N* hydrochloric acid to produce a concentration of about 20 mcg. of hydroxyzine hydrochloride per ml. The ultraviolet absorption spectrum of this solution exhibits maxima and minima at the same wavelengths as that of a 1 in 50,000 solution of NF Hydroxyzine Hydrochloride Reference Standard in 0.1 *N* hydrochloric acid, similarly measured.

pH, page 824—The pH of Hydroxyzine Hydrochloride Injection is between 3.5 and 6.0.

Other requirements—Hydroxyzine Hydrochloride Injection meets the requirements under *Injections*, page 810.

Assay—Transfer an accurately measured volume of Hydroxyzine Hydrochloride Injection, equivalent to about 100 mg. of hydroxyzine hydrochloride, to a 250-ml. separator containing 20 ml. of 0.1 *N* sodium hydroxide, and extract with four 50-ml. portions of chloroform, filtering the extracts through a layer of anhydrous sodium sulfate into a 250-ml. beaker. Evaporate the chloroform to a volume of about 10 ml. on a steam bath with the aid of a stream of nitrogen or air, and cool. Add 10 ml. of glacial acetic acid, 5 ml. of acetic anhydride, 5 ml. of mercuric acetate T.S., and 1 drop of quinaldine red T.S., and titrate with 0.02 *N* perchloric acid in glacial acetic acid. Perform a blank determination, and make any necessary correction. Each ml. of 0.02 *N* perchloric acid is equivalent to 4.478 mg. of $C_{21}H_{27}ClN_2O_2.2HCl$.

Packaging and storage—Preserve Hydroxyzine Hydrochloride Injection in single-dose or in multiple-dose containers, protected from light.

Injections available—Hydroxyzine Hydrochloride Injection usually available contains the following amounts of hydroxyzine hydrochloride; 25 and 50 mg. in 1 ml.; 100 mg. in 2 ml.; and 250 and 500 mg. in 10 ml.

CATEGORY and DOSE—See Hydroxyzine Hydrochloride.

Hydroxyzine Hydrochloride Syrup

Hydroxyzine Hydrochloride Syrup contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{21}H_{27}ClN_2O_2.2HCl$.

Identification—Dilute a volume of Hydroxyzine Hydrochloride Syrup, equivalent to about 20 mg. of hydroxyzine hydrochloride, with 25 ml. of 1 *N* sodium hydroxide and 25 ml. of acetone, and mix. On a suitable thin-layer chromatographic plate (see page 791), coated with a 0.25-mm. layer of silica gel G and dried in air for 30 minutes followed by drying in vacuum at 140° for 30 minutes, spot 10 μl. of this solution and 10 μl. of a solution, in the same medium, containing about 350 mcg. of NF Hydroxyzine Hydrochloride Reference Standard per ml. Allow the spots to dry, and develop the chromatogram with 0.1 *N* hydrochloric acid until the solvent front is about 2.5 cm. from the top of the plate. Remove the plate from the developing chamber, and locate the spots by lightly spraying with potassium iodoplatinate T.S.: the R_f value of the main spot obtained from the sample solution corresponds to that obtained from the Reference Standard solution.

Assay—Transfer an accurately measured volume of Hydroxyzine Hydrochloride Syrup, equivalent to about 40 mg. of hydroxyzine hydrochloride, to a 250-ml. separator containing 20 ml. of 0.1 *N* sodium hydroxide, and extract with three 50-ml. portions of chloroform, filtering the extracts through a layer of anhydrous sodium sulfate into a 250-ml. beaker. Evaporate the chloroform to a volume of about 10 ml. on a steam bath with the aid of a stream of nitrogen or air, and cool. Add 10 ml. of glacial acetic acid, 5 ml. of acetic anhydride, 5 ml. of mercuric acetate T.S., and 1 drop of quinaldine red T.S., and titrate with 0.02 *N* perchloric acid in glacial acetic acid. Perform a blank determination, and make any necessary correction. Each ml. of 0.02 *N* perchloric acid is equivalent to 4.478 mg. of $C_{21}H_{27}ClN_2O_2.2HCl$.

Packaging and storage—Preserve Hydroxyzine Hydrochloride Syrup in tight, light-resistant containers.

Syrup available—Hydroxyzine Hydrochloride Syrup usually available contains the following amount of hydroxyzine hydrochloride: 10 mg. in 5 ml.

CATEGORY and DOSE—See Hydroxyzine Hydrochloride.

Hydroxyzine Hydrochloride Tablets

Hydroxyzine Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{21}H_{27}ClN_2O_2.2HCl$.

Identification—Triturate a quantity of finely powdered Hydroxyzine Hydrochloride Tablets, equivalent to about 50 mg. of hydroxyzine hydrochloride, with 20 ml. of chloroform, filter, evaporate the chloroform on a steam bath, and dry at 105° for 30 minutes. The ultraviolet absorption spectrum of a 1 in 100,000 solution of the residue so obtained, in alcohol exhibits maxima and minima at the same wavelengths as that of NF Hydroxyzine Hydrochloride Reference Standard, similarly measured.

Disintegration, page 878—The disintegration time limit for Hydroxyzine Hydrochloride Tablets is 30 minutes.

Content uniformity, *Method II,* page 799—Hydroxyzine Hydrochloride Tablets meet the requirements of the content uniformity test for tablets, using the following special procedure: Transfer a tablet to a 200-ml. volumetric flask, add 100 ml. of water, and heat on a steam bath with occasional stirring until dispersed. Cool, dilute to volume with water, mix, and filter, discarding the first 20 ml. of filtrate. Dilute a portion of the subsequent filtrate quantitatively and stepwise, if necessary, with 0.1 N hydrochloric acid to provide a solution containing approximately 10 mcg. of hydroxyzine hydrochloride per ml. Concomitantly determine the absorbance of this solution and of a solution of NF Hydroxyzine Hydrochloride Reference Standard, in the same medium, at a concentration of about 10 mcg. per ml., in 1-cm. cells, at the maximum at about 230 mμ, with a suitable spectrophotometer, using 0.1 N hydrochloric acid as the blank. Calculate the quantity, in mg., of $C_{21}H_{27}ClN_2O_2 . 2HCl$ in the tablet by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity of hydroxyzine hydrochloride, in mg., in the tablet; D is the exact concentration, in mcg. per ml., of hydroxyzine hydrochloride in the sample solution based upon the labeled quantity per tablet and the extent of dilution; C is the exact concentration of the Reference Standard solution, in mcg. per ml.; A_U is the absorbance of the sample solution; and A_S is the absorbance of the Reference Standard solution.

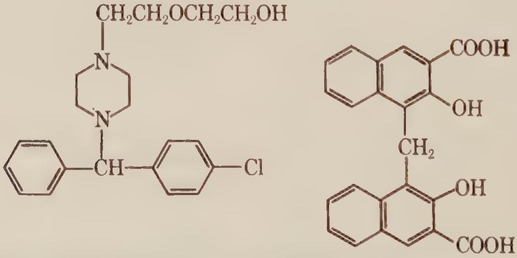
Assay—Triturate 20 Hydroxyzine Hydrochloride Tablets with 25 ml. of chloroform, and quantitatively transfer the supernatant liquid to a 250-ml. glass-stoppered conical flask. Triturate the residue with a second 25-ml. portion of chloroform, and add the supernatant liquid to the flask. Quantitatively transfer the tablet residue to the flask with the aid of 50 ml. of chloroform, and shake mechanically for 30 minutes. Filter the mixture into a 250-ml. volumetric flask, and wash the conical flask with four 25-ml. portions of chloroform, filtering each portion into the volumetric flask. Dilute the combined filtrates to volume with chloroform, and mix. Transfer an accurately measured volume of this solution, equivalent to 150 to 200 mg. of hydroxyzine hydrochloride, to a conical flask, and evaporate on a steam bath to a volume of about 15 ml. with the aid of a current of air. To the residual liquid add 10 ml. of glacial acetic acid, 5 ml. of acetic anhydride, 5 ml. of mercuric acetate T.S., and 3 drops of quinaldine red T.S., and titrate with 0.1 N perchloric acid in glacial acetic acid. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 N perchloric acid is equivalent to 22.39 mg. of $C_{21}H_{27}ClN_2O_2 . 2HCl$.

Packaging and storage—Preserve Hydroxyzine Hydrochloride Tablets in tight containers.

Tablets available—Hydroxyzine Hydrochloride Tablets usually available contain the following amounts of hydroxyzine hydrochloride: 10, 25, and 100 mg.

CATEGORY and DOSE—See Hydroxyzine Hydrochloride.

Hydroxyzine Pamoate*



2-[2-[4-(p-Chloro-α-phenylbenzyl)-1-piperazinyl]ethoxy]ethanol 4,4′-Methylenebis-[3-hydroxy-2-naphthoate] (1:1)

$C_{21}H_{27}ClN_2O_2 . C_{23}H_{16}O_6$ Mol. wt. 763.29

---

* Patented. See notice, page ii.

Hydroxyzine Pamoate contains not less than 97.0 percent and not more than 102.0 percent of $C_{21}H_{27}ClN_2O_2 . C_{23}H_{16}O_6$, calculated on the anhydrous basis.

Description—Hydroxyzine Pamoate occurs as a light yellow, practically odorless powder.

Solubility—Hydroxyzine Pamoate is practically insoluble in water and in methanol. It is freely soluble in dimethylformamide.

Identification—Prepare a solution of Hydroxyzine Pamoate in a mixture of equal volumes of 1 *N* sodium hydroxide and acetone containing 2 mg. per ml. On a suitable thin-layer chromatographic plate (see page 791), coated with a 0.6-mm. layer of silica gel G, spot 10 µl. of this solution and 10 µl. of a solution of NF Hydroxyzine Pamoate Reference Standard in the same medium containing 2 mg. per ml. Allow the spots to dry, and develop the chromatogram in 0.1 *N* hydrochloric acid until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and locate the spots on the plate by viewing under longwave ultraviolet light: the R_f value of the main spot, representing the pamoate moiety, obtained from the sample solution corresponds to that obtained from the Reference Standard solution. Spray the plate lightly with potassium iodoplatinate T.S.: the R_f value of the main spot, representing the hydroxyzine moiety, obtained from the sample solution corresponds to that obtained from the Reference Standard solution.

Ultraviolet absorption, page 866—Transfer about 85 mg. of Hydroxyzine Pamoate (equivalent to about 50 mg. of hydroxyzine hydrochloride) to a separator containing 25 ml. of sodium hydroxide T.S., and extract with three 20-ml. portions of chloroform. Evaporate the combined chloroform extracts to dryness on a steam bath with the aid of a current of air, and dissolve the residue in sufficient 0.1 *N* hydrochloric acid to make 100 ml. Dilute a 1-ml. portion of this solution to 50 ml. with 0.1 *N* hydrochloric acid: the ultraviolet absorption spectrum of the solution so obtained exhibits maxima and minima at the same wavelengths as that of a 1 in 100,000 solution of NF Hydroxyzine Hydrochloride Reference Standard in 0.1 *N* hydrochloric acid, similarly measured.

Water, page 900—Determine the water content of Hydroxyzine Pamoate by the titrimetric method: not more than 5 percent is found.

Residue on ignition, page 858—Hydroxyzine Pamoate yields not more than 0.5 percent of residue on ignition. Retain the residue on ignition from a 1-g. sample for the *Heavy metals test.*

Heavy metals, *Method II*, page 806—To the residue obtained in the test for *Residue on ignition* add 1 ml. of hydrochloric acid and 0.5 ml. of nitric acid and evaporate to dryness on a steam bath. Add 2 ml. of diluted acetic acid, digest on the steam bath for 5 minutes, filter, and wash the residue with sufficient water to make 25 ml.: the heavy metals limit for Hydroxyzine Pamoate is 50 parts per million.

Assay—Transfer 600 mg. of Hydroxyzine Pamoate, accurately weighed, to a 125-ml. separator, suspend the sample in 25 ml. of 1 *N* sodium hydroxide, and extract with six 25-ml. portions of chloroform, shaking each extraction for two minutes. After the sixth extraction the aqueous layer should be clear or not more than very slightly turbid. Combine the chloroform extracts, and evaporate to about 20 ml. on a steam bath. Transfer the solution to a 50-ml. volumetric flask, dilute to volume with chloroform, and mix. Transfer 20.0 ml. of the solution to a 150-ml. beaker, add 50 ml. of glacial acetic acid and 3 drops of quinaldine red T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 38.16 mg. of $C_{21}H_{27}ClN_2O_2 . C_{23}H_{16}O_6$.

Packaging and storage—Preserve Hydroxyzine Pamoate in tight containers.

CATEGORY—Tranquilizer (minor).

USUAL DOSE RANGE—The equivalent of **25 mg.** of hydroxyzine hydrochloride three times a day to the equivalent of **100 mg.** of hydroxyzine hydrochloride four times a day.

Hydroxyzine Pamoate Capsules

Hydroxyzine Pamoate Capsules contain $C_{21}H_{27}ClN_2O_2 . C_{23}H_{16}O_6$ (hydroxyzine pamoate) equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{21}H_{27}ClN_2O_2 . 2HCl$ (hydroxyzine hydrochloride).

Identification—

A: Dissolve a portion of the contents of Hydroxyzine Pamoate Capsules, equivalent to about 100 mg. of hydroxyzine pamoate, in a mixture consisting of 25 ml. of 0.1 *N* sodium hydroxide and 25 ml. of acetone, and filter: a 10-μl. portion of the filtrate meets the requirements of the *Identification test* under *Hydroxyzine Pamoate*, page 360.

B: The ultraviolet absorption spectrum of the solution prepared from Hydroxyzine Pamoate Capsules as directed in the *Assay* exhibits maxima and minima at the same wavelengths as that of a 1 in 100,000 solution of NF Hydroxyzine Hydrochloride Reference Standard in 0.1 *N* hydrochloric acid, similarly measured.

Content uniformity, *Method I*, page 798—Hydroxyzine Pamoate Capsules meet the requirements of the content uniformity test for capsules.

Assay—Transfer as completely as possible the contents of not less than 20 Hydroxyzine Pamoate Capsules to a tared beaker, and determine the average weight per capsule. Mix the combined contents thoroughly, and transfer an accurately weighed portion, equivalent to about 50 mg. of hydroxyzine hydrochloride, to a separator, add 25 ml. of 5 *N* sodium hydroxide, and extract with five 45-ml. portions of chloroform, shaking each portion for 2 minutes. Filter the extracts through anhydrous sodium sulfate into a 250-ml. volumetric flask, dilute to volume with chloroform, and mix. Evaporate a 5.0-ml. portion of this solution to dryness on a steam bath with the aid of a current of air. Dissolve the residue in about 25 ml. of 0.1 *N* hydrochloric acid, transfer the solution to a 100-ml. volumetric flask, rinsing the flask with 0.1 *N* hydrochloric acid, dilute to volume with 0.1 *N* hydrochloric acid, mix, and filter, discarding the first 10-ml. of filtrate. Concomitantly determine the absorbance of the subsequent filtrate and of a solution of NF Hydroxyzine Hydrochloride Reference Standard, in the same medium at a concentration of about 10 mcg. per ml., in 1-cm. cells, at the maximum at about 232 mμ, with a suitable spectrophotometer, using 0.1 *N* hydrochloric acid as the blank. Calculate the equivalent quantity, in mg., of $C_{21}H_{27}ClN_2O_2.2HCl$ in the portion of Capsules taken by the formula $5C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Hydroxyzine Pamoate Capsules in well-closed containers.

Capsules available—Hydroxyzine Pamoate Capsules usually available contain hydroxyzine pamoate equivalent to the following amounts of hydroxyzine hydrochloride: 25, 50, and 100 mg.

Category and Dose—See Hydroxyzine Pamoate.

Hydroxyzine Pamoate Oral Suspension

Hydroxyzine Pamoate Oral Suspension contains $C_{21}H_{27}ClN_2O_2.C_{23}H_{16}O_6$ (hydroxyzine pamoate) equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{21}H_{27}ClN_2O_2.2HCl$ (hydroxyzine hydrochloride).

Identification—Dissolve a portion of Hydroxyzine Pamoate Oral Suspension, equivalent to about 100 mg. of hydroxyzine pamoate, in a mixture of 25 ml. of 0.1 *N* sodium hydroxide and 25 ml. of acetone, and filter: a 10-μl. portion of the filtrate meets the requirements of the *Identification test* under *Hydroxyzine Pamoate*, page 360.

pH, page 824—The pH of Hydroxyzine Pamoate Oral Suspension is between 4.5 and 7.0.

Assay—Transfer an accurately measured volume of Hydroxyzine Pamoate Oral Suspension, equivalent to about 25 mg. of hydroxyzine hydrochloride, to a 125-ml. separator, add 50 ml. of chloroform, and mix. Add 25 ml. of 5 *N* sodium hydroxide, and shake for 2 minutes. Allow the layers to separate, and filter the chloroform layer through anhydrous sodium sulfate into a 250-ml. volumetric flask. Repeat the extraction with five 25-ml. portions of chloroform, filtering each extract through anhydrous sodium sulfate into the volumetric flask. Wash the sodium sulfate with about 25 ml. of chloroform, dilute the combined chloroform solutions to volume, and mix. Transfer 5.0 ml. of this solution to a 50-ml. volumetric flask, and evaporate to dryness on a steam bath with the aid of a stream of nitrogen. Cool, dissolve the residue in 0.1 *N* hydrochloric acid with gentle warming, dilute to volume with 0.1 *N* hydrochloric acid, mix, and filter, discarding the first 10-ml. of filtrate. Concomitantly determine the absorbance of the subsequent filtrate and of a solution of NF Hydroxyzine Hydrochloride Reference Standard, in the same medium at a concentration of about 10 mcg. per ml., in 1-cm. cells, at the maximum at about

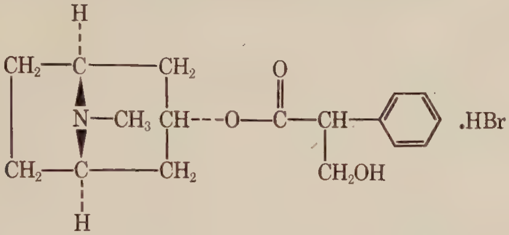
232 mμ, with a suitable spectrophotometer, using 0.1 *N* hydrochloric acid as the blank. Calculate the equivalent quantity, in mg., of $C_{21}H_{27}ClN_2O_2 . 2HCl$ in each ml. of the Suspension taken by the formula $2.5 \times (C/V) \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard, V is the volume, in ml., of the Suspension taken, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Hydroxyzine Pamoate Oral Suspension in tight, light-resistant containers.

Suspension available—Hydroxyzine Pamoate Oral Suspension usually available contains hydroxyzine pamoate equivalent to the following amount of hydroxyzine hydrochloride: 25 mg. in 5 ml.

CATEGORY and DOSE—See Hydroxyzine Pamoate.

Hyoscyamine Hydrobromide



1αH,5αH-Tropan-3α-ol (−)-Tropate (Ester) Hydrobromide

$C_{17}H_{23}NO_3 . HBr$ Mol. wt. 370.29

Hyoscyamine Hydrobromide contains not less than 98.5 percent and not more than 100.5 percent of $C_{17}H_{23}NO_3 . HBr$, calculated on the dried basis.

Caution: Hyoscyamine Hydrobromide is extremely poisonous.

Description—Hyoscyamine Hydrobromide occurs as white, odorless crystals or as a crystalline powder. The pH of a 1 in 20 solution is about 5.4. It is affected by light.

Solubility—Hyoscyamine Hydrobromide is freely soluble in water. It is freely soluble in alcohol and in chloroform. It is very slightly soluble in ether.

Identification—

A: Place about 10 mg. of Hyoscyamine Hydrobromide in a porcelain dish, add 5 drops of nitric acid, evaporate to dryness on a steam bath, and add a few drops of alcoholic potassium hydroxide T.S. to the residue: a violet color is produced.

B: To about 1 ml. of a solution of Hyoscyamine Hydrobromide (1 in 20) add gold chloride T.S., dropwise with shaking, until a definite precipitate separates. Add a small amount of diluted hydrochloric acid, dissolve the precipitate with the aid of heat, and allow the solution to cool: lustrous reddish brown scales that may be accompanied by reddish brown needles are formed (*distinction from atropine and scopolamine*).

C: To an aqueous solution of Hyoscyamine Hydrobromide (1 in 20) add silver nitrate T.S.: a yellowish white precipitate forms which is insoluble in nitric acid.

Melting temperature, page 814—Hyoscyamine Hydrobromide does not melt below 149°.

Loss on drying, page 814—Dry Hyoscyamine Hydrobromide at 105° for 2 hours: it loses not more than 1 percent of its weight.

Specific rotation, page 822—The specific rotation of Hyoscyamine Hydrobromide, previously dried at 105° for 2 hours, determined in a solution in water containing 500 mg. of Hyoscyamine Hydrobromide in each 10 ml., is not less than −24°.

Residue on ignition, page 858—Hyoscyamine Hydrobromide yields not more than 0.2 percent of residue on ignition.

Other alkaloids—Dissolve 250 mg. of Hyoscyamine Hydrobromide in 1 ml. of 0.1 *N* hydrochloric acid and dilute with water to make 15 ml. To 5 ml. of the solution add a few drops of platinic chloride T.S.: no precipitate is formed immediately. To another 5-ml. portion, add 2 ml. of ammonia T.S.: the mixture may develop a slight opalescence, but no turbidity or precipitate is formed immediately.

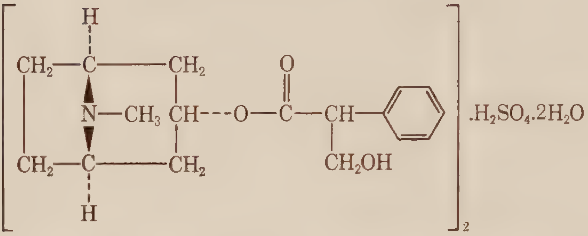
Assay—Dissolve about 700 mg. of Hyoscyamine Hydrobromide, accurately weighed, in a mixture of 50 ml. of glacial acetic acid and 10 ml. of mercuric acetate T.S. Add 1 drop of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a blue-green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 37.03 mg. of $C_{17}H_{23}NO_3.HBr$.

Packaging and storage—Preserve Hyoscyamine Hydrobromide in tight, light-resistant containers.

CATEGORY—Anticholinergic.

USUAL DOSE—**250 mcg.** to **1.0 mg.**

Hyoscyamine Sulfate



1αH,5αH-Tropan-3α-ol (−)-Tropate (Ester) Sulfate (2:1)

$(C_{17}H_{23}NO_3)_2.H_2SO_4.2H_2O$ Mol. wt. 712.86

Hyoscyamine Sulfate contains not less than 98.5 percent and not more than 100.5 percent of $(C_{17}H_{23}NO_3)_2.H_2SO_4$, calculated on the anhydrous basis.

Caution: Hyoscyamine Sulfate is extremely poisonous.

Description—Hyoscyamine Sulfate occurs as white, odorless crystals or as a crystalline powder. It is deliquescent. It is affected by light. Its solutions are acid to litmus.

Solubility—Hyoscyamine Sulfate is very soluble in water and is freely soluble in alcohol. It is practically insoluble in ether.

Identification—

A: Place about 10 mg. of Hyoscyamine Sulfate in a porcelain dish, add 5 drops of nitric acid, evaporate to dryness on a steam bath, and add a few drops of alcoholic potassium hydroxide T.S. to the residue: a violet color is produced.

B: To about 1 ml. of a solution of Hyoscyamine Sulfate (1 in 20) add gold chloride T.S., dropwise with shaking, until a definite precipitate separates. Add a small amount of diluted hydrochloric acid, dissolve the precipitate with the aid of heat and allow the solution to cool: lustrous golden-yellow scales are formed (*distinction from atropine and scopolamine*).

C: Hyoscyamine Sulfate (1 in 20) responds to the test for *Sulfate*, page 810.

Melting temperature, page 814—Hyoscyamine Sulfate, previously dried at 105° for 4 hours, does not melt below 200°.

Water, page 900—Determine the water content of Hyoscyamine Sulfate by the titrimetric method: not less than 4 percent and not more than 6 percent is found.

Specific rotation, page 822—The specific rotation of Hyoscyamine Sulfate, previously dried at 105° for 4 hours, determined in a solution in water containing 500 mg. of Hyoscyamine Sulfate in each 10 ml., is not less than −24°.

Readily carbonizable substances, page 856—Dissolve 200 mg. of Hyoscyamine Sulfate in 5 ml. of sulfuric acid T.S.: the solution has no more color than Matching Fluid A.

Residue on ignition, page 858—Hyoscyamine Sulfate yields not more than 0.2 percent of residue on ignition.

Other alkaloids—Dissolve 250 mg. of Hyoscyamine Sulfate in 1 ml. of 0.1 *N* hydrochloric acid and dilute with water to make 15 ml. To 5 ml. of the solution add a few drops of platinic chloride T.S.: no precipitate is formed. To another 5-ml. portion, add 2 ml. of ammonia T.S.: the mixture may develop a slight opalescence, but no turbidity or precipitate is formed immediately.

Assay—Dissolve about 1 g. of Hyoscyamine Sulfate, accurately weighed, in 50 ml. of glacial acetic acid, and titrate with 0.1 *N* perchloric acid in glacial acetic acid, determining the end-point potentiometrically. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 67.68 mg. of $(C_{17}H_{23}NO_3)_2.H_2SO_4$.

Packaging and storage—Preserve Hyoscyamine Sulfate in tight, light-resistant containers.

CATEGORY—Anticholinergic.

USUAL DOSE RANGE—**125** to **250 mcg.** three or four times a day.

Hyoscyamine Sulfate Tablets

Hyoscyamine Sulfate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $(C_{17}H_{23}NO_3)_2 . H_2SO_4 . 2H_2O$.

Identification—Macerate a quantity of powdered Hyoscyamine Sulfate Tablets, equivalent to about 5 mg. of hyoscyamine sulfate, with 20 ml. of water, and transfer to a separator. Make the solution alkaline with ammonia T.S., and extract the alkaloid with 50 ml. of chloroform. Filter the chloroform layer, divide it into two equal portions, and evaporate to dryness. Perform tests *A* and *B* on the residue.

A: To one portion of the dry residue add 2 drops of nitric acid, evaporate to dryness on a steam bath, and add a few drops of alcoholic potassium hydroxide T.S.: a violet color is produced.

B: Dissolve the other portion of the residue in 1 ml. of 0.1 *N* hydrochloric acid, and add gold chloride T.S., dropwise with shaking, until a definite precipitate separates. Slowly heat until the precipitate dissolves, and allow the solution to cool: lustrous golden yellow scales are formed.

Disintegration, page 878—The disintegration time limit for Hyoscyamine Sulfate Tablets is 10 minutes.

Content uniformity, *Method I,* page 799—Hyoscyamine Sulfate Tablets meet the requirements of the content uniformity test for tablets.

Assay—

Internal standard solution—Prepare a solution in chloroform containing 100.0 mg. of anthracene in each ml.

Standard preparation—Transfer about 12.5 mg. of NF Hyoscyamine Sulfate Reference Standard, accurately weighed, to a 100-ml. volumetric flask, add water to volume, and mix. Transfer 2.0 ml. of this solution to a 60-ml. separator, and continue as directed under *Assay preparation,* beginning with "... add 20 ml. of water and 5 drops of ammonia T.S. ..."

Assay preparation—Weigh and finely powder not less than 20 Hyoscyamine Sulfate Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 250 mcg. of hyoscyamine sulfate, to a 60-ml. separator, add 20 ml. of water and 5 drops of ammonia T.S., and extract with three 25-ml. portions of chloroform, filtering each extract through cotton into a suitable container. Evaporate the combined extracts to a volume of about 5 ml. on a steam bath with the aid of a current of air. With the aid of about 5 ml. of chloroform, transfer the residual liquid to a 10-ml. glass-stoppered conical flask, evaporate to near dryness in the same manner, and then remove the last few ml. of chloroform at reduced pressure. Transfer 2.0 ml. of *Internal standard solution* to the flask, and swirl to dissolve. Use the resultant solution as directed in the *Procedure.*

Procedure—Inject an appropriate volume of the *Standard preparation* into a suitable gas chromatograph equipped with a flame-ionization detector, and record the chromatogram. Under typical conditions, the instrument contains a 1-meter × 6-mm. (outside diameter) glass column packed with 5 percent methyl silicone gum on 80 to 100-mesh or 100 to 120-mesh acid-washed, silanized, flux-calcined siliceous earth. The column is maintained at 200° and the injector port and detector block at 230°; helium is used as the carrier gas at a flow rate of 50 ml. per minute.

Measure the peak height of each component, recording the height of the anthracene peak as P_1 and that of the hyoscyamine peak as P_2.

Similarly, inject an appropriate volume of the *Assay preparation* into the chromatograph, and record the chromatogram under the same conditions as described for the *Standard preparation.* Measure the peak height of each component, recording the height of the anthracene peak as p_1 and that of the hyoscyamine peak as p_2.

Calculate the quantity, in mcg., of $(C_{17}H_{23}NO_3)_2 . H_2SO_4 . 2H_2O$ in the portion of Tablets taken by the formula $C \times (p_2 \times P_1)/(p_1 \times P_2)$, in which C is the exact equivalent concentration, in mcg. per ml., of hyoscyamine sulfate in the *Standard preparation.*

Packaging and storage—Preserve Hyoscyamine Sulfate Tablets in tight, light-resistant containers.

Tablets available—Hyoscyamine Sulfate Tablets usually available contain the following amounts of hyoscyamine sulfate: 125 mcg. and 250 mcg.

CATEGORY and DOSE—See Hyoscyamine Sulfate.

Hypophosphorous Acid

H_3PO_2 Mol. wt. 66.00

Hypophosphorous Acid contains not less than 30.0 percent and not more than 32.0 percent of H_3PO_2.

Description—Hypophosphorous Acid is a colorless or slightly yellow, odorless liquid. Its specific gravity is about 1.13.

Identification—Hypophosphorous Acid responds to the tests for *Hypophosphite,* page 808.

Test liquid—Hypophosphorous Acid, diluted with 3 volumes of water, meets the requirements of the following tests for *Arsenic, Barium,* and *Oxalate.*

Arsenic—Mix 25 ml. of the *Test liquid* with 5 ml. of 30 percent hydrogen peroxide solution, and evaporate to dryness on a steam bath. Cool, add 10 ml. of diluted sulfuric acid, and evaporate to strong fuming of sulfur trioxide, cool, add cautiously 10 ml. of water, and again evaporate to strong fuming, repeating if necessary to remove any trace of hydrogen peroxide. Cool, and dilute cautiously with water to 35 ml. This *Test Preparation* meets the requirements of the *Arsenic Test,* page 777 (1.5 parts per million As).

Barium—Neutralize 30 ml. of the *Test liquid* with ammonia T.S.: the mixture exhibits little or no precipitation. Filter, acidify 10 ml. of the filtrate with hydrochloric acid, and add 2 ml. of potassium sulfate T.S.: no turbidity is produced.

Oxalate—Another 10-ml. portion of the filtrate obtained in the test for *Barium* shows no turbidity upon the addition of 1 ml. of calcium chloride T.S.

Heavy metals, page 806—Place 0.9 ml. (1 g.) of Hypophosphorous Acid in a small beaker, and add 3 ml. of water. Add 1 ml. of nitric acid, and evaporate on a steam bath to about 1 ml. Again add 1 ml. of nitric acid, and evaporate on the steam bath. Dissolve the residue in 3 ml. of water, add ammonia T.S. until the solution is distinctly alkaline to litmus, then boil gently until the odor of ammonia disappears. Add 2 ml. of diluted acetic acid and 15 ml. of warm water, filter, and dilute the filtrate with water to 25 ml.: the heavy metals limit for Hypophosphorous Acid is 20 parts per million.

Assay—Pour about 7 ml. of Hypophosphorous Acid into a tared, glass-stoppered flask, and weigh accurately. Dilute with about 25 ml. of water, add phenolphthalein T.S., and titrate with 1 *N* sodium hydroxide. Each ml. of 1 *N* sodium hydroxide is equivalent to 66.00 mg. of H_3PO_2.

Packaging and storage—Preserve Hypophosphorous Acid in tight containers.

CATEGORY—Antioxidant.

Ichthammol

Ichthammol is obtained by the destructive distillation of certain bituminous schists, sulfonating the distillate, and neutralizing the product with ammonia. Ichthammol yields not less than 2.5 percent of NH_3 (ammonia) and not less than 10.0 percent of total S (sulfur).

Description—Ichthammol is a reddish brown to brownish black, viscous fluid, with a strong, characteristic, empyreumatic odor.

Solubility—Ichthammol is miscible with water, with glycerin, and with fixed oils and fats. It is partially soluble in alcohol and in ether.

Identification—

A: To a solution of Ichthammol (1 in 10) add hydrochloric acid: a dark, resinous precipitate is formed which is insoluble in ether.

B: To a solution of Ichthammol (1 in 10) add sodium hydroxide T.S., and heat to the boiling point: ammonia is evolved.

Loss on drying, page 814—Dry Ichthammol at 80° for 8 hours and continue the drying at 100° to constant weight: it loses not more than 50 percent of its weight.

Residue on ignition, page 858—Ichthammol yields not more than 0.5 percent of residue on ignition.

Limit for ammonium sulfate—Accurately weigh about 1 g. of Ichthammol, transfer to a 100-ml. beaker, and add 25 ml. of alcohol. Stir thoroughly, filter, and wash the filter with a mixture of equal parts of ether and alcohol until the last washing is clear and colorless. Air-dry the filter and residue, and pass 200 ml. of warm water, slightly acidified with hydrochloric acid, through the residue on the filter. Heat the filtrate to boiling, add barium chloride T.S. in excess, and heat for 30 minutes on a steam bath. Collect the precipitate of barium sulfate on a filter, wash it well, dry, and ignite to constant weight. Each g. of barium sulfate is equivalent to 566.1 mg. of $(NH_4)_2SO_4$. Ichthammol contains not more than 8 percent of ammonium sulfate.

Assay for ammonia—Dissolve about 5 g. of Ichthammol, accurately weighed, in 100 ml. of water, transfer the solution to a distillation flask, add 1 ml. of octyl alcohol and 20 ml. of sodium hydroxide solution (1 in 2.5). Connect the flask to a condenser by means of a spray trap and immerse the lower outlet tube of the condenser in 30.0 ml. of 0.5 *N* sulfuric acid. Distil slowly and collect about 50 ml. of distillate, then titrate the excess acid with 0.5 *N* sodium hydroxide, using methyl red T.S. as the indicator. Each ml. of 0.5 *N* sulfuric acid is equivalent to 8.515 mg. of NH_3.

Assay for total sulfur—Transfer from 500 to 800 mg. of Ichthammol, accurately weighed, into a Kjeldahl flask with the aid of 20 ml. of water. Add 3 g. of potassium chlorate, then add slowly 30 ml. of nitric acid, and evaporate the mixture on a hot plate to about 5 ml. Repeat the oxidation with 3 g. of potassium chlorate and 30 ml. of nitric acid, and evaporate to about 5 ml. Add 25 ml. of hydrochloric acid and again evaporate to about 5 ml. Add 100 ml. of water, heat to boiling, filter, and wash well. To the hot filtrate add 25 ml. of barium chloride T.S., and heat on a steam bath for 1 hour. Collect the barium sulfate on a previously ignited and tared filter crucible, wash, dry, and ignite, then cool, and weigh. Each g. of barium sulfate is equivalent to 137.4 mg. of S.

Packaging and storage—Preserve Ichthammol in well-closed containers.

CATEGORY—Local anti-infective.

FOR EXTERNAL USE—Topically as a 10 percent ointment.

Ichthammol Ointment

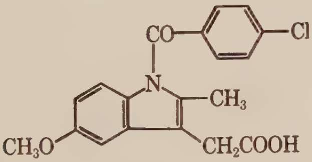
Ichthammol	**100 g.**
Anhydrous Lanolin	**100 g.**
Petrolatum	**800 g.**
To make	**1000 g.**

Thoroughly incorporate the ichthammol with the anhydrous lanolin and then combine this mixture with the petrolatum.

Packaging and storage—Preserve Ichthammol Ointment in tight containers and avoid prolonged exposure to temperatures above 30°.

CATEGORY—See Ichthammol.

Indomethacin*



1-(*p*-Chlorobenzoyl)-5-methoxy-2-methylindole-3-acetic Acid

$C_{19}H_{16}ClNO_4$ Mol. wt. 357.80

Indomethacin contains not less than 98.0 percent and not more than 101.0 percent of $C_{19}H_{16}ClNO_4$, calculated on the dried basis.

Description—Indomethacin occurs as a pale yellow to a yellow-tan, crystalline powder. It is odorless or has a slight odor. It is sensitive to light. It exhibits polymorphism, one form melting at about 155° and the other at about 162°. It may occur as a mixture of both forms, which mixture may melt within the range of about 155° to 162°.

Solubility—Indomethacin is practically insoluble in water. It is sparingly soluble in alcohol, in chloroform, and in ether.

Identification—

A: Dissolve 300 mg. of Indomethacin in 15 ml. of methanol. To a 5-ml. portion of this solution add one pellet of sodium hydroxide, shake to dissolve, and allow to stand for 5 minutes: the color of the solution changes from a strong yellow through greenish yellow and colorless, to a very light yellow. To another 5-ml. portion add 2.5 ml. of hydrochloric acid: a heavy white precipitate forms, and the supernatant liquid is decolorized to a very light yellow.

B: Dissolve 100 mg. of Indomethacin in 100 ml. of water containing 0.5 ml. of sodium hydroxide T.S. To a 1-ml. portion add 1 ml. of freshly prepared sodium nitrite solution (1 in 1000), allow to stand for about 5 minutes, and add 0.5 ml. of sulfuric acid: a golden yellow color appears. To another 1-ml. portion add 1 ml. of the sodium nitrite solution, allow to stand for about 5 minutes, and add 0.5 ml. of hydrochloric acid: a green color appears.

Infrared absorption, page 866—The

---

* Patented. See notice, page ii.

infrared absorption spectrum of a mineral oil dispersion of Indomethacin, previously dried at 100° for 2 hours at a pressure below 5 mm. of mercury, exhibits maxima only at the same wavelengths as that of NF Indomethacin Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 40,000 solution of Indomethacin in 0.1 *N* methanolic hydrochloric acid exhibits maxima and minima at the same wavelengths as that of NF Indomethacin Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorbance occurring at about 318 mμ, do not differ by more than 3 percent.

X-ray diffraction, page 902—The X-ray diffraction pattern of Indomethacin conforms to the following pattern:

d	I/I_1
8.70	30
7.60	100
6.96	19
5.31	80
5.21	40
5.12	45

3.10	9
3.04	24
2.93	17
2.73	9
2.62	9
2.39	14

Loss on drying, page 814—Dry Indomethacin at 100° for 2 hours at a pressure below 5 mm. of mercury: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Indomethacin yields not more than 0.2 percent of residue on ignition.

Heavy metals, *Method II*, page 806—The heavy metals limit for Indomethacin is 20 parts per million.

Alkaline hydrolysis—Transfer about 450 mg. of Indomethacin, accurately weighed, to a glass-stoppered conical flask, and dissolve in 25.0 ml. of carbon dioxide-free methanol. While flushing the flask with a stream of carbon dioxide-free nitrogen, add 5.0 ml. of carbon dioxide-free 1 *N* sodium hydroxide, mix, and stopper immediately. Allow to stand for 15 minutes, again flush the flask with carbon dioxide-free nitrogen, add 30 ml. of carbon dioxide-free water, and mix. Restopper immediately, and allow to stand for 90 minutes. Wash the stopper and sides of the flask with 50 ml. of carbon dioxide-free water, add 3 drops of phenolphthalein T.S., and, with continuous nitrogen flush, titrate the excess alkali with 0.1 *N* hydrochloric acid. Determine the normality, N_3, of the 0.1 *N* hydrochloric acid under the conditions of the test by taking an accurately measured volume (3.0 ml.) of the 1 *N* sodium hydroxide, adding 25.0 ml. of carbon dioxide-free methanol, and proceeding as directed for the sample, beginning with "While flushing the flask ..." Calculate the quantity, in mg., of sodium hydroxide required to hydrolyze 1 g. of the sample by the formula $[40(5N_2 - V_4N_3)/W_2] - [40(V_1 - V_2)(N_1)/W_1]$, in which N_1 is the exact normality, and V_1 the volume, in ml., of the 0.1 *N* sodium hydroxide used in the *Assay;* N_2 is the exact normality of the 1 *N* sodium hydroxide used in the alkaline hydrolysis procedure; V_2 is the volume, in ml., of the 0.1 *N* sodium hydroxide used to titrate the blank in the *Assay;* N_3 is the exact normality, and V_4 is the volume, in ml., of the 0.1 *N* hydrochloric acid used to titrate the sample in the alkaline hydrolysis procedure; W_1 is the weight of the *Assay* sample, in g., calculated on the dried basis; and W_2 is the weight of the alkaline hydrolysis sample, in g., calculated on the dried basis: not less than 109 mg. and not more than 113 mg. of sodium hydroxide is required to hydrolyze each g. of Indomethacin, calculated on the dried basis.

Assay—Transfer about 450 mg. of Indomethacin, accurately weighed, to a 250-ml. conical flask, add 75 ml. of methanol which has been purged with carbon dioxide-free nitrogen for 15 minutes, and stir magnetically until the sample has dissolved. Flush out the air above the solution with carbon dioxide-free nitrogen. With continued nitrogen flush, add 75 ml. of carbon dioxide-free water and 0.2 ml. of phenolphthalein T.S., and titrate with 0.1 *N* sodium hydroxide. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* sodium hydroxide is equivalent to 35.78 mg. of $C_{19}H_{16}ClNO_4$.

Packaging and storage—Preserve Indomethacin in well-closed, light-resistant containers.

Category—Anti-inflammatory (nonsteroid).

Usual dose range—**25** or **50 mg.** two or three times a day.

Indomethacin Capsules

Indomethacin Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{19}H_{16}ClNO_4$.

Identification—Transfer the contents of Indomethacin Capsules, equivalent to about 100 mg. of indomethacin, to a test tube containing 15 ml. of methanol, agitate for a few minutes, and then centrifuge: the supernatant liquid responds to *Identification tests A* and *B* under *Indomethacin*, page 367.

Content uniformity, *Method I*, page 798—Indomethacin Capsules meet the requirements of the content uniformity test for capsules.

Dissolution, *Method II*, page 802—Accurately weigh 10 Indomethacin Capsules, and determine the average weight per Capsule. Accurately weigh one of the Capsules, place it in one of the tubes of the basket rack assembly (modified by placing a 10-mesh stainless steel cloth on top of the basket to prevent the capsules from floating out of the tube), and operate the apparatus, using a mixture of 150 ml. of pH 7.2 phosphate buffer solution (page 784) and 600 ml. of water as the *Dissolution Fluid*, contained in a 1000-ml. beaker 14.5 cm. in height and 10 cm. inside diameter. Determine the amount of $C_{19}H_{16}ClNO_4$ in solution after the apparatus has operated for 15 minutes by determining the ultraviolet absorption of filtered aliquots removed from the dissolution solution, diluted with the *Dissolution Fluid* to a concentration of about 30 mcg. of indomethacin per ml., at the maximum at about 318 mμ, in 1-cm. cells, with a suitable spectrophotometer, using the *Dissolution Fluid* as the blank, and utilizing a standard curve, representing absorbance *versus* concentration of NF Indomethacin Reference Standard, similarly measured. Calculate the percent of the labeled amount of $C_{19}H_{16}ClNO_4$ in the Capsule dissolved after 15 minutes, adjusted for weight variation. Repeat the test on 5 more Capsules, tested individually. The requirements are met if the average of the 6 Capsules is not less than 80 percent of the labeled amount. If the average is less than 80 percent, repeat the test on an additional 12 Capsules, tested individually. The requirements are met if the average of the 18 determinations is not less than 80 percent, and if not more than 5 of the 18 results are below 80 percent.

Assay—

Standard preparation—Transfer about 25 mg. of NF Indomethacin Reference Standard, accurately weighed, to a 200-ml. volumetric flask, dissolve in 2 ml. of methanol, dilute to volume with pH 7.2 phosphate buffer, page 784, and mix. Transfer 25.0 ml. of this solution to a separator, and extract with three 25-ml. portions of methylene chloride. Filter the extracts through a pledget of cotton into a 100-ml. volumetric flask, rinse the filter with methylene chloride, dilute to volume with methylene chloride, and mix.

Assay preparation—Transfer as completely as possible the contents of not less than 20 Indomethacin Capsules to a suitable tared container, and determine the average content weight per capsule. Mix the combined contents thoroughly, and transfer an accurately weighed portion, equivalent to about 25 mg. of indomethacin, to a 200-ml. volumetric flask, add 2 ml. of methanol, shake for 10 minutes, dilute to volume with pH 7.2 phosphate buffer, and mix. Transfer about 50 ml. to a centrifuge tube, and centrifuge for 15 minutes. Transfer 25.0 ml. of the supernatant liquid to a 125-ml. separator and extract with three 25-ml. portions of methylene chloride. Filter the extracts through a pledget of cotton into a 100-ml. volumetric flask, rinse the filter with methylene chloride, dilute to volume with methylene chloride, and mix.

Procedure—Concomitantly determine the absorbances of the solutions in 1-cm. cells, at the maximum at about 318 mμ, with a suitable spectrophotometer, using methylene chloride as the blank. Record the absorbance of the *Standard preparation* as A_S and that of the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{19}H_{16}ClNO_4$ in the portion of Capsules taken by the formula $0.8C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*.

Packaging and storage—Preserve Indomethacin Capsules in well-closed containers.

Capsules available—Indomethacin Capsules usually available contain the following amounts of indomethacin: 25 mg. and 50 mg.

Category and Dose—See Indomethacin.

Iodine Ampuls

Iodine Ampuls contain, in each 100 ml., not less than 1.8 g. and not more than 2.2 g. of I, and not less than 2.1 g. and not more than 2.6 g. of NaI.

NOTE: Iodine Ampuls contain Iodine Tincture USP.

Assay—Proceed as directed in the *Assay* under *Iodine Solution*, page 370.

Alcohol content, page 772—Iodine Ampuls contain from 44 to 50 percent (v/v) of C_2H_5OH.

CATEGORY—Local anti-infective.

Iodine Solution

Iodine Solution contains, in each 100 ml., not less than 1.8 g. and not more than 2.2 g. of I, and not less than 2.1 g. and not more than 2.6 g. of NaI.

Iodine	**20 g.**
Sodium Iodide	**24 g.**
Purified Water, a sufficient quantity,	
To make	**1000 ml.**

Dissolve the iodine and sodium iodide in 50 ml. of purified water, then add sufficient purified water to make the product measure 1000 ml.

Description—Iodine Solution is a transparent liquid, having a reddish brown color and the odor of iodine.

Identification—Add 1 drop of Iodine Solution to a mixture of 1 ml. of starch T.S. and 9 ml. of water: a deep blue color is produced.

Assay—Pipet 5.0 ml. of Iodine Solution into a 500-ml. glass-stoppered flask, and dilute with 10 ml. of water. Titrate with 0.1 *N* potassium arsenite, using starch T.S. as the indicator. Each ml. of 0.1 *N* potassium arsenite is equivalent to 12.69 mg. of I. To the titration mixture add 25 ml. of hydrochloric acid and 5 ml. of chloroform, and cool to room temperature. Titrate with 0.05 *M* potassium iodate until the purple color of iodine disappears from the chloroform. The last portion of iodate solution must be added dropwise, the mixture being agitated vigorously and continuously. After the chloroform has been decolorized, allow the mixture to stand for 5 minutes. If the chloroform develops a purple color, the mixture should be titrated further with the iodate solution. The difference between the number of ml. of 0.05 *M* potassium iodate used and the number of ml. of 0.1 *N* potassium arsenite used, multiplied by 14.99, equals the number of mg. of NaI in the volume of Solution taken for the assay.

Packaging and storage—Preserve Iodine Solution in tight, light-resistant containers, preferably at a temperature not above 35°.

CATEGORY—Local anti-infective.

Iodized Oil

Iodized Oil is an iodine addition product of vegetable oil or oils, containing not less than 38.0 percent and not more than 42.0 percent of organically combined I (iodine). It is sterile.

Description—Iodized Oil is a thick, viscous, oily liquid, having an alliaceous odor, and an oleaginous taste. Iodized Oil decomposes on exposure to air and sunlight, becoming dark brown in color.

Solubility—Mix 1 ml. of Iodized Oil with 10 ml. of solvent hexane: a clear solution results.

Identification—Mix 0.2 ml. of Iodized Oil with 1 g. of anhydrous sodium carbonate in a small porcelain crucible, cover with 1 g. of anhydrous sodium carbonate, well pressed down, and heat the crucible rapidly and strongly for 10 minutes. Allow the crucible and contents to cool, and dissolve the residue in 20 ml. of hot water. Filter the solution, and add hydrochloric acid cautiously until effervescence ceases. Place 10 ml. of the solution in a test tube, add 2 ml. of chloroform and a few drops of chlorine T.S., and mix: a violet color is produced in the chloroform layer.

Acidity—Dissolve 1 ml. of Iodized Oil in 10 ml. of chloroform in a glass-stoppered cylinder, add 3 drops of phenolphthalein T.S. and 0.3 ml. of 0.1 *N* sodium hydroxide, stopper, and shake the mixture vigorously: a red color is produced.

Residue on ignition, page 858—Iodized Oil yields not more than 0.1 percent of residue on ignition.

Sterility—Iodized Oil meets the requirements under *Sterility Tests*, page 874.

Assay—Weigh accurately about 18 mg. of Iodized Oil in a tared methylcellulose capsule, and proceed as directed under *Oxygen Flask Combustion*, page 823, beginning with "Place the sample, together with a paper fuse-strip . . . ," and using a mixture of 10 ml. of sodium hydroxide solution (1 in 100) and 1 ml. of freshly prepared sodium bisulfite solution (1 in 100) as the absorbing liquid. Following combustion, pipet 1.0 ml. of bromine-sodium acetate T.S. into the cup of the flask, loosen the stopper and allow the solution to be sucked into the flask. Wash down the cup and the ground joint with water, stopper the flask and shake it vigorously, then add 5 drops of formic acid, and again shake the flask. Remove the stopper, and rinse the stopper and sample holder with water, collecting the rinsings in the flask. Bubble nitrogen through the solution to displace all the oxygen from the solution and the flask. Add 500 mg. of potassium iodide and 3 ml. of diluted sulfuric acid, allow the mixture to stand for 2 minutes, and titrate the liberated iodine with 0.05 *N* sodium thiosulfate, adding starch T.S. as the indicator. Each ml. of 0.05 *N* sodium thiosulfate is equivalent to 1.058 mg. of iodine (I).

Packaging and storage—Preserve Iodized Oil in well-filled, single-dose or multiple-dose, light-resistant containers.

CATEGORY—Diagnostic aid (radiopaque—hysterosalpingographic).

USUAL DOSE RANGE—**1** to **30 ml.** by special injection, and depending on procedure.

Iodochlorhydroxyquin and Hydrocortisone Cream

Iodochlorhydroxyquin and Hydrocortisone Cream contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of C_9H_5ClINO (iodochlorhydroxyquin) and of $C_{21}H_{30}O_5$ (hydrocortisone).

Identification—

A: The infrared absorption spectrum of the *Assay preparation*, prepared as directed in the *Assay for iodochlorhydroxyquin*, determined in a 3-mm. cell, exhibits maxima in the region from 7 μ to 11 μ only at the same wavelengths as that of the *Standard preparation*, prepared as directed in the *Assay*, similarly measured.

B: Evaporate 50 ml. of the *Assay preparation*, prepared as directed in the *Assay for hydrocortisone*, just to dryness on a steam bath, and dissolve the residue in 0.5 ml. of a 1:1 mixture of chloroform and methanol. On a suitable thin-layer chromatographic plate (see page 791), coated with a 0.25-mm. layer of chromatographic silica gel mixture, spot 10 μl. of this solution and 10 μl. of a 1:1 chloroform-methanol solution of USP Hydrocortisone Reference Standard containing 10 mg. per ml. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of chloroform and methanol (9:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, and allow the solvent to evaporate. Observe under shortwave ultraviolet light, and mark the location of the spots. Spray the plate with a reagent prepared by cautiously dissolving 0.8 ml. of formaldehyde in 10 ml. of sulfuric acid and then adding 3 ml. of water, and heat the plate for 10 minutes at 80°: the R_f value of the main spot from the sample corresponds to that obtained from the Reference Standard solution.

Weight variation, page 901—Iodochlorhydroxyquin and Hydrocortisone Cream meets the requirements of the weight variation test for creams.

Assay for iodochlorhydroxyquin—

NOTE—All glassware should be free from metal contamination.

Standard preparation—Dissolve an accurately weighed amount of USP Iodochlorhydroxyquin Reference Standard, previously dried over phosphorus pentoxide for 5 hours, in sufficient carbon disulfide to obtain a solution containing about 3 mg. per ml.

Assay preparation—Transfer an accurately weighed portion of Iodochlorhydroxyquin and Hydrocortisone Cream, equivalent to about 30 mg. of iodochlorhydroxyquin, to a centrifuge tube, suspend in 10 ml. of carbon tetrachloride by shaking, add 3 ml. of water, and shake for 2 minutes. Centrifuge, and filter the carbon tetrachloride layer through a pledget of cotton into a second centrifuge tube. Repeat the extraction with one 10-ml. and one 5-ml. portion of carbon tetrachloride, and evaporate the combined extracts to about 2 ml. Retain the aqueous phase and the cotton pledget for the *Assay for hydrocortisone.* Extract the residual carbon tetrachloride solution with one 10-ml. followed by three 5-ml. portions of 3.5 *M* hydrochloric acid, filtering each extract through cotton into a 125-ml. separator. To the combined extracts add 3.5 *M* sodium hydroxide, with cooling, until the pH of the solution is between 1 and 2, and then extract with two 5-ml. portions of carbon disulfide. Filter the carbon disulfide phase through cotton into a 10-ml. volumetric flask, dilute to volume with carbon disulfide, and mix. Retain the acid phase for the *Assay for hydrocortisone.*

Procedure—Concomitantly determine the absorbances of the solutions in 3-mm. cells at the maximum of about 14.4 μ and at the minimum at about 14.9 μ, with a suitable infrared spectrophotometer, using carbon disulfide as the blank. Record the absorbances of the *Standard preparation* at 14.4 μ and 14.9 μ as $A_{S14.4}$ and $A_{S14.9}$, respectively, and the absorbances of the *Assay preparation* at 14.4 μ and 14.9 μ as $A_{U14.4}$ and $A_{U14.9}$, respectively. Calculate the quantity, in mg., of C_9H_5ClINO in the portion of the Cream taken by the formula $10C \times (A_{U14.4} - A_{U14.9})/(A_{S14.4} - A_{S14.9})$, in which C is the exact concentration of the *Standard preparation*, in mg. per ml.

Assay for hydrocortisone—

Standard preparation—Prepare as directed under *Steroid Assay*, page 876, using USP Hydrocortisone Reference Standard.

Assay preparation—With the aid of alcohol, quantitatively transfer the aqueous phase, reserved in the *Assay for iodochlorhydroxyquin*, to a 100-ml. volumetric flask, filtering it through the pledget of cotton reserved in the *Assay* for *iodochlorhydroxyquin*. Extract the acid phase, also reserved in the *Assay for iodochlorhydroxyquin*, with three 10-ml. portions of chloroform, and filter each extract through a pledget of cotton. Evaporate the combined chloroform extracts to dryness on a steam bath, and quantitatively transfer the residue, dissolved in alcohol, to the volumetric flask containing the aqueous phase. Dilute to volume with alcohol, and mix. Transfer an accurately measured volume, V, in ml., of this solution, equivalent to about 1 mg. of hydrocortisone, to a second 100-ml. volumetric flask, dilute to volume with alcohol, and mix. Transfer 20.0 ml. of this final solution to a glass-stoppered, 50-ml. conical flask.

Procedure—Proceed as directed for *Procedure* under *Steroid Assay*, page 876. Calculate the quantity, in mg., of $C_{21}H_{30}O_5$ in the portion of Cream taken by the formula $10 \times (C/V) \times (A_U/A_S)$, in which V is as defined under *Assay preparation*.

Packaging and storage—Preserve Iodochlorhydroxyquin and Hydrocortisone Cream in well-closed containers.

Creams available—Iodochlorhydroxyquin and Hydrocortisone Cream usually available contains 3 percent of iodochlorhydroxyquin and 0.5 percent or 1 percent of hydrocortisone.

CATEGORY—Local anti-infective; glucocorticoid.

APPLICATION—Topically to affected area 3 or 4 times daily as a cream containing 3 percent iodochlorhydroxyquin and 0.5 or 1 percent hydrocortisone.

Iodochlorhydroxyquin and Hydrocortisone Lotion

Iodochlorhydroxyquin and Hydrocortisone Lotion contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of C_9H_5ClINO (iodochlorhydroxyquin) and of $C_{21}H_{30}O_5$ (hydrocortisone).

Identification—

A: The infrared absorption spectrum of the *Assay preparation*, prepared as directed in the *Assay for iodochlorhydroxyquin*, determined in a 3-mm. cell, exhibits maxima in the region of 7 μ to 11 μ only at the same wavelengths as that of the *Standard preparation* prepared as directed in the *Assay*, similarly measured.

B: A 50-ml. portion of the *Assay preparation*, prepared as directed in the *Assay for hydrocortisone*, meets the requirements of *Identification test B* under *Iodochlorhydroxyquin and Hydrocortisone Cream*, page 371.

Assay for iodochlorhydroxyquin—Proceed as directed in the *Assay for iodochlorhydroxyquin* under *Iodochlorhydroxyquin and Hydrocortisone Cream*, page 371, using an accurately weighed portion of Iodochlorhydroxyquin and Hydrocortisone Lotion equivalent to about 30 mg. of iodochlorhydroxyquin.

Assay for hydrocortisone—Proceed as directed in the *Assay for hydrocortisone* under *Iodochlorhydroxyquin and Hydrocortisone Cream*, page 371.

Packaging and storage—Preserve Iodochlorhydroxyquin and Hydrocortisone Lotion in well-closed containers.

Lotion available—Iodochlorhydroxyquin and Hydrocortisone Lotion usually available contains 3 percent of iodochlorhydroxyquin and 1 percent of hydrocortisone.

CATEGORY—Local anti-infective; glucocorticoid.

APPLICATION—Topically to the affected area 3 or 4 times daily as a lotion containing 3 percent iodochlorhydroxyquin and 1 percent hydrocortisone.

Iodochlorhydroxyquin and Hydrocortisone Ointment

Iodochlorhydroxyquin and Hydrocortisone Ointment contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of C_9H_5ClINO (iodochlorhydroxyquin) and of $C_{21}H_{30}O_5$ (hydrocortisone).

Identification—

A: The infrared absorption spectrum of the *Assay preparation*, prepared as directed in the *Assay for iodochlorhydroxyquin*, determined in a 3-mm. cell, exhibits maxima in the region of 7 μ to 11 μ only at the same wavelengths as that of the *Standard preparation*, prepared as directed in the *Assay*, similarly measured.

B: A 50-ml. portion of the *Assay preparation*, prepared as directed in the *Assay for hydrocortisone*, meets the requirements of *Identification test B* under *Iodochlorhydroxyquin and Hydrocortisone Cream*, page 371.

Weight variation—Iodochlorhydroxyquin and Hydrocortisone Ointment meets the requirements of the weight variation test for ointment.

Assay for iodochlorhydroxyquin—Proceed as directed in the *Assay for iodochlorhydroxyquin* under *Iodochlorhydroxyquin and Hydrocortisone Cream*, page 371, using an accurately weighed portion of Iodochlorhydroxyquin and Hydrocortisone Ointment equivalent to about 30 mg. of iodochlorhydroxyquin.

Assay for hydrocortisone—Proceed as directed in the *Assay for hydrocortisone* under *Iodochlorhydroxyquin and Hydrocortisone Cream*, page 371.

Packaging and storage—Preserve Iodochlorhydroxyquin and Hydrocortisone Ointment in well-closed containers.

Ointments available—Iodochlorhydroxyquin and Hydrocortisone Ointment usually available contains 3 percent of iodochlorhydroxyquin and 0.5 or 1 percent of hydrocortisone.

CATEGORY—Local anti-infective; glucocorticoid.

APPLICATION—Topically to the affected area three or four times daily as an ointment containing 3 percent iodochlorhydroxyquin and 0.5 or 1 percent hydrocortisone.

Compound Iodochlorhydroxyquin Powder

Compound Iodochlorhydroxyquin Powder contains not less than 22.5 percent and not more than 27.5 percent of C_9H_5ClINO.

Iodochlorhydroxyquin	**250 g.**
Lactic Acid	**25 g.**
Zinc Stearate	**200 g.**
Lactose	**525 g.**
To make	**1000 g.**

Mix the lactic acid with the lactose, then add the iodochlorhydroxyquin and the zinc stearate, and mix the Powder.

Identification—Place a quantity of Compound Iodochlorhydroxyquin Powder, equivalent to about 30 mg. of iodochlorhydroxyquin, in a 50-ml. glass-stoppered conical flask, add 20 ml. of 1 *N* sulfuric acid, and shake 5 minutes. Filter, transfer 5 ml. of the filtrate to a glass-stoppered test tube, add 5 drops of potassium dichromate T.S. and 2 ml. of chloroform, and shake well: a red-violet color develops in the chloroform layer.

Assay—Transfer an accurately weighed quantity of Compound Iodochlorhydroxyquin Powder, equivalent to about 50 mg. of iodochlorhydroxyquin, to a 200-ml. volumetric flask, add 100 ml. of 3 *N* hydrochloric acid, and shake mechanically for 15 minutes. Add 3 *N* hydrochloric acid to volume, and mix. Filter a portion of the solution, dilute 4.0 ml. of the filtrate with 3 *N* hydrochloric acid to 200.0 ml., and mix. Concomitantly determine the absorbance of this solution and of a solution of USP Iodochlorhydroxyquin Reference Standard, in the same medium, at a concentration of about 5 mcg. per ml., in 1-cm. cells, at the maximum at about 267 mμ, with a suitable spectrophotometer, using 3 *N* hydrochloric acid as the blank. Calculate the quantity, in mg., of C_9H_5ClINO in the portion of the Powder taken by the formula $10C \times (A_U/A_S)$, in which C is the exact concentration of the Reference Standard solution, in mcg. per ml., A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Compound Iodochlorhydroxyquin Powder in well-closed, light-resistant containers.

CATEGORY—Antitrichomonal (vaginal tract).

APPLICATION—Topically as required.

Iodochlorhydroxyquin Tablets

Iodochlorhydroxyquin Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of C_9H_5ClINO.

Identification—Transfer a portion of finely powdered Iodochlorhydroxyquin Tablets, equivalent to about 25 mg. of iodochlorhydroxyquin, to a 100-ml. volumetric flask, add about 75 ml. of 3 *N* hydrochloric acid, and shake to dissolve the iodochlorhydroxyquin. Add 3 *N* hydrochloric acid to volume, and mix. Filter a portion, and dilute 3 ml. of the filtrate with 3 *N* hydrochloric acid to 100 ml.: the ultraviolet absorption spectrum of the resulting solution exhibits maxima and minima at the same wavelengths as that of USP Iodochlorhydroxyquin Reference Standard, similarly measured.

Disintegration, page 878—The disintegration time limit for Iodochlorhydroxyquin Tablets is 30 minutes.

Weight variation, page 901—Iodochlorhydroxyquin Tablets meet the requirements of the weight variation test for tablets.

Assay—Weigh and finely powder not less than 20 Iodochlorhydroxyquin Tablets. Transfer a portion of the powder, equivalent to about 100 mg. of iodochlorhydroxyquin and accurately weighed, to a 250-ml. conical flask. Add 50 ml. of ethyl acetate, heat to boiling, and decant the hot, supernatant solution through a filter. Repeat the extraction with three additional 50-ml. portions of ethyl acetate, washing the residue and the filter. Combine the extracts, and evaporate on a steam bath to dryness. Dissolve the residue in about 40 ml. of acetone, add 2 ml. of glacial acetic acid and 20 ml. of a saturated solution of cupric acetate in methanol. Allow the mixture to stand for 5 minutes, and collect the precipitate on a tared, sintered-glass filter. Wash the precipitate with five 5-ml. portions of acetone and five 5-ml. portions of solvent hexane. Dry at 105° to constant weight: the weight of the copper complex so obtained, multiplied by 0.975, represents the weight of C_9H_5ClINO in the portion of the Tablets taken.

Packaging and storage—Preserve Iodochlorhydroxyquin Tablets in tight, light-resistant containers.

Tablets available—Iodochlorhydroxyquin Tablets usually available contain the following amount of iodochlorhydroxyquin: 250 mg.

CATEGORY—Antiamebic.

USUAL DOSE—**250 mg.** three times a day for 10 days; may repeat this 10-day regimen after 8 to 10 days.

USUAL DOSE RANGE—**250** to **500 mg.**

Iodoform

Triiodomethane

CHI_3 Mol. wt. 393.73

Iodoform, previously dried over phosphorus pentoxide for 4 hours, contains not less than 99.0 percent and not more than 100.5 percent of CHI_3.

Description—Iodoform occurs as a fine greenish yellow powder, or lustrous crystals. It has a peculiar, very penetrating, persistent odor. Iodoform is slightly volatile even at ordinary temperatures, and distils slowly with steam.

Solubility—Iodoform is sparingly soluble in alcohol, in glycerin, and in olive oil. It is freely soluble in chloroform and in ether, and is soluble in boiling alcohol. Iodoform is practically insoluble in water to which, however, it imparts its odor and taste.

Melting point, page 814—Iodoform melts to a brown liquid at about 115° and decomposes at a higher temperature, emitting vapors of iodine.

Loss on drying, page 814—Dry Iodoform over phosphorus pentoxide for 4 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Iodoform yields not more than 0.2 percent of residue on ignition.

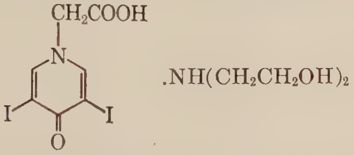
Coloring matter, acids, and alkalies—Shake about 2 g. of Iodoform with 5 ml. of water for 1 minute, and filter: the filtrate is colorless, free from bitter taste, and is neutral to litmus.

Assay—Dissolve about 200 mg. of Iodoform, previously dried over phosphorus pentoxide for 4 hours and accurately weighed, in 20 ml. of alcohol in a 500-ml. glass-stoppered conical flask. Add 30.0 ml. of 0.1 *N* silver nitrate and 10 ml. of nitric acid, stopper the flask, and set it aside overnight. Add 150 ml. of water and 5 ml. of ferric ammonium sulfate T.S., and titrate the excess silver nitrate with 0.1 *N* ammonium thiocyanate. Each ml. of 0.1 *N* silver nitrate is equivalent to 13.12 mg. of CHI_3.

Packaging and storage—Preserve Iodoform in tight, light-resistant containers, and avoid excessive heat.

CATEGORY—Local anti-infective.

Iodopyracet Injection



3,5-Diiodo-4-oxo-1(4*H*)-pyridineacetic Acid 2,2′-Iminodiethanol (1:1) Compound

$C_{11}H_{16}I_2N_2O_5$ Mol. wt. 510.07

Iodopyracet Injection is a sterile solution of iodopyracet in water for injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{11}H_{16}I_2N_2O_5$.

Description—Iodopyracet Injection occurs as a clear, nearly colorless liquid. It is neutral to litmus. Its specific gravity is about 1.19.

Identification—

A: Dilute 5 ml. of Iodopyracet Injection with 10 ml. of water, and add a slight excess of diluted hydrochloric acid. Collect the liberated acid on a filter and wash thoroughly with cold water. Retain the filtrate and washings. The precipitate of 3,5-diiodo-4-oxo-1(4*H*)-pyridineacetic acid, when dried at 105° for 1 hour, melts between 245° and 249°, page 814.

B: Dilute the combined filtrate and washings from *Identification test A* to 50 ml., cool in ice water, and filter. Evaporate 40 ml. of the filtrate to a syrupy consistency. Add 5 ml. of dehydrated alcohol, neutralize with 1 *N* sodium hydroxide, filter, and dilute to 10 ml. with dehydrated alcohol. Add 1 g. of picric acid, heat to boiling, and cool in ice water. Collect the crystals on a filter, recrystallize from alcohol, and dry over sulfuric acid in vacuum: the picrate so obtained melts between 108° and 110°, page 814. Retain the filtrate. (*Caution: Picrates may be explosive.*)

Residue on ignition, page 858—A 5-ml. portion of Iodopyracet Injection, after evaporation to dryness on a steam bath, yields not more than 5 mg. of residue on ignition (0.1 percent).

Iodide—To 10 ml. of the filtrate from *Identification test B* add 1 ml. of chloroform and 2 drops of ferric chloride T.S., and shake: the chloroform remains free from even a transient red-purple or purplish color.

Pyrogen—Iodopyracet Injection meets the requirements of the *Pyrogen Test*, page 851, the Injection being diluted with an equal volume of sterile water for injection.

Other requirements—Iodopyracet Injection meets the requirements under *Injections*, page 810.

Assay—Pipet into a glass-stoppered, 250-ml. conical flask a volume of Iodopyracet Injection, equivalent to about 350 mg. of iodopyracet. Add 30 ml. of sodium hydroxide solution (1 in 20) and 500 mg. of 30-mesh zinc, and reflux the mixture for 1 hour. Cool to room temperature, wash the condenser with 20 ml. of water, and filter the mixture. Wash the flask and the filter with small portions of water, adding the washings to the filtrate. Add to the filtrate 5 ml. of glacial acetic acid and 1 ml. of tetrabromophenolphthalein ethyl ester T.S., and titrate with 0.05 *N* silver nitrate until the color of the yellow precipitate just changes to green. Each ml. of 0.05 *N* silver nitrate is equivalent to 12.75 mg. of $C_{11}H_{16}I_2N_2O_5$.

Packaging and storage—Preserve Iodopyracet Injection in single-dose containers, preferably of Type I glass.

Injections available—Iodopyracet Injection usually available contains the following amounts of iodopyracet: 3.5 g. in 10 ml.; 7 g. in 20 ml.; 10.5 g. in 30 ml.

CATEGORY—Diagnostic aid (radiopaque–urographic).

USUAL DOSE—Intramuscular and intravenous, **20 ml.**

Ipodate, Calcium, page 121

Ipodate, Calcium, for Oral Suspension, page 122

Ipodate, Sodium, page 649

Ipodate, Sodium, Capsules, page 649

Iso-Alcoholic Elixir

Low-Alcoholic Elixir
High-Alcoholic Elixir, of each a calculated volume

Mix the ingredients.

Low-Alcoholic Elixir

Compound Orange Spirit	**10 ml.**
Alcohol	**100 ml.**
Glycerin	**200 ml.**
Sucrose	**320 g.**
Purified Water, a sufficient quantity,	
To make	**1000 ml.**

Mix the alcohol, glycerin, and 500 ml. of purified water, add the compound orange spirit, agitate thoroughly from time to time, and let stand 24 hours. Filter this solvent mixture through a hard filter paper, returning, if necessary, the first portions of the filtrate until it passes through clear. Dissolve the sucrose in the filtrate by agitation or percolation, and add enough of the solvent mixture to make the product measure 1000 ml.

Alcohol content, page 772—Low-Alcoholic Elixir contains from 8 to 10 percent (v/v) of C_2H_5OH.

Packaging and storage—Preserve Low-Alcoholic Elixir in tight containers.

High-Alcoholic Elixir

Compound Orange Spirit	**4 ml.**
Saccharin	**3 g.**
Glycerin	**200 ml.**
Alcohol, a sufficient quantity,	
To make	**1000 ml.**

Dissolve the compound orange spirit and the saccharin in 700 ml. of alcohol, add the glycerin and sufficient alcohol to make the product measure 1000 ml., mix well, and filter.

Alcohol content, page 772—High-Alcoholic Elixir contains from 73 to 78 percent (v/v) of C_2H_5OH.

Packaging and storage—Preserve High-Alcoholic Elixir in tight containers.

CATEGORY—Vehicle.

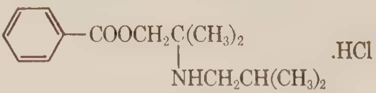
NOTE: Iso-Alcoholic Elixir is intended to serve as a general vehicle for various medicaments that require solvents of different alcohol strengths. When Iso-Alcoholic Elixir is specified in a prescription, the proportion of its two ingredients to be used is that which will produce a solution of the required alcohol strength.

The alcohol strength of the Iso-Alcoholic Elixir to be used with a single liquid galenical in a prescription is approximately the same as that of the galenical.

When galenicals of different alcohol strengths are used in the same prescription, the Iso-Alcoholic Elixir to be used is to be of such alcohol strength as to secure the best solution possible. This will generally be found to be the average of the alcohol strengths of the several ingredients.

For nonextractive substances, the lowest alcohol strength of Iso-Alcoholic Elixir that will yield a perfect solution should be chosen.

Isobucaine Hydrochloride*



2-(Isobutylamino)-2-methyl-1-propanol Benzoate (Ester) Hydrochloride

$C_{15}H_{23}NO_2 . HCl$ Mol. wt. 285.82

---

* Patented. See notice, page ii.

Isobucaine Hydrochloride, dried at 105° for 4 hours, contains not less than 98.0 percent and not more than 102.0 percent of $C_{15}H_{23}NO_2 . HCl$.

Description—Isobucaine Hydrochloride occurs as a white, odorless, crystalline solid. The pH of a 1 in 50 solution is about 6.

Solubility—Isobucaine Hydrochloride is freely soluble in water, in alcohol, and in chloroform. It is sparingly soluble in isopropanol, and is very slightly soluble in ether.

Identification—

A: A solution of Isobucaine Hydrochloride (1 in 100) responds to the tests for *Chloride*, page 808.

B: Dissolve about 100 mg. of Isobucaine Hydrochloride in 10 ml. of water, heat almost to boiling, and add, with stirring, 1 ml. of a saturated solution of picric acid in 20 percent alcohol. Cool slowly, collect the precipitate on a filter, wash with a few small portions of water, and dry in a vacuum desiccator over phosphorus pentoxide for 18 hours: the picrate so obtained melts with decomposition at about 180°, page 814. (*Caution: Picrates may be explosive.*)

C: Dissolve about 100 mg. of Isobucaine Hydrochloride in 10 ml. of diluted hydrochloric acid, cool to 0° in an ice bath, and add 5 ml. of sodium nitrite solution (1 in 5) with gentle stirring. Add 2 ml. of a solution of 100 mg. of betanaphthol in 5 ml. of sodium hydroxide T.S. and observe immediately: the solution turns green in color, and no bright orange-red precipitate is formed (*absence of a primary aminophenyl group*).

Melting range, page 814—Isobucaine Hydrochloride melts between 182° and 185°.

Loss on drying, page 814—Dry Isobucaine Hydrochloride at 105° for 4 hours: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Isobucaine Hydrochloride yields not more than 0.1 percent of residue on ignition.

Assay—Transfer about 600 mg. of Isobucaine Hydrochloride, previously dried at 105° for 4 hours and accurately weighed, to a 200-ml. tall form beaker, dissolve it in 50 ml. of glacial acetic acid, heating if necessary. Add 10 ml. of mercuric acetate T.S. and 1 drop of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to the green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 28.58 mg. of $C_{15}H_{23}NO_2 . HCl$.

Packaging and storage—Preserve Isobucaine Hydrochloride in well-closed containers.

CATEGORY—Local anesthetic (dental).

Isobucaine Hydrochloride and Epinephrine Injection

Isobucaine Hydrochloride and Epinephrine Injection is a sterile solution of isobucaine hydrochloride and epinephrine in water for injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{15}H_{23}NO_2 . HCl$ (isobucaine hydrochloride) and not less than 95.0 percent and not more than 110.0 percent of the labeled amount of $C_9H_{13}NO_3$ (epinephrine).

Identification—Isobucaine Hydrochloride and Epinephrine Injection responds to the *Identification tests* under *Isobucaine Hydrochloride*, page 376.

Other requirements—Isobucaine Hydrochloride and Epinephrine Injection meets the requirements under *Injections*, page 810.

Assay for isobucaine hydrochloride—Transfer to a 60-ml. separator an accurately measured volume of Isobucaine Hydrochloride and Epinephrine Injection, equivalent to about 40 mg. of isobucaine hydrochloride. Add water to make 10 ml. and 1 ml. of sodium hydroxide T.S., and completely extract the isobucaine with three 10-ml. portions of chloroform. Wash the combined chloroform extracts with 10 ml. of water, filter the chloroform through chloroform-washed cotton, wash the filter with chloroform, add 2 drops of methyl red T.S. to the combined chloroform filtrate and washings, and titrate with 0.01 *N* perchloric acid in dioxane to a red end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.01 *N* perchloric acid is equivalent to 2.858 mg. of $C_{15}H_{23}NO_2 . HCl$.

Assay for epinephrine—Prepare a *Ferrocitrate solution*, a *Buffer solution*, and a *Standard preparation* as directed under *Epinephrine Assay*, page 803.

Assay preparation—Proceed as directed for *Assay preparation* under *Epinephrine Assay*, page 803.

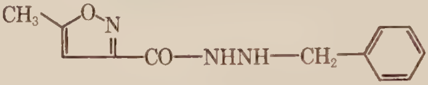
Procedure—Proceed as directed for *Procedure* under *Epinephrine Assay*, page 803. When the *Buffer solution* is added to the *Assay preparation*, an oily precipitate may form. This precipitate should be removed by shaking with 1 ml. of chloroform followed by centrifugation before the spectrophotometric measurements are made using the clear supernatant solution.

Packaging and storage—Preserve Isobucaine Hydrochloride and Epinephrine Injection in single-dose containers, preferably of Type I glass.

Injection available—Isobucaine Hydrochloride and Epinephrine Injection usually available contains the following amounts of isobucaine hydrochloride and epinephrine: 2 percent isobucaine hydrochloride and 1 in 65,000 epinephrine in 1.8-ml. cartridges.

CATEGORY—See Isobucaine Hydrochloride.

Isocarboxazid*



5-Methyl-3-isoxazolecarboxylic Acid 2-Benzylhydrazide

$C_{12}H_{13}N_3O_2$ Mol. wt. 231.26

Isocarboxazid contains not less than 98.5 percent and not more than 100.5 percent of $C_{12}H_{13}N_3O_2$, calculated on the dried basis.

Description—Isocarboxazid occurs as a white or nearly white, crystalline powder. It has a slight, characteristic odor.

Solubility—Isocarboxazid is slightly soluble in water. It is soluble in alcohol and is very soluble in chloroform.

Identification—

A: Dissolve about 10 mg. of Isocarboxazid in 10 ml. of acetone, add 0.2 ml. of water, 0.2 ml. of ammonium molybdate solution (prepared by dissolving 100 mg. of ammonium molybdate in 10 ml. of diluted hydrochloric acid) and mix well: an orange color develops.

B: Dissolve about 15 mg. of Isocarboxazid in alcohol, and add 1 ml. of a *p*-dimethylaminobenzaldehyde solution (prepared by dissolving 100 mg. of *p*-dimethylaminobenzaldehyde in 1 ml. of hydrochloric acid and diluting with alcohol to 100 ml.): a yellow color appears.

Melting range, page 814—Isocarboxazid melts between 105° and 108°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Isocarboxazid, previously dried in vacuum over phosphorus pentoxide at 60° for 4 hours, exhibits maxima only at the same wavelengths as that of NF Isocarboxazid Reference Standard, similarly measured.

Loss on drying, page 814—Dry Isocarboxazid in vacuum over phosphorus pentoxide at 60° for 4 hours: it loses not more than 0.25 percent of its weight.

Residue on ignition, page 858—Isocarboxazid yields not more than 0.1 percent of residue on ignition.

Chloride, page 784—Boil for 2 minutes 100 mg. of Isocarboxazid with 3 ml. of 30 percent hydrogen peroxide, 5 ml. of 2 *N* sodium hydroxide, and 7 ml. of water, cool, and neutralize the solution to litmus with nitric acid: the solution shows no more chloride than corresponds to 0.3 ml. of 0.02 *N* hydrochloric acid (200 parts per million).

Limit of methyl 5-methyl-3-isoxazolecarboxylate and 1-benzyl-3-methyl-5-aminopyrazole—

Standard methyl 5-methyl-3-isoxazole carboxylate preparation—Dissolve 12.5 mg. of NF Methyl 5-methyl-3-isoxazolecarboxylate Reference Standard in sufficient methanol to make 50.0 ml., and mix.

Standard 1-benzyl-3-methyl-5-aminopyrazole preparation—Dissolve 12.5 mg. of NF 1-Benzyl-3-methyl-5-aminopyrazole Hydrochloride Reference Standard in 50.0 ml. of methanol, add 1 g. of sodium carbonate, shake for 2 minutes, and filter. Use the filtrate as directed in the *Procedure.*

Standard isocarboxazid preparation—Prepare a solution of NF Isocarboxazid Reference Standard accurately weighed in methanol containing approximately 50 mg. per ml.

Test preparation—Dissolve 500.0 mg. of Isocarboxazid in sufficient methanol to make 10.0 ml., and mix.

Procedure—Apply 20 µl. each of the *Standard isocarboxazid preparation*, of the *Standard methyl 5-methyl-3-isoxazolecarboxylate preparation*, of the *Standard 1-benzyl-3-methyl-5-aminopyrazole preparation*, and of the *Test preparation* at separate locations on a suitable thin-layer chromatographic plate (see page 791) coated with a 0.25-mm. layer of chromatographic silica gel mixture. Develop the chromatogram in a solvent system consisting of ethyl acetate and *n*-heptane (60:40) until the solvent front has moved about 12 cm. from the origin. Remove the plate from the developing chamber, and examine the chromatogram under shortwave ultraviolet light: any spot produced by the *Test preparation* at about R_f 0.85 does not exceed in magnitude or intensity the spot produced by the *Standard methyl 5-methyl-3-isoxazolecarboxylate preparation* at the same R_f value (0.5 percent). Spray the plate with a freshly prepared mixture consisting of equal volumes of ferric chloride solution (1 in 10) and potassium ferricyanide solution (1 in 5): any spot produced by the *Test preparation* at about R_f 0.25 does not exceed in magnitude or intensity the spot produced by the *Standard 1-benzyl-3-methyl-5-aminopyrazole preparation* at the same R_f value (0.5 percent). The *Standard isocarboxazid preparation* produces a spot at about R_f 0.6.

---

* Patented. See notice, page ii.

Assay—Dissolve about 700 mg. of Isocarboxazid, accurately weighed, in 20 ml. of glacial acetic acid, add 20 ml. of hydrochloric acid and 40 ml. of water, and cool to room temperature. Titrate with 0.1 *M* sodium nitrite, determining the end-point electrometrically by means of suitable electrodes. Each ml. of 0.1 *M* sodium nitrite is equivalent to 23.13 mg. of $C_{12}H_{13}N_3O_2$.

Packaging and storage—Preserve Isocarboxazid in well-closed containers.

CATEGORY—Antidepressant.

USUAL DOSE—Initial, **30 mg.** daily as a single dose or in divided doses; maintenance, **10** to **20 mg.** daily.

Isocarboxazid Tablets

Isocarboxazid Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{12}H_{13}N_3O_2$.

Identification—Triturate a quantity of Isocarboxazid Tablets, equivalent to about 15 mg. of isocarboxazid, with 10 ml. of alcohol: the triturate responds to *Identification test B* under *Isocarboxazid*, page 378.

Disintegration, page 878—The disintegration time limit for Isocarboxazid Tablets is 30 minutes.

Content uniformity, *Method I*, page 799—Isocarboxazid Tablets meet the requirements of the content uniformity test for tablets.

Assay—

Ammonium molybdate reagent—Dissolve 1 g. of ammonium molybdate in 100 ml. of dilute hydrochloric acid (1 in 10).

Standard preparation—Weigh accurately about 50 mg. of NF Isocarboxazid Reference Standard, dissolve in sufficient acetone to make 250.0 ml., and mix.

Assay preparation—Weigh and finely powder not less than 20 Isocarboxazid Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 10 mg. of isocarboxazid, to a 50-ml. volumetric flask, add acetone to volume, and mix. Shake well, centrifuge to clarify, and use the clear supernatant liquid as directed in the *Procedure*.

Procedure—Transfer to separate 100-ml. volumetric flasks 5.0 ml. each of the *Standard preparation*, of the *Assay preparation*, and of acetone to serve as the blank. To each flask add 1.0 ml. of water, 50.0 ml. of acetone, and 1.0 ml. of *Ammonium molybdate reagent*. Stopper the flasks, mix, and allow to stand for 30 minutes with occasional swirling. Concomitantly determine the absorbances of the solutions, in 1-cm. cells, at the maximum at about 420 mμ, with a suitable spectrophotometer, using the blank to set the instrument. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{12}H_{13}N_3O_2$ in the portion of the Tablets taken by the formula $0.05C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*.

Packaging and storage—Preserve Isocarboxazid Tablets in well-closed, light-resistant containers.

Tablets available—Isocarboxazid Tablets usually available contain the following amount of isocarboxazid: 10 mg.

CATEGORY and DOSE—See Isocarboxazid.

Isoflurophate Ophthalmic Ointment

$[(CH_3)_2CHO]_2FPO$

Diisopropyl Phosphorofluoridate

$C_6H_{14}FO_3P$ Mol. wt. 184.15

Isoflurophate Ophthalmic Ointment contains not less than 0.0225 percent and not more than 0.0275 percent of $C_6H_{14}FO_3P$ in a suitable, anhydrous base.

Identification—Place about 100 mg. of Isoflurophate Ophthalmic Ointment in the right eye of each of 3 rabbits, and examine the eye 18 to 20 hours later: the average diameter of the pupils of the treated eyes is at least 2 mm. smaller than the average diameter of the pupils of the untreated eyes.

Irritation—The conjuctivas of the eyes treated as directed in the *Identification test*, as compared with those of the untreated eyes, after 1 hour, show not more than a slight reddening, which practically disappears in 4 hours.

Weight variation, page 901—Isoflurophate Ophthalmic Ointment meets the requirements of the weight variation test for ointments.

Metal particles—Isoflurophate Ophthalmic Ointment meets the requirements of the test for *Metal Particles—Ophthalmic Ointments*, page 816.

Water, page 900—Dissolve about 10 g. of Isoflurophate Ophthalmic Ointment, accurately weighed, in a mixture of 25 ml. each of absolute methanol and of toluene, and determine the water content by the titrimetric method: not more than 0.03 percent is found.

Assay—

Standard preparation—Pipet into a 250-ml. volumetric flask 3.0 ml. of phosphate solution (154.0 mg. of dried KH_2PO_4 in water to make 500.0 ml.), add 7.5 g. of zinc oxide, 30 ml. of water, and 25 ml. of 10 *N* sulfuric acid, and heat on a steam bath, if necessary, until the zinc oxide has dissolved. Cool, dilute to volume with water, and mix.

Assay preparation—Weigh accurately about 2 g. of Isoflurophate Ophthalmic Ointment in a small porcelain crucible, and cover it with 3.0 g. of zinc oxide. Apply heat intermittently with a low flame to allow the oil to burn off. Then ignite continuously at 700° to 800°, preferably in a muffle furnace, to remove all or nearly all of the carbon. Allow the crucible to cool, and place it in a 250-ml. beaker, loosening the contents by tapping the crucible against the side of the beaker. Add 30 ml. of water and 10 ml. of 10 *N* sulfuric acid, and heat on a hot plate or steam bath, with occasional stirring, until solution is complete. Remove the crucible from the solution, and rinse it with a few ml. of water, collecting the rinsings in a beaker. Cool the solution, quantitatively transfer it to a 100-ml. volumetric flask, add water to volume, and mix.

Procedure—Pipet 50.0 ml. each of the *Standard preparation* and of the *Assay preparation* into separate 100-ml. volumetric flasks, then treat each as follows: Add, dropwise, sodium carbonate solution (1 in 5), swirling the flask after each addition, until a permanent turbidity is produced. Add 10 ml. of 10 *N* sulfuric acid and 10 ml. of molybdate reagent (5 g. of ammonium molybdate in 1 *N* sulfuric acid to make 100 ml.). Add, with mixing, 5 ml. of freshly prepared stannous chloride solution (dissolve 1.0 g. of stannous chloride in 5 ml. of hydrochloric acid and dilute with water to 500 ml.), add water to volume, mix, and 10 minutes after the addition of the stannous chloride, measure the absorbance of each solution at 710 mμ with a suitable spectrophotometer. Calculate the quantity, in mg., of $C_6H_{14}FO_3P$ in the weight of Isoflurophate Ophthalmic Ointment taken by the formula $2W \times 1.938 \times (A_U/A_S)$, in which W is the weight, in mg., of PO_4 in the volume of *Standard preparation* taken, 1.938 is the conversion factor from PO_4 to $C_6H_{14}FO_3P$, A_U is the absorbance of the solution from the *Assay preparation*, and A_S is that from the *Standard preparation*.

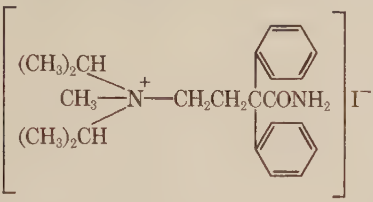
Packaging and storage—Preserve Isoflurophate Ophthalmic Ointment in collapsible ophthalmic ointment tubes.

Labeling—The label of Isoflurophate Ophthalmic Ointment bears the expiration date, which is not more than 2 years after date of manufacture.

CATEGORY—Cholinergic (ophthalmic).

APPLICATION—Topically to conjunctiva once every 3 days to three times a day.

Isopropamide Iodide*



(3-Carbamoyl-3,3-diphenylpropyl)diisopropylmethylammonium Iodide

$C_{23}H_{33}IN_2O$ Mol. wt. 480.44

Isopropamide Iodide, dried in vacuum at 60° for 2 hours, contains not less than 98.0 percent and not more than 101.0 percent of $C_{23}H_{33}IN_2O$.

Description—Isopropamide Iodide occurs as a white to pale yellow crystalline powder and has a bitter taste.

Solubility—Isopropamide Iodide is sparingly soluble in water and is freely soluble in chloroform and in alcohol. It is very slightly soluble in benzene and in ether.

Identification—

A: To 5 ml. of a solution of Isopropamide Iodide (1 in 1000), add 5 ml. of sodium carbonate solution (1 in 100), 0.5 ml. of bromophenol blue T.S., and 10 ml. of chloroform, and shake for several minutes: the chloroform layer becomes an intense blue.

B: A solution of Isopropamide Iodide (1 in 1000) responds to the tests for *Iodide,* page 808.

Infrared absorption, page 866—The infrared absorption spectrum of a 2 in 25 solution in chloroform of Isopropamide Iodide, previously dried in vacuum at 60° for 2 hours, determined in a 0.1-mm. cell, exhibits maxima only at the same wavelengths as that of NF Isopropamide Iodide Reference Standard, similarly measured.

Loss on drying, page 814—Dry Isopropamide Iodide in vacuum at 60° for 2 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Transfer about 1 g. of Isopropamide Iodide, accurately weighed, to a tared porcelain crucible. Ignite carefully, using a low flame, until the sample is practically free of carbon, and then heat the residue in a muffle furnace at 550° for 4 hours. Cool the crucible in a desiccator, and weigh. Isopropamide Iodide yields not more than 0.5 percent of residue on ignition.

Assay—Dissolve about 750 mg. of Isopropamide Iodide, dried in vacuum at 60° for 2 hours and accurately weighed, in 60 ml. of glacial acetic acid, add 15 ml. of mercuric acetate T.S. and 3 drops of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a blue end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 48.04 mg. of $C_{23}H_{33}IN_2O$.

Packaging and storage—Preserve Isopropamide Iodide in well-closed, light-resistant containers.

CATEGORY—Anticholinergic.

USUAL DOSE—**5 mg.** two times a day.

USUAL DOSE RANGE—**10** to **20 mg.** daily.

---

* Patented. See notice, page ii.

Isopropamide Iodide Tablets

Isopropamide Iodide Tablets contain an amount of $C_{23}H_{33}IN_2O$ (isopropamide iodide) equivalent to not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{23}H_{33}N_2O$ (isopropamide).

Identification—Triturate a portion of powdered Isopropamide Iodide Tablets, equivalent to about 10 mg. of isopropamide, with 10 ml. of water, and filter. The filtrate responds to the *Identification tests* under *Isopropamide Iodide,* page 381.

Disintegration, page 878—The disintegration time limit for Isopropamide Iodide Tablets is 30 minutes.

Content uniformity, *Method II,* page 799—Isopropamide Iodide Tablets meet the requirements of the content uniformity test for tablets, using the following special procedure: Crush and quantitatively transfer one tablet to a 100-ml. volumetric flask with about 50 ml. of water, and shake mechanically for 30 minutes. Dilute to volume with water, mix well, and filter, discarding the first 20 ml. of filtrate. Concomitantly determine the absorbance of this solution and of a solution of NF Isopropamide Iodide Reference Standard, in the same medium at a concentration of about 70 mcg. per ml., in 5-cm. cells, at 280 mμ and at the maximum at about 258 mμ, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg., of $C_{23}H_{33}N_2O$ (isopropamide) in the tablet by the formula, $(T/D) \times 0.7359C \times (A_{U258} - A_{U280})/(A_{S258} - A_{S280})$, in which T is the labeled quantity, in mg., of isopropamide in the tablet; D is the exact concentration, in mcg. per ml., of isopropamide in the sample solution, based upon the labeled quantity per tablet and the extent of dilution; 0.7358 is the factor converting isopropamide iodide to isopropamide; C is the exact concentration, in mcg. per ml., of the Reference Standard solution; A_{U258} and A_{U280} are the absorbances of the sample solution at 258 mμ and 280 mμ, respectively; and A_{S258} and A_{S280} are the absorbances of the Reference Standard solution at 258 mμ and 280 mμ, respectively.

Assay—

Ion-exchange column—Insert a small pledget of glass wool in the bottom of a 240 × 6-mm. glass tube fitted with a stopcock, fill the tube with water, and add an aqueous slurry of a suitable anion-exchange resin, chloride form (previously soaked in water for at least 24 hours prior to use), until a height of about 200 mm. is reached. Wash the column with 50 ml. of water, and use without delay.

Standard preparation—Transfer about 135 mg. of NF Isopropamide Iodide Reference Standard, accurately weighed, to a 250-ml. volumetric flask, and dissolve in 150 ml. of water. Add 5 ml. of aluminum chloride solution (1 in 10) and 2 ml. of stronger ammonia T.S., then dilute to volume with water, mix, and filter, discarding the first 15 ml. of filtrate. Use the subsequent filtrate as directed in the *Procedure*.

Assay preparation—Weigh and finely powder not less than 25 Isopropamide Iodide Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg. of isopropamide, to a 250-ml. volumetric flask, add 150 ml. of water, and shake mechanically for 60 minutes. Add 5 ml. of aluminum chloride solution (1 in 10) and 2 ml. of stronger ammonia T.S., then dilute to volume with water, mix, and filter, discarding the first 15 ml. of filtrate. Use the subsequent filtrate as directed in the *Procedure*.

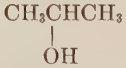
Procedure—Pipet 50.0 ml. each of the *Standard preparation* and of the *Assay preparation* onto separate ion-exchange columns, and collect the eluates in separate 200-ml. volumetric flasks. Regulate the flow of effluent so that it does not exceed 40 drops per minute, and when the liquid level reaches the top of each column, add successively two 5-ml. portions and one 10-ml. portion of water to each column, allowing each portion to just enter the column before adding the next portion of water. After the eluates have been collected, dilute each flask to volume with water, and mix. Concomitantly determine the absorbances of the solutions in 5-cm. cells, at 280 mμ and at the maximum at about 258 mμ, with a suitable spectrophotometer, using water as the blank. Record the absorbances of the solution from the *Standard preparation* at 258 mμ and at 280 mμ as A_{S258} and A_{S280}, respectively, and the absorbances of the solution from the *Assay preparation* at 258 mμ and at 280 mμ as A_{U258} and A_{U280}, respectively. Calculate the quantity, in mg., of $C_{23}H_{33}N_2O$ (isopropamide) in the portion of Tablets taken by the formula $0.25C \times 0.7359 \times (A_{U258} - A_{U280})/(A_{S258} - A_{S280})$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*, and 0.7359 is the factor converting isopropamide iodide to isopropamide.

Packaging and storage—Preserve Isopropamide Iodide Tablets in well-closed containers.

Tablets available—Isopropamide Iodide Tablets usually available contain isopropamide iodide equivalent to the following amount of isopropamide: 5 mg.

CATEGORY and DOSE—See Isopropamide Iodide.

Isopropyl Alcohol



$$CH_3\underset{\displaystyle OH}{\underset{|}{C}}HCH_3$$

2-Propanol

C_3H_8O Mol. wt. 60.10

Isopropyl Alcohol contains not less than 99.0 percent and not more than 100.5 percent, by weight, of C_3H_8O.

Description—Isopropyl Alcohol is a transparent, colorless, mobile, and volatile liquid. It has a characteristic odor and a slightly bitter taste.

Solubility—Isopropyl Alcohol is miscible with water, with alcohol, with ether, and with chloroform.

Identification—To 2 ml. of Isopropyl Alcohol contained in a test tube, add 3 ml. of water and 1 ml. of mercuric sulfate T.S., and warm gently: a white or yellowish precipitate or turbidity is formed.

Specific gravity, page 866—The specific gravity of Isopropyl Alcohol is not less than 0.783 and not more than 0.787, indicating not less than 99.0 percent and not more than 100.5 percent, by weight, of C_3H_8O.

Distilling range, *Method I,* page 782—Isopropyl Alcohol distils completely between 81° and 83°.

Refractive index, page 858—The refractive index of Isopropyl Alcohol is not less than 1.376 and not more than 1.378 at 20°.

Acidity—To 50 ml. of Isopropyl Alcohol in a suitable flask add 100 ml. of carbon dioxide-free water. Add 2 drops of phenolphthalein T.S., and titrate with 0.02 *N* sodium hydroxide to a pink color that persists for 30 seconds. Not more than 0.7 ml. of 0.02 *N* sodium hydroxide is required for neutralization.

Nonvolatile residue—Evaporate 50 ml. of Isopropyl Alcohol to dryness in a tared porcelain dish on a steam bath and heat at 105° for 1 hour: the weight of the residue does not exceed 2.5 mg. (50 parts per million, w/v).

Packaging and storage—Preserve Isopropyl Alcohol in tight containers.

Category—Solvent.

Isopropyl Rubbing Alcohol

Isopropyl Rubbing Alcohol contains not less than 68.0 percent and not more than 72.0 percent of isopropyl alcohol, by volume, the remainder consisting of water, with or without color additives certified by the federal Food and Drug Administration for use in drugs, suitable stabilizers, and perfume oils.

Description—Isopropyl Rubbing Alcohol is a transparent, mobile, and volatile liquid having a slightly bitter taste and, in the absence of added odorous constituents, a characteristic odor.

Identification—To 2 ml. of Isopropyl Rubbing Alcohol contained in a test tube, add 2 ml. of water and 1 ml. of mercuric sulfate T.S., and warm gently: a white or yellowish precipitate or turbidity is formed.

Specific gravity, page 866—The specific gravity of Isopropyl Rubbing Alcohol is not less than 0.869 and not more than 0.879.

Acidity—Transfer 50 ml. of Isopropyl Rubbing Alcohol into a suitable flask and add about 75 ml. of carbon dioxide-free water. Titrate immediately with 0.02 *N* sodium hydroxide, using 3 drops of phenolphthalein T.S. as the indicator, to a pink color that persists for 30 seconds: not more than 1 ml. of 0.02 *N* sodium hydroxide is required for neutralization.

Nonvolatile residue—Evaporate 50 ml. of Isopropyl Rubbing Alcohol to dryness in a tared porcelain dish on a steam bath and dry at 105° for 1 hour: the weight of the residue does not exceed 50 mg. (0.1 percent).

Assay—Pipet 50.0 ml. of Isopropyl Rubbing Alcohol into a 250-ml. distilling flask, note its temperature, and add 100 ml. of water. Arrange the flask for distillation, distil, and collect 95 ml. of distillate in a 100-ml. volumetric flask. Adjust to the temperature at which the original test liquid was measured, and add water to volume. Mix, and determine the specific gravity of the distillate at 25° (see page 866). The specific gravity is no greater than 0.955, corresponding to 68.0 percent, and no less than 0.950, corresponding to 72.0 percent of isopropyl alcohol in the original sample.

Packaging and storage—Preserve Isopropyl Rubbing Alcohol in tight containers.

Category—Rubefacient.

Isoproterenol Sulfate Aerosol

Isoproterenol Sulfate Aerosol is a suspension of microfine isoproterenol sulfate in fluorochlorohydrocarbon propellants in a pressurized container. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of

$(C_{11}H_{17}NO_3)_2.H_2SO_4$, and it delivers not less than 75.0 percent and not more than 125.0 percent of the labeled amount of $(C_{11}H_{17}NO_3)_2.H_2SO_4$ per inhalation through an oral inhalation actuator.

Identification—

A: Place 10 ml. of water in a small beaker, and fire 10 sprays from Isoproterenol Sulfate Aerosol under the surface of the water, actuating the valve by pressing the container against the bottom of the beaker. Filter, and to 5 ml. of the filtrate add 1 drop of 0.1 *N* hydrochloric acid. Add 0.5 ml. of 0.1 *N* iodine, allow to stand for 5 minutes, and add 1 ml. of 0.1 *N* sodium thiosulfate: a red-brown color is produced.

B: A portion of the filtrate obtained in *Identification test A* responds to the tests for *Sulfate*, page 810.

Unit spray content—

Unit spray sampling apparatus—Prepare as directed under *Aerosols*, page 770.

Ferro-citrate solution and *Buffer solution*—Prepare as directed under *Epinephrine Assay*, page 803.

Standard preparation—Transfer about 50 mg. of USP Isoproterenol Hydrochloride Reference Standard, accurately weighed, to a 100-ml. volumetric flask, add a freshly prepared solution of sodium bisulfite (1 in 500) to volume, and mix. Transfer 5.0 ml. of this solution to a second 100-ml. volumetric flask, dilute to volume with the sodium bisulfite solution, and mix.

Test preparation—Transfer 30.0 ml. of a freshly prepared solution of sodium bisulfite (1 in 500) to the collection chamber of the apparatus, and clamp the intake tube in a horizontal position. Fit the aerosol container with its oral inhalation actuator, and prime the unit by alternately shaking and firing it 10 times. Couple the unit to the intake tube of the apparatus, and adjust the air flow to a rate of 10 to 15 liters per minute. Remove the container, leaving the actuator in place. Shake the container, seat it in the actuator, and immediately deliver a single spray into the system. Deliver a total of 10 sprays in this manner. Remove the container and actuator from the assembly, clamp the intake tube in a vertical position, and scavenge the drug remaining in the intake system as follows: disconnect the collection chamber, transfer the sample solution to a small beaker, and then wash the inside of the intake tube with the sample solution, collecting the washings in the collection chamber placed a few cm. below its normal position. Connect the collection chamber into the system again, and draw the sample solution into it through the bubbler and intake tube. Recycle the sample solution two times in this manner, then add 15 ml. of chloroform to the collection chamber, stopper it, and shake vigorously for 5 minutes. Use the clear supernatant solution as directed in the *Procedure*.

Procedure—Proceed as directed for *Procedure* in the *Assay*. Calculate the quantity, in mg., of $(C_{11}H_{17}NO_3)_2.H_2SO_4$ delivered per spray by the formula $0.03 \times 1.051 \times (C/10) \times (A_U/A_S)$, in which 1.051 is the ratio of one-half the molecular weight of isoproterenol sulfate (anhydrous) to the molecular weight of isoproterenol hydrochloride (anhydrous), and C is the exact concentration, in mcg. per ml., of the *Standard preparation*.

Particle size—Prime the valve of Isoproterenol Sulfate Aerosol by alternately shaking and firing it several times, and then actuate one measured spray onto a clean, dry microscope slide held 5 cm. from the end of the oral inhalation actuator, perpendicular to the direction of the spray. Carefully rinse the slide with about 2 ml. of carbon tetrachloride, and allow to dry. Examine the slide under a microscope, equipped with a calibrated ocular micrometer, using 450× magnification. Focus on the particles of 25 fields of view near the center of the sample pattern, and note the size of the great majority of individual particles: they are less than 5 μ in diameter; record the number and size of all individual crystalline particles (not agglomerates) more than 10 μ in length measured along the longest axis: not more than 10 such particles are observed.

Other requirements—Isoproterenol Sulfate Aerosol meets the requirements for *Leak Testing* under *Aerosols*, page 770.

Assay—

Ferro-citrate solution and *Buffer solution*—Prepare as directed under *Epinephrine Assay*, page 803.

Container sampling apparatus—Prepare as directed under *Aerosols*, page 770.

Standard preparation—Transfer about 50 mg. of USP Isoproterenol Hydrochloride Reference Standard, accurately weighed, to a 100-ml. volumetric flask, add a freshly prepared solution of sodium bisulfite (1 in 500) to volume, and mix. Transfer 10.0 ml. of this solution to a second 100-ml. volumetric flask, dilute to volume with the sodium bisulfite solution, and mix.

Assay preparation—Transfer 10 ml. of chloroform and 20.0 ml. of a freshly prepared solution of sodium bisulfite (1 in 500) to the tube of the apparatus, and connect the tube with the firing adapter. Prime the valve of Isoproterenol Sulfate Aerosol by alternately shaking and firing it 10 times through a clean actuator. Accurately weigh the Aerosol, shake it, seat the valve stem in the firing adapter inlet hole, and then press down firmly to deliver a single spray. Deliver a total of 10 sprays in this manner. Weigh the Aerosol, and determine the total weight of the 10 sprays. Place a finger over the inlet hole of the firing adapter, and shake vigorously for 1 minute. Transfer the mixture to a centrifuge tube, and centrifuge for 5 minutes. Use the clear supernatant solution as directed in the *Procedure.*

Procedure—Transfer 10.0 ml. each of the *Standard preparation* and of the *Assay preparation* to separate test tubes. To each tube add 0.1 ml. of *Ferro-citrate solution* and 1.0 ml. of *Buffer solution,* and mix. Concomitantly determine the absorbances of the solutions in 1-cm. cells, at the maximum at about 530 mμ, with a suitable spectrophotometer, using water as the blank. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $(C_{11}H_{17}NO_3)_2 \cdot H_2SO_4$ in each ml. of the Aerosol by the formula $0.02C \times 1.051 \times (d/W) \times (A_U/A_S)$, in which C is the exact concentration of the *Standard preparation,* in mcg. per ml., 1.051 is the ratio of one-half the molecular weight of isoproterenol sulfate (anhydrous) to the molecular weight of isoproterenol hydrochloride (anhydrous), W is the weight of the sample taken, in g., and d is the density, in g. per ml., of the Aerosol, determined as follows: Weigh a known volume (v) of the Aerosol in a suitable 5-ml. gas-tight syringe equipped with a linear valve. Calibrate the volume of the syringe by filling to the 5-ml. mark with dichlorotetrafluoroethane withdrawn from a plastic-coated glass vial sealed with a neoprene multiple-dose rubber stopper and an aluminum seal, using 1.456 g. per ml. as the density of the calibrating liquid. Maintain the dichlorotetrafluoroethane, the Aerosol sample, and the syringe (protected from becoming wet) at 25° in a water bath. Obtain the sample, equivalent to the same volume as that obtained during the sampling procedure, from the Aerosol by means of a sampling device consisting of a replaceable rubber septum engaged in the plate threads at one end of a threaded fitting, the opposite end of which contains a sharpened tube capable of puncturing the aerosol container, and a rubber gasket around the tube to prevent leakage of the container contents after puncture.* Record the weight of the volume (v) of the Aerosol as w, and calculate the density by the formula w/v.

Packaging and storage—Preserve Isoproterenol Sulfate Aerosol in small, nonreactive, light-resistant aerosol containers equipped with metered-dose valves and provided with oral inhalation actuators.

Aerosol available—Isoproterenol Sulfate Aerosol usually available contains 2 mg. of isoproterenol sulfate per ml. of aerosol, and delivers 80 mcg. of isoproterenol sulfate per inhalation.

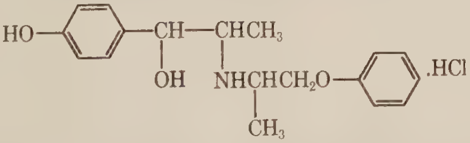
Category—Adrenergic (bronchodilator).

Usual dose of isoproterenol sulfate—Oral inhalation, **80** to **160 mcg.** in an aerosol, allowing at least 2 minutes to elapse between inhalations.

---

* A suitable sampling system is available from Alltek Associates, PO Box 498, Arlington Heights, IL 60006.

Isoxsuprine Hydrochloride*



p-Hydroxy-α-[1-[(1-methyl-2-phenoxyethyl)amino]ethyl]benzyl Alcohol Hydrochloride

$C_{18}H_{23}NO_3 \cdot HCl$ Mol. wt. 337.85

Isoxsuprine Hydrochloride contains not less than 97.0 percent and not more than 103.0 percent of $C_{18}H_{23}NO_3 \cdot HCl$, calculated on the dried basis.

Description—Isoxsuprine Hydrochloride occurs as a white, crystalline powder having a bitter taste. It is odorless.

Solubility—Isoxsuprine Hydrochloride is slightly soluble in water and is sparingly soluble in alcohol.

Identification—

A: To 1 ml. of a solution of Isoxsuprine Hydrochloride (1 in 100) add stronger ammonia water until the solution is just alkaline to litmus, and then add 5 ml. of a solution of sodium nitrite (1 in 15) in diluted sulfuric acid: a yellow precipitate forms which dissolves upon the addition of sodium hydroxide solution (1 in 5).

---

* Patented. See notice, page ii.

B: To 1 ml. of a solution of Isoxsuprine Hydrochloride (1 in 100) add 1 ml. of phosphomolybdic acid solution (1 in 100): a pale yellow to white precipitate forms.

Melting range, *Class Ia,* page 815—Isoxsuprine Hydrochloride melts between 201° and 208°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Isoxsuprine Hydrochloride, previously dried at 105° for 1 hour, exhibits maxima only at the same wavelengths as that of NF Isoxsuprine Hydrochloride Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 20,000 solution of Isoxsuprine Hydrochloride in water exhibits maxima and minima at the same wavelengths as that of NF Isoxsuprine Hydrochloride Reference Standard, similarly measured.

pH, page 824—The pH of a solution of Isoxsuprine Hydrochloride (1 in 100) is between 4.5 and 6.0.

Loss on drying, page 814—Dry Isoxsuprine Hydrochloride at 105° for 1 hour: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Isoxsuprine Hydrochloride yields not more than 0.2 percent of residue on ignition.

Heavy metals, *Method II,* page 806—The heavy metals limit for Isoxsuprine Hydrochloride is 20 parts per million.

Assay—Transfer about 50 mg. of Isoxsuprine Hydrochloride, accurately weighed, to a 1000-ml. volumetric flask, add water to volume, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Isoxsuprine Hydrochloride Reference Standard, in the same medium, at a concentration of about 50 mcg. per ml., in 1-cm. cells, at 269 mμ and at 300 mμ, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg., of $C_{18}H_{23}NO_3.HCl$ in the Isoxsuprine Hydrochloride taken by the formula $C \times (A_{U269} - A_{U300})/(A_{S269} - A_{S300})$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_{U269} and A_{U300} are the absorbances of the sample solution at 269 mμ and 300 mμ, respectively, and A_{S269} and A_{S300} are the absorbances of the Reference Standard solution at 269 mμ and 300 mμ, respectively.

Packaging and storage—Preserve Isoxsuprine Hydrochloride in tight containers.

CATEGORY—Vasodilator.

USUAL DOSE RANGE—**10 mg.** to **20 mg.** three or four times a day.

Isoxsuprine Hydrochloride Tablets

Isoxsuprine Hydrochloride Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{18}H_{23}NO_3.HCl$.

Identification—Transfer a portion of finely powdered Isoxsuprine Hydrochloride Tablets, equivalent to about 10 mg. of isoxsuprine hydrochloride, to a 60-ml. separator, add 10 ml. of pH 9.0 alkaline borate buffer, and shake vigorously to mix. Extract with 2 ml. of chloroform, filter the extract through a pledget of cotton, and mix the filtrate with 500 mg. of potassium bromide. Evaporate the chloroform, carefully removing the last trace of solvent in a small vacuum flask, and use the residue to prepare a potassium bromide dispersion. The infrared absorption spectrum of the potassium bromide dispersion of the isoxsuprine so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of NF Isoxsuprine Hydrochloride Reference Standard, which has been treated in the same manner as the sample.

Disintegration, page 878—The disintegration time limit for Isoxsuprine Hydrochloride Tablets is 30 minutes.

Content uniformity, *Method I,* page 799—Isoxsuprine Hydrochloride Tablets meet the requirements of the content uniformity test for tablets.

Assay—Weigh and finely powder not less than 20 Isoxsuprine Hydrochloride Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg. of isoxsuprine hydrochloride, to a 250-ml. separator containing 50 ml. of 0.2 *M* disodium phosphate. Stopper the separator, and shake vigorously to effect complete dispersion. Extract with four 20-ml. portions of chloroform, filtering each extract through cotton into a 250-ml. separator. Extract the combined filtrates with four 20-ml. portions of 0.1 *N* hydrochloric acid. Collect the aqueous extracts in a 100-ml. volumetric flask, dilute to volume with 0.1 *N* hydrochloric acid, and mix. Transfer 10.0 ml. into a 100-ml. volumetric flask, dilute to volume with water, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Isoxsuprine Hydrochloride Reference Standard, in the same medium, at a concentration of about 50 mcg. per ml., in 1-cm. cells, at 269 mμ and at 300 mμ, with a suitable spectrophotometer, using 0.01 *N* hydrochloric acid as the blank. Calculate the quantity, in mg., of $C_{18}H_{23}NO_3.HCl$ in the portion of the Tablets taken by the formula $C \times (A_{U269} - A_{U300})/(A_{S269} - A_{S300})$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_{U269} and A_{U300} are the absorbances of the sample solution at 269 mμ and 300 mμ, respectively, and A_{S269} and A_{S300} are the absorbances of the Reference Standard solution at 269 mμ and 300 mμ, respectively.

Packaging and storage—Preserve Isoxsuprine Hydrochloride Tablets in tight containers.

Tablets available—Isoxsuprine Hydrochloride Tablets usually available contain the following amount of isoxsuprine hydrochloride: 10 mg.

CATEGORY and DOSE—See Isoxsuprine Hydrochloride.

Juniper Tar

Juniper Tar is the empyreumatic volatile oil obtained from the woody portions of *Juniperus oxycedrus* Linné (Fam. *Pinaceæ*).

Description—Juniper Tar is a dark brown, clear, thick liquid, having a tarry odor and a faintly aromatic, bitter taste.

Solubility—Juniper Tar is very slightly soluble in water. One volume of Juniper Tar dissolves in 9 volumes of alcohol. It dissolves in 3 volumes of ether, leaving only a slight, flocculent residue. Juniper Tar is only partially soluble in solvent hexane. It is miscible with amyl alcohol, with chloroform, and with glacial acetic acid.

Identification—Shake 1 volume of Juniper Tar with 20 volumes of warm water, filter, and use the filtrate for the following tests:

A: To 5 ml. of the cold filtrate add a few drops of silver-ammonium nitrate T.S.: a black color is produced.

B: To 5 ml. of the filtrate add a few drops of alkaline cupric tartrate T.S., and heat the solution to boiling: a red precipitate is formed.

Specific gravity, page 866—The specific gravity of Juniper Tar is not less than 0.950 and not more than 1.055.

Reaction—The filtrate prepared for the *Identification tests* is acid to litmus.

Rosin or rosin oils—Triturate 1 ml. of Juniper Tar with 15 ml. of solvent hexane, filter the solution, add an equal volume of cupric acetate solution (1 in 100), shake vigorously, and allow the liquids to separate. Decant the solvent hexane layer into a test tube, and add an equal volume of ether: the liquid does not become intensely green and is not darker than brown.

Packaging and storage—Preserve Juniper Tar in tight, light-resistant containers, and avoid exposure to excessive heat.

CATEGORY—Local anti-eczematic.

FOR EXTERNAL USE—Topically as 1 to 5 percent ointment.

Kaolin

Kaolin is a native hydrated aluminum silicate, powdered and freed from gritty particles by elutriation.

Description—Kaolin occurs as a soft, white or yellowish white powder, or as lumps. It has an earthy or clay-like taste and, when moistened with water, assumes a darker color and develops a marked clay-like odor.

Solubility—Kaolin is insoluble in water, in cold dilute acids, and in solutions of the alkali hydroxides.

Identification—Mix 1 g. of Kaolin with 10 ml. of water and 5 ml. of sulfuric acid in a porcelain dish. Evaporate the mixture until the excess of water is removed, and further heat the residue until dense white fumes of sulfur trioxide appear; then cool, cautiously add 20 ml. of water, boil for a few minutes, and filter: there remains on the filter a gray residue (*impure silica*). The filtrate responds to the tests for *Aluminum*, page 807.

Loss on ignition—Kaolin loses not more than 15 percent of its weight upon ignition between 550° and 600°.

Acid-soluble substances—Digest 1 g. of Kaolin with 20 ml. of diluted hydrochloric acid for 15 minutes, and filter: 10 ml. of the filtrate evaporated to dryness and ignited leaves not more than 10 mg. of residue (2 percent).

Carbonate—Mix 1 g. of Kaolin with 10 ml. of water and 5 ml. of sulfuric acid: no effervescence occurs.

Iron—Triturate 2 g. of Kaolin in a mortar with 10 ml. of water and add 500 mg. of sodium salicylate: the mixture does not acquire more than a slight reddish tint.

Lead—To 1 g. of Kaolin contained in a centrifuge tube add 10 ml. of 5 percent nitric acid and digest for 1 hour in a boiling water bath. Centrifuge until the solids are completely separated and pour the supernatant liquid into a 100-ml. volumetric flask. Add 5 ml. of 5 percent nitric acid to the Kaolin, mix well, and digest for 15 minutes in a boiling water bath. Centrifuge, and add the supernatant liquid to the previous extract in the volumetric flask. Dilute to volume with water. A 50-ml. portion of this solution contains not more than 5 mcg. of lead (corresponding to not more than 10 parts per million) when tested according to the *Lead Limit Test*, page 813, using 3 ml. of ammonium citrate solution, 1 ml. of potassium cyanide solution, and 0.5 ml. of hydroxylamine hydrochloride solution.

Packaging and storage—Preserve Kaolin in well-closed containers.

CATEGORY—Adsorbent.

Kaolin Mixture with Pectin

Kaolin	**200**	**g.**
Pectin	**10**	**g.**
Tragacanth, powdered	**5**	**g.**
Benzoic Acid	**2**	**g.**
Sodium Saccharin	**1**	**g.**
Glycerin	**20**	**ml.**
Peppermint Oil	**0.75**	**ml.**
Purified Water, a sufficient quantity,		
To make	**1000**	**ml.**

Mix the kaolin with 500 ml. of purified water. Triturate the pectin, powdered tragacanth, and sodium saccharin with the glycerin and add to this, with constant stirring, the benzoic acid dissolved in 300 ml. of boiling purified water. Allow the mixture to stand until it cools to room temperature and all the pectin is dissolved. Add the peppermint oil and the kaolin–water mixture, mix thoroughly, and finally add sufficient purified water to make 1000 ml.

In order to obtain a product with suitable consistency when larger amounts are prepared, the quantity of tragacanth and, if necessary, the quantity of pectin may be altered. However, if the proportion of pectin in the formula is altered by more than 10 percent, the pectin content of the preparation must be clearly stated on the label.

Identification—Mix 850 mg. of the residue, obtained in the determination of *Residue on ignition*, with 12 ml. of water and 5 ml. of sulfuric acid in a porcelain crucible. Heat the mixture until the excess of water is removed and dense white fumes of sulfur trioxide appear. Cool, cautiously add 20 ml. of water, boil for a few minutes, and filter: a gray residue of impure silica remains on the filter. The filtrate responds to the tests for *Aluminum*, page 807.

Specific gravity, page 866—The specific gravity of Kaolin Mixture with Pectin is not less than 1.10 and not more than 1.15.

Residue on ignition—Weigh accurately about 10 g. of Kaolin Mixture with Pectin in a tared evaporating dish. Determine the volume by dividing its weight by the specific gravity. Evaporate on a steam bath and ignite at red heat to constant weight. The weight of the residue on ignition of Kaolin Mixture with Pectin is not less than 17.5 g. and not more than 19.5 g. in each 100 ml. (17.5 to 19.5 percent).

Salmonella, page 862—The test for *Salmonella* in Kaolin Mixture with Pectin is negative.

Packaging and storage—Preserve Kaolin Mixture with Pectin in tight containers.

CATEGORY—Adsorbent (antidiarrheal).
USUAL DOSE—**30 ml.** as needed.

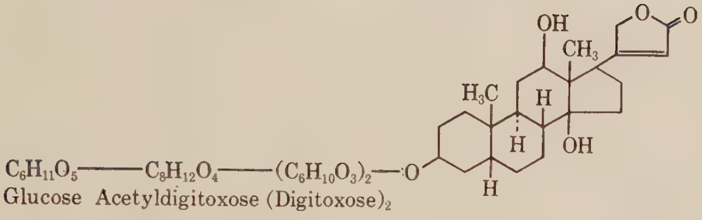
Lanatoside C



OH
CH3
O
O
H3C
H
H
OH
H
C6H11O5——C8H12O4——(C6H10O3)2—O
Glucose Acetyldigitoxose (Digitoxose)2

$C_{49}H_{76}O_{20}$ Mol. wt. 985.14

Lanatoside C contains not less than 98.0 percent and not more than 102.0 percent of $C_{49}H_{76}O_{20}$, calculated on the dried basis.

Caution: Lanatoside C is extremely poisonous.

Description—Lanatoside C occurs as colorless or white crystals or as a white, crystalline powder. It is odorless. It melts indistinctly, and with decomposition, above 240° after previous sintering. It is hygroscopic, rapidly absorbing about 7 percent of moisture when exposed to air.

Solubility—Lanatoside C is insoluble in water. It is soluble in dioxane, in pyridine, and in methanol. It is very slightly soluble in chloroform, and practically insoluble in ether and in solvent hexane.

Identification—Prepare a solution of Lanatoside C in methanol containing 2.5 mg. per ml. On a suitable thin-layer chromatographic plate (see page 791), coated with a 0.25-mm. layer of silica gel G, spot 5 µl. of this solution and 5 µl. of a methanol solution of NF Lanatoside C Reference Standard containing 2.5 mg. per ml. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of benzene-methanol (4:1) until the solvent front has advanced about 10 cm. from the origin. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by lightly spraying with dilute sulfuric acid (1 in 10) in methanol and heating at about 140° for 5 minutes. Cool, and examine under ultraviolet light: the R_f value of the main spot obtained from the sample solution corresponds to that obtained from the Reference Standard solution.

Specific rotation, page 822—The specific rotation at 20° of Lanatoside C, previously dried in vacuum over phosphorus pentoxide to constant weight, determined in a solution in methanol containing 200 mg. of Lanatoside C in each 10 ml., is between +32.0° and +34.5°.

Loss on drying, page 814—Dry Lanatoside C in vacuum over phosphorus pentoxide to constant weight: it loses not more than 7.5 percent of its weight.

Residue on ignition, page 858—Lanatoside C yields not more than 0.1 percent of residue on ignition.

Assay—

Standard preparation—Transfer about 25 mg. of NF Lanatoside C Reference Standard, accurately weighed, to a 500-ml. volumetric flask, add alcohol to volume, and mix.

Assay preparation—Transfer about 25 mg. of Lanatoside C, accurately weighed, to a 500-ml. volumetric flask, add alcohol to volume, and mix.

Procedure—Transfer 5.0 ml. each of the *Standard preparation* and of the *Assay preparation* to separate glass-stoppered conical flasks. To a third flask add 5.0 ml. of alcohol to serve as the blank. To each flask add 3.0 ml. of alkaline picrate T.S., and mix by swirling, maintaining the temperature at 25 ± 3°. Allow the solutions to stand for 25 minutes protected from direct light. Concomitantly determine the absorbances of the solutions in 1-cm. cells, at the maximum at about 490 mµ, with a suitable spectrophotometer, using the blank to set the instrument. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{49}H_{76}O_{20}$ in the Lanatoside C taken by the formula $0.5C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation.*

Packaging and storage—Preserve Lanatoside C in tight, light-resistant containers.

CATEGORY—Cardiotonic.

USUAL DOSE—Oral, Initial, **7.5–10.0 mg.** Maintenance, **0.5–1.5 mg.**

Lanatoside C Tablets

Lanatoside C Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{49}H_{76}O_{20}$.

Identification—Shake a portion of finely powdered Lanatoside C Tablets, equivalent to about 1 mg. of lanatoside C, with 10 ml. of water, and extract with 25 ml. of chloroform-alcohol (7:3). Evaporate the extract to dryness on a steam bath, and dissolve the residue in 0.4 ml. of methanol: a 5-μl. portion of the solution so obtained responds to the *Identification* test under *Lanatoside C*, page 389.

Disintegration, page 878—The disintegration time limit for Lanatoside C Tablets is 15 minutes.

Content uniformity, *Method I*, page 799—Lanatoside C Tablets meet the requirements of the content uniformity test for tablets.

Assay—

Standard preparation—Prepare as directed in the *Assay* under *Lanatoside C*, page 389.

Assay preparation—Weigh and finely powder not less than 20 Lanatoside C Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 5 mg. of Lanatoside C, to a 100-ml. volumetric flask, add 50 ml. of alcohol, and shake mechanically for 15 minutes, protecting the mixture from direct sunlight. Dilute to volume with alcohol, mix, and filter, discarding the first 20 ml. of filtrate.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Lanatoside C*, page 389. Calculate the quantity, in mg., of $C_{49}H_{76}O_{20}$ in the portion of the Tablets taken by the formula $0.1C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*.

Packaging and storage—Preserve Lanatoside C Tablets in well-closed containers.

Tablets available—Lanatoside C Tablets usually available contain the following amount of Lanatoside C: 500 mcg.

CATEGORY and DOSE—See Lanatoside C.

Lavender Oil

Lavender Oil is the volatile oil distilled with steam from the fresh flowering tops of *Lavandula officinalis* Chaix ex Villars (*Lavandula vera* De Candolle) (Fam. *Labiatæ*). It contains not less than 35.0 percent of total esters calculated as $C_{12}H_{20}O_2$ (linalyl acetate).

Description—Lavender Oil is a colorless or yellow liquid, having the characteristic odor and taste of lavender flowers.

Solubility in 70 percent alcohol—One volume of Lavender Oil dissolves in 4 volumes of 70 percent alcohol.

Specific gravity, page 866—The specific gravity of Lavender Oil is not less than 0.875 and not more than 0.888.

Angular rotation, page 822—The angular rotation of Lavender Oil is between $-3°$ and $-10°$ in a 100-mm. tube.

Refractive index, page 858—The refractive index of Lavender Oil is not less than 1.459 and not more than 1.470 at 20°.

Alcohol—Shake 5 ml. of Lavender Oil with an equal volume of water in a narrow, graduated, glass-stoppered, 10-ml. cylinder: the volume of the oil does not diminish.

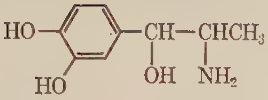
Foreign water-soluble esters—Shake 20.0 ml. of Lavender Oil with 40 ml. of 5 percent alcohol in a glass-stoppered, 100-ml. cylinder. When the mixture has cleared, pipet 30.0 ml. of the alcohol solution into a 125-ml. conical flask. Add phenolphthalein T.S., and neutralize the solution with 0.5 *N* sodium hydroxide. Add 5.0 ml. of 0.5 *N* sodium hydroxide, and heat the mixture on a steam bath under a reflux condenser for 1 hour. Allow the mixture to cool, and titrate the excess alkali with 0.5 *N* hydrochloric acid: not less than 4.7 ml. of the acid is required for neutralization.

Assay—Place about 5 g. of Lavender Oil, accurately weighed, in a 250-ml. conical flask, add 5 ml. of neutralized alcohol and 2 drops of phenolphthalein T.S., and add, dropwise, 0.1 *N* sodium hydroxide until a faint pink color appears. Add 50.0 ml. of 0.5 *N* alcoholic potassium hydroxide, connect the flask to a reflux condenser, and heat on a steam bath for 1 hour. Allow the mixture to cool, add 20 ml. of water, add phenolphthalein T.S., and titrate the excess alkali with 0.5 *N* hydrochloric acid. Perform a blank determination, disregarding the 0.1 *N* sodium hydroxide (see *Residual Titrations*, page 883). Each ml. of 0.5 *N* alcoholic potassium hydroxide consumed in the saponification is equivalent to 98.15 mg. of $C_{12}H_{20}O_2$.

Packaging and storage—Preserve Lavender Oil in tight containers.

CATEGORY—Perfume.

Levonordefrin



(−)-α-(1-Aminoethyl)-3,4-dihydroxybenzyl Alcohol

$C_9H_{13}NO_3$ Mol. wt. 183.21

Levonordefrin, dried in vacuum at 60° for 15 hours, contains not less than 98.0 percent and not more than 102.0 percent of $C_9H_{13}NO_3$.

Description—Levonordefrin occurs as a white to buff-colored, odorless, crystalline solid. It melts at about 210°.

Solubility—Levonordefrin is practically insoluble in water, and is slightly soluble in acetone, in chloroform, in alcohol, and in ether. It is freely soluble in aqueous solutions of mineral acids.

Identification—

A: Dissolve about 100 mg. of Levonordefrin in 10 ml. of water containing 2 drops of nitric acid and add 1 ml. of silver nitrate T.S.: the solution remains clear and does not change in color (*absence of chloride and distinction from the hydrochloride salt*).

B: Add 100 mg. of Levonordefrin to 2 ml. of a saturated solution of chloranil in acetone: the yellow solution turns reddish brown within 15 minutes (*presence of an amino group*).

C: To a suspension of about 100 mg. of Levonordefrin in 10 ml. of water add 1 drop of ferric chloride T.S.: the suspension immediately turns green and changes to deep blue within one minute. Add 2 drops of diluted hydrochloric acid: the color reverts to light green.

Specific rotation, page 822—The specific rotation of Levonordefrin, previously dried in vacuum at 60° for 15 hours, determined in a solution prepared by dissolving 500 mg. of Levonordefrin in 3 ml. of 1 *N* hydrochloric acid and diluting to 10.0 ml. with water, is not less than −28° and not more than −31°.

Loss on drying, page 814—Dry Levonordefrin in vacuum at 60° for 15 hours: it loses not more than 1 percent of its weight.

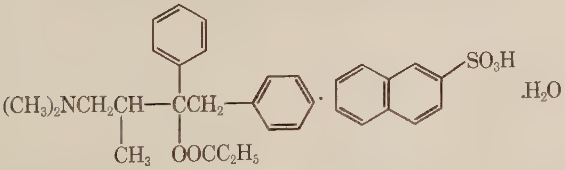
Residue on ignition, page 858—Levonordefrin yields not more than 0.2 percent of residue on ignition.

Assay—Transfer about 350 mg. of Levonordefrin, previously dried in vacuum at 60° for 15 hours and accurately weighed, to a small flask, dissolve it in 50 ml. of glacial acetic acid, heating if necessary, add 1 drop of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 18.32 mg. of $C_9H_{13}NO_3$.

Packaging and storage—Preserve Levonordefrin in well-closed containers.

CATEGORY—Vasoconstrictor.

Levopropoxyphene Napsylate*



(−)-α-4-(Dimethylamino)-3-methyl-1,2-diphenyl-2-butanol Propionate (ester) 2-Naphthalenesulfonate (salt)

$C_{22}H_{29}NO_2 . C_{10}H_8O_3S . H_2O$ Mol. wt. 565.73

Levopropoxyphene Napsylate contains not less than 97.0 percent and not more than 101.0 percent of $C_{22}H_{29}NO_2 . C_{10}H_8O_3S$, calculated on the anhydrous basis.

---

* Patented. See notice, page ii.

Description—Levopropoxyphene Napsylate occurs as a white powder having essentially no odor but having a bitter taste.

Solubility—Levopropoxyphene Napsylate is soluble in methanol, in alcohol, in chloroform, and in acetone. It is very slightly soluble in water.

Melting range, page 814—Levopropoxyphene Napsylate, dried at 105° for 3 hours, melts within a range of 4° between 158° and 165°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Levopropoxyphene Napsylate, previously dried at 105° for 3 hours, exhibits maxima only at the same wavelengths as that of NF Levopropoxyphene Napsylate Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 25,000 solution of Levopropoxyphene Napsylate in methanol exhibits maxima and minima at the same wavelengths as that of NF Levopropoxyphene Napsylate Reference Standard, similarly measured, and the respective absorptivities, calculated on the anhydrous basis at the point of maximum absorption occurring at about 275 mμ, do not differ by more than 3 percent.

Specific rotation, page 822—The specific rotation of Levopropoxyphene Napsylate, determined in a solution in chloroform containing 100 mg. of Levopropoxyphene Napsylate in each 10 ml. is between −35° and −43°.

X-ray diffraction, page 902—The X-ray diffraction pattern of Levopropoxyphene Napsylate conforms to the following pattern:

d	I/I_1
16.2	40
10.33	2
8.71	4
8.07	4
6.73	100

Water, page 900—Determine the water content of Levopropoxyphene Napsylate by the titrimetric method: not less than 2.5 percent and not more than 5 percent is found.

Residue on ignition, page 858—Levopropoxyphene Napsylate yields not more than 0.5 percent of residue on ignition.

Heavy metals, *Method II,* page 806—The heavy metals limit for Levopropoxyphene Napsylate is 30 parts per million.

Assay—Place a pledget of glass wool in the base of a 1 × 30-cm. ion-exchange column. Add to the column 15 ml. of a suitable anionic-exchange resin (page 907), and gently tamp the column to pack the resin. Pass 50 ml. of sodium hydroxide solution (1 in 4) through the column, adjusting the flow rate at about 2 to 4 ml. per minute, wash the column with water until the eluate is neutral, and then wash the column with 50 ml. of methanol, discarding the washings. (*Caution:* Do not permit the column to become dry at any time.) Before the last few ml. of methanol has passed through the column, place a 400-ml. beaker under the column, and pass through the column 25 ml. of a methanol solution containing about 550 mg. of Levopropoxyphene Napsylate, accurately weighed, collecting the eluate in the beaker. Wash the column with one 25-ml. portion and one 50-ml. portion of methanol, collecting the washings in the beaker. Add 50 ml. of water to the beaker, and titrate the combined eluates with 0.1 *N* hydrochloric acid, determining the end-point potentiometrically with suitable electrodes. Each ml. of 0.1 *N* hydrochloric acid is equivalent to 54.77 mg. of $C_{22}H_{29}NO_2 . C_{10}H_8O_3S$.

Packaging and storage—Preserve Levopropoxyphene Napsylate in tight containers.

CATEGORY—Antitussive.

USUAL DOSE—**50** to **100 mg.** every 4 hours.

Levopropoxyphene Napsylate Capsules

Levopropoxyphene Napsylate Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{22}H_{29}NO_2$ (levopropoxyphene base).

Identification—

A: The solution prepared from Levopropoxyphene Napsylate Capsules as directed in the *Assay* exhibits an absorbance maximum at about 5.80 μ.

B: Transfer to a small flask the contents of Levopropoxyphene Napsylate Capsules, equivalent to about 100 mg. of levopropoxyphene base, mix with 10 ml. of chloroform, and filter: the solution is levorotatory (see page 822).

Content uniformity, *Method II*, page 798—Levopropoxyphene Napsylate Capsules meet the requirements of the content uniformity test for capsules, using the following special procedure: Quantitatively transfer the contents of a capsule as completely as possible to a 100-ml. volumetric flask. Rinse the empty capsule with methanol, and add these rinsings to the flask. Add 50 ml. of methanol, and shake mechanically for 15 minutes. Dilute to volume with methanol, mix, and filter, discarding the first 20 ml. of filtrate. Dilute a portion of the subsequent filtrate quantitatively and stepwise, if necessary, with methanol to provide a solution containing approximately 25 mcg. of levopropoxyphene base per ml. Concomitantly determine the absorbance of this solution and of a solution of NF Levopropoxyphene Napsylate Reference Standard, in the same medium, at a concentration of about 42 mcg. per ml., in 1-cm. cells, at the maximum at about 275 mμ, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg., of $C_{22}H_{29}NO_2$ in the capsule by the formula $(T/D) \times (0.6198C) \times (A_U/A_S)$, in which T is the labeled quantity of levopropoxyphene base, in mg., in the capsule; D is the exact concentration, in mcg. per ml., of levopropoxyphene base in the sample solution, based upon the labeled content per capsule and the extent of dilution; 0.6198 is the ratio of the molecular weight of levopropoxyphene base to that of anhydrous levopropoxyphene napsylate; C is the exact concentration of levopropoxyphene napsylate in the Reference Standard solution, in mcg. per ml., calculated on the anhydrous basis; A_U is the absorbance of the sample solution; and A_S is the absorbance of the Reference Standard solution.

Assay—

Standard preparation—Transfer about 85 mg. of NF Levopropoxyphene Napsylate Reference Standard, accurately weighed, to a 125-ml. separator containing 40 ml. of water, and proceed as directed under *Assay preparation*, beginning with "Extract with four 25-ml. portions of chloroform. . . ."

Assay preparation—Remove as completely as possible the contents of not less than 20 Levopropoxyphene Napsylate Capsules, and weigh. Transfer an accurately weighed portion of the contents, equivalent to about 50 mg. of levopropoxyphene base, to a 125-ml. separator containing 40 ml. of water. Extract with four 25-ml. portions of chloroform, and combine the chloroform extracts in a 250-ml. separator, discarding the aqueous phase. Add 40 ml. of 0.5 *N* sodium hydroxide to the chloroform, shake for 3 minutes, and allow the mixture to stand until the emulsion breaks. Filter the chloroform phase through a layer of anhydrous sodium sulfate into a 150-ml. beaker. Evaporate the chloroform solution to about 3 ml. on a steam bath with the aid of a current of air, and complete the evaporation of the remaining chloroform without further heat. With the aid of chloroform, quantitatively transfer the residue to a 10-ml. glass-stoppered flask, again evaporate the chloroform as before, and dissolve the last residue in 2.0 ml. of chloroform.

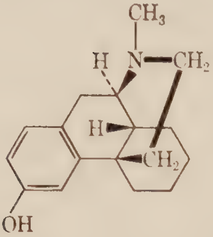
Procedure—Concomitantly determine the absorbance of each solution in 0.1-mm. cells, at the maximum at about 5.80 μ, with a suitable infrared spectrophotometer, using chloroform as the blank. Record the absorbance of the *Standard preparation* as A_S and that of the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{22}H_{29}NO_2$ in the portion of the Capsules taken by the formula $0.6198W \times (A_U/A_S)$, in which 0.6198 is the ratio of the molecular weight of levopropoxyphene base to that of anhydrous levopropoxyphene napsylate, and W is the exact weight, in mg., calculated on the anhydrous basis, of NF Levopropoxyphene Napsylate Reference Standard taken in the preparation of the *Standard preparation*.

Packaging and storage—Preserve Levopropoxyphene Napsylate Capsules in tight containers.

Capsules available—Levopropoxyphene Napsylate Capsules usually available contain the following amounts of levopropoxyphene base: 50 and 100 mg.

CATEGORY and DOSE—See Levopropoxyphene Napsylate.

Levorphanol Tartrate



$.H_2C_4H_4O_6.2H_2O$

17-Methylmorphinan-3-ol Tartrate (1:1)

$C_{17}H_{23}NO.C_4H_6O_6.2H_2O$ Mol. wt. 443.50

Levorphanol Tartrate, dried in vacuum at 90° to constant weight, contains not less than 99.0 percent and not more than 101.0 percent of $C_{17}H_{23}NO.C_4H_6O_6$.

Description—Levorphanol Tartrate occurs as a practically white, odorless, crystalline powder.

Solubility—Levorphanol Tartrate is sparingly soluble in water. It is slightly soluble in alcohol, and is insoluble in chloroform and in ether.

Identification—

A: Mix about 1 mg. of Levorphanol Tartrate with 1 ml. of a solution of ammonium molybdate in sulfuric acid (1 in 100): a blue or greenish blue color develops.

B: Dissolve about 5 mg. of Levorphanol Tartrate in 1 ml. of water, and add a drop of diluted hydrochloric acid and 2 drops of ferric chloride T.S.: no red color develops (*distinction from morphine*). Heat the mixture to boiling and add 1 ml. of potassium ferricyanide (1 in 200): an intense blue color develops.

C: Dissolve about 50 mg. of Levorphanol Tartrate in 2 ml. of diluted sulfuric acid, add 1 ml. of a freshly prepared solution of mercuric nitrate (700 mg. in 4 ml.) and 100 mg. of sodium nitrite, and filter the mixture: a red color develops immediately with heating.

Melting range, page 814—Levorphanol Tartrate melts between 114° and 117°.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 7500 solution of Levorphanol Tartrate in 0.1 *N* hydrochloric acid exhibits a maximum at 279 ± 2 mμ and a minimum at 246 ± 3 mμ.

Loss on drying, page 814—Dry Levorphanol Tartrate in vacuum at 90° to constant weight: it loses not less than 7 percent and not more than 9 percent of its weight.

Residue on ignition, page 858—Levorphanol Tartrate yields not more than 0.1 percent of residue on ignition.

Specific rotation, page 822—The specific rotation of Levorphanol Tartrate, determined in a solution in water containing 300 mg. in each 10 ml. is between −13.5° and −15.0°.

Assay—Transfer about 250 mg. of Levorphanol Tartrate, previously dried in vacuum at 90° to constant weight and accurately weighed, into a 250-ml. flask, add 25 ml. of dehydrated alcohol, and warm slightly to dissolve. Dilute the solution with 100 ml. of chloroform, add 4 drops of methanolic methyl red T.S., and titrate with 0.02 *N* perchloric acid in dioxane to a red end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.02 *N* perchloric acid is equivalent to 8.149 mg. of $C_{17}H_{23}NO.C_4H_6O_6$.

Packaging and storage—Preserve Levorphanol Tartrate in well-closed containers.

CATEGORY—Analgesic (narcotic).

USUAL DOSE—Oral and subcutaneous, **2 mg.**

USUAL DOSE RANGE—**1** to **3 mg.**

Levorphanol Tartrate Injection

Levorphanol Tartrate Injection is a sterile solution of levorphanol tartrate in water for injection. It contains not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{17}H_{23}NO.C_4H_6O_6.2H_2O$.

Identification—

A: To 1 ml. of Levorphanol Tartrate Injection add 1 drop of diluted hydrochloric acid and 2 drops of ferric chloride T.S. Heat to boiling and add 1 ml. of potassium ferricyanide solution (1 in 200): a blue-green color develops.

B: The angular rotation of Levorphanol Tartrate Injection is levorotatory, page 822.

pH, page 824—The pH of Levorphanol Tartrate Injection is between 4.2 and 4.4.

Other requirements—Levorphanol Tartrate Injection meets the requirements under *Injections*, page 810.

Assay—Transfer to a 125-ml. separator 20.0 ml. of Levorphanol Tartrate Injection. Add 5 g. of sodium chloride and sufficient sodium bicarbonate to make the solution alkaline to litmus. Add an additional 100 mg. of sodium bicarbonate, and completely extract the levorphanol with successive portions of a mixture of 3 parts of ether and 1 part of chloroform. Collect the extracts in a 500-ml. conical flask, evaporate to about 30 ml., add 50 ml. of chloroform and 1 drop of methanolic methyl red T.S., and titrate with 0.01 N perchloric acid in dioxane to a red endpoint. Perform a blank determination, and make any necessary correction. Each ml. of 0.01 N perchloric acid is equivalent to 4.435 mg. of $C_{17}H_{23}NO.C_4H_6O_6.2H_2O$.

Packaging and storage—Preserve Levorphanol Tartrate Injection in single-dose or multiple-dose containers, preferably of Type I glass.

Injections available—Levorphanol Tartrate Injection usually available contains the following amounts of levorphanol tartrate: 2 mg. in 1 ml., and 20 mg. in 10 ml.

CATEGORY and DOSE—See Levorphanol Tartrate.

Levorphanol Tartrate Tablets

Levorphanol Tartrate Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{17}H_{23}NO.C_4H_6O_6.2H_2O$.

Identification—

A: Finely powder a number of Levorphanol Tartrate Tablets. To a portion, equivalent to about 1 mg. of levorphanol tartrate, add 1 ml. of water, 1 drop of diluted hydrochloric acid, 2 drops of ferric chloride T.S., and heat to boiling. To the hot solution add 1 ml. of potassium ferricyanide solution (1 in 200): a bluish color develops.

B: Powder a number of Levorphanol Tartrate Tablets, equivalent to about 60 mg. of levorphanol tartrate, and transfer the mixture to a small separator. Add 10 ml. of water, dissolve as much of the powder as possible, add about 400 mg. of sodium bicarbonate and extract the mixture with a 50-ml. portion of chloroform. Evaporate the filtered chloroform extract to a small volume on a steam bath, then dilute to 10 ml. with chloroform and determine the angular rotation in a 200-mm. tube: the solution is levorotatory.

Disintegration, page 878—The disintegration time limit for Levorphanol Tartrate Tablets is 30 minutes.

Content uniformity, *Method II*, page 799—Levorphanol Tartrate Tablets meet the requirements of the content uniformity test for tablets, using the following special procedure: Transfer a tablet to a glass-stoppered flask, add 25.0 ml. of 0.1 N hydrochloric acid, and allow the tablet to disintegrate. Shake well, and filter through a small filter paper, discarding the first portion of the filtrate. Dilute a portion of the filtrate quantitatively and stepwise, if necessary, to provide a solution containing 80 mcg. of levorphanol tartrate per ml. Concomitantly determine the absorbance of this solution and of a standard solution of NF Levorphanol Tartrate, in the same medium and a concentration of about 80 mcg. per ml., in 1-cm. cells, at the maximum at about 279 mμ, with a suitable spectrophotometer, using 0.1 N hydrochloric acid as the blank. Calculate the quantity, in mg., of $C_{17}H_{23}NO.C_4H_6O_6.2H_2O$ in the tablet by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity of levorphanol tartrate, in mg., in the tablet; D is the exact concentration, in mcg. per ml., of the sample solution based upon the labeled quantity per tablet and the extent of dilution; C is the exact concentration of the standard solution, in mcg. per ml.; A_U is the absorbance of the sample solution, and A_S is the absorbance of the standard solution.

Assay—Weigh and finely powder not less than 20 Levorphanol Tartrate Tablets. Weigh accurately a portion of the powder, equivalent to about 40 mg. of levorphanol tartrate, and transfer it to a 125-ml. separator. Add 20 ml. of water and sufficient sodium bicarbonate to make the suspension alkaline to litmus, and then add an additional 100 mg. of sodium bicarbonate. Completely extract the suspension with successive portions of a mixture of 3 parts of ether and 1 part of chloroform. Filter the combined extracts into a 500-ml. conical flask, evaporate to about

30 ml., add 50 ml. of chloroform, 1 drop of methanolic methyl red T.S., and titrate with 0.01 *N* perchloric acid in dioxane to a red end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.01 *N* perchloric acid is equivalent to 4.435 mg. of $C_{17}H_{23}NO.C_4H_6O_6.2H_2O$.

Packaging and storage—Preserve Levorphanol Tartrate Tablets in well-closed containers.

Tablets available—Levorphanol Tartrate Tablets usually available contain the following amount of levorphanol tartrate: 2 mg.

CATEGORY and DOSE—See Levorphanol Tartrate.

Light Mineral Oil, page 461

Magaldrate*

Magaldrate is a chemical combination of aluminum hydroxide and magnesium hydroxide, corresponding to the approximate formula of $Al_2H_{14}Mg_4O_{14}.2H_2O$. It contains the equivalent of not less than 28.0 percent and not more than 39.0 percent of MgO (magnesium oxide), and the equivalent of not less than 17.0 percent and not more than 25.0 percent of Al_2O_3 (aluminum oxide).

Description—Magaldrate occurs as a white, odorless, crystalline powder.

Solubility—Magaldrate is insoluble in water and in alcohol. It is soluble in dilute solutions of mineral acids.

Identification—Dissolve about 600 mg. of Magaldrate in 20 ml. of diluted hydrochloric acid, add 3 drops of methyl red T.S. and about 30 ml. of water, and heat to boiling. Add ammonia T.S. until the color just changes to yellow, continue boiling for 2 minutes, and filter: the filtrate responds to the tests for *Magnesium,* page 809. Wash the precipitate with 50 ml. of hot ammonium chloride solution (1 in 50), then dissolve the precipitate in 15 ml. of diluted hydrochloric acid: the solution responds to the tests for *Aluminum,* page 807.

X-ray diffraction, page 902—The X-ray diffraction pattern of Magaldrate conforms to the following pattern:

d	I/I_1
2.57	95
2.30	55
1.97	33
1.52	100
1.49	65
1.41	10
1.31	10
1.265	12
0.992	6
0.973	8
0.876	10

Acid-consuming capacity—Transfer about 3 g. of Magaldrate, accurately weighed, to a 250-ml. beaker, add 100.0 ml. of 1 *N* hydrochloric acid, and stir until the solution becomes clear. Titrate the excess acid with 1 *N* sodium hydroxide to a pH of 3.0, determined potentiometrically: the volume of 1 *N* acid consumed is not less than 18.0 ml. for each g. of Magaldrate.

Loss on drying, page 814—Dry Magaldrate at 105° for 3 hours: it loses not more than 10 percent of its weight.

Soluble chloride—Boil 1 g. of Magaldrate, accurately weighed, with 50.0 ml. of water for 5 minutes, cool, add sufficient water to restore the original volume, mix, and filter. To 25.0 ml. of the filtrate add 0.1 ml. of potassium chromate T.S., and then titrate with 0.1 *N* silver nitrate until a persistent pink color is obtained: not more than 5.0 ml. of 0.1 *N* silver nitrate is required (3.5 percent).

Soluble sulfate, page 784—A 2.5-ml. portion of the filtrate obtained in the test for *Soluble chloride* shows no more sulfate than corresponds to 1.0 ml. of 0.02 *N* sulfuric acid (1.9 percent).

Sodium—Transfer 2 g. of Magaldrate, accurately weighed, to a 100-ml. volumetric flask, place in an ice bath, add 5 ml. of nitric acid, and swirl to dissolve. Allow to warm to room temperature, dilute to volume with water, and mix. Filter, if necessary, to obtain a clear solution. Dilute 10.0 ml. of the filtrate to 100.0 ml. with water: the emission intensity of this solution, determined with a suitable flame photometer at 589 mμ and corrected for background transmission at 580 mμ, is not greater than that produced by a standard containing 2.2 mcg. of Na per ml., similarly measured (0.11 percent).

Arsenic—A solution of 1.25 g. of Magaldrate in 20 ml. of diluted hydrochloric acid meets the requirements of the

---

* Patented. See notice, page ii.

Arsenic Test, page 777 (8 parts per million As).

Heavy metals, page 806—Dissolve 400 mg. of Magaldrate in 10 ml. of diluted hydrochloric acid, filter if necessary to obtain a clear solution, and dilute with water to 25 ml.: the heavy metals limit for Magaldrate is 60 parts per million.

Assay for magnesium oxide—Dissolve about 100 mg. of Magaldrate, accurately weighed, in 3 ml. of 1 *N* hydrochloric acid, and dilute to about 200 ml. with water. Add, with stirring, 1 g. of ammonium chloride, 20 ml. of triethanolamine, 10 ml. of ammonia-ammonium chloride buffer T.S., and 0.1 ml. of eriochrome black T.S., and titrate with 0.05 *M* disodium ethylenediaminetetraacetate to a blue color. Perform a blank determination, and make any necessary correction. Each ml. of 0.05 *M* disodium ethylenediaminetetraacetate is equivalent to 2.016 mg. of MgO.

Assay for aluminum oxide—Dissolve about 100 mg. of Magaldrate, accurately weighed, in 3 ml. of 1 *N* hydrochloric acid, and dilute to about 30 ml. with water. Add, with stirring, 25.0 ml. of 0.05 *M* disodium ethylenediaminetetraacetate, 20 ml. of acetic acid-ammonium acetate buffer T.S., 60 ml. of alcohol, and 2 ml. of dithizone T.S., and titrate with 0.05 *M* zinc sulfate to a bright rose-pink color. Perform a blank determination, and make any necessary correction. Each ml. of 0.05 *M* disodium ethylenediaminetetraacetate is equivalent to 2.549 mg. of Al_2O_3.

Packaging and storage—Preserve Magaldrate in well-closed containers.

CATEGORY—Antacid.

USUAL DOSE—**400** to **800 mg.** of magaldrate as required, preferably taken between meals and at bedtime.

Magaldrate Oral Suspension

Magaldrate Oral Suspension contains the equivalent of not less than 2.5 percent and not more than 3.0 percent (w/w) of MgO (magnesium oxide), and the equivalent of not less than 1.5 percent and not more than 2.0 percent (w/w) of Al_2O_3 (aluminum oxide).

Identification—

A: Dissolve 10 g. of Magaldrate Oral Suspension in 20 ml. of diluted hydrochloric acid, dilute to about 50 ml. with water, add 3 drops of methyl red T.S., and continue as directed in the test for *Identification* under *Magaldrate,* page 396, beginning with "... and heat to boiling."

B: Evaporate to dryness on a steam bath a few ml. of Magaldrate Oral Suspension: the residue so obtained displays an X-ray diffraction pattern which conforms to that detailed in the test for *X-ray diffraction* under *Magaldrate,* page 396.

Acid-consuming capacity—Transfer about 40 g. of Magaldrate Oral Suspension, accurately weighed, to a 250-ml. beaker, add 100.0 ml. of 1 *N* hydrochloric acid, and stir until the solution becomes clear. Titrate the excess acid with 1 *N* sodium hydroxide to a pH of 3.0, determined potentiometrically: the volume of 1 *N* acid consumed is not less than 1.8 ml. and not more than 2.4 ml. per g. of Suspension.

Other requirements—Evaporate to dryness on a steam bath about 5 ml. of Magaldrate Oral Suspension: the residue so obtained meets the requirements of the tests for *Arsenic* and *Heavy metals* under *Magaldrate,* page 396.

Assay for magnesium oxide—Dissolve about 1.2 g. of Magaldrate Oral Suspension, accurately weighed, in a mixture of 3 ml. of 1 *N* hydrochloric acid and 10 ml. of water, and continue as directed in the *Assay for magnesium oxide* under *Magaldrate,* page 396, beginning with "... and dilute to about 200 ml. with water."

Assay for aluminum oxide—Dissolve about 1.2 g. of Magaldrate Oral Suspension, accurately weighed, in a mixture of 3 ml. of 1 *N* hydrochloric acid and 10 ml. of water, and continue as directed in the *Assay for aluminum oxide* under *Magaldrate,* page 396, beginning with "... and dilute to about 30 ml. with water."

Packaging and storage—Preserve Magaldrate Oral Suspension in tight containers.

CATEGORY and DOSE—See Magaldrate.

Magaldrate Tablets

Magaldrate Tablets contain the equivalent of not less than 130 mg. and not more than 160 mg. of MgO (magnesium oxide), and the equivalent of not less than 80 mg. and not more than 105 mg. of Al_2O_3 (aluminum oxide) per tablet.

Identification—Extract five finely powdered Magaldrate Tablets with three 100-ml. portions of water, and heat the insoluble material to dryness on a steam bath: the residue so obtained meets the requirements of the tests for *Identification* and *X-ray diffraction* under *Magaldrate,* page 396.

Disintegration, page 878—The disintegration time limit for Magaldrate Tablets labeled to be swallowed is 2 minutes.

Weight variation, page 901—Magaldrate Tablets meet the requirements of the weight variation test for tablets.

Acid-consuming capacity—Weigh and finely powder not less than 20 Magaldrate Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 15 tablets, to a 200-ml. volumetric flask, add 100.0 ml. of 2 *N* hydrochloric acid, shake for 15 minutes, dilute to volume with water, and mix. Filter, and transfer 100.0 ml. of the filtrate to a 250-ml. beaker. Titrate the excess acid with 1 *N* sodium hydroxide to a pH of 3.0, determined potentiometrically: not less than 10.0 ml. and not more than 12.2 ml. of 1 *N* acid is consumed per tablet.

Assay for magnesium oxide—Weigh and finely powder not less than 20 Magaldrate Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 2.5 tablets, to a 100-ml. volumetric flask, add 30 ml. of 1 *N* hydrochloric acid, shake for 15 minutes, dilute to volume with water, and mix. Transfer 10.0 ml. of this solution to a 400-ml. beaker, and continue as directed in the *Assay for magnesium oxide* under *Magaldrate,* page 396, beginning with "... and dilute to about 200 ml. with water."

Assay for aluminum oxide—Weigh and finely powder not less than 20 Magaldrate Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 2.5 tablets, to a 100-ml. volumetric flask, add 30 ml. of 1 *N* hydrochloric acid, shake for 15 minutes, dilute to volume with water, and mix. Transfer 10.0 ml. of this solution and 20 ml. of water to a 250-ml. beaker, and continue as directed in the *Assay for aluminum oxide* under *Magaldrate,* page 396, beginning with "Add, with stirring, 25.0 ml. of 0.05 *M* disodium ethylenediaminetetraacetate . . . ."

Packaging and storage—Preserve Magaldrate Tablets in well-closed containers.

Labeling—Label Magaldrate Tablets to indicate whether they are to be swallowed or to be chewed.

CATEGORY and DOSE—See Magaldrate.

Magnesium Carbonate

Magnesium Carbonate is a basic hydrated magnesium carbonate or a normal hydrated magnesium carbonate. It contains the equivalent of not less than 40.0 percent and not more than 43.5 percent of MgO (magnesium oxide).

Description—Magnesium Carbonate occurs as light, white, friable masses, or as a bulky, white powder. It is odorless, and is stable in air.

Solubility—Magnesium Carbonate is practically insoluble in water, to which, however, it imparts a slightly alkaline reaction. It is insoluble in alcohol, but is dissolved by dilute acids with effervescence.

Identification—When Magnesium Carbonate is treated with diluted hydrochloric acid, it dissolves with effervescence and the resulting solution responds to the tests for *Magnesium,* page 809.

Soluble salts—Mix 2 g. of Magnesium Carbonate with 100 ml. of a mixture of equal volumes of 1-propanol and water. Heat the mixture to the boiling point with constant stirring, cool to room temperature, add water to make 100 ml., and filter. Evaporate 50 ml. of the filtrate on a steam bath to dryness, and dry at 105° for 1 hour: the weight of the residue does not exceed 10 mg. (1 percent).

Acid-insoluble substances—Mix 5 g. of Magnesium Carbonate with 75 ml. of water, add hydrochloric acid in small portions, with agitation, until no more of the Magnesium Carbonate dissolves, and boil for 5 minutes. If an insoluble residue remains, filter, wash well with water until the last washing is free from chloride, and ignite: the weight of the ignited residue does not exceed 2.5 mg. (0.05 percent).

Arsenic—A solution of 2.5 g. of Magnesium Carbonate in about 10 ml. of diluted hydrochloric acid meets the requirements of the *Arsenic Test,* page 777 (4 parts per million As).

Calcium oxide—Dissolve about 1 g. of Magnesium Carbonate, accurately weighed, in a mixture of 3 ml. of sulfuric acid and 22 ml. of water. Add 50 ml. of alcohol, and allow the mixture to stand overnight. If crystals of magnesium sulfate separate, warm the mixture to about 50° to dissolve them. Filter through a porcelain filter crucible containing an asbestos mat that previously has been washed with diluted sulfuric acid, water, and alcohol and ignited and weighed. Wash the crystals on the mat several times with a mixture of 2 volumes of alcohol and 1 volume of diluted sulfuric acid. Ignite the crucible and contents at a dull red heat, cool, and weigh. The weight of calcium sulfate so obtained, multiplied by 0.4119, gives the equivalent of CaO (calcium oxide) in the Magnesium Carbonate taken for the test: the CaO does not exceed 0.6 percent.

Heavy metals, page 806—Dissolve 1 g. of Magnesium Carbonate in 10 ml. of diluted hydrochloric acid, and evaporate the solution on a steam bath to dryness. Toward the end of the evaporation stir frequently to disintegrate the residue so that finally a dry powder is obtained. Dissolve the residue in 20 ml. of water, and evaporate to dryness in the same manner as before. Redissolve the residue in 20 ml. of water, filter if necessary, and add to the filtrate 2 ml. of diluted acetic acid and water to make 25 ml.: the heavy metals limit for Magnesium Carbonate is 30 parts per million.

Iron—Boil 100 mg. of Magnesium Carbonate with 5 ml. of a mixture of 1 volume of nitric acid and 9 volumes of water for 1 minute. Cool, dilute to 50 ml. with water, add about 50 mg. of ammonium persulfate and 5 ml. of ammonium thiocyanate T.S., mix, and transfer to a color-comparison tube. Treat in the same manner 2.0 ml. of a solution of ferric ammonium sulfate, made by dissolving 86.5 mg. of ferric ammonium sulfate in 10 ml. of diluted sulfuric acid and adding water to make 1000 ml., each ml. representing 0.01 mg. of Fe. The color of the test solution is not deeper than that of the solution containing the standard iron solution (0.02 percent).

Assay—Dissolve about 1 g. of Magnesium Carbonate, accurately weighed, in 30.0 ml. of 1 *N* sulfuric acid, add 3 drops of methyl orange T.S., and titrate the excess acid with 1 *N* sodium hydroxide. From the volume of 1 *N* sulfuric acid consumed, deduct the volume of 1 *N* sulfuric acid corresponding to the content of calcium oxide in the weight of Magnesium Carbonate taken for the assay. The difference is the volume of 1 *N* sulfuric acid equivalent to the magnesium oxide present. Each ml. of 1 *N* sulfuric acid is equivalent to 20.15 mg. of MgO and to 28.04 mg. of CaO.

Packaging and storage—Preserve Magnesium Carbonate in well-closed containers.

CATEGORY—Antacid.

USUAL DOSE RANGE—**500 mg. to 2 g.** four times a day.

Magnesium Citrate Solution

Magnesium Citrate Solution contains, in each 100 ml., an amount of magnesium citrate corresponding to not less than 1.55 g. and not more than 1.9 g. of MgO (magnesium oxide).

Magnesium Carbonate	**15 g.**
Anhydrous Citric Acid	**27.4 g.**
Syrup	**60 ml.**
Talc	**5 g.**
Lemon Oil	**0.1 ml.**
Potassium Bicarbonate	**2.5 g.**
Purified Water, a sufficient quantity,	
To make	**350 ml.**

NOTE: An amount of citric acid containing 1 molecule of water of hydration, equivalent to 27.4 g. of anhydrous citric acid, may be used in the above formula.

Dissolve the anhydrous citric acid in 150 ml. of hot purified water in a suitable dish, add slowly the magnesium carbonate, previously mixed with 100 ml. of purified water, and stir until it is dissolved. Then add the syrup, heat the mixed liquids to the boiling point, immediately add the lemon oil, previously triturated with the talc, and filter the mixture, while hot, into a strong bottle (previously rinsed with boiling purified water) of suitable capacity. Add enough boiled purified water to make the product measure 350 ml. Stopper the bottle with purified cotton, allow to cool, add the potassium bicarbonate, and immediately stopper the bottle securely. Lastly, shake the solution occasionally until the potassium bicarbonate is dissolved.

NOTE: In this process the 2.5 g. of potassium bicarbonate may be replaced by 2.1 g. of sodium bicarbonate, preferably in tablet form. The Solution may be further carbonated by the use of CO_2 under pressure.

The stability of Magnesium Citrate Solution may be improved by pasteurizing or sterilizing the Solution. For Solutions which are not intended to be pasteurized or sterilized, the stability may be improved by employing 30 g. of citric acid and a quantity of magnesium carbonate equivalent to 6.0 g. of MgO for each 350 ml. of Solution.

Description—Magnesium Citrate solution is a colorless to slightly yellow, clear, effervescent liquid, having a sweet, acidulous taste and a lemon flavor.

Identification—

A: Magnesium Citrate Solution responds to the tests for *Magnesium,* page 809.

B: To 5 ml. of Magnesium Citrate Solution add 1 ml. of potassium permanganate T.S. and 5 ml. of mercuric sulfate T.S., and heat the solution: a white precipitate is formed

Chloride, page 784—A 2-ml. portion of Magnesium Citrate Solution shows no more chloride than corresponds to 0.3 ml. of 0.02 *N* hydrochloric acid (0.01 percent).

Sulfate, page 784—A 2-ml. portion of Magnesium Citrate Solution shows no more sulfate than corresponds to 0.3 ml. of 0.02 *N* sulfuric acid (0.015 percent).

Tartaric acid—To 10 ml. of Magnesium Citrate Solution in a test tube add 1 ml. of glacial acetic acid and 3 ml. of a solution of potassium acetate (1 in 2), shake the mixture vigorously, then gently rub the inner wall of the test tube with a glass rod for a few minutes, and allow to stand for 1 hour: no white, crystalline precipitate soluble in ammonia T.S. is formed.

Assay for anhydrous citric acid—Measure accurately 10 ml. of Magnesium Citrate Solution, which has been previously freed from excessive carbon dioxide by repeated pouring, into a 250-ml. beaker, and add 30 ml. of water. Then add 3 drops of phenolphthalein T.S. and just enough 1 *N* sodium hydroxide to give the liquid a persistent pink color, and acidify with 4 drops of 1 *N* hydrochloric acid. Add 20 ml. of calcium chloride T.S., and concentrate, by boiling, to about 30 ml., stirring constantly with a rubber-tipped glass rod during the boiling. Completely transfer the precipitate from the hot mixture to a filter of from 9 to 11 cm. in diameter with the aid of small quantities of boiling water. Then wash the precipitate five times with boiling water. Collect the filtrate and washings in a 150-ml. beaker, and concentrate the solution, by boiling, to about 20 ml. Add sufficient ammonia T.S., dropwise, to give the liquid a distinct red color, and then concentrate to about 10 ml. Transfer the precipitate completely from the hot mixture to a filter of from 7 to 9 cm. in diameter with the aid of small quantities of boiling water, and wash the precipitate six times with 5-ml. portions of boiling water.

Dry the two filters with the precipitates, and incinerate them together in a loosely covered platinum crucible, heating at first at a low temperature until the precipitates are well charred, and then remove the cover and raise the temperature until the residue is nearly white. If a gas flame is used, it must not come in contact with the mass in the crucible. Cool, place the crucible with its contents in a suitable beaker, add about 30 ml. of water, and then 50.0 ml. of 0.5 *N* hydrochloric acid. When the residue has dissolved, remove the crucible, rinsing it well with water into the beaker. Add 100 ml. of water, cover the beaker with a watch glass, and boil gently for 10 minutes. Cool, and titrate the excess acid with 0.5 *N* sodium hydroxide, using phenolphthalein T.S. as the indicator. Not less than 23.7 ml. of 0.5 *N* hydrochloric acid is consumed (7.59 g. of anhydrous citric acid, $C_6H_8O_7$, in 100 ml. of the Solution).

Assay for magnesium oxide—Transfer to a 100-ml. volumetric flask 50.0 ml. of Magnesium Citrate Solution which has been previously freed from excessive carbon dioxide by repeated pouring. Add water to volume, and mix. Pipet 5.0 ml. of this solution to a beaker containing 150 ml. of water heated to 70° to 80°, add 1 ml. of ammonium chloride T.S., and then 3 ml. of stronger ammonia water. Mix thoroughly, and add slowly, with stirring, 8 ml. of 8-hydroxyquinoline T.S. After standing for 30 minutes, filter through a sintered-glass crucible, previously dried and weighed, and wash the precipitate with ten 10-ml. portions of water. Dry the crucible and contents at 105° for 3 hours, cool, and weigh. The weight of $C_{18}H_{12}MgN_2O_2 . 2H_2O$ so obtained, multiplied by 4.624, gives the equivalent of MgO in 100 ml. of the Solution.

Packaging and storage—Preserve Magnesium Citrate Solution in a cold place, preferably in a refrigerator, keeping the bottle on its side. Package Magnesium Citrate Solution in bottles containing not less than 200 ml.

CATEGORY—Cathartic.
USUAL DOSE—**200 ml.**

Magnesium Hydroxide

$Mg(OH)_2$ Mol. wt. 58.32

Magnesium Hydroxide, dried at 105° for 2 hours, contains not less than 95.0 percent and not more than 100.5 percent of $Mg(OH)_2$.

Description—Magnesium Hydroxide occurs as a bulky, white powder.

Solubility—Magnesium Hydroxide dissolves in dilute acids. It is practically insoluble in water and in alcohol.

Identification—A solution of Magnesium Hydroxide (1 in 20) in diluted hydrochloric acid responds to the tests for *Magnesium*, page 809.

Loss on drying, page 814—Dry Magnesium Hydroxide at 105° for 2 hours: it loses not more than 2 percent of its weight.

Loss on ignition—Transfer to a tared platinum crucible about 500 mg. of Magnesium Hydroxide, weigh accurately, and ignite at 800°, increasing the heat gradually, to constant weight: the loss in weight is not less than 30 percent and not more than 33 percent.

Soluble salts—Boil 2 g. of Magnesium Hydroxide with 100 ml. of water for 5 minutes in a covered beaker, then filter while hot. Titrate 50 ml. of the cooled filtrate with 0.1 *N* sulfuric acid using methyl red T.S. as the indicator: not more than 2 ml. of the acid is consumed. Evaporate 25 ml. of the filtrate to dryness, and dry at 105° for 3 hours: not more than 10 mg. of residue remains.

Carbonate—Boil a mixture of 100 mg. of Magnesium Hydroxide with 5 ml. of water, cool, and add 5 ml. of acetic acid: no effervescence is produced.

Arsenic—A solution of 1.25 g. of Magnesium Hydroxide in 20 ml. of diluted hydrochloric acid meets the requirements of the *Arsenic Test,* page 777 (8 parts per million As).

Calcium oxide—Dissolve about 500 mg. of Magnesium Hydroxide, accurately weighed, in a mixture of 3 ml. of sulfuric acid and 22 ml. of water. Add 50 ml. of alcohol, and allow the mixture to stand overnight. If crystals of magnesium sulfate separate, warm the mixture to about 50° to dissolve them. Filter through a tared porcelain filter crucible containing an asbestos mat which has been previously washed with diluted sulfuric acid, water, and alcohol, and ignited. Wash the crystals on the mat several times with a mixture of 3 volumes of alcohol and 1 volume of water. Ignite the crucible and contents at a dull red heat, cool, and weigh. The weight of calcium sulfate thus obtained, multiplied by 0.4119, gives the equivalent of CaO in the Magnesium Hydroxide taken for the test: the weight of CaO thus obtained does not exceed 1 percent.

Heavy metals, page 806—Dissolve 1 g. of Magnesium Hydroxide in 10 ml. of diluted hydrochloric acid and evaporate the solution to dryness on a steam bath. Toward the end of the evaporation, stir the residue frequently, disintegrate it so that finally a dry powder is obtained, dissolve the residue in 20 ml. of water, and filter. To the filtrate, which should be neutral to litmus, add 2 ml. of diluted acetic acid, and dilute to 25 ml. with water: the heavy metals limit for Magnesium Hydroxide is 40 parts per million.

Assay—Transfer about 400 mg. of Magnesium Hydroxide, previously dried at 105° for 2 hours and accurately weighed, into a conical flask. Add 25.0 ml. of 1 *N* sulfuric acid, and after solution is complete add 3 drops of methyl red T.S. Titrate the excess acid with 1 *N* sodium hydroxide. From the volume of 1 *N* sulfuric acid, deduct the volume of 1 *N* sulfuric acid consumed, corresponding to the content of CaO in the Magnesium Hydroxide taken for the assay. The difference is the volume of 1 *N* sulfuric acid equivalent to the $Mg(OH)_2$ in the portion of Magnesium Hydroxide taken. Each ml. of 1 *N* sulfuric acid is equivalent to 29.16 mg. of $Mg(OH)_2$ and to 28.04 mg. of CaO.

Packaging and storage—Preserve Magnesium Hydroxide in tight containers.

CATEGORY—Antacid; cathartic.

USUAL DOSE RANGE—Antacid, **300** to **600 mg.**; cathartic, **2** to **4 g.**

Magnesium Phosphate

$Mg_3(PO_4)_2 . 5H_2O$ Mol. wt. 352.93

Magnesium Phosphate, ignited to constant weight, contains not less than 98.0 percent and not more than 101.5 percent of $Mg_3(PO_4)_2$.

Description—Magnesium Phosphate occurs as a white, odorless, and tasteless powder.

Solubility—Magnesium Phosphate is readily soluble in diluted mineral acids but is almost insoluble in water.

Identification—

A: Dissolve about 200 mg. of Magnesium Phosphate in 10 ml. of diluted nitric acid and add, dropwise, ammonium molybdate T.S.: a greenish yellow precipitate of ammonium phosphomolybdate forms which is soluble in ammonia T.S.

B: Dissolve 100 mg. of Magnesium Phosphate in 0.7 ml. of diluted acetic acid and 20 ml. of water. Add 1 ml. of ferric chloride T.S., let stand 5 minutes, and filter. Five ml. of the filtrate responds to the test for *Magnesium*, page 809.

Loss on ignition—Weigh accurately about 1 g. of Magnesium Phosphate and ignite at 425° to constant weight: it loses not less than 20 percent and not more than 27 percent of its weight.

Acid-insoluble substances—If an insoluble residue remains in the test for *Carbonate*, filter the solution, wash well with hot water until the last washing is free from chloride, and ignite the residue: the weight of the residue does not exceed 4 mg. (0.2 percent).

Soluble substances—Digest 2 g. of Magnesium Phosphate with 100 ml. of water for 30 minutes on a steam bath, cool, add sufficient water to restore the original volume, mix, and filter. Evaporate 50 ml. of the filtrate to dryness, and ignite gently to constant weight: the weight of the residue does not exceed 15 mg. (1.5 percent).

Carbonate—Mix 2 g. of Magnesium Phosphate with 20 ml. of water, and add hydrochloric acid, dropwise, to effect solution: no effervescence occurs when the acid is added.

Chloride, page 784—Dissolve 500 mg. of Magnesium Phosphate in 50 ml. of diluted nitric acid and add 1 ml. of silver nitrate T.S.: the turbidity does not exceed that produced by 1 ml. of 0.02 *N* hydrochloric acid (0.14 percent).

Nitrate—Mix 200 mg. of Magnesium Phosphate with 5 ml. of water, and add just sufficient hydrochloric acid to effect solution. Dilute with water to 10 ml., add 0.1 ml. of indigo carmine T.S., then add, with stirring, 10 ml. of sulfuric acid: the blue color persists for at least 5 minutes.

Sulfate, page 784—Dissolve 500 mg. of Magnesium Phosphate in the smallest possible amount of diluted hydrochloric acid, dilute to 48 ml. with water, and add 2 ml. of barium chloride T.S.: the turbidity does not exceed that produced by 3 ml. of 0.02 *N* sulfuric acid (0.6 percent).

Arsenic—A solution of 1.25 g. of Magnesium Phosphate in just sufficient diluted hydrochloric acid (about 9 ml.) to dissolve the sample meets the requirements of the *Arsenic Test*, page 777 (8 parts per million As).

Barium—Mix 2 g. of Magnesium Phosphate with 40 ml. of water, heat, add hydrochloric acid, dropwise, to effect solution, then add 1 ml. of acid in excess. Cool, dilute with water to 50 ml., and filter. To 5 ml. of the filtrate add 1 ml. of potassium sulfate T.S.: no turbidity is produced within 15 minutes.

Calcium—Mix 500 mg. of Magnesium Phosphate with 15 ml. of water, heat, and add sufficient hydrochloric acid, in small portions, to effect solution. Cool, add ammonia T.S., in small portions, to produce a slight permanent precipitate, then add 2 ml. of acetic acid. Dilute with water to 25 ml., and filter. To 10 ml. of the filtrate add 2 ml. of ammonium oxalate T.S.: not more than a slight turbidity is produced within 5 minutes.

Heavy metals, page 806—Dissolve 1 g. of Magnesium Phosphate in 4.5 ml. of diluted hydrochloric acid, and dilute to 25 ml. with water. The heavy metals limit for Magnesium Phosphate is 30 parts per million.

Dibasic salt and magnesium oxide—Ignite about 2.5 g. of Magnesium Phosphate to constant weight. Weigh accurately about 2 g. of the ignited salt, and dissolve it by warming with 50.0 ml. of 1 *N* hydrochloric acid. Cool, add 1 or 2 drops of methyl orange T.S., and slowly titrate the excess of 1 *N* hydrochloric acid with 1 *N* sodium hydroxide to a yellow color, vigorously shaking the mixture during the titration. Not less than 14.8 ml. and not more than 15.4 ml. of 1 *N* hydrochloric acid is consumed for each g. of the ignited salt.

Assay—Weigh accurately about 200 mg. of Magnesium Phosphate, previously ignited to constant weight, and dissolve it in a mixture of 25 ml. of water and 10 ml. of diluted nitric acid. Filter, if necessary, wash any precipitate, add sufficient ammonia T.S. to the filtrate to produce a slight precipitate, then dissolve the precipitate by the addition of 1 ml. of diluted nitric acid. Adjust the temperature to about 50°, add 75 ml. of ammonium molybdate T.S., and maintain the temperature at about 50° for 30 minutes, stirring occasionally. Wash the precipitate once or twice with water by decantation, using from 30 to 40 ml. each time and passing the washings through a filter. Transfer the precipitate to the filter, and wash with potassium nitrate solution (1 in 100) until the last washing is not acid to litmus paper. Transfer the precipitate and filter to the precipitation vessel, add 50 ml. of water and 40.0 ml. of 1 *N* sodium hydroxide, agitate until the precipitate is dissolved, add 3 drops of phenolphthalein T.S., and then titrate the excess alkali with

1 *N* sulfuric acid. Each ml. of 1 *N* sodium hydroxide is equivalent to 5.716 mg. of $Mg_3(PO_4)_2$.

Packaging and storage—Preserve Magnesium Phosphate in well-closed containers.

CATEGORY—Antacid.

USUAL DOSE—**1 g.**

Menadiol Sodium Diphosphate Tablets

Menadiol Sodium Diphosphate Tablets contain not less than 95.0 percent and not more than 110.0 percent of the labeled amount of $C_{11}H_8Na_4O_8P_2 . 6H_2O$.

Identification—

A: Triturate a quantity of powdered Menadiol Sodium Diphosphate Tablets, equivalent to about 100 mg. of menadiol sodium diphosphate, with a mixture of 10 ml. of water and 10 ml. of diluted sulfuric acid, centrifuge the mixture, and filter the supernatant liquid. To the filtrate add 1 ml. of 0.5 *N* ceric sulfate, mix, extract with 10 ml. of chloroform, and centrifuge. Evaporate the chloroform extract on a steam bath just to dryness, and then dry at 80° for 1 hour: the menadione so obtained melts between 103° and 107°, page 814.

B: To 50 mg. of the menadione obtained in *Identification test A* add 5 ml. of water, then add 75 mg. of sodium bisulfite, and heat on a steam bath, shaking vigorously until the substance is dissolved and the solution is almost colorless. Add water to make 50 ml., and mix. To 2 ml. of the solution add 2 ml. of alcoholic ammonia (prepared by mixing equal volumes of alcohol and stronger ammonia water), shake, and add 3 drops of ethyl cyanoacetate: a deep purplish blue color is produced, which, on the addition of 1 ml. of sodium hydroxide solution (1 in 3), changes to green and then to yellow.

C: Triturate a quantity of powdered Menadiol Sodium Diphosphate Tablets, equivalent to about 20 mg. of menadiol sodium diphosphate, with 10 ml. of water, centrifuge the mixture, filter the supernatant liquid, and evaporate to a volume of about 2 ml. Add 2 drops of nitric acid and 1 ml. of sulfuric acid, and heat slowly to the evolution of white fumes. Cool, cautiously dilute with water to about 10 ml., and filter if not clear. Render the filtrate slightly alkaline to litmus paper with ammonia T.S., then make it acid with nitric acid, and add to the warm solution 3 ml. of ammonium molybdate T.S.: a yellow precipitate is formed within a few minutes.

Disintegration, page 878—The disintegration time limit for Menadiol Sodium Diphosphate Tablets is 30 minutes.

Content uniformity, *Method II,* page 799—Menadiol Sodium Diphosphate Tablets meet the requirements of the content uniformity test for tablets, using the following special procedure: [NOTE—Use low-actinic glassware.] Quantitatively transfer a finely powdered tablet to a glass-stoppered centrifuge tube, add 25 ml. of pH 8.0 phosphate buffer (see page 783), and shake vigorously for several minutes. Filter into a 50-ml. volumetric flask, rinse the centrifuge tube and filter with three 5-ml. portions of pH 8.0 phosphate buffer, adding the rinsings to the volumetric flask, dilute to volume with pH 8.0 phosphate buffer, and mix. Dilute a portion of this solution quantitatively and stepwise, if necessary, with pH 8.0 phosphate buffer to provide a solution containing approximately 40 mcg. of menadiol sodium diphosphate per ml. Concomitantly determine the absorbance of this solution and of a solution of USP Menadiol Sodium Diphosphate, previously dried in vacuum over phosphorus pentoxide for 4 hours, in the same medium, at a concentration of about 40 mcg. per ml., at the maximum at about 297 mμ, with a suitable spectrophotometer, using pH 8.0 phosphate buffer as the blank. Calculate the quantity, in mg., of $C_{11}H_8Na_4O_8P_2 . 6H_2O$ in the tablet by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity of menadiol sodium diphosphate, in mg., in the tablet; D is the exact concentration, in mcg. per ml., of menadiol sodium diphosphate in the sample solution, based upon the labeled quantity per tablet and the extent of dilution; C is the exact concentration of $C_{11}H_8Na_4O_8P_2 . 6H_2O$ in the standard solution, in mcg. per ml.; A_U is the absorbance of the sample solution, and A_S is the absorbance of the standard solution.

Assay—Weigh and finely powder not less than 20 Menadiol Sodium Diphosphate Tablets. Weigh accurately into a 250-ml. beaker a portion of the powder, equivalent to about 50 mg. of menadiol sodium diphosphate. Moisten the powder with a few ml. of glacial acetic acid, then add sufficient of the acid to make 25 ml. Add 25 ml. of diluted hydrochloric acid and 25 ml. of water, mix, and titrate with 0.01 *N* ceric sulfate, determining the endpoint potentiometrically using a platinum-calomel electrode system. Each ml. of 0.01 *N* ceric sulfate is equivalent to 2.651 mg. of $C_{11}H_8Na_4O_8P_2 . 6H_2O$.

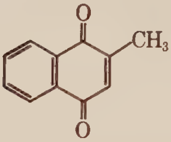
Packaging and storage—Preserve Menadiol Sodium Diphosphate Tablets in well-closed, light-resistant containers.

Tablets available—Menadiol Sodium Diphosphate Tablets usually available contain the following amount of menadiol sodium diphosphate: 5 mg.

CATEGORY—Source of Vitamin K.

USUAL DOSE OF MENADIOL SODIUM DIPHOSPHATE—**5 mg.** daily.

Menadione



2-Methyl-1,4-naphthoquinone

$C_{11}H_8O_2$ Mol. wt. 172.19

Menadione contains not less than 98.5 percent and not more than 101.0 percent of $C_{11}H_8O_2$, calculated on the dried basis.

Caution—Menadione powder is irritating to the respiratory tract and to the skin, and a solution of it in alcohol is a vesicant.

Description—Menadione occurs as a bright yellow, crystalline powder, and is nearly odorless. It is affected by sunlight.

Solubility—Menadione is practically insoluble in water. It is soluble in benzene and vegetable oils, and is sparingly soluble in chloroform and in alcohol.

Identification—To 50 mg. of Menadione add 5 ml. of water, then add 75 mg. of sodium bisulfite, and heat on a steam bath, shaking vigorously until the sample is dissolved and the solution is almost colorless. Dilute to 50 ml. with water, and mix. To 2 ml. of this solution add 2 ml. of alcoholic ammonia (prepared by mixing equal volumes of alcohol and stronger ammonia water), shake, and add 3 drops of ethyl cyanoacetate: a deep purplish blue color is produced, and on the addition of 1 ml. of sodium hydroxide solution (1 in 3), it changes to green and then to yellow.

Melting range, page 814—Menadione melts between 105° and 107°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Menadione, previously dried over silica gel for 4 hours, exhibits maxima only at the same wavelengths as that of NF Menadione Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 200,000 solution of Menadione in alcohol exhibits maxima and minima at the same wavelengths as that of NF Menadione Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorption occurring at about 250 mμ, do not differ by more than 3 percent.

Loss on drying, page 814—Dry Menadione over silica gel for 4 hours: it loses not more than 0.3 percent of its weight.

Residue on ignition, page 858—Menadione yields not more than 0.1 percent of residue on ignition.

Assay—Weigh accurately about 150 mg. of Menadione, and transfer to a 150-ml. flask. Add 15 ml. of glacial acetic acid and 15 ml. of diluted hydrochloric acid, and rotate the flask until the Menadione is dissolved. Then add about 3 g. of zinc dust, close the flask with a stopper bearing a Bunsen valve, shake well, and allow to stand in the dark for 1 hour, with frequent shaking. Rapidly decant the solution through a pledget of cotton into another flask, immediately wash the reduction flask with three 10-ml. portions of freshly boiled and cooled water, add 0.1 ml. of orthophenanthroline T.S., and immediately titrate the combined filtrate and washings with 0.1 *N* ceric sulfate. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* ceric sulfate is equivalent to 8.609 mg. of $C_{11}H_8O_2$.

Packaging and storage—Preserve Menadione in well-closed, light-resistant containers.

CATEGORY—Vitamin K supplement.

USUAL DOSE—Oral and parenteral, **2 mg.** daily.

USUAL DOSE RANGE—**2** to **5 mg.**

Menadione Injection

Menadione Injection is a sterile solution of menadione in oil. It contains not less than 90.0 percent and not more than 120.0 percent of the labeled amount of $C_{11}H_8O_2$.

Other requirements—Menadione Injection meets the requirements under *Injections*, page 810.

Assay—

Standard preparation—Weigh accurately 25.0 mg. of NF Menadione Reference Standard, previously dried over phosphorus pentoxide for 4 hours in the dark, dissolve it in a mixture of equal volumes of alcohol and ether to make 100.0 ml., and mix. Keep the solution tightly closed in a dark, cool place, and use it within 7 days.

Assay preparation—Dilute an accurately measured volume of Menadione Injection, equivalent to about 25 mg. of menadione, with a mixture of equal volumes of ether and of alcohol to make 100.0 ml.

Procedure—Pipet 1.0 ml. each of the *Standard preparation* and of the *Assay preparation* into separate 50-ml. volumetric flasks, add to each 4 ml. of alcohol, and mix. Then to each flask add 1.0 ml. of a solution made by dissolving 50 mg. of 2,4-dinitrophenylhydrazine in 20 ml. of a mixture of 2 volumes of diluted hydrochloric acid and 1 volume of water. Place the flasks in a bath maintained at 70° to 75° for 15 minutes, shaking vigorously every 2 or 3 minutes. Immediately after the heating, cool the flasks to about 25°, then add to each 5 ml. of alcoholic ammonia, made by mixing equal volumes of alcohol and of stronger ammonia water. Shake the flasks thoroughly, add alcohol to make 50.0 ml., mix, allow to stand for 15 minutes, and decant from any separated oil. Determine the absorbance of each solution in a suitable spectrophotometer at 635 mμ relative to a reagent blank. Record the absorbance of the solution from the *Standard preparation* as A_S, and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{11}H_8O_2$ in the volume of the Injection taken by the formula $25 \times (A_U/A_S)$.

Packaging and storage—Preserve Menadione Injection in single-dose or multiple-dose containers, preferably of Type I glass.

Injections available—Menadione Injection usually available contains the following amounts of menadione: 2 and 5 mg. in 1 ml.

CATEGORY and DOSE—See Menadione.

Menadione Tablets

Menadione Tablets contain not less than 95.0 percent and not more than 110.0 percent of the labeled amount of $C_{11}H_8O_2$.

Identification—Powder a sufficient number of Menadione Tablets to yield about 10 mg. of menadione. Macerate the powder with two 10-ml. portions of chloroform, and decant the chloroform solution through a filter. Protect from light and evaporate the chloroform extract with the aid of a current of air to dryness. To 5 mg. of the residue add 1 ml. of water and 7.5 mg. of sodium bisulfite, and heat on a steam bath, shaking vigorously until the menadione is dissolved and the solution is nearly colorless. Dilute to 5 ml. with water, and mix. To 2 ml. of the solution add 2 ml. of alcoholic ammonia (prepared by mixing equal volumes of alcohol and stronger ammonia water), shake, and add 3 drops of ethyl cyanoacetate: a deep purplish blue color is produced, and on the addition of 1 ml. of sodium hydroxide solution (1 in 3), it changes to green and then to yellow.

Disintegration, page 878—The disintegration time limit for Menadione Tablets is 30 minutes.

Content uniformity, *Method II*, page 799—Menadione Tablets meet the requirements of the content uniformity test for tablets, using the following special procedure: Transfer one tablet to a 50-ml. volumetric flask containing 25 ml. of alcohol, and shake the flask until the tablet is dissolved. Dilute to volume with alcohol, mix, and filter, discarding the first 10 ml. of filtrate. Dilute a portion of the subsequent filtrate quantitatively and stepwise with alcohol to provide a solution containing approximately 5 mcg. of menadione per ml. Concomitantly determine the absorbance of this solution and of a solution of NF Menadione Reference Standard, in the same medium at a concentration of about 5 mcg. per ml., in 1-cm. cells, at the maximum at about 250 mμ, with a suitable spectrophotometer, using alcohol as the blank. Calculate the quantity, in mg., of $C_{11}H_8O_2$ in the Tablet by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity, in mg., of menadione in the tablet; D is the exact concentration, in mcg. per ml., of menadione in the sample solution, based upon the labeled quantity per tablet and the extent of dilution; C is the exact concentration, in mcg. per ml., of the Reference Standard solution; A_U is the absorbance of the sample solution; and A_S is the absorbance of the Reference Standard solution.

Assay—Weigh and finely powder not less than 20 Menadione Tablets. Weigh accurately a portion of the powder, equivalent to about 20 mg. of menadione, and transfer to a suitable vessel. Extract with three 10-ml. portions of chloroform, each time stirring the mixture well, then allowing the undissolved matter to settle and decanting the supernatant liquid onto a sintered-glass filter, suitably protected from light. Finally transfer the residue to the filter with the aid of chloroform, and wash it, the vessel and the filter with 5-ml. portions of chloroform until the last washing is colorless. Protect from light and evaporate the combined chloroform extracts and washings with the aid of a current of air to dryness. Add to the residue 7 ml. of glacial acetic acid, agitate until dissolved, then add 10 ml. of diluted hydrochloric acid and about 1 g. of zinc dust, with shaking. Close the flask with a stopper bearing a Bunsen valve, and allow to stand in the dark, with frequent shaking, for 1 hour, or until the solution is colorless. Rapidly decant the liquid through a pledget of cotton into another flask, wash the flask in which the reduction was made, and the filter with three 5-ml. portions of freshly boiled and cooled water, add 0.1 ml. of orthophenanthroline T.S., and promptly titrate the combined filtrate and washings with 0.02 *N* ceric sulfate. Perform a blank determination, and make any necessary correction. Each ml. of 0.02 *N* ceric sulfate is equivalent to 1.722 mg. of $C_{11}H_8O_2$.

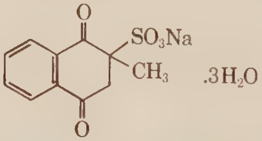
If the Tablets contain stearic acid, proceed as follows: Shake the chloroform extract of the Tablets, obtained as described in the preceding paragraph, in a separator with a mixture of 2 ml. of 1 *N* sodium hydroxide and 8 ml. of water, allow to separate, and drain the chloroform layer into a filter moistened with chloroform. Wash the water layer with 10 ml. of chloroform, and add the latter to the main chloroform solution. Finally wash the filter with about 10 ml. of chloroform, and proceed as directed in the foregoing paragraph, beginning with "Protect from light. . . ."

Packaging and storage—Preserve Menadione Tablets in well-closed containers.

Tablets available—Menadione Tablets usually available contain the following amounts of Menadione: 2, 5, and 10 mg.

CATEGORY and DOSE—See Menadione.

Menadione Sodium Bisulfite



Sodium 1,2,3,4-Tetrahydro-2-methyl-1,4-dioxo-2-naphthalenesulfonate

$C_{11}H_9NaO_5S.3H_2O$ Mol. wt. 330.29

Menadione Sodium Bisulfite, dried in vacuum at 100° for 3 hours, contains not less than 94.0 percent and not more than 100.5 percent of $C_{11}H_9NaO_5S$.

Description—Menadione Sodium Bisulfite occurs as a white, crystalline, odorless, hygroscopic powder.

Solubility—Menadione Sodium Bisulfite is freely soluble in water. It is slightly soluble in alcohol, and is practically insoluble in ether and in benzene.

Identification—

A: Dissolve about 100 mg. of Menadione Sodium Bisulfite in 10 ml. of water in a separator. Add 3 ml. of sodium hydroxide T.S., and extract the precipitated menadione with two 5-ml. portions of chloroform. Filter the chloroform solution through a chloroform-washed filter, and evaporate the filtrate with the aid of a current of air to dryness. Dissolve the residue in a few ml. of alcohol, and again evaporate to dryness: the menadione so obtained melts between 104° and 107°, page 814.

B: To 50 mg. of the menadione obtained in *Identification test A* add 5 ml. of water, then add 75 mg. of sodium bisulfite, and heat on a steam bath, shaking vigorously until the substance is dissolved and the solution is almost colorless. Add water to make 50 ml., and mix. To 2 ml. of the solution add 2 ml. of alcoholic ammonia (prepared by mixing equal volumes of alcohol and stronger ammonia water), shake, and add 3 drops of ethyl cyanoacetate: a deep purplish blue color is produced, which, on the addition of 1 ml. of sodium hydroxide solution (1 in 3), changes to green and then to yellow.

C: To 2 ml. of a solution of Menadione Sodium Bisulfite (1 in 25) add a few drops of diluted hydrochloric acid, and warm: sulfur dioxide, recognizable by its odor, is evolved.

Loss on drying, page 814—Dry Menadione Sodium Bisulfite at 100° in vacuum for 3 hours: it loses not less than 11 percent and not more than 16.5 percent of its weight.

Selenium—A *Test Preparation* prepared with 200 mg. of Menadione Sodium Bisulfite meets the requirements of the *Selenium Limit Test,* page 865 (30 parts per million).

Assay—Dissolve about 300 mg. of Menadione Sodium Bisulfite, previously dried in vacuum at 100° for 3 hours and accurately weighed, in 20 ml. of water in a separator. Add 40 ml. of chloroform and 5 ml. of sodium carbonate T.S., and shake for about 30 seconds. Allow the layers to separate, and filter the chloroform extract through chloroform-moistened paper into a 250-ml. flask. Extract the water layer with two 40-ml. portions of chloroform, and filter as before, collecting the filtrate in the flask. Evaporate the combined chloroform extract to dryness in a water bath with the aid of a current of air. Add 15 ml. of glacial acetic acid and 15 ml. of diluted hydrochloric acid, and rotate the flask until the menadione is dissolved. Then add about 3 g. of zinc dust, close the flask with a stopper bearing a Bunsen valve, shake well, and allow to stand in the dark for 1 hour, with frequent shaking. Rapidly decant the solution through a pledget of cotton into another flask, immediately wash the reduction flask with three 10-ml. portions of carbon dioxide-free water, add 0.1 ml. of orthophenanthroline T.S., and at once titrate the combined filtrate and washings with 0.1 *N* ceric sulfate. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* ceric sulfate is equivalent to 13.81 mg. of $C_{11}H_9NaO_5S$.

Packaging and storage—Preserve Menadione Sodium Bisulfite in tight, light-resistant containers.

CATEGORY—Form of vitamin K.

USUAL DOSE—Intravenous and subcutaneous, **2 mg.** daily.

Menadione Sodium Bisulfite Injection

Menadione Sodium Bisulfite Injection is a sterile solution of menadione sodium bisulfite in water for injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{11}H_9NaO_5S.3H_2O$.

Identification—

A: To a volume of Menadione Sodium Bisulfite Injection, equivalent to about 100 mg. of menadione sodium bisulfite, contained in a separator, add 3 ml. of sodium hydroxide T.S., and extract with two 10-ml. portions of chloroform. Filter the chloroform solution through a chloroform-washed filter, and evaporate the filtrate with the aid of a current of air to dryness. Dissolve the residue in a few ml. of alcohol, and again evaporate to dryness: the menadione so obtained melts between 103° and 107°, page 814.

B: A 50-mg. portion of the menadione obtained in *Identification test A* responds to *Identification test B* under *Menadione Sodium Bisulfite,* page 406.

C: To about 1 ml. of Menadione Sodium Bisulfite Injection add 2 to 3 drops of diluted hydrochloric acid, and warm: sulfur dioxide, recognizable by its odor, is evolved.

pH, page 824—The pH of Menadione Sodium Bisulfite Injection is between 2.0 and 4.0.

Other requirements—Menadione Sodium Bisulfite Injection meets the requirements under *Injections,* page 810.

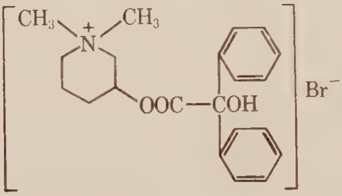
Assay—Transfer to a small separator an accurately measured volume of Menadione Sodium Bisulfite Injection, equivalent to about 50 mg. of menadione sodium bisulfite. Add 25 ml. of chloroform and 5 ml. of sodium carbonate T.S., and shake for about 30 seconds. Allow the layers to separate, and filter the chloroform extract through chloroform-moistened paper into a 125-ml. flask. Extract the water layer with two 25-ml. portions of chloroform, and filter as before, collecting the extracts in the flask. Evaporate the combined chloroform extracts to dryness in a water bath with the aid of a current of air. Add to the residue 7 ml. of glacial acetic acid, agitate until dissolved, then add 10 ml. of diluted hydrochloric acid and about 1 g. of zinc dust, with shaking. Close the flask with a stopper bearing a Bunsen valve, and allow to stand in the dark, with frequent shaking, for 1 hour, or until the solution is colorless. Rapidly decant the liquid through a pledget of cotton into another flask, wash the flask in which the reduction was made and the filter with three 5-ml. portions of carbon dioxide-free water, add 0.1 ml. of orthophenanthroline T.S., and at once titrate the combined filtrate and washings with 0.02 *N* ceric sulfate. Perform a blank determination, and make any necessary correction. Each ml. of 0.02 *N* ceric sulfate is equivalent to 3.303 mg. of $C_{11}H_9NaO_5S.3H_2O$.

Packaging and storage—Preserve Menadione Sodium Bisulfite Injection in single-dose, light-resistant containers, preferably of Type I glass.

Injections available—Menadione Sodium Bisulfite Injection usually available contains the following amounts of menadione sodium bisulfite: 2.5 mg. in 0.5 ml., 5 and 10 mg. in 1 ml., and 72 mg. in 10 ml.

CATEGORY and DOSE—See Menadione Sodium Bisulfite.

Mepenzolate Bromide*



3-Hydroxy-1,1-dimethylpiperidinium Bromide Benzilate

$C_{21}H_{26}BrNO_3$ Mol. wt. 420.35

Mepenzolate Bromide contains not less than 98.0 percent and not more than 102.0 percent of $C_{21}H_{26}BrNO_3$, calculated on the dried basis.

Description—Mepenzolate Bromide occurs as a white or light cream colored powder.

Solubility—Mepenzolate Bromide is freely soluble in methanol. It is slightly soluble in water and in chloroform, and is practically insoluble in ether.

Identification—

A: A solution of Mepenzolate Bromide responds to the tests for *Bromide*, page 808.

B: Dissolve 5 to 10 mg. of Mepenzolate Bromide in sulfuric acid: a bright yellow color is produced which changes to orange-red upon heating and is completely destroyed by dilution with several volumes of water.

Melting range, *Class Ia,* page 815—Mepenzolate Bromide melts between 230° and 237°.

Infrared absorption, page 866—The infrared absorption spectrum of a mineral oil dispersion of Mepenzolate Bromide, previously dried in vacuum at 80° for 3 hours, exhibits maxima only at the same wavelengths as that of NF Mepenzolate Bromide Reference Standard, similarly measured.

Loss on drying, page 814—Dry Mepenzolate Bromide in vacuum at 80° for 3 hours: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Mepenzolate Bromide yields not more than 0.2 percent of residue on ignition.

Heavy metals, page 806—Dissolve 1 g. of Mepenzolate Bromide in 23 ml. of water with heating, and add 2 ml. of diluted acetic acid: the heavy metals limit for Mepenzolate Bromide is 20 parts per million.

Bromide content—Dissolve about 250 mg. of Mepenzolate Bromide, accurately weighed, in about 100 ml. of water, add 2 ml. of nitric acid, and titrate with 0.1 *N* silver nitrate, determining the end-point potentiometrically using silver and silver chloride electrodes. Each ml. of 0.1 *N* silver nitrate is equivalent to 7.991 mg. of Br. Not less than 18.6 percent and not more than 19.4 percent of Br is found.

Assay—Dissolve about 350 mg. of Mepenzolate Bromide, accurately weighed, in 100 ml. of glacial acetic acid, add 10 ml. of mercuric acetate T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid, determining the end-point potentiometrically. Each ml. of 0.1 *N* perchloric acid is equivalent to 42.04 mg. of $C_{21}H_{26}BrNO_3$.

Packaging and storage—Preserve Mepenzolate Bromide in tight containers.

CATEGORY—Anticholinergic.
USUAL DOSE—**25 mg.** four times a day.
USUAL DOSE RANGE—**25** to **50 mg.**

---

* Patented. See notice, page ii.

Mepenzolate Bromide Tablets

Mepenzolate Bromide Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{21}H_{26}BrNO_3$.

Identification—Powder a number of Mepenzolate Bromide Tablets, equivalent to about 100 mg. of mepenzolate bromide, digest with 50 ml. of chloroform for 10 minutes, cool, and filter.

A: Evaporate 5 ml. of the filtrate in a beaker, take up the residue in 10 ml. of water, and filter: the filtrate responds to the tests for *Bromide*, page 808.

B: Evaporate 5 ml. of the filtrate in a beaker, and add about 1 ml. of sulfuric acid: a bright yellow color is produced immediately which changes to orange-red upon warming and completely disappears when the solution is diluted with several volumes of water.

Disintegration, page 878—The disintegration time limit for Mepenzolate Bromide Tablets is 30 minutes.

Content uniformity, *Method I*, page 799—Mepenzolate Bromide Tablets meet the requirements of the content uniformity test for tablets.

Assay—

Standard preparation—Dissolve 100 mg. of NF Mepenzolate Bromide Reference Standard, previously dried at 80° for 3 hours and accurately weighed, in sufficient 0.1 *N* hydrochloric acid to make 100.0 ml.

Assay preparation—Weigh and powder not less than 20 Mepenzolate Bromide Tablets. Weigh accurately a portion of the powder equivalent to about 100 mg. of mepenzolate bromide, transfer to a 100-ml. volumetric flask, and add 60 ml. of 0.1 *N* hydrochloric acid. Shake for 30 minutes, dilute to volume with 0.1 *N* hydrochloric acid, mix, and filter through a dry paper, rejecting the first 10 ml. of filtrate.

Procedure—Transfer 5.0 ml. each of the *Assay preparation* and of the *Standard preparation* to separate separators. To each separator add 20 ml. of ammonium cobaltothiocyanate solution (prepared by dissolving 3.75 g. of cobaltous nitrate and 15.0 g. of ammonium thiocyanate in sufficient water to make 100 ml.), and shake for 1 minute. Extract with four 5-ml. portions of chloroform, collecting the extracts from each separator in a 25-ml. volumetric flask. Add chloroform to volume, and mix. If the solutions are turbid due to a suspension of water droplets, centrifuge to clarify. Concomitantly determine the absorbances of the clear solutions at 620 mμ, in 1-cm. cells, with a suitable spectrophotometer, using chloroform as the blank. Record the absorbance of the solution from the *Assay preparation* as A_U and that from the *Standard preparation* as A_S. Calculate the quantity, in mg., of $C_{21}H_{26}BrNO_3$, in the portion of the Tablets taken by the formula $100C \times (A_U/A_S)$, in which C is the exact concentration, in mg. per ml., of NF Mepenzolate Bromide Reference Standard in the *Standard preparation*.

Packaging and storage—Preserve Mepenzolate Bromide Tablets in well-closed containers.

Tablets available—Mepenzolate Bromide Tablets usually available contain the following amount of mepenzolate bromide: 25 mg.

CATEGORY and DOSE—See Mepenzolate Bromide.

Meperidine Hydrochloride Syrup

Meperidine Hydrochloride Syrup contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{15}H_{21}NO_2.HCl$.

Identification—Transfer 10 ml. of Meperidine Hydrochloride Syrup to a 125-ml. separator, add 40 ml. of water and 3 ml. of sodium hydroxide T.S., and extract with three 25-ml. portions of *n*-hexane. Wash the combined extracts with two 20-ml. portions of water, discard the water, and then extract with three 25-ml. portions of 0.1 *N* hydrochloric acid. Transfer the extracts to a 100-ml. volumetric flask, dilute to volume with 0.1 *N* hydrochloric acid, and mix: the ultraviolet absorption spectrum of this solution exhibits maxima at about 251 mμ, 257 mμ, and 263 mμ, and minima at about 248 mμ, 254 mμ, and 260 mμ.

pH, page 824—The pH of Meperidine Hydrochloride Syrup is between 3.5 and 3.9.

Assay—Transfer to a separator an accurately measured volume of Meperidine Hydrochloride Syrup, equivalent to about 250 mg. of meperidine hydrochloride, and add 3 ml. of sodium hydroxide T.S. Extract with five 20-ml. portions of chloroform, and filter the extracts through a pledget of cotton into a 250-ml. conical flask. Wash the cotton with 5 ml. of chloroform, and add the washing to the combined filtrates. Add 10 ml. of glacial acetic acid and 2 drops of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a green endpoint. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 28.38 mg. of $C_{15}H_{21}NO_2.HCl$.

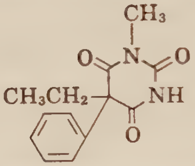
Packaging and storage—Preserve Meperidine Hydrochloride Syrup in tight, light-resistant containers.

Syrup available—Meperidine Hydrochloride Syrup usually available contains the following amount of meperidine hydrochloride: 50 mg. in 5 ml.

Category—Analgesic (narcotic).

Usual dose of meperidine hydrochloride—**50 mg.** every 4 hours.

Mephobarbital



5-Ethyl-1-methyl-5-phenylbarbituric Acid

$C_{13}H_{14}N_2O_3$ Mol. wt. 246.27

Mephobarbital, dried at 105° for 4 hours, contains not less than 98.0 percent and not more than 100.5 percent of $C_{13}H_{14}N_2O_3$.

Description—Mephobarbital occurs as a white, crystalline powder. It is odorless and has a bitter taste. Its saturated solution is acid to litmus.

Solubility—Mephobarbital is slightly soluble in water, in alcohol, and in ether. It is soluble in chloroform, and in solutions of fixed alkali hydroxides and carbonates.

Identification—

A: Boil about 200 mg. of Mephobarbital with 10 ml. of sodium hydroxide T.S.: ammonia is evolved.

B: Shake about 60 mg. of Mephobarbital with 5 ml. of 0.05 *N* sodium hydroxide, and filter. To a 1-ml. portion of the filtrate add 3 drops of mercuric nitrate T.S.: a white precipitate, which is soluble in ammonia T.S., is formed. To another 1-ml. portion of the filtrate add silver nitrate T.S., dropwise: a white precipitate, which dissolves readily in ammonia T.S., is formed.

C: Add about 300 mg. of Mephobarbital to a mixture of 3 ml. of nitric acid and 2 ml. of sulfuric acid. Heat nearly to boiling, and maintain this temperature while shaking for 1 minute. Cool in ice, add about 15 ml. of water, and stir to promote precipitation. Cool again and filter. Wash the precipitate with 2 or 3 ml. of water, dry, and recrystallize from alcohol: the mononitromephobarbital so obtained melts between 155° and 160°, page 814.

Melting range, page 814—Mephobarbital melts between 176° and 181°.

Loss on drying, page 814—Dry Mephobarbital at 105° for 4 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Mephobarbital yields not more than 0.1 percent of residue on ignition.

Readily carbonizable substances, page 856—Dissolve 500 mg. of Mephobarbital in 5 ml. of sulfuric acid T.S.: the solution has no more color than Matching Fluid A.

Assay—Dissolve about 500 mg. of Mephobarbital, previously dried at 105° for 4 hours and accurately weighed, in 50 ml. of dimethylformamide in a 200-ml. flask. Add 4 drops of thymolphthalein T.S., and titrate with 0.1 *N* lithium methoxide, using a magnetic stirrer, and a cover for the flask to protect against atmospheric carbon dioxide. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* lithium methoxide is equivalent to 24.63 mg. of $C_{13}H_{14}N_2O_3$.

Packaging and storage—Preserve Mephobarbital in well-closed containers.

Category—Anticonvulsant; sedative.

Usual dose range—Anticonvulsant, **400** to **600 mg.** daily; sedative, **32** to **100 mg.** three or four times a day.

Mephobarbital Tablets

Mephobarbital Tablets contain not less than 95.0 percent and not more than 110.0 percent of the labeled amount of $C_{13}H_{14}N_2O_3$.

Identification—The mephobarbital obtained in the *Assay* of Mephobarbital Tablets melts between 174° and 181°, page 814, and responds to the *Identification tests* under *Mephobarbital*, page 410.

Disintegration, page 878—The disintegration time limit for Mephobarbital Tablets is 30 minutes.

Content uniformity, *Method I*, page 799—Mephobarbital Tablets meet the requirements of the content uniformity test for tablets.

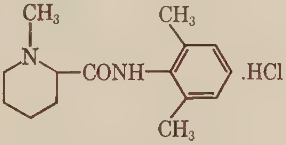
Assay—Weigh and finely powder not less than 20 Mephobarbital Tablets. Weigh accurately a portion of the powder, equivalent to about 300 mg. of mephobarbital, and transfer it to an extraction thimble. Extract the sample with 15 ml. of solvent hexane, allow the thimble to drain, transfer it to a continuous-extraction apparatus provided with a tared flask, and extract the mephobarbital with chloroform for 2 hours. Evaporate the chloroform on a steam bath with the aid of a current of air, cool, dissolve the residue in about 10 ml. of alcohol, re-evaporate, dry the residue at 105° for 1 hour, cool, and weigh. The weight of the residue represents the weight of $C_{13}H_{14}N_2O_3$ in the portion of the Tablets taken.

Packaging and storage—Preserve Mephobarbital Tablets in well-closed containers.

Tablets available—Mephobarbital Tablets usually available contain the following amounts of mephobarbital: 32, 50, 100, and 200 mg.

Category and Dose—See Mephobarbital.

Mepivacaine Hydrochloride*



(±)-1-Methyl-2′,6′-pipecoloxylidide Hydrochloride

$C_{15}H_{22}N_2O . HCl$ Mol. wt. 282.82

Mepivacaine Hydrochloride, dried at 105° for 4 hours, contains not less than 98.0 percent and not more than 102.0 percent of $C_{15}H_{22}N_2O . HCl$.

Description—Mepivacaine Hydrochloride occurs as a white, odorless, crystalline solid. The pH of a 1 in 50 solution is about 4.5.

Solubility—Mepivacaine Hydrochloride is freely soluble in water and in methanol, very slightly soluble in chloroform, and practically insoluble in ether.

Identification—

A: A solution of Mepivacaine Hydrochloride (1 in 100) responds to the tests for *Chloride*, page 808.

B: Dissolve about 250 mg. of Mepivacaine Hydrochloride in 10 ml. of water, add sufficient sodium carbonate T.S. to make slightly alkaline, extract the precipitate with ether, evaporate the ether extract to dryness on a steam bath, and dry the residue in vacuum at 60° for 1 hour: the mepivacaine so obtained melts between 149° and 153°, page 814.

Melting range, *Class Ia*, page 815—Mepivacaine Hydrochloride melts with decomposition between 255° and 262°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Mepivacaine Hydrochloride, previously dried at 105° for 4 hours, exhibits maxima only at the same wavelengths as that of NF Mepivacaine Hydrochloride Reference Standard, similarly measured.

Loss on drying, page 814—Dry Mepivacaine Hydrochloride at 105° for 4 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Mepivacaine Hydrochloride yields not more than 0.1 percent of residue on ignition.

Assay—Transfer about 550 mg. of Mepivacaine Hydrochloride, previously dried at 105° for 4 hours and accurately weighed, to a 200-ml. tall form beaker, and dissolve it in 50 ml. of glacial acetic acid, heating if necessary. Add 10 ml. of mercuric acetate T.S. and 1 drop of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 28.28 mg. of $C_{15}H_{22}N_2O . HCl$.

Packaging and storage—Preserve Mepivacaine Hydrochloride in well-closed containers.

Category—Local anesthetic.

---

* Patented. See notice, page ii.

Mepivacaine Hydrochloride Injection

Mepivacaine Hydrochloride Injection is a sterile solution of mepivacaine hydrochloride in water for injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{15}H_{22}N_2O . HCl$.

Identification—

A: Mepivacaine Hydrochloride Injection responds to the tests for *Chloride,* page 808.

B: Extract a volume of Mepivacaine Hydrochloride Injection, equivalent to about 200 mg. of mepivacaine, with two 10-ml. portions of ether and discard the ether extracts. The remaining solution responds to *Identification test B* under *Mepivacaine Hydrochloride,* page 411.

pH, page 824—The pH of Mepivacaine Hydrochloride Injection is between 4.5 and 6.8.

Other requirements—Mepivacaine Hydrochloride Injection meets the requirements under *Injections,* page 810.

Assay—Transfer to a 60-ml. separator an accurately measured volume of Mepivacaine Hydrochloride Injection, equivalent to about 40 mg. of mepivacaine hydrochloride. Dilute with water to 10 ml., add 1 ml. of sodium hydroxide T.S., and completely extract the mepivacaine with three 10-ml. portions of chloroform. Wash the combined chloroform extracts with 10 ml. of water, filter the chloroform through a pledget of cotton, wash the filter with chloroform, add 2 drops of methyl red T.S. to the combined chloroform filtrate and washings, and titrate with 0.01 *N* perchloric acid in dioxane to a red end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.01 *N* perchloric acid is equivalent to 2.828 mg. of $C_{15}H_{22}N_2O . HCl$.

Packaging and storage—Preserve Mepivacaine Hydrochloride Injection in single-dose or in multiple-dose containers, preferably of Type I glass.

Injections available—Mepivacaine Hydrochloride Injection usually available contains the following amounts of mepivacaine hydrochloride: 3 percent in 1.8-ml. cartridges, 1 and 1.5 percent in 30 ml., 2 percent in 20 ml., 1 and 2 percent in 50 ml.

CATEGORY—See Mepivacaine Hydrochloride.

Mepivacaine Hydrochloride and Levonordefrin Injection

Mepivacaine Hydrochloride and Levonordefrin Injection is a sterile solution of mepivacaine hydrochloride and levonordefrin in water for injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{15}H_{22}N_2O . HCl$ (mepivacaine hydrochloride) and not less than 95.0 percent and not more than 110.0 percent of the labeled amount of $C_9H_{13}NO_3$ (levonordefrin).

Identification—

A: Mepivacaine Hydrochloride and Levonordefrin Injection responds to the tests for *Chloride,* page 808.

B: Extract a volume of Mepivacaine Hydrochloride and Levonordefrin Injection, equivalent to about 200 mg. of mepivacaine, with two 10-ml. portions of ether and discard the ether extracts. The remaining solution responds to *Identification test B* under *Mepivacaine Hydrochloride,* page 411.

pH, page 824—The pH of Mepivacaine Hydrochloride and Levonordefrin Injection is between 3.3 and 5.5.

Other requirements—Mepivacaine Hydrochloride and Levonordefrin Injection meets the requirements under *Injections,* page 810.

Assay for mepivacaine hydrochloride—Transfer to a 60-ml. separator an accurately measured volume of Mepivacaine Hydrochloride and Levonordefrin Injection, equivalent to about 40 mg. of mepivacaine hydrochloride, and proceed as directed in the *Assay* under *Mepivacaine Hydrochloride Injection,* page 412, beginning with "Dilute with water to make 10 ml., and . . . ."

Assay for levonordefrin—Prepare a *Ferro-citrate solution, a Buffer solution,* and a *Standard preparation* as directed under *Epinephrine Assay,* page 803.

Assay preparation—Proceed as directed for *Assay preparation* under *Epinephrine Assay,* page 803, except change epinephrine to levonordefrin.

Procedure—Proceed as directed under *Epinephrine Assay,* page 803, except change epinephrine (base) to levonordefrin. When the *Ferro-citrate solution* and the *Buffer solution* are mixed with the

Assay preparation, a fine precipitate may form. This precipitate should be removed by centrifugation or by filtration through dry filter paper before the colorimetric measurements are taken.

Packaging and storage—Preserve Mepivacaine Hydrochloride and Levonordefrin Injection in single-dose or multiple-dose containers, preferably of Type I glass.

Injections available—Mepivacaine Hydrochloride and Levonordefrin Injection usually available contains the following amounts of mepivacaine hydrochloride and levonordefrin: 2 percent mepivacaine hydrochloride and 1 in 20,000 levonordefrin in 1.8-ml. cartridges and in 20-ml. multiple-dose vials.

CATEGORY—See Mepivacaine Hydrochloride.

Meprobamate Oral Suspension

Meprobamate Oral Suspension contains not less than 95.0 percent and not more than 110.0 percent of the labeled amount of $C_9H_{18}N_2O_4$.

Identification—Mix 2 ml. of Meprobamate Oral Suspension with 2 ml. of acetone and 2 ml. of a solution of furfural in glacial acetic acid (1 in 100), add 5 ml. of hydrochloric acid, and shake: a purple color is produced which, on standing, changes to blue, then to blue-black, and finally to black-brown.

Assay—Transfer an accurately measured volume of Meprobamate Oral Suspension, equivalent to about 400 mg. of meprobamate, to a separator, and completely extract the meprobamate with 20-ml. portions of chloroform, filtering the extracts through a pledget of cotton enclosed in glass wool which has previously been moistened with chloroform. Collect the filtrate in a conical flask, add several glass beads to the flask, and evaporate to dryness on a steam bath. To the residue add 20 ml. of water, heat on a steam bath for several minutes, then add 40 ml. of hydrochloric acid, and reflux for 90 minutes. Remove the condenser, and continue boiling until the volume is reduced to about 20 ml. Cool to room temperature, add 50 ml. of water, and cool in an ice bath. Add 1 drop of methyl red T.S., and, while cooling continuously, cautiously neutralize with sodium hydroxide solution (4 in 10) until the indicator begins to change color. Add hydrochloric acid, if necessary, to restore the pink color, and then carefully neutralize with 0.1 *N* sodium hydroxide. Add 30 ml. of neutral formaldehyde solution (18 percent), and titrate with 0.1 *N* sodium hydroxide until the solution becomes yellow. Add 0.2 ml. of phenolphthalein T.S., and continue the titration with 0.1 *N* sodium hydroxide to a distinct pink color. Perform a blank determination, and make any necessary correction. Each ml. of the total volume of 0.1 *N* sodium hydroxide consumed after the addition of the formaldehyde solution is equivalent to 10.91 mg. of $C_9H_{18}N_2O_4$.

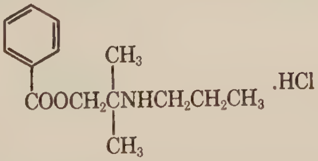
Packaging and storage—Preserve Meprobamate Oral Suspension in tight containers.

Suspension available—Meprobamate Oral Suspension usually available contains the following amount of meprobamate: 200 mg. in 5 ml.

CATEGORY—Tranquilizer (minor).

USUAL DOSE OF MEPROBAMATE—**400 mg.** three or four times a day.

Meprylcaine Hydrochloride*



2-Methyl-2-(propylamino)-1-propanol Benzoate (Ester) Hydrochloride

$C_{14}H_{21}NO_2 . HCl$ Mol. wt. 271.79

Meprylcaine Hydrochloride, dried in a vacuum desiccator over phosphorus pentoxide for 6 hours, contains not less than 98.5 percent and not more than 101.5 percent of $C_{14}H_{21}NO_2 . HCl$.

---

* Patented. See notice, page ii.

Description—Meprylcaine Hydrochloride occurs as a white, odorless, crystalline solid. The pH of a 1 in 50 solution is about 5.7.

Solubility—Meprylcaine Hydrochloride is freely soluble in water, in alcohol, and in chloroform. It is slightly soluble in acetone.

Identification—

A: A solution of Meprylcaine Hydrochloride (1 in 100) responds to the tests for *Chloride*, page 808.

B: Dissolve about 100 mg. of Meprylcaine Hydrochloride in 10 ml. of water, heat almost to boiling, and add, with stirring, 1 ml. of a saturated solution of picric acid in 20 percent alcohol. Cool slowly, collect the precipitate on a filter, wash with a few small portions of water, and dry in a vacuum desiccator over phosphorus pentoxide for 18 hours: the picrate so obtained melts with decomposition between 196° and 200°, page 814. (*Caution: Picrates may be explosive.*)

C: Dissolve about 100 mg. of Meprylcaine Hydrochloride in 10 ml. of diluted hydrochloric acid, cool to 0° in an ice bath, and introduce 5 ml. of a solution of sodium nitrite (1 in 5), stirring gently. Add 2 ml. of a solution of 100 mg. of beta-naphthol in 5 ml. of sodium hydroxide T.S. and observe immediately: the solution turns green in color, and no bright orange-red precipitate is formed (*absence of a primary aminophenyl group*).

Melting range, page 814—Meprylcaine Hydrochloride melts between 150° and 152°.

Loss on drying, page 814—Dry Meprylcaine Hydrochloride in a vacuum desiccator over phosphorus pentoxide for 6 hours: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Meprylcaine Hydrochloride yields not more than 0.1 percent of residue on ignition.

Assay—Transfer about 150 mg. of Meprylcaine Hydrochloride, previously dried in a vacuum desiccator over phosphorus pentoxide for 6 hours and accurately weighed, to a separator, dissolve the sample in 20 ml. of water, add 3 ml. of ammonia T.S., and completely extract the meprylcaine with 20-ml. portions of isooctane. Filter the isooctane extracts into a beaker, wash the filter with isooctane, and evaporate the combined filtrate and washings in a current of warm air nearly to dryness. To the residue add 5 ml. of neutralized alcohol and 40.0 ml. of 0.02 *N* sulfuric acid, and heat on a steam bath until the odor of isooctane is no longer perceptible. Cool, add 2 drops of methyl red T.S., and titrate with 0.02 *N* sodium hydroxide (see *Residual Titrations*, page 883). Each ml. of 0.02 *N* sulfuric acid is equivalent to 5.436 mg. of $C_{14}H_{21}NO_2 . HCl$.

Packaging and storage—Preserve Meprylcaine Hydrochloride in well-closed containers.

CATEGORY—Local anesthetic.

Meprylcaine Hydrochloride and Epinephrine Injection

Meprylcaine Hydrochloride and Epinephrine Injection is a sterile solution of meprylcaine hydrochloride and epinephrine in water for injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{14}H_{21}NO_2 . HCl$ (meprylcaine hydrochloride) and not less than 95.0 percent and not more than 110.0 percent of the labeled amount of $C_9H_{13}NO_3$ (epinephrine).

Identification—Meprylcaine Hydrochloride and Epinephrine Injection responds to *Identification tests B* and *C* under *Meprylcaine Hydrochloride*, page 413.

Other requirements—Meprylcaine Hydrochloride and Epinephrine Injection meets the requirements under *Injections*, page 810.

Assay for meprylcaine hydrochloride—Transfer to a separator an accurately measured volume of Meprylcaine Hydrochloride and Epinephrine Injection, equivalent to about 150 mg. of meprylcaine hydrochloride, and proceed as directed in the *Assay* under *Meprylcaine Hydrochloride*, page 413, beginning with "... add 3 ml. of ammonia T.S. ..."

Assay for epinephrine—Prepare a *Ferro-citrate solution*, *a Buffer solution*, and a *Standard preparation* as directed under *Epinephrine Assay*, page 803.

Assay preparation—Proceed as directed for *Assay preparation* under *Epinephrine Assay*, page 803.

Procedure—Proceed as directed for *Procedure* under *Epinephrine Assay*, page 803.

Packaging and storage—Preserve Meprylcaine Hydrochloride and Epinephrine Injection in single-dose containers, preferably of Type I glass.

Injections available—Meprylcaine Hydrochloride and Epinephrine Injection usually available contains the following amounts of meprylcaine hydrochloride and epinephrine: 2 percent meprylcaine hydrochloride and 1 in 50,000 epinephrine in 2-ml. and 2.5-ml. cartridges and in 20-ml. bottles.

CATEGORY—See Meprylcaine Hydrochloride.

Yellow Mercuric Oxide

HgO Mol. wt. 216.59

Yellow Mercuric Oxide, dried at 105° for 2 hours, contains not less than 99.5 percent and not more than 100.5 percent of HgO.

Description—Yellow Mercuric Oxide occurs as a yellow to orange-yellow, heavy, impalpable powder. It is odorless, and is stable in air, but becomes discolored on exposure to light. It is not alkaline when moistened with hot water.

Solubility—Yellow Mercuric Oxide is practically insoluble in water, and is insoluble in alcohol. It is readily soluble in diluted hydrochloric or diluted nitric acid, forming colorless solutions.

Identification—Mix 1 g. of Yellow Mercuric Oxide with 20 ml. of water, and add just enough hydrochloric acid, dropwise, to effect solution: this solution responds to the tests for *Mercuric Salts*, page 809.

Loss on drying, page 814—Dry Yellow Mercuric Oxide at 105° for 2 hours: it loses not more than 2 percent of its weight.

Residue on ignition, page 858—Yellow Mercuric Oxide yields not more than 0.2 percent of residue on ignition.

Acid-insoluble substances—A solution of 500 mg. of Yellow Mercuric Oxide in 25 ml. of either diluted hydrochloric acid or diluted nitric acid is not more than slightly turbid.

Distinction from red mercuric oxide—Dissolve 1 g. of oxalic acid in 1 ml. of ammonia T.S., diluted with 10 ml. of water. To this solution add 500 mg. of Yellow Mercuric Oxide, and heat the mixture in a test tube on a steam bath for 2 hours, replacing from time to time the water lost by evaporation: the Oxide is converted into white or yellowish white mercuric oxalate.

Assay—Dry about 300 mg. of Yellow Mercuric Oxide at 105° for 2 hours, weigh accurately, dissolve it in a mixture of 10 ml. of water and 5 ml. of nitric acid, and dilute the solution with 150 ml. of cold water. Then add 2 ml. of ferric ammonium sulfate T.S., and titrate with 0.1 N ammonium thiocyanate. Each ml. of 0.1 N ammonium thiocyanate is equivalent to 10.83 mg. of HgO.

Packaging and storage—Preserve Yellow Mercuric Oxide in well-closed, light-resistant containers.

CATEGORY—Local anti-infective (ophthalmic).

APPLICATION—To the conjunctiva as a 1 percent ointment.

Yellow Mercuric Oxide Ophthalmic Ointment

Caution: During its manufacture and storage, Yellow Mercuric Oxide Ophthalmic Ointment must not come into contact with metallic utensils or containers except those made of stainless steel, tin, or tin-coated material.

Yellow Mercuric Oxide Ophthalmic Ointment contains not less than 0.9 percent and not more than 1.1 percent of HgO.

Yellow Mercuric Oxide, in very fine powder	**10 g.**
Mineral Oil	**10 g.**
White Ointment	**980 g.**
To make	**1000 g.**

Levigate the yellow mercuric oxide with the mineral oil until the mixture is smooth, and then incorporate the white ointment (see page 8).

Weight variation, page 901—Yellow Mercuric Oxide Ophthalmic Ointment meets the requirements of the weight variation test for ointments.

Metal particles—Yellow Mercuric Oxide Ophthalmic Ointment meets the requirements of the test for *Metal Particles—Ophthalmic Ointments*, page 816.

Assay—Transfer an accurately weighed quantity of Yellow Mercuric Oxide Ophthalmic Ointment, equivalent to about 100 mg. of yellow mercuric oxide, to a stoppered flask with the aid of 20 ml. of chloroform. Add 10 ml. of diluted nitric acid and 20 ml. of water, and shake until the mercuric oxide is dissolved. Add 50 ml. of water and 2 ml. of ferric ammonium sulfate T.S., and titrate with 0.1 *N* ammonium thiocyanate at a temperature not exceeding 20°. Each ml. of 0.1 *N* ammonium thiocyanate is equivalent to 10.83 mg. of HgO.

Packaging and storage—Preserve Yellow Mercuric Oxide Ophthalmic Ointment in collapsible ophthalmic tubes.

Category—See Yellow Mercuric Oxide.

Mestranol Tablets

Mestranol Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{21}H_{26}O_2$.

Identification—The absorption spectrum of the solution employed for measurement of absorbance in the *Assay* exhibits a maximum at 545 ± 3 mμ.

Disintegration, page 878—The disintegration time limit for Mestranol Tablets is 30 minutes.

Content uniformity, *Method II,* page 799—Mestranol Tablets meet the requirements of the content uniformity test for tablets, using the following special procedure.

Color reagent—Prepare as directed in the *Assay.*

Standard preparation—Transfer about 8 mg. of USP Mestranol Reference Standard, accurately weighed, to a 200-ml. volumetric flask, add chloroform to volume, and mix. Transfer 10.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with chloroform, and mix.

Test preparation—Transfer one tablet to a 60-ml. separator containing 5.0 ml. of water and 0.05 ml. of sodium hydroxide solution (1 in 2). Carefully add 20.0 ml. of chloroform, stopper the separator with a stopper moistened with water, and shake until the tablet has completely disintegrated. Shake 3 minutes longer to ensure complete solution of the mestranol. Separate and drain most of the chloroform layer into a 25-ml. glass-stoppered flask containing about 3 g. of anhydrous sodium sulfate, stopper, and mix well. Use the chloroform solution as directed in the *Procedure.*

Procedure—Transfer 4.0 ml. each of the *Standard preparation* and of the *Test preparation* to separate 25-ml. volumetric flasks, wash down the neck of each flask with 2 ml. of chloroform, and then evaporate each to dryness with the aid of a slow current of air, without heating. To each flask add 0.3 ml. of methanol, then stopper the flasks and rotate to dissolve the residue completely. Immerse the bulb and part of the neck of each flask in a water bath maintained at 25°, and, with constant swirling, add 10.0 ml. of the *Color reagent* to each flask. Remove the flasks from the water bath, stopper, and mix thoroughly by swirling and inversion. (*Caution:* Do not shake.) Six minutes after the addition of the *Color reagent,* concomitantly determine the absorbances of the solutions, in 1-cm. cells, at the maximum at about 545 mμ, with a suitable spectrophotometer, using the *Color reagent* as the blank. Calculate the quantity, in mcg., of $C_{21}H_{26}O_2$ in the Tablet by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity, in mcg., of mestranol in the tablet; D is the exact concentration, in mcg. per ml., of mestranol in the sample solution, based upon the labeled quantity per tablet and the extent of dilution; C is the exact concentration, in mcg. per ml., of the *Standard preparation;* A_U is the absorbance of the final sample solution; and A_S is the absorbance of the solution from the *Standard preparation.*

Assay—

Color reagent—Transfer 30.0 ml. of methanol to a 100-ml. volumetric flask, and place the flask in an ice water bath. Keeping the temperature below 15°, and with constant stirring, slowly and cautiously add sulfuric acid until a volume of about 95 ml. is reached. Allow the solution to return to room temperature, dilute to volume with sulfuric acid, and mix.

Standard preparation—Transfer about 16 mg. of USP Mestranol Reference Standard, accurately weighed, to a 200-ml. volumetric flask, add chloroform to volume, and mix. Transfer 10.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with chloroform, and mix.

Assay preparation—Transfer a number of Mestranol Tablets, equivalent to about 1.6 mg. of mestranol, to a 125-ml. separator containing 30 ml. of water, 0.15 ml. of sodium hydroxide solution (1 in 2), and 40 ml. of chloroform. Stopper the separator, and shake until disintegration is complete. Separate and drain the chloroform layer, through a filter funnel containing 10 g. of anhydrous sodium sulfate, into a 200-ml. volumetric flask. Extract with three additional 40-ml. portions of chloroform, passing each in succession through the filter and into the flask.

Rinse the filter with chloroform into the flask, dilute to volume with chloroform, and mix.

Procedure—Transfer 2.0 ml. each of the *Standard preparation* and of the *Assay preparation* to separate 25-ml. volumetric flasks, wash down the neck of each flask with 2 ml. of chloroform, and then evaporate each to dryness with the aid of a slow current of air, without heating. To each flask add 0.3 ml. of methanol, then rotate the flasks to dissolve the residues completely. Submerge the flasks in a water bath maintained at 25°, and, with constant swirling, add 10.0 ml. of the *Color reagent* to each flask. Remove the flasks from the water bath, stopper, and mix thoroughly by swirling and inversion. (*Caution:* Do not shake.) Six minutes after the addition of the *Color reagent*, concomitantly determine the absorbances of the solutions, in 1-cm. cells, at the maximum at about 545 mμ, with a suitable spectrophotometer, using the *Color reagent* as the blank. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{21}H_{26}O_2$ in the Tablets taken by the formula $0.2C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation*.

Packaging and storage—Preserve Mestranol Tablets in well-closed containers.

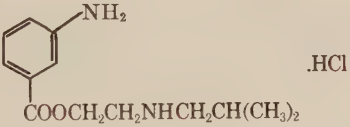
Tablets available—Mestranol Tablets usually available contain the following amounts of mestranol: 80 and 100 mcg.

Category—Estrogen.

Usual dose of mestranol—**80** to **100 mcg.** daily for 20 days of each menstrual cycle.

Mestranol and Chlormadinone Acetate Tablets, page 152

Metabutethamine Hydrochloride



2-(Isobutylamino)ethanol *m*-Aminobenzoate (Ester) Monohydrochloride

$C_{13}H_{20}N_2O_2 . HCl$ Mol. wt. 272.78

Metabutethamine Hydrochloride, dried in a vacuum desiccator over phosphorus pentoxide for 6 hours, contains not less than 98.5 percent and not more than 100.5 percent of $C_{13}H_{20}N_2O_2 . HCl$.

Description—Metabutethamine Hydrochloride occurs as a white, odorless, crystalline solid. The pH of a 1 in 50 solution is about 6.

Solubility—Metabutethamine Hydrochloride is soluble in water. It is slightly soluble in alcohol, in acetone, and in chloroform.

Identification—

A: A solution of Metabutethamine Hydrochloride (1 in 100) responds to the tests for *Chloride*, page 808.

B: Dissolve about 100 mg. of Metabutethamine Hydrochloride in 10 ml. of water, heat almost to boiling, and add, with stirring, 1 ml. of a saturated solution of picric acid in 20 percent alcohol. Cool slowly, collect the precipitate on a filter, wash with a few small portions of water, and dry in a vacuum desiccator over phosphorus pentoxide for 18 hours: the picrate so obtained melts between 147° and 149°, page 814. (*Caution: Picrates may be explosive.*)

C: Dissolve about 100 mg. of Metabutethamine Hydrochloride in 5 ml. of water. Add 0.5 ml. of this solution to a solution prepared immediately before use by mixing 0.5 to 1 ml. of stronger ammonia water with 1 ml. of a reagent consisting of 500 mg. of nickel chloride hexahydrate in 100 ml. of water with sufficient carbon disulfide to be in excess of saturation: a deep green color is formed immediately, followed in a few minutes by the formation of a green precipitate (*presence of a secondary amino group*).

Melting range, page 814—Metabutethamine Hydrochloride melts between 181° and 184°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Metabutethamine Hydrochloride, previously dried in a vacuum desiccator over phosphorus pentoxide for 6 hours, exhibits maxima only at the same wavelengths as that of NF Metabutethamine Hydrochloride Reference Standard, similarly measured.

Ultraviolet absorption, page 886—The

ultraviolet absorption spectrum of a 1 in 50,000 solution of Metabutethamine Hydrochloride in water exhibits maxima and minima at the same wavelengths as that of NF Metabutethamine Hydrochloride Reference Standard, similarly measured.

Loss on drying, page 814—Dry Metabutethamine Hydrochloride in a vacuum desiccator over phosphorus pentoxide for 6 hours: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Metabutethamine Hydrochloride yields not more than 0.1 percent of residue on ignition.

Assay—Transfer about 200 mg. of Metabutethamine Hydrochloride, previously dried in a vacuum desiccator over phosphorus pentoxide for 6 hours and accurately weighed, to a 100-ml. volumetric flask, add water to volume, and mix. Transfer 10.0 ml. of this solution to a 1000-ml. volumetric flask, dilute to volume with water, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Metabutethamine Hydrochloride Reference Standard, in the same medium at a concentration of about 20 mcg. per ml., in 1-cm. cells, at the maximum at about 315 mμ, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg., of $C_{13}H_{20}N_2O_2.HCl$ in the Metabutethamine Hydrochloride taken by the formula $10C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Metabutethamine Hydrochloride in well-closed containers.

CATEGORY—Local anesthetic (dental).

Metabutethamine Hydrochloride and Epinephrine Injection

Metabutethamine Hydrochloride and Epinephrine Injection is a sterile solution of metabutethamine hydrochloride and epinephrine in water for injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{13}H_{20}N_2O_2.HCl$ (metabutethamine hydrochloride), and not less than 95.0 percent and not more than 110.0 percent of the labeled amount of $C_9H_{13}NO_3$ (epinephrine).

Identification—Metabutethamine Hydrochloride and Epinephrine Injection responds to *Identification tests B* and *C* under *Metabutethamine Hydrochloride*, page 417.

Other requirements—Metabutethamine Hydrochloride and Epinephrine Injection meets the requirements under *Injections*, page 810.

Assay for metabutethamine hydrochloride—Transfer to a separator an accurately measured volume of Metabutethamine Hydrochloride and Epinephrine Injection, equivalent to about 150 mg. of metabutethamine hydrochloride, add 3 ml. of ammonia T.S., and completely extract the metabutethamine with 20-ml. portions of chloroform. Filter the chloroform extracts and wash the filter with chloroform, then evaporate the combined filtrates and washings in a current of warm air to dryness. Dry the residue at 60° for 2 hours, and weigh. Each mg. of the residue is equivalent to 1.154 mg. of $C_{13}H_{20}N_2O_2.HCl$.

Assay for epinephrine—Prepare a *Ferro-citrate solution, a Buffer solution,* and a *Standard preparation* as directed under *Epinephrine Assay*, page 803.

Assay preparation—Proceed as directed for *Assay preparation* under *Epinephrine Assay*, page 803.

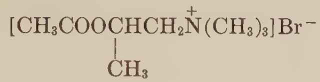
Procedure—Proceed as directed for *Procedure* under *Epinephrine Assay*, page 803.

Packaging and storage—Preserve Metabutethamine Hydrochloride and Epinephrine Injection in single-dose or multiple-dose containers, preferably of Type I glass.

Injections available—Metabutethamine Hydrochloride and Epinephrine Injection usually available contains the following amounts of metabutethamine hydrochloride and epinephrine: 3.8 percent metabutethamine hydrochloride and 1 in 60,000 epinephrine in 2-ml. cartridges and in 30-ml. bottles.

CATEGORY—See Metabutethamine Hydrochloride.

Methacholine Bromide



$$[CH_3COO\underset{\substack{| \\ CH_3}}{CH}CH_2\overset{+}{N}(CH_3)_3]Br^-$$

(2-Hydroxypropyl)trimethylammonium Bromide Acetate

$C_8H_{18}BrNO_2$ Mol. wt. 240.14

Methacholine Bromide, dried at 105° for 4 hours, contains not less than 98.0 percent and not more than 102.0 percent of $C_8H_{18}BrNO_2$.

Description—Methacholine Bromide occurs as a white, crystalline powder, possessing a slight amine-like odor. It is very hygroscopic. The pH of a freshly prepared 1 in 20 solution of Methacholine Bromide is about 5.

Solubility—Methacholine Bromide is freely soluble in water and in alcohol. It is practically insoluble in benzene and in ether.

Identification—

A: Dissolve about 1 g. of Methacholine Bromide in 10 ml. of water. To a 1-ml. portion add 1 ml. of alcohol and 1 ml. of sulfuric acid and heat on a steam bath: the odor of ethyl acetate is perceptible (*presence of an acetyl group*). To a 5-ml. portion add 2.5 g. of potassium hydroxide and heat: the odor of trimethylamine is perceptible (*presence of an amine*). To the remaining portion add an excess of silver nitrate T.S.: a light yellow, curdy precipitate forms which is only slightly soluble in ammonia T.S. (*presence of bromide*).

B: Dissolve 200 mg. of Methacholine Bromide in 2 ml. of sulfuric acid: a brown hygroscopic gas is evolved immediately, and the solution turns orange-brown (*presence of bromine; distinction from methacholine chloride*).

C: To a few crystals of Methacholine Bromide on a microscope slide add several drops of platinic chloride T.S.: small rhombohedric plates form (*distinction from acetylcholine chloride, which forms needles, and choline chloride, which forms no crystals*).

Melting range, page 814—Methacholine Bromide melts between 147° and 150°.

Loss on drying, page 814—Dry Methacholine Bromide at 105° for 4 hours: it loses not more than 1.5 percent of its weight.

Residue on ignition, page 858—Methacholine Bromide yields not more than 0.1 percent of residue on ignition.

Acetylcholine—To 2 ml. of a solution of Methacholine Bromide (1 in 10) add 3 ml. of a solution of sodium perchlorate (1 in 5), shake well, and cool in ice water: no precipitate forms.

Assay—Transfer to a conical flask about 500 mg. of Methacholine Bromide, previously dried at 105° for 4 hours and accurately weighed (because it is very hygroscopic, store the dried material in a vacuum desiccator), dissolve it in 50 ml. of glacial acetic acid, add 10 ml. of mercuric acetate T.S. and 1 drop of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 24.01 mg. of $C_8H_{18}BrNO_2$.

Packaging and storage—Preserve Methacholine Bromide in tight containers.

CATEGORY—Cholinergic.

USUAL DOSE—**200 mg.** two or three times a day.

USUAL DOSE RANGE—**200** to **600 mg.**

Methacholine Bromide Tablets

Methacholine Bromide Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_8H_{18}BrNO_2$.

Identification—Transfer to a glass-stoppered, 50-ml. conical flask an amount of powdered Methacholine Bromide Tablets, equivalent to about 1.5 g. of methacholine bromide, add 15 ml. of water, and shake mechanically for 15 minutes. Filter, pass water through the filter to make a total of 15 ml. of filtrate, and mix. The filtrate responds to *Identification tests A* and *B* under *Methacholine Bromide,* page 419.

Disintegration, page 878—The disintegration time limit for Methacholine Bromide Tablets is 30 minutes.

Weight variation, page 901—Methacholine Bromide Tablets meet the requirements of the weight variation test for tablets.

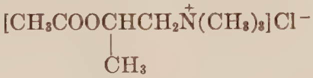
Assay—Weigh and finely powder not less than 20 Methacholine Bromide Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 300 mg. of methacholine bromide, to a beaker, add 25 ml. of methanol, and heat to boiling on a steam bath. Decant the warm methanol through a sintered-glass funnel, collecting the filtrate in a 250-ml. beaker, and repeat the extraction with five 20-ml. portions of methanol. Evaporate the methanol solution just to dryness on a steam bath, dissolve the residue in 50 ml. of glacial acetic acid with the aid of heat, and allow to cool. Add 10 ml. of mercuric acetate T.S., and 1 drop of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 24.01 mg. of $C_8H_{18}BrNO_2$.

Packaging and storage—Preserve Methacholine Bromide Tablets in tight containers.

Tablets available—Methacholine Bromide Tablets usually available contain the following amount of methacholine bromide: 200 mg.

Category and Dose—See Methacholine Bromide.

Methacholine Chloride



$$[CH_3COO\underset{CH_3}{\underset{|}{CH}}CH_2\overset{+}{N}(CH_3)_3]Cl^-$$

(2-Hydroxypropyl)trimethylammonium Chloride Acetate

$C_8H_{18}ClNO_2$ Mol. wt. 195.69

Methacholine Chloride, dried at 105° for 4 hours, contains not less than 98.0 percent and not more than 102.0 percent of $C_8H_{18}ClNO_2$.

Description—Methacholine Chloride occurs as colorless or white crystals, or as a white, crystalline powder. It is odorless or has a slight odor, and is very hygroscopic. Its solutions are neutral to litmus.

Solubility—Methacholine Chloride is very soluble in water, and is freely soluble in alcohol and in chloroform.

Identification—

A: To about 100 mg. of Methacholine Chloride on a watch glass add 3 ml. of platinic chloride T.S. previously diluted with 2 ml. of water: small rhombohedric plates are formed, which melt between 220° and 225°, page 814 (*distinction from acetylcholine chloride, which forms needles radiating from a central point, and from choline chloride, which forms no crystals*).

B: To 1 ml. of a solution of Methacholine Chloride (1 in 10) add 1 ml. of alcohol and 1 ml. of sulfuric acid, and heat gently: the odor of ethyl acetate becomes perceptible.

C: To 5 ml. of a solution of Methacholine Chloride (1 in 10) add 2 g. of potassium hydroxide and heat gently: the odor of trimethylamine is perceptible.

D: A solution of Methacholine Chloride (1 in 50) responds to the tests for *Chloride*, page 808.

Melting range, page 814—Dissolve about 100 mg. of Methacholine Chloride in 2 to 3 ml. of chloroform in a small beaker. Heat at 110° for 1 hour. Quickly powder the dry residue, while still hot, with a glass rod and transfer to a melting point tube in the usual manner. Determine the melting range without delay. Methacholine Chloride melts between 170° and 173°.

Loss on drying, page 814—Dry Methacholine Chloride at 105° for 4 hours: it loses not more than 1.5 percent of its weight.

Residue on ignition, page 858—Methacholine Chloride yields not more than 0.1 percent of residue on ignition.

Acetylcholine chloride—To 2 ml. of Methacholine Chloride solution (1 in 10) add 3 ml. of a solution of sodium perchlorate (1 in 5), shake well, and immerse in ice water for 5 minutes: no precipitate is formed.

Assay—Transfer to a conical flask about 400 mg. of Methacholine Chloride, previously dried at 105° for 4 hours and accurately weighed (because it is very hygroscopic, store the dried material in a vacuum desiccator), dissolve it in 50 ml. of glacial acetic acid, add 10 ml. of mercuric acetate T.S. and 1 drop of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a blue-green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 19.57 mg. of $C_8H_{18}ClNO_2$.

Packaging and storage—Preserve Methacholine Chloride in tight containers.

Category—Cholinergic.

Usual dose—Subcutaneous, initial, **10 mg.**; then may give **25 mg.** 10 to 30 minutes later.

Usual dose range—**10 to 40 mg.**

Sterile Methacholine Chloride

Sterile Methacholine Chloride, dried at 105° for 4 hours, contains not less than 98.0 percent and not more than 102.0 percent of $C_8H_{18}ClNO_2$.

Description and other requirements—Sterile Methacholine Chloride conforms to the *Description* and meets the *Identification tests* and the other requirements under *Methacholine Chloride,* page 420.

Completeness of solution—Place 1 g. of Sterile Methacholine Chloride in a 10-ml. glass-stoppered cylinder, nearly fill to the 10-ml. mark with water, and shake gently until dissolved: the solution is clear.

Sterility—Sterile Methacholine Chloride meets the requirements under *Sterility Tests,* page 874.

Weight variation, page 901—Sterile Methacholine Chloride meets the requirements of the weight variation test for sterile solids, and the mean net weight so determined is not less than 90 percent and not more than 110 percent of the labeled amount.

Assay—Proceed as directed in the *Assay* under *Methacholine Chloride,* page 420.

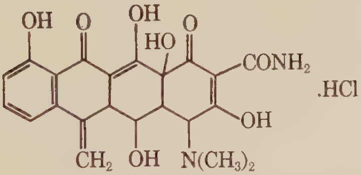
Packaging and storage—Preserve Sterile Methacholine Chloride in hermetic or other suitable containers so closed that the sterility of the product is maintained until the package is opened for use.

Labeling—Sterile Methacholine Chloride complies with the requirements for *Labeling* under *Injections,* page 810.

Size available—Sterile Methacholine Chloride is usually available in the following amount: 25 mg.

CATEGORY and DOSE—See Methacholine Chloride.

Methacycline Hydrochloride*



4-(Dimethylamino)-1,4,4*a*,5,5*a*,6,11,12*a*-octahydro-3,5,10,12,12*a*-pentahydroxy-6-methylene-1,11-dioxo-2-naphthacenecarboxamide Monohydrochloride

$C_{22}H_{22}N_2O_8 . HCl$ Mol. wt. 478.89

Methacycline Hydrochloride has a potency of not less than 832 mcg. of $C_{22}H_{22}N_2O_8$ (methacycline) per mg. Methacycline Hydrochloride conforms to the regulations of the federal Food and Drug Administration concerning certification of antibiotic drugs.

Description—Methacycline Hydrochloride occurs as a yellow to dark yellow crystalline powder. The pH of a 1 percent solution is between 2 and 3.

Solubility—Methacycline Hydrochloride is freely soluble in water.

Packaging and storage—Preserve Methacycline Hydrochloride in tight, light-resistant containers in a cool place.

CATEGORY—Antibacterial.

USUAL DOSE—**600 mg.** (equivalent to 560 mg. of methacycline base) daily in divided doses.

---

* Patented. See notice, page ii.

Methacycline Hydrochloride Capsules

Methacycline Hydrochloride Capsules contain methacycline hydrochloride equivalent to not less than 90.0 percent and not more than 120.0 percent of the labeled amount of $C_{22}H_{22}N_2O_8$ (methacycline base). Methacycline Hydrochloride Capsules conform to the regulations of the federal Food and Drug Administration concerning certification of antibiotic drugs.

Packaging and storage—Preserve Methacycline Hydrochloride Capsules in tight, light-resistant containers.

Capsules available—Methacycline Hydrochloride Capsules usually available contain the following amounts of methacycline hydrochloride: 150 mg. (equivalent to 140 mg. of methacycline) and 300 mg. (equivalent to 280 mg. of methacycline).

CATEGORY and DOSE—See Methacycline Hydrochloride.

Methacycline Hydrochloride Oral Suspension

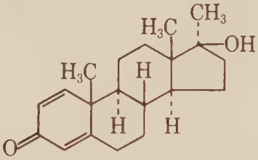
Methacycline Hydrochloride Oral Suspension contains methacycline hydrochloride and one or more suitable and harmless buffers, dispersants, diluents, colorings, flavorings, and preservatives. It contains not less than 90.0 percent and not more than 125.0 percent of the labeled amount of $C_{22}H_{22}N_2O_8$ (methacycline base). Methacycline Hydrochloride Oral Suspension conforms to the regulations of the federal Food and Drug Administration concerning certification of antibiotic drugs.

Packaging and storage—Preserve Methacycline Hydrochloride Oral Suspension in tight, light-resistant containers in a cool place.

Suspension available—Methacycline Hydrochloride Oral Suspension usually available contains the following amount of methacycline hydrochloride: 75 mg. (equivalent to 70 mg. of methacycline) in 5 ml.

CATEGORY and DOSE—See Methacycline Hydrochloride.

Methandrostenolone*



17β-Hydroxy-17-methylandrosta-1,4-dien-3-one

$C_{20}H_{28}O_2$ Mol. wt. 300.44

Methandrostenolone contains not less than 97.0 percent and not more than 103.0 percent of $C_{20}H_{28}O_2$, calculated on the dried basis.

Description—Methandrostenolone occurs as white crystals or as a white crystalline powder. It is odorless.

Solubility—Methandrostenolone is insoluble in water. It is soluble in alcohol, in chloroform, and in glacial acetic acid, and is slightly soluble in ether.

Identification—Prepare a solution of Methandrostenolone in chloroform containing 2 mg. per ml. On a suitable thin-layer chromatographic plate (see page 791), coated with a 0.25-mm. layer of silica gel G, spot 10 μl. of this solution and 10 μl. of a chloroform solution of NF Methandrostenolone Reference Standard containing 2 mg. per ml. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of chloroform and methanol (96:4) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by lightly spraying with dilute sulfuric acid (1 in 2) and heating on a hot plate or under a lamp until spots appear: the R_f value of the main spot obtained from the sample solution corresponds to that obtained from the Reference Standard solution.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Methandrostenolone, previously dried at 105° for 3 hours, exhibits maxima only at the same wavelengths as that of NF Methandrostenolone Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The

ultraviolet absorption spectrum of a 1 in 100,000 solution of Methandrostenolone in methanol exhibits maxima and minima at the same wavelengths as that of NF Methandrostenolone Reference Standard, similarly measured.

---

* Patented. See notice, page ii.

Melting range, page 814—Methandrostenolone melts with decomposition between 160° and 166°.

Specific rotation, page 822—The specific rotation of Methandrostenolone, calculated on the dried basis, determined in a solution in alcohol containing 200 mg. of Methandrostenolone in each 10 ml., is between +9° and +17°.

Loss on drying, page 814—Dry Methandrostenolone at 105° for 3 hours: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Methandrostenolone yields not more than 0.2 percent of residue on ignition.

Selenium—A *Test Preparation* prepared with 200 mg. of Methandrostenolone meets the requirements of the *Selenium Limit Test,* page 865 (30 parts per million).

Methyltestosterone—Prepare a solution of Methandrostenolone in chloroform containing 2 mg. per ml. On a suitable thin-layer chromatographic plate (see page 791), coated with a 0.25-mm. layer of silica gel G, spot 10 μl. of this solution, 10 μl. of a chloroform solution of NF Methandrostenolone Reference Standard containing 2 mg. per ml., and 10 μl. of a chloroform solution of NF Methyltestosterone Reference Standard containing 10 mcg. per ml. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of chloroform and methanol (96:4) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, and allow the solvent to evaporate. Locate the spots on the plate by lightly spraying with a formaldehyde solution (prepared by cautiously dissolving 0.8 ml. of formaldehyde in 10 ml. of sulfuric acid and then adding 3 ml. of water), followed by heating on a hot plate for 5 to 10 minutes, and inspecting under ambient lighting and longwave ultraviolet light: no more than three spots, in addition to that produced by methandrostenolone, are found, and any spot occurring at the same R_f as methyltestosterone is not greater in size or intensity than that produced by NF Methyltestosterone Reference Standard (0.5 percent as methyltestosterone).

Assay—Transfer about 50 mg. of Methandrostenolone, accurately weighed, to a 250-ml. volumetric flask, add methanol to volume, and mix. Transfer 5.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with methanol, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Methandrostenolone Reference Standard, in methanol, at a concentration of about 10 mcg. per ml., in 1-cm. cells, at the maximum at about 245 mμ, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg., of $C_{20}H_{28}O_2$ in the Methandrostenolone taken, by the formula $5C \times (A_U/A_S)$, in which C is the exact concentration in mcg. per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Methandrostenolone in tight, light-resistant containers.

CATEGORY—Androgen.
USUAL DOSE—**2.5** to **5 mg.** daily.

Methandrostenolone Tablets

Methandrostenolone Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{20}H_{28}O_2$.

Identification—

A: Triturate a quantity of finely powdered Methandrostenolone Tablets, equivalent to about 10 mg. of methandrostenolone, with 5 ml. of chloroform, and filter. Proceed as directed for *Identification* under *Methandrostenolone,* page 422, beginning with "On a suitable thin-layer chromatographic plate . . . ."

B: The ultraviolet absorption spectrum of the solution employed for measurement of the absorbance in the *Assay* exhibits maxima and minima at the same wavelengths as that of the solution of NF Methandrostenolone Reference Standard, similarly measured.

Dissolution, *Method I,* page 802—Not less than 50 percent of the labeled amount of $C_{20}H_{28}O_2$ in Methandrostenolone Tablets dissolves into solution within 45 minutes, using a stirring speed of 100 r.p.m. and water as the *Dissolution Fluid.* Determine the amount of $C_{20}H_{28}O_2$ in solution by determining the ultraviolet absorption of aliquots removed from the dissolution solution, at 245 mμ, in 1-cm. cells, with a suitable spectrophotometer, using water as the blank and utilizing a standard curve, representing absorbance *versus* concentration of NF Methandrostenolone Reference Standard.

Content uniformity, *Method II,* page 799—Place a Methandrostenolone Tablet in a 100-ml. volumetric flask, and gently pulverize with a glass rod. Add 3 ml. of water, mix well, and then add 50 ml. of methanol. Shake mechanically for 5 minutes, dilute to volume with methanol, and mix. Centrifuge a portion of the solution, and dilute a portion of the supernatant liquid, quantitatively and stepwise, if necessary, with methanol to provide a solution containing approximately 10 mcg. of methandrostenolone per ml. Concomitantly determine the absorbance of this solution and of a solution of NF Methandrostenolone Reference Standard, in the same medium, at a concentration of about 10 mcg. per ml., in 1-cm. cells, at the maximum at about 245 mμ, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg., of $C_{20}H_{28}O_2$ in the Tablet by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity of methandrostenolone, in mg., in the tablet; D is the exact concentration, in mcg. per ml., of methandrostenolone in the sample solution, based upon the labeled quantity per tablet and the extent of dilution; C is the exact concentration of the Reference Standard solution, in mcg. per ml.; A_U is the absorbance of the sample solution; and A_S is the absorbance of the Reference Standard solution.

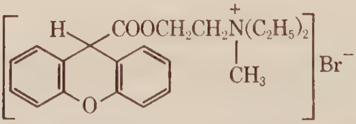
Assay—Weigh and finely powder not less than 20 Methandrostenolone Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 5 mg. of methandrostenolone, to a separator, add 25 ml. of water, and mix well. Extract the methandrostenolone completely, using three 25-ml. portions of chloroform, filtering each portion through chloroform-washed cotton into a 100-ml. volumetric flask. Dilute to volume with chloroform, and mix. Transfer 10.0 ml. of this solution to a 50-ml. volumetric flask, and evaporate on a steam bath with the aid of a current of air just to dryness. Dissolve the residue in methanol, dilute to volume with methanol, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Methandrostenolone Reference Standard, in methanol, at a concentration of about 10 mcg. per ml., in 1-cm. cells, at the maximum at about 245 mμ, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg., of $C_{20}H_{28}O_2$ in the portion of the Tablets taken, by the formula $0.5C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Methandrostenolone Tablets in tight, light-resistant containers.

Tablets available—Methandrostenolone Tablets usually available contain the following amounts of methandrostenolone: 2.5 and 5.0 mg.

CATEGORY and DOSE—See Methandrostenolone.

Methantheline Bromide*



Diethyl(2-hydroxyethyl)methylammonium Bromide Xanthene-9-carboxylate

$C_{21}H_{26}BrNO_3$ Mol. wt. 420.35

Methantheline Bromide contains not less than 98.0 percent and not more than 102.0 percent of $C_{21}H_{26}BrNO_3$, calculated on the dried basis.

Description—Methantheline Bromide is a white or nearly white powder. It has a very bitter taste, and is practically odorless. Its solutions have a pH of about 5.

Solubility—Methantheline Bromide is very soluble in water, is freely soluble in alcohol and in chloroform, and is practically insoluble in ether. Its water solution decomposes on standing.

Identification—

A: Dissolve about 250 mg. of Methantheline Bromide in 10 ml. of water. To 2 ml. of the solution, add 5 ml. of water, 2 ml. of diluted nitric acid, and 2 ml. of silver nitrate T.S.: a light yellow, curdy precipitate forms which is only slightly soluble in ammonia T.S. To the remainder of the solution add 10 ml. of sodium hydroxide T.S., and heat to boiling. Keep the mixture hot for about 2 minutes, cool slightly, and acidify with about 5 ml. of diluted hydrochloric acid. Cool, filter, wash the precipitate thoroughly with water, recrystallize from 50 percent alcohol, and dry at 105° for 1 hour: the xanthanoic acid so obtained melts between 218° and 223°, page 814.

---

* Patented. See notice, page ii.

B: Place about 10 mg. of the crystals obtained in *Identification test A* in a test tube, and add 5 ml. of sulfuric acid: a bright yellow to orange solution is obtained.

Melting range, page 814—Methantheline Bromide melts between 171° and 177°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Methantheline Bromide, previously dried at 105° for 4 hours, exhibits maxima only at the same wavelengths as that of NF Methantheline Bromide Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 20,000 solution of Methantheline Bromide in methanol exhibits maxima and minima at the same wavelengths as that of NF Methantheline Bromide Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorption occurring at about 282 mμ, do not differ by more than 3 percent.

Loss on drying, page 814—Dry Methantheline Bromide at 105° for 4 hours: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Methantheline Bromide yields not more than 0.15 percent of residue on ignition.

Assay—Dissolve about 800 mg. of Methantheline Bromide, accurately weighed, in 50 ml. of glacial acetic acid. Add 10 ml. of mercuric acetate T.S., and 1 drop of crystal violet T.S., and titrate with 0.1 *N* perchloric acid in glacial acetic acid to a blue-green end-point. Perform a blank determination, and make any necessary correction. Each ml. of 0.1 *N* perchloric acid is equivalent to 42.04 mg. of $C_{21}H_{26}BrNO_3$.

Packaging and storage—Preserve Methantheline Bromide in well-closed containers.

CATEGORY—Anticholinergic.
USUAL DOSE—**50 mg.** four times a day.
USUAL DOSE RANGE—**50** to **100 mg.**

Methantheline Bromide Tablets

Methantheline Bromide Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{21}H_{26}BrNO_3$.

Identification—Triturate a quantity of powdered Methantheline Bromide Tablets, equivalent to about 500 mg. of methantheline bromide, with 10 ml. of chloroform. Filter the mixture, and evaporate the filtrate to a thick oil with the aid of a current of air. Stir the residue with about 5 ml. of ether: a white powder is obtained which responds to the *Identification tests* under *Methantheline Bromide*, page 424.

Disintegration, page 878—The disintegration time limit for Methantheline Bromide Tablets is 15 minutes.

Content uniformity, *Method II*, page 799—Methantheline Bromide Tablets meet the requirements of the content uniformity test for tablets, using the following special procedure: Triturate a tablet with methanol in a glass mortar, and quantitatively transfer the mixture to a 100-ml. volumetric flask with the aid of methanol. Dilute to volume with methanol, mix, and filter, discarding the first 25 ml. of filtrate. Dilute a portion of the subsequent filtrate quantitatively and stepwise, if necessary, with methanol to provide a solution containing approximately 500 mcg. of methantheline bromide per ml. Concomitantly determine the absorbance of this solution and of a solution of NF Methantheline Bromide Reference Standard, in the same medium, at a concentration of about 500 mcg. per ml., in 1-cm. cells, at the maximum at about 282 mμ, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg., of $C_{21}H_{26}BrNO_3$ in the tablet by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity of methantheline bromide, in mg., in the tablet; D is the exact concentration, in mcg. per ml., of methantheline bromide in the sample solution, based upon the labeled quantity per tablet and the extent of dilution; C is the exact concentration, in mcg. per ml., of the Reference Standard solution; A_U is the absorbance of the sample solution; and A_S is the absorbance of the Reference Standard solution.

Assay—Weigh and finely powder not less than 20 Methantheline Bromide Tablets. Weigh accurately a portion of the powder, equivalent to about 800 mg. of methantheline bromide, and transfer to a medium-porosity, sintered-glass funnel that is fitted into a small suction flask.

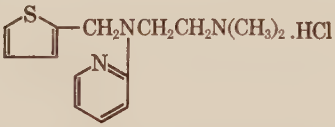
Wash the powder with 10 ml. of ether, stir with a small rod, and remove the ether by suction. Wash with two additional 10-ml. portions of ether, and discard the ether washings. In the same manner, extract the powder with four 10-ml. portions of chloroform. Transfer the combined chloroform extracts to a tared beaker, and evaporate carefully on a hot plate until only a heavy oil remains, avoiding local overheating. Cool, and dry the residue in vacuum for 15 minutes. Add 10 ml. of ether to the oily residue, and stir until the residue becomes a white, crystalline powder. Allow the solids to settle, and decant the clear liquid, avoiding loss of solid. Dry in air until the odor of ether is no longer perceptible, heat at 105° for 30 minutes, cool, and weigh. Continue as directed in the *Assay* under *Methantheline Bromide*, page 424.

Packaging and storage—Preserve Methantheline Bromide Tablets in well-closed containers.

Tablets available—Methantheline Bromide Tablets usually available contain the following amount of methantheline bromide: 50 mg.

CATEGORY and DOSE—See Methantheline Bromide.

Methapyrilene Hydrochloride



2-[[2-(Dimethylamino)ethyl]-2-thenylamino]pyridine Monohydrochloride

$C_{14}H_{19}N_3S.HCl$ Mol. wt. 297.85

Methapyrilene Hydrochloride, dried at 105° for 3 hours, contains not less than 98.0 percent and not more than 100.5 percent of $C_{14}H_{19}N_3S.HCl$.

Description—Methapyrilene Hydrochloride occurs as a white, crystalline powder, usually having a faint odor. Its solutions are slightly acid to litmus, having a pH of about 5 to 6.

Solubility—Methapyrilene Hydrochloride is very soluble in water. It is freely soluble in alcohol and in chloroform. It is practically insoluble in ether and in benzene.

Identification—

A: Dissolve 25 mg. of Methapyrilene Hydrochloride in 5 ml. of sulfuric acid: a pronounced orange-brown color is produced, which changes to a greenish yellow upon dilution with 20 ml. of water, the solution acquiring a slight turbidity.

B: Methapyrilene Hydrochloride responds to the tests for *Chloride,* page 808

Melting range, page 814—Methapyrilene Hydrochloride melts between 161° and 165°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Methapyrilene Hydrochloride, previously dried at 105° for 3 hours, exhibits maxima only at the same wavelengths as that of NF Methapyrilene Hydrochloride Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 40,000 solution of Methapyrilene Hydrochloride in 0.5 *N* sulfuric acid exhibits maxima and minima at the same wavelengths as that of NF Methapyrilene Hydrochloride Reference Standard, similarly measured, and the respective absorptivities, calculated on the dried basis, at the point of maximum absorption occurring at about 313 mμ, do not differ by more than 3 percent.

Loss on drying, page 814—Dry Methapyrilene Hydrochloride at 105° for 3 hours: it loses not more than 0.5 percent of its weight.

Selenium—A *Test Preparation* prepared with 100 mg. of Methapyrilene Hydrochloride and 100 mg. of magnesium oxide meets the requirements of the *Selenium Limit Test,* page 865 (30 parts per million).

Residue on ignition, page 858—Methapyrilene Hydrochloride yields not more than 0.3 percent of residue on ignition.

Assay—Transfer to a beaker about 500 mg. of Methapyrilene Hydrochloride, previously dried at 105° for 3 hours and accurately weighed, and dissolve it in 80 ml. of glacial acetic acid. Add 10 ml. of mercuric acetate T.S., and titrate with 0.1 *N* perchloric acid, determining the endpoint potentiometrically. Each ml. of 0.1 *N* perchloric acid is equivalent to 14.89 mg. of $C_{14}H_{19}N_3S.HCl$.

Packaging and storage—Preserve Methapyrilene Hydrochloride in tight, light-resistant containers.

Category—Antihistaminic.

Usual dose—**50 mg.** up to four times a day.

Usual dose range—**50** to **100 mg.**

Methapyrilene Hydrochloride Capsules

Methapyrilene Hydrochloride Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{14}H_{19}N_3S.HCl$.

Identification—

A: The solution prepared from Methapyrilene Hydrochloride Capsules as directed in the *Assay* exhibits an absorbance maximum at 313 ± 2 mμ.

B: A filtered solution of Methapyrilene Hydrochloride Capsules, equivalent to methapyrilene hydrochloride solution (1 in 20), responds to the tests for *Chloride*, page 808.

Content uniformity, *Method II*, page 798—Methapyrilene Hydrochloride Capsules meet the requirements of the content uniformity test for capsules, using the following special procedure: Quantitatively transfer the contents of a capsule as completely as possible to a 100-ml. volumetric flask. Rinse the empty capsule with about 5 ml. of alcohol, and add these rinsings to the flask. Add 50 ml. of water, and shake mechanically for 15 minutes. Dilute to volume with water, mix, and filter, discarding the first 20 ml. of filtrate. Dilute a portion of the subsequent filtrate quantitatively and stepwise, if necessary, with 0.1 N hydrochloric acid to provide a solution containing approximately 25 mcg. of methapyrilene hydrochloride per ml. Concomitantly determine the absorbance of this solution and of a solution of NF Methapyrilene Hydrochloride Reference Standard, in the same medium, at a concentration of about 25 mcg. per ml., in 1-cm. cells, at the maximum at about 313 mμ, with a suitable spectrophotometer, using 0.1 N hydrochloric acid as the blank. Calculate the quantity, in mg., of $C_{14}H_{19}N_3S.HCl$ in the capsule by the formula $(T/D) \times C \times (A_U/A_S)$, in which T is the labeled quantity of methapyrilene hydrochloride, in mg., in the capsule; D is the exact concentration, in mcg. per ml., of methapyrilene hydrochloride in the sample solution, based upon the labeled quantity per capsule and the extent of dilution; C is the exact concentration of the Reference Standard solution, in mcg. per ml.; A_U is the absorbance of the sample solution; and A_S is the absorbance of the Reference Standard solution.

Assay—Transfer, as completely as possible, the contents of not less than 20 Methapyrilene Hydrochloride Capsules to a suitable tared container, and weigh. Mix the powder thoroughly with a glass rod, and transfer an accurately weighed portion of the powder, equivalent to about 25 mg. of methapyrilene hydrochloride, to a 125-ml. separator. Proceed as directed under *Salts of Organic Nitrogenous Bases*, page 865, beginning with "Then to the separator add 20 ml. of 0.1 N sulfuric acid . . . ," and determining the absorbance at the maximum at about 313 mμ. Calculate the quantity, in mg., of $C_{14}H_{19}N_3S.HCl$ in the portion of the Capsules taken by the formula $0.05C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of NF Methapyrilene Hydrochloride Reference Standard in the *Standard preparation*.

Packaging and storage—Preserve Methapyrilene Hydrochloride Capsules in tight containers.

Capsules available—Methapyrilene Hydrochloride Capsules usually available contain the following amounts of methapyrilene hydrochloride: 25, 50, and 100 mg.

Category and Dose—See Methapyrilene Hydrochloride.

Methapyrilene Hydrochloride Tablets

Methapyrilene Hydrochloride Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{14}H_{19}N_3S.HCl$.

Identification—Extract a quantity of finely powdered Methapyrilene Hydrochloride Tablets, equivalent to about 25 mg. of methapyrilene hydrochloride, with two 5-ml. portions of chloroform. Filter the combined chloroform extracts, and evaporate to dryness: the residue so obtained responds to *Identification test A* under *Methapyrilene Hydrochloride*, page 426.

Disintegration, page 878—The disintegration time limit for Methapyrilene Hydrochloride Tablets is 30 minutes.

Content uniformity, *Method I*, page 799—Methapyrilene Hydrochloride Tablets meet the requirements of the content uniformity test for tablets.

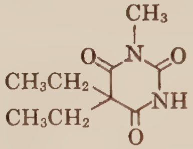
Assay—Proceed as directed under *Salts of Organic Nitrogenous Bases*, page 865, determining the absorbance at 313 mμ. Calculate the quantity, in mg., of $C_{14}H_{19}N_3S.HCl$ in the portion of the Tablets taken by the formula $0.05C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., calculated on the anhydrous basis, of NF Methapyrilene Hydrochloride Reference Standard in the *Standard preparation*.

Packaging and storage—Preserve Methapyrilene Hydrochloride Tablets in tight, light-resistant containers.

Tablets available—Methapyrilene Hydrochloride Tablets usually available contain the following amount of methapyrilene hydrochloride: 50 mg.

CATEGORY and DOSE—See Methapyrilene Hydrochloride.

Metharbital



5,5-Diethyl-1-methylbarbituric Acid

$C_9H_{14}N_2O_3$ Mol. wt. 198.22

Metharbital, dried at 105° for 4 hours, contains not less than 98.0 percent and not more than 100.5 percent of $C_9H_{14}N_2O_3$.

Description—Metharbital occurs as a white to nearly white, crystalline powder, possessing a faint aromatic odor. The pH of a saturated solution is about 6.

Solubility—Metharbital is slightly soluble in water. It is soluble in alcohol and sparingly soluble in ether.

Identification—Shake about 300 mg. of Metharbital with 5 ml. of 0.2 *N* sodium hydroxide for 2 minutes, filter, and to 1 ml. of the filtrate add several drops of silver nitrate T.S.: a white precipitate, soluble in ammonia T.S., is formed. To a second 1-ml. portion of the filtrate add several drops of mercuric chloride T.S.: a white precipitate, soluble in ammonia T.S., is formed.

Melting range, page 814—Metharbital melts between 151° and 155°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Metharbital, previously dried at 105° for 4 hours, exhibits maxima only at the same wavelengths as that of NF Metharbital Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 100,000 solution of Metharbital in 0.1 *N* sodium hydroxide exhibits maxima and minima at the same wavelengths as that of NF Metharbital Reference Standard similarly measured.

Water, page 900—Determine the water content of Metharbital by the titrimetric method: not more than 1 percent is found.

Residue on ignition, page 858—Metharbital yields not more than 0.1 percent of residue on ignition.

Assay—Transfer to a 100-ml. volumetric flask about 100 mg. of Metharbital, previously dried at 105° for 4 hours and accurately weighed, add 0.1 *N* sodium hydroxide to volume, and mix. Transfer 10.0 ml. of this solution to a second 100-ml. volumetric flask, dilute to volume with 0.1 *N* sodium hydroxide, and mix. Transfer 10.0 ml. of this last solution to a third 100-ml. volumetric flask, dilute to volume with 0.1 *N* sodium hydroxide, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Metharbital Reference Standard, in 0.1 *N* sodium hydroxide, at a concentration of about 10 mcg. per ml., in 1-cm. cells, at the maximum at about 244 mμ, with a suitable spectrophotometer, using 0.1 *N* sodium hydroxide as the blank. Calculate the quantity, in mg., of $C_9H_{14}N_2O_3$ in the Metharbital taken by the formula $10C \times (A_U/A_S)$, in which C is the exact concentration of the Reference Standard solution, in mcg. per ml., A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Metharbital in tight containers.

Category—Anticonvulsant.

Usual dose—Initial, **100 mg.** up to three times a day.

Usual dose range—**100** to **800 mg.** per day.

Metharbital Tablets

Metharbital Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_9H_{14}N_2O_3$.

Identification—Extract with solvent hexane in a continuous extraction apparatus, an amount of powdered Metharbital Tablets, equivalent to about 500 mg. of metharbital. Dry the residue in the thimble, extract it with alcohol in the apparatus, evaporate the alcohol extract to dryness, and dry at 105° for 2 hours: a portion of the residue of metharbital so obtained responds to the *Identification tests* and the *Ultraviolet absorption test* under *Metharbital*, page 428.

Disintegration, page 878—The disintegration time limit for Metharbital Tablets is 10 minutes.

Weight variation, page 901—Metharbital Tablets meet the requirements of the weight variation test for tablets.

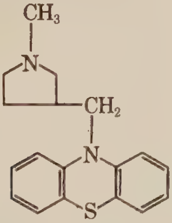
Assay—Weigh and finely powder not less than 20 Metharbital Tablets. Weigh accurately a portion of the powder, equivalent to about 100 mg. of metharbital, and transfer it to a 100-ml. volumetric flask. Add 50 ml. of 0.1 *N* sodium hydroxide, and shake mechanically for 15 minutes. Dilute to volume with 0.1 *N* sodium hydroxide, mix, and filter. Transfer 10.0 ml. of the filtrate to a second 100-ml. volumetric flask, dilute to volume with 0.1 *N* sodium hydroxide, and mix. Transfer 10.0 ml. of this last solution to a third 100-ml. volumetric flask, dilute to volume with 0.1 *N* sodium hydroxide, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Metharbital Reference Standard, in 0.1 *N* sodium hydroxide, at a concentration of about 10 mcg. per ml. in 1-cm. cells, at the maximum at about 244 mμ, with a suitable spectrophotometer, using 0.1 *N* sodium hydroxide as the blank. Calculate the quantity, in mg., of $C_9H_{14}N_2O_3$ in the portion of the Tablets taken by the formula $10C \times (A_U/A_S)$, in which C is the exact concentration of the Reference Standard solution, in mcg. per ml., A_U is the absorbance of the sample solution, and A_S is the absorbance of the Reference Standard solution.

Packaging and storage—Preserve Metharbital Tablets in tight containers.

Tablets available—Metharbital Tablets usually available contain the following amount of metharbital: 100 mg.

Category and Dose—See Metharbital.

Methdilazine*



10-[(1-Methyl-3-pyrrolidinyl)methyl]phenothiazine

$C_{18}H_{20}N_2S$ Mol. wt. 296.44

Methdilazine contains not less than 97.0 percent and not more than 103.0 percent of $C_{18}H_{20}N_2S$, calculated on the dried basis.

Description—Methdilazine occurs as a light tan, crystalline powder having a characteristic odor.

Solubility—Methdilazine is practically insoluble in water. It is freely soluble in diluted hydrochloric acid, and is soluble in alcohol and in chloroform.

Identification—Dissolve about 50 mg. of Methdilazine in 10 ml. of diluted hydrochloric acid in a test tube, add 3 ml. of buffered palladium chloride T.S. and 1 ml. of sodium lauryl sulfate solution (1 in 100), and mix: a blue color is formed.

---

* Patented. See notice, page ii.

Melting range, page 814—Methdilazine melts within a range of 2° between 83° and 88°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Methdilazine, previously dried in vacuum at 70° for 4 hours, exhibits maxima only at the same wavelengths as that of NF Methdilazine Reference Standard, similarly measured.

Ultraviolet absorption, page 866—Dissolve 25.0 mg. of Methdilazine in 25 ml. of 1 *N* hydrochloric acid, and dilute quantitatively and stepwise, with water, to a concentration of 5 mcg. per ml. The ultraviolet absorption spectrum of this solution exhibits maxima and minima at the same wavelengths as that of a 1 in 200,000 solution of NF Methdilazine Reference Standard in the same medium, similarly measured.

Loss on drying, page 814—Dry Methdilazine in vacuum at 70° for 4 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Methdilazine yields not more than 0.5 percent of residue on ignition.

Selenium—A *Test Preparation* prepared with 100 mg. of Methdilazine and 100 mg. of magnesium oxide meets the requirements of the *Selenium Limit Test*, page 865, (30 parts per million).

Heavy metals, *Method II*, page 806—The heavy metals limit for Methdilazine is 20 parts per million.

Assay—Transfer about 100 mg. of Methdilazine, accurately weighed, to a 1000-ml. volumetric flask, dissolve in 100 ml. of 1 *N* hydrochloric acid, dilute to volume with water, and mix. Transfer 5.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with water, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Methdilazine Reference Standard, in water at a concentration of about 5 mcg. per ml., in 1-cm. cells, at 252 mμ and at 275 mμ, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg., of $C_{18}H_{20}N_2S$ in the Methdilazine taken by the formula $20C \times (A_{U252} - A_{U275})/(A_{S252} - A_{S275})$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_{U252} and A_{U275} are the absorbances of the sample solution at 252 mμ and 275 mμ, respectively, and A_{S252} and A_{S275} are the absorbances of the Reference Standard solution at 252 mμ and 275 mμ, respectively.

Packaging and storage—Preserve Methdilazine in tight containers.

CATEGORY—Antipruritic.

USUAL DOSE—**7.2 mg.** (equivalent to 8 mg. of methdilazine hydrochloride) two to four times a day.

Methdilazine Tablets

Methdilazine Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{18}H_{20}N_2S$.

Identification—Place in a mortar a number of Methdilazine Tablets, equivalent to about 20 mg. of methdilazine, add 10 ml. of ether, and grind thoroughly. Cool the mixture by evaporating a small amount of the ether in a stream of air, and filter. Again cool by evaporating a small amount of the ether. Filter if a precipitate forms. Evaporate the filtrate to dryness on a steam bath, dissolve the residue in about 3 ml. of chloroform, and transfer to a suitable mortar containing 500 mg. of potassium bromide. Grind thoroughly, dry under vacuum, repeat if necessary to remove the last trace of solvent, and prepare a pressed disk from the triturate. The infrared absorption spectrum of the potassium bromide dispersion exhibits maxima only at the same wavelengths as that of NF Methdilazine Reference Standard, similarly measured, in the 6 to 16-μ region.

Content uniformity, *Method I*, page 799—Methdilazine Tablets meet the requirements of the content uniformity test for tablets.

Disintegration, page 878—The disintegration time limit for Methdilazine Tablets is 30 minutes.

Assay—

Standard preparation—Transfer about 100 mg. of NF Methdilazine Reference Standard, accurately weighed, to a 250-ml. volumetric flask, add chloroform to volume, and mix.

Assay preparation—Weigh and finely powder not less than 20 Methdilazine Tablets, and transfer an accurately weighed portion of the powder, equivalent to about 40 mg. of methdilazine, to a 100-ml. volumetric flask. Add 60 ml. of chloroform, shake for 20 minutes, dilute to volume with chloroform, and mix. Filter, discarding the first 15 ml. of filtrate. Use the subsequent filtrate as directed in the *Procedure*.

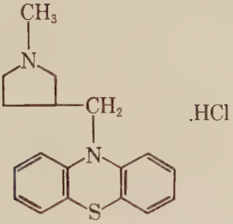
Procedure—Transfer 10.0 ml. each of the *Standard preparation* and of the *Assay preparation* to separate 100-ml. volumetric flasks. To each flask add 20 ml. of chloroform and 4.0 ml. of buffered palladium chloride T.S., dilute to volume with alcohol, and mix. Concomitantly determine the absorbances of the solutions in 1-cm. cells, at the maximum at about 460 mμ, with a suitable spectrophotometer, using water as the blank. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{18}H_{20}N_2S$ in the portion of the Tablets taken by the formula $0.1C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of the *Standard preparation.*

Packaging and storage—Preserve Methdilazine Tablets in tight containers.

Tablets available—Methdilazine Tablets usually available contain the following amount of methdilazine: 3.6 mg.

CATEGORY and DOSE—See Methdilazine.

Methdilazine Hydrochloride*



10-[(1-Methyl-3-pyrrolidinyl)methyl]phenothiazine Monohydrochloride

$C_{18}H_{20}N_2S.HCl$ Mol. wt. 332.90

Methdilazine Hydrochloride contains not less than 97.0 percent and not more than 103.0 percent of $C_{18}H_{20}N_2S.HCl$, calculated on the dried basis.

Description—Methdilazine Hydrochloride occurs as a light tan, crystalline powder having a slight characteristic odor.

Solubility—Methdilazine Hydrochloride is freely soluble in water, in alcohol, and in chloroform.

Identification—

A: Dissolve about 50 mg. of Methdilazine Hydrochloride in 10 ml. of diluted hydrochloric acid in a test tube. Add 3 ml. of buffered palladium chloride T.S. and 1 ml. of sodium lauryl sulfate solution (1 in 100) and mix: a dark blue color is formed.

B: A solution of Methdilazine Hydrochloride responds to the tests for *Chloride,* page 808.

Melting range, page 814—Methdilazine Hydrochloride melts between 184° and 190°.

Infrared absorption, page 866—The infrared absorption spectrum of a potassium bromide dispersion of Methdilazine Hydrochloride, previously dried in vacuum at 70° for 4 hours, exhibits maxima only at the same wavelengths as that of NF Methdilazine Hydrochloride Reference Standard, similarly measured.

Ultraviolet absorption, page 866—The ultraviolet absorption spectrum of a 1 in 200,000 solution of Methdilazine Hydrochloride in water exhibits maxima and minima at the same wavelengths as that of NF Methdilazine Hydrochloride Reference Standard, similarly measured.

pH, page 824—The pH of a solution of Methdilazine Hydrochloride (1 in 100) is between 4.8 and 6.0.

Loss on drying, page 814—Dry Methdilazine Hydrochloride in vacuum at 70° for 4 hours: it loses not more than 1 percent of its weight.

Residue on ignition, page 858—Methdilazine Hydrochloride yields not more than 0.5 percent of residue on ignition.

Heavy metals, *Method II,* page 806—The heavy metals limit for Methdilazine Hydrochloride is 20 parts per million.

Selenium—A *Test Preparation* prepared with 100 mg. of Methdilazine Hydrochloride and 100 mg. of magnesium oxide meets the requirements of the *Selenium Limit Test,* page 865 (30 parts per million).

Assay—Transfer about 100 mg. of Methdilazine Hydrochloride, accurately weighed, to a 1000-ml. volumetric flask, add water to volume, and mix. Transfer 5.0 ml. of this solution to a 100-ml. volumetric flask, dilute to volume with water, and mix. Concomitantly determine the absorbance of this solution and of a solution of NF Methdilazine Hydrochloride Reference Standard, in the same medium, at a concentration of about 5 mcg. per ml., in 1-cm. cells, at 252 mμ and at 275 mμ, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg., of $C_{18}H_{20}N_2S.HCl$ in the portion of Methdilazine Hydrochloride taken by the formula $20C \times (A_{U252} - A_{U275})/(A_{S252} - A_{S275})$, in which C is the exact concentration, in mcg. per ml., of the Reference Standard solution, A_{U252} and A_{U275} are the absorbances of the sample solution at 252 mμ and 275 mμ, respectively, and A_{S252} and A_{S275} are the absorbances of the Reference Standard solution at 252 mμ and 275 mμ, respectively.

---

* Patented. See notice, page ii.

Packaging and storage—Preserve Methdilazine Hydrochloride in tight containers.

Category—Antipruritic.

Usual dose range—**8 mg.** two to four times a day.

Methdilazine Hydrochloride Syrup

Methdilazine Hydrochloride Syrup contains not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{18}H_{20}N_2S.HCl$.

Identification—Transfer a volume of the Syrup, equivalent to about 4 mg. of methdilazine hydrochloride, to a 60-ml. separator, add 5 ml. of 0.1 *N* hydrochloric acid, and extract with 10 ml. of ether, discarding the extract. Add 10 ml. of sodium bicarbonate solution (1 in 10) to the separator, and extract with 3 ml. of chloroform. Filter the extract through a pledget of cotton. Evaporate the chloroform, carefully removing the last trace of solvent in a small vacuum flask. The infrared absorption spectrum of a potassium bromide dispersion of the methdilazine so obtained exhibits maxima at the same wavelengths as that of a similar preparation of NF Methdilazine Hydrochloride Reference Standard which has been treated in the same manner as the sample.

pH, page 824—The pH of Methdilazine Hydrochloride Syrup is between 3.3 and 4.1.

Assay—

Standard preparation—Transfer about 100 mg. of NF Methdilazine Hydrochloride Reference Standard, accurately weighed, to a 250-ml. volumetric flask, add chloroform to volume, and mix.

Assay preparation—Transfer a volume of Methdilazine Hydrochloride Syrup, equivalent to about 4 mg. of methdilazine hydrochloride, to a 60-ml. separator, add 10 ml. of a saturated solution of sodium chloride, and extract with three 10-ml. portions of chloroform, transferring each extract into a 100-ml. volumetric flask.

Procedure—Transfer 10.0 ml. of the *Standard preparation* to a 100-ml. volumetric flask, and add 20 ml. of chloroform. To this flask and to the flask containing the *Assay preparation* add 20 ml. of chloroform and 4.0 ml. of palladium chloride T.S., dilute to volume with alcohol, and mix. Concomitantly determine the absorbances of the solutions, in 1-cm. cells, at the maximum at about 460 mμ with a suitable spectrophotometer, using a mixture of 30 ml. of chloroform, 4 ml. of water, and 66 ml. of alcohol as the blank. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{18}H_{20}N_2S.HCl$ in each ml. of the Syrup taken by the formula $0.01 \times (C/V) \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of NF Methdilazine Hydrochloride Reference Standard in the *Standard preparation*, and V is the volume, in ml., of Syrup taken.

Alcohol content—Determine the alcohol content by the gas-liquid chromatographic procedure, page 772. Methdilazine Hydrochloride Syrup contains from 6.5 to 7.5 percent (v/v) of C_2H_5OH.

Packaging and storage—Preserve Methdilazine Hydrochloride Syrup in tight, light-resistant containers.

Syrup available—Methdilazine Hydrochloride Syrup usually available contains the following amount of methdilazine hydrochloride: 4 mg. in 5 ml.

Category and Dose—See Methdilazine Hydrochloride.

Methdilazine Hydrochloride Tablets

Methdilazine Hydrochloride Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{18}H_{20}N_2S.HCl$.

Identification—Transfer a portion of finely powdered Methdilazine Hydrochloride Tablets, equivalent to about 8 mg. of methdilazine hydrochloride, to a 60-ml. separator, add 10 ml. of sodium bicarbonate solution (1 in 10), and extract with 3 ml. of chloroform. Filter the extract through a pledget of cotton. Evaporate the chloroform, carefully removing the last trace of solvent in a small vacuum flask. The infrared absorption spectrum of a potassium bromide dispersion of the methdilazine so obtained exhibits maxima at the same wavelengths as that of a similar preparation of NF Methdilazine Hydrochloride Reference Standard, which has been treated in the same manner as the sample.

Disintegration, page 878—The disintegration time limit for Methdilazine Hydrochloride Tablets is 30 minutes.

Content uniformity, *Method I*, page 799—Methdilazine Hydrochloride Tablets meet the requirements of the content uniformity test for tablets.

Assay—

Standard preparation—Transfer about 100 mg. of NF Methdilazine Hydrochloride Reference Standard, accurately weighed, to a 250-ml. volumetric flask, add chloroform to volume, and mix.

Assay preparation—Weigh and finely powder not less than 20 Methdilazine Hydrochloride Tablets, and transfer an accurately weighed portion of the powder, equivalent to about 80 mg. of methdilazine, to a 200-ml. volumetric flask. Add 60 ml. of chloroform, shake for 20 minutes, dilute to volume with chloroform, and mix. Filter, discarding the first 15 ml. of filtrate. Use the subsequent filtrate as directed in the *Procedure*.

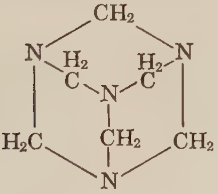
Procedure—Transfer 10.0 ml. each of the *Standard preparation* and of the *Assay preparation* to separate 100-ml. volumetric flasks. To each flask add 20 ml. of chloroform and 4.0 ml. of buffered palladium chloride T.S., dilute to volume with alcohol, and mix. Concomitantly determine the absorbances of the solutions, in 1-cm. cells, at the maximum at about 460 mμ with a suitable spectrophotometer, using water as the blank. Record the absorbance of the solution from the *Standard preparation* as A_S and that from the *Assay preparation* as A_U. Calculate the quantity, in mg., of $C_{18}H_{20}N_2S.HCl$ in the portion of the Tablets taken by the formula $0.2C \times (A_U/A_S)$, in which C is the exact concentration, in mcg. per ml., of NF Methdilazine Hydrochloride in the *Standard preparation*.

Packaging and storage—Preserve Methdilazine Hydrochloride Tablets in tight containers.

Tablets available—Methdilazine Hydrochloride Tablets usually available contain the following amount of methdilazine hydrochloride: 8 mg.

CATEGORY and DOSE—See Methdilazine Hydrochloride.

Methenamine



Hexamethylenetetramine

$C_6H_{12}N_4$ Mol. wt. 140.19

Methenamine, dried over phosphorus pentoxide for 4 hours, contains not less than 99.0 percent and not more than 100.5 percent of $C_6H_{12}N_4$.

Description—Methenamine occurs as colorless, lustrous crystals, or as a white, crystalline powder. It is practically odorless. When brought into contact with fire, it readily ignites, burning with a smokeless flame. It sublimes at about 260° without melting. Its solutions are alkaline to litmus.

Solubility—Methenamine is freely soluble in water. It is soluble in alcohol and in chloroform.

Identification—Heat a solution of Methenamine (1 in 10) with diluted sulfuric acid: formaldehyde is liberated, recognizable by its odor and by its darkening of paper moistened with silver ammonium nitrate T.S. On the subsequent addition of an excess of sodium hydroxide T.S. to the solution, ammonia is evolved.

Loss on drying, page 814—Dry Methenamine over phosphorus pentoxide for 4 hours: it loses not more than 2 percent of its weight.

Residue on ignition, page 858—Methenamine yields not more than 0.05 percent of residue on ignition.

Chloride, page 784—One g. of Methenamine shows no more chloride than corresponds to 0.2 ml. of 0.02 *N* hydrochloric acid (0.014 percent).

Sulfate—To 10 ml. of a solution of Methenamine (1 in 50), acidified with 5 drops of hydrochloric acid, add 5 drops of barium chloride T.S.: no turbidity is produced within 1 minute.

Ammonium salts—To 10 ml. of a solution of Methenamine (1 in 20) add 1 ml. of alkaline mercuric-potassium iodide T.S.: the mixture is not darker in color than a mixture of 1 ml. of the reagent and 10 ml. of water.

Heavy metals, page 806—Dissolve 2 g. of Methenamine in 10 ml. of water, and add 2 ml. of diluted hydrochloric acid and water to make 25 ml. Continue as directed for *Solution B* under *Method I*, page 806, except use glacial acetic acid to adjust the pH: the heavy metals limit for Methenamine is 10 parts per million.

Assay—Transfer about 1 g. of Methenamine, previously dried over phosphorus pentoxide for 4 hours and accurately weighed, to a beaker. Add 40.0 ml. of 1 *N* sulfuric acid, and heat on a steam bath, adding water from time to time, if necessary, until the odor of formaldehyde is no longer perceptible. Cool, add 20 ml. of water, then add 3 drops of methyl red T.S., and titrate the excess acid with 1 *N* sodium hydroxide. Perform a blank determination (see *Residual Titrations,* page 883). Each ml. of 1 *N* sulfuric acid is equivalent to 35.05 mg. of $C_6H_{12}N_4$.

Packaging and storage—Preserve Methenamine in well-closed containers.

CATEGORY—Antibacterial (urinary tract).

USUAL DOSE—**1 g.** four times a day.

USUAL DOSE RANGE—**500 mg.** to **1.5 g.**

Methenamine Tablets

Methenamine Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_6H_{12}N_4$.

Identification—Dissolve about 500 mg. of powdered Methenamine Tablets in 10 ml. of water, add 10 ml. of diluted sulfuric acid, and heat: formaldehyde is liberated, recognizable by its odor and by its darkening of paper moistened with silver ammonium nitrate T.S. On the subsequent addition of an excess of sodium hydroxide T.S. to the solution, ammonia is evolved.

Disintegration, page 878—The disintegration time limit for Methenamine Tablets is 30 minutes.

Weight variation, page 901—Methenamine Tablets meet the requirements of the weight variation test for tablets.

Assay—Weigh and finely powder not less than 20 Methenamine Tablets. Weigh accurately a portion of the powder, equivalent to about 1 g. of methenamine, and transfer it completely to a beaker. Add 40.0 ml. of 1 *N* sulfuric acid, and heat on a steam bath, adding water from time to time, if necessary, until the odor of formaldehyde is no longer perceptible. Cool, add 20 ml. of water, then add 3 drops of methyl red T.S., and titrate the excess acid with 1 *N* sodium hydroxide. Perform a blank determination (see *Residual Titrations,* page 883). Each ml. of 1 *N* sulfuric acid is equivalent to 35.05 mg. of $C_6H_{12}N_4$.

Packaging and storage—Preserve Methenamine Tablets in well-closed containers.

Tablets available—Methenamine Tablets usually available contain the following amounts of methenamine: 300 and 500 mg.

CATEGORY and DOSE—See Methenamine.

Methenamine and Sodium Biphosphate Tablets

Methenamine and Sodium Biphosphate Tablets contain not less than 92.5 percent and not more than 107.5 percent of the labeled amount of $C_6H_{12}N_4$ (methenamine) and of $NaH_2PO_4 . H_2O$ (sodium biphosphate).

Identification—

A: Powder several Methenamine and Sodium Biphosphate Tablets, and heat a filtered solution of the powder, equivalent to methenamine 1 in 10, with diluted sulfuric acid: it decomposes with the liberation of formaldehyde, recognizable by its odor, and by its darkening of paper moistened with silver ammonium nitrate T.S. On the subsequent addition of an excess of sodium hydroxide T.S. to the solution, ammonia is evolved.

B: Add 1 ml. of alkaline mercuric-potassium iodide T.S. to a filtered solution of Methenamine and Sodium Biphosphate Tablets, equivalent to methenamine 1 in 20: a yellow precipitate forms, and after acidification with hydrochloric acid, the precipitate becomes soluble upon the addition of ammonia T.S.

C: A filtered solution of Methenamine and Sodium Biphosphate Tablets, equivalent to sodium biphosphate 1 in 20, responds to the tests for *Sodium*, page 810, and for *Phosphate*, page 809.

Disintegration, page 878—The disintegration time limit for Methenamine and Sodium Biphosphate Tablets is 30 minutes.

Weight variation, page 901—Methenamine and Sodium Biphosphate Tablets meet the requirements of the weight variation test for tablets.

Ammonium salts—Dissolve 500 mg. of powdered Methenamine and Sodium Biphosphate Tablets in 10 ml. of water, add 5 ml. of sodium hydroxide T.S., and follow with 1 ml. of alkaline mercuric-potassium iodide T.S.: the color produced in 15 seconds may be yellow, but not orange-yellow or darker.

Assay for methenamine—Weigh and finely powder not less than 20 Methenamine and Sodium Biphosphate Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 250 mg. of methenamine, to a 1-liter beaker. Add 200 ml. of water and 50 ml. of 1 *N* sulfuric acid, and boil the mixture gently until all of the formaldehyde has been driven off, adding water, if necessary, to maintain approximately the original volume. Cool the liquid, transfer to an 800-ml. Kjeldahl flask, add water to make the liquid measure about 300 ml., and add an excess of sodium hydroxide solution (1 in 2). Connect the flask to a distillation trap and condenser and distil the liberated ammonia into 25.0 ml. of 0.5 *N* sulfuric acid, taking care that the adapter dips beneath the surface of the acid, and that at least 250 ml. of distillate is collected. Add 3 drops of methyl red T.S. and titrate the excess acid with 0.5 *N* sodium hydroxide. Each ml. of 0.5 *N* sulfuric acid is equivalent to 17.52 mg. of $C_6H_{12}N_4$.

Assay for sodium biphosphate—Transfer an accurately weighed portion of finely powdered Methenamine and Sodium Biphosphate Tablets, equivalent to about 60 mg. of sodium biphosphate, into a 500-ml. Kjeldahl flask. Add 25 ml. of nitric acid and 10 ml. of sulfuric acid, and boil gently, adding additional nitric acid, if necessary, until all organic matter is destroyed. Cool, add 50 ml. of water, and boil vigorously until brown fumes cease to be evolved. Cool, transfer the contents of the Kjeldahl flask to a beaker, dilute to about 100 ml. with water, and neutralize the solution with ammonia T.S. To the neutralized solution add 10 g. of ammonium nitrate, heat to a temperature of 35° or 40°, and add 75 ml. of ammonium molybdate T.S. with stirring, and continue to stir the mixture for 15 minutes at room temperature. Allow the mixture to stand for about 15 minutes, and decant the supernatant liquid through a filter crucible. Wash the precipitate in the beaker by decantation with two 30-ml. portions of water, stirring thoroughly and allowing to settle before passing the supernatant liquid through the filter crucible. Transfer the precipitate to the filter, wash with cold water until the washings are neutral to litmus, place the crucible and contents in the beaker used for the precipitation, and add 50 ml. of water. Dissolve the yellow precipitate in an accurately measured excess of 0.5 *N* sodium hydroxide, add 3 drops of phenolphthalein T.S., and titrate the excess sodium hydroxide with 0.5 *N* sulfuric acid. Perform a blank determination (see *Residual Titrations*, page 883). Each ml. of 0.5 *N* sodium hydroxide is equivalent to 3.000 mg. of $NaH_2PO_4 . H_2O$.

Packaging and storage—Preserve Methenamine and Sodium Biphosphate Tablets in tight containers.

Tablets available—Methenamine and Sodium Biphosphate Tablets usually available contain the following amounts of methenamine and sodium biphosphate: of each, 300 and 500 mg.

Category—Antibacterial (urinary tract).

Usual individual dose of methenamine and sodium biphosphate—**500 mg.** of each.

Methiodal, Sodium, Injection, page 651

Methionine

$$CH_3SCH_2CH_2\underset{\underset{NH_2}{|}}{C}HCOOH$$

DL-2-Amino-4-(methylthio)butyric Acid

$C_5H_{11}NO_2S$ Mol. wt. 149.21

Methionine contains not less than 99.0 percent and not more than 100.5 percent of $C_5H_{11}NO_2S$, calculated on the dried basis.

Description—Methionine occurs as white, crystalline platelets or as a powder. It has a characteristic odor.

Solubility—Methionine is soluble in water. It is soluble in dilute acids and in solutions of alkali hydroxides. It is very slightly soluble in alcohol, and practically insoluble in ether.

Identification—

A: Add 25 mg. of dry Methionine to 1 ml. of a saturated solution of anhydrous cupric sulfate in sulfuric acid: a yellow color appears.

B: To a solution of Methionine (1 in 1000) add in succession, shaking after each addition, 1 ml. of 5 *N* sodium hydroxide, 1 ml. of aminoacetic acid solution (1 in 100), and 0.3 ml. of freshly prepared sodium nitroprusside solution (1 in 10). Keep the mixture at about 40° for 10 minutes, cool in an ice bath for 2 minutes, then add 2 ml. of 20 percent hydrochloric acid and shake the mixture: a reddish purple color appears.

C: To 1 ml. of a 1 in 30 solution of Methionine add 1 ml. of ninhydrin T.S. and 100 mg. of sodium acetate, and heat to boiling: an intense violet-blue color is formed (*distinction from hydroxyl analog*).

pH, page 824—The pH of a solution of Methionine (1 in 100) is between 5.6 and 6.1.

Clarity and color of solution—Dissolve 450 mg. of Methionine in 15 ml. of water: the solution is clear and colorless.

Loss on drying, page 814—Dry Methionine at 105° for 4 hours: it loses not more than 0.5 percent of its weight.

Residue on ignition, page 858—Methionine yields not more than 0.1 percent of residue on ignition.

Chloride, page 784—A 750-mg. portion of Methionine shows no more chloride than corresponds to 0.2 ml. of 0.02 *N* hydrochloric acid (0.019 percent).

Sulfate, page 784—A 750-mg. portion of Methionine shows no more sulfate than corresponds to 0.4 ml. of 0.02 *N* sulfuric acid (0.05 percent).

Selenium—A *Test Preparation* prepared with 200 mg. of Methionine meets the requirements of the *Selenium Limit Test,* page 865 (30 parts per million).

Heavy metals, *Method II,* page 806—The heavy metals limit for Methionine is 20 parts per million.

Iron—Dissolve 1 g. of Methionine in 40 ml. of water, add 2 ml. of hydrochloric acid and about 50 mg. of ammonium persulfate, dilute to 50 ml., and mix. To this solution add 3 ml. of ammonium thiocyanate T.S., and mix thoroughly: the color obtained is no darker than that produced in 50 ml. of a solution containing 70 mcg. of ferrous ammonium sulfate (equivalent to 10 mcg. of Fe) when treated in the same manner. Methionine contains not more than 10 parts per million of Fe.

Assay—Transfer about 300 mg. of Methionine, accurately weighed, to a glass-stoppered flask. Add 100 ml. of water, 5 g. of dibasic potassium phosphate, 2 g. of monobasic potassium phosphate, and 2 g. of potassium iodide, and mix to dissolve. Add 50.0 ml. of 0.1 *N* iodine, stopper the flask, mix, and allow to stand for 30 minutes. Titrate the excess iodine with 0.1 *N* sodium thiosulfate. Perform a blank determination (see *Residual Titrations,* page 883). Each ml. of 0.1 *N* iodine is equivalent to 7.461 mg. of $C_5H_{11}NO_2S$.

Packaging and storage—Preserve Methionine in well-closed, light-resistant containers.

CATEGORY—Lipotropic.

USUAL DOSE—**3 g.** one to three times a day.

USUAL DOSE RANGE—**3** to **20 g.** per day.

Methionine Capsules

Methionine Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_5H_{11}NO_2S$.

Identification—Macerate the contents of a sufficient number of Methionine Capsules, equivalent to about 100 mg. of methionine, in 100 ml. of water, and filter the solution. The solution responds to *Identification test B* under *Methionine,* page 435.

Weight variation, page 901—Methionine Capsules meet the requirements of the weight variation test for capsules.

Assay—Transfer, as completely as possible, the contents of not less than 20 Methionine Capsules into a 1000-ml. volumetric flask. Wash the emptied capsules with cold water and transfer the washings to the flask. Add water to volume, and mix. Filter, if necessary, through a dry filter into a dry flask, rejecting the first 20 ml. of the filtrate. Transfer to a glass-stoppered flask an accurately measured volume of the filtrate, equivalent to about 300 mg. of methionine. Add a sufficient amount of water to make the volume about 100 ml., and 5 g. of dibasic potassium phosphate, 2 g. of monobasic potassium phosphate, and 2 g. of potassium iodide, and mix to dissolve. Add 50.0 ml. of 0.1 *N* iodine, stopper the flask, mix, and allow to stand for 30 minutes. Titrate the excess iodine with 0.1 *N* sodium thiosulfate. Perform a blank determination (see *Residual Titrations*, page 883). Each ml. of 0.1 *N* iodine is equivalent to 7.461 mg. of $C_5H_{11}NO_2S$.

Packaging and storage—Preserve Methionine Capsules in well-closed, light-resistant containers.

Capsules available—Methionine Capsules usually available contain the following amounts of methionine: 200 and 500 mg.

CATEGORY and DOSE—See Methionine.

Methionine Tablets

Methionine Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_5H_{11}NO_2S$.

Identification—A filtered solution of Methionine Tablets, representing a concentration of approximately 1 in 1000 of methionine, responds to *Identification test B* under *Methionine*, page 435.

Disintegration, page 878—The disintegration time limit for Methionine Tablets is 30 minutes in simulated gastric fluid T.S.

Weight variation, page 901—Methionine Tablets meet the requirements of the weight variation test for tablets.
